FOREWORD

The Pond Dynamics/Aquaculture Collaborative Research Support Program (PD/A CRSP) represents an international community of researchers and institutions dedicated to strengthening health and nutrition in developing countries by improving the efficiency of pond aquaculture systems. It is one of several agricultural CRSPs supported by the U.S. Agency for International Development under the authority of Title XII of the International Development and Food Assistance Act of 1975.

The "Global Experiment" in Pond Dynamics/Aquaculture is the major CRSP research activity, covering the period from 1982 to 1987. The Global Experiment was designed to quantitatively describe the physical, chemical and biological principles of pond culture systems. The information gained from the Global Experiment will be used to improve production technologies and develop quantitative production functions to facilitate rigorous economic analyses of aquaculture systems.

Standardization is a key element of the Global Experiment. Standardization permits the comparison of data from diverse geographic locations. The experimental design involves monitoring specified environmental and fish production variables in accordance with standardized work plans in twelve or more ponds at each of seven geographical locations. The variables observed, frequency of observation, and materials and methods are uniform for all locations. The field data are filed in a centralized data base, called the CRSP Central Data Base. Statistical methods will be used to test hypotheses about correlations between variables and to evaluate the sources of variance within ponds, between ponds within locations, and between locations.

The CRSP Central Data Base will be used to develop predictive models of the processes occurring in pond culture systems. The models will be used to provide guidance for ongoing and future research, to predict the performance of existing and proposed pond systems subject to specific inputs and constraints, and to improve the operation and efficiency of pond culture systems.

The Global Experiment includes three cycles of experiments. Each cycle consists of two series of observations, one during the dry season and one during the wet season. The objective of the first cycle is to create a detailed baseline of chemical, physical, and biological data on all ponds treated with a standard level of inorganic fertilizer. In the second experimental cycle, ponds treated with inorganic fertilizer are compared to ponds treated with organic fertilizer. In the third cycle, the responses of ponds to different levels of organic fertilizer are compared.

The goal of the Pond Dynamics/Aquaculture Collaborative Research Data Reports (referred to as Data Reports) is to record the CRSP Central Data Base and to present interpretations of site specific results. The Pond Dynamics/Aquaculture CRSP has conducted the Global Experiment at seven project sites in six developing countries: Thailand, Indonesia, the Philippines, Panama, Honduras, and Rwanda. The first volume of these reports provides descriptive information for each CRSP site. It presents the physical characteristics of each site, including a geographical sketch, climatology, and water and soil analyses. Experimental cycles are described in CRSP Work Plans One to Three, which are summarized in the first volume.

Volume One will serve as the reference volume for the entire report series. Subsequent volumes will focus on each site separately. Each Data Report will include one cycle (wet and dry seasons) of the Pond Dynamics/Aquaculture CRSP Global Experiment. Therefore, with few exceptions, each project site will have three Data Reports devoted to it, representing the results of the three cycles of the Global Experiment. In addition to the hard copy of experimental data published as a part of each Data Report, data are also available from the PD/A CRSP in electronic form (on diskette) for computer analysis. Cycle III the Global Experiment in Iloilo, Philippines is presented in this volume.

INTRODUCTION

This Data Report covers the wet and dry season experiments of CRSP Cycle III research in the Philippines. All experiments were conducted at the Brackishwater Aquaculture Center (BAC) of the University of the Philippines in the Visayas. Experiments concentrated on two topics:

1. Polyculture of shrimp, bivalves and fish; and
2. Manure loading in brackishwater tilapia ponds.

The overall objective of the polyculture experiments was to develop an economically viable, intensive polyculture system. Shrimp were to be the primary crop, with bivalves and fish used to maintain suitable water quality while minimizing energy requirements for water flushing and emergency aeration. Attainment of this objective required the establishment of bivalve and fish stocking densities that would optimize their cropping rates on phytoplankton and zooplankton such that phytoplankton are maintained in log-phase growth. Secondarily, the bivalves and fish may provide an additional crop for market.

The manure loading experiments were designed to determine the level of organic fertilization that would optimize fish yields. These manure loading experiments were conducted at all CRSP sites as specified in the CRSP Third Work Plan. The experimental design included four organic fertilizer application rates, ranging from a low level to a level which was considered excessive, thereby bracketing the optimum level.

MATERIALS AND METHODS

The details of the methodologies for the experiments were described in the CRSP Third Work Plan. Pond preparation, stocking procedures, stock monitoring and measurement of water quality, soil, and weather parameters followed the work plan except for deviations listed in Table 1.

Polyculture Experiment

Eighteen 1000-m² ponds were used in this study. Three primary treatments, with six replicates each, consisted of:

- (1) monoculture of the shrimp *Penaeus monodon* (shrimp stocking density 4/m² in all treatments);
- (2) shrimp and bivalves (bivalve stocking density 90,000/ha in all treatments with bivalves); and
- (3) shrimp and bivalves and milkfish (*Chanos chanos*) (milkfish stocking density of 3,000/ha) stocked in 45-m² pens in the ponds.

The oyster *Crassostrea tredalei* was stocked initially during the first trial, but later was found to be unsuitable for use in fishponds. The green mussel *Perna viridis* was used during the later part of the first trial and throughout the second trial. Three ponds in each of the primary treatments were circulated during daytime using a motor-driven, 18-inch, propeller-type blade running at 90 rpm. The remaining three ponds in each primary treatment were not circulated. Two trials were conducted, each starting in March and September 1986, corresponding with the dry and wet seasons, respectively. The first trial lasted 120 days, while the second trial was terminated prematurely after two months of grow-out. During the course of the experiment, shrimp and fish growth, dissolved oxygen, salinity, temperature, un-ionized ammonia concentration, pond depth, Secchi disk depth, nitrate concentration,

available phosphorous, total phosphorous, pH, chlorophyll levels, primary productivity, phytoplankton abundance, and zooplankton abundance were monitored at regular intervals.

Manure Loading Experiment

Twelve 500-m² earthen ponds were used in this experiment. There were three replicates in each of four chicken manure application rate treatments:

| Treatment | Fertilization Rate (kg/ha/wk) |
|-----------|----------------------------------|
| I | 125 |
| II | 250 |
| III | 500 |
| IV | 1000 |

Chicken manure was applied three times per week to yield the weekly totals shown. Tilapia were stocked as per the Work Plan.

As in Cycle II, tilapia were plagued by a high incidence of prominent external lesions and subsequent high mortality rate during Cycle III at BAC. Several attempts were made to start the tilapia core project during the dry season but all were aborted prematurely due to these and other problems. In one case there was an offshore chemical spill which entered canals and caused many mortalities at BAC. The tilapia were being brought up to the required experimental stocking size in nursery ponds, and a high percent of these died after the chemical spill. Many of these seed stock already had a higher incidence of lesions than normal. On two other occasions high mortalities apparently due to lesions caused the dry season trial to be aborted essentially before it started.

After the many delays in initiating the dry season trial, it was decided to spend the remaining part of the dry season preparing ponds for the wet season trial. It was hoped that by treating the ponds prophylactically, the disease could be eradicated. The bottom of the ponds were excavated a few inches to remove the organically rich detritus. This was done in the event that the sediments were contributing to disease by promoting microbial growth. The ponds were also treated with quick lime to help reduce microbes and eliminate the disease which was causing the lesions. The tilapia fry were held in hapas in the culture ponds and fed antibiotic-treated feeds to bring them to stocking size.

During sampling it was noticed that a considerable number of lesions were still occurring despite the preparations for the wet season trial. Up to 20% of the fish sampled had lesions. These levels were comparable to previous trials and the experiment was terminated after the second stock sampling.

RESULTS AND DISCUSSION

Weather

Rainfall was greater during the rainy season trial (Figure 1), when it ranged from 0 to 6.1 cm/d and averaged 0.38 cm/d. Rainfall ranged from 0 to 3.8 cm/d and averaged 0.14 cm/d during the dry season trial. Solar radiation was generally higher during

the dry season trial (Figure 2), when it averaged 3,206 E/m²/day. Windspeed (Figure 3) averaged 5.8 km/hr during the dry season trial and 4.2 km/hr during the wet season trial. Air temperature (Figures 4 and 5) ranged from 21.6 to 36.1°C during the dry season trial and 16.1 to 41.3°C during the wet season trial. Averaged minimum and maximum air temperatures were 23.9 and 32.0°C, respectively, during the dry season trial, and 23.9 and 33.5°C, respectively, during the wet season trial.

Polyculture

The means of variables for each treatment for both trials are presented in Tables 2 and 3. Significant treatment effects are listed in Tables 4 and 5.

A major problem encountered during the experiment was mortality of bivalves. Oysters (*Crassostrea iridalei*) were stocked initially during the dry season, but these soon suffered over 65% mortality in all ponds. These mortalities may have been due to a sudden, heavy downpour which lowered the salinity in the ponds from around 35 ppt to 25 ppt. After these mortalities were replaced, the oysters continued to sustain a steady, high death rate. After 10 weeks, survival ranged from about 7 to 73%. It appeared that the species of oyster we were using simply was not suited to pond culture. During the last month of grow-out in the dry season, the oyster mortalities were replaced with green mussels (*Perna viridis*). Green mussels appeared to do well in the ponds and were used almost exclusively during the wet season trial. For the last month of culture during the dry season the mussels increased in size from an average of 4 g (whole shell wet weight) to 8.7 g. During the wet season, mussels were stocked at an average size of 9.8 g and averaged 15 g after two months. After two months in the ponds, mussel survival was generally between 65 and 99%. Two ponds, however, experienced mass mortalities of mussels. This occurred during an unusual period of thermal inversion in the ponds and was accompanied by a heavy plankton bloom. It is not known if the plankton bloom caused the mussel mortalities, perhaps by clogging gills, or if, after the mussels died, the respite from cropping may have caused the plankton bloom. We suspect that the latter is the case because the bloom seemed to intensify after the mussel die-off was discovered. It is possible that thermal or oxygen irregularities during the thermal inversion were the immediate cause of the mass mortality. It is interesting (albeit inconclusive) to note that these die-offs did not occur in ponds with circulation. It may be that circulation is a necessity for pond culture of bivalves, to prevent thermal inversions and consequent mortalities.

The growth of milkfish in polyculture was generally slow. This may have been due to the fact that 300 fish were stocked in 45-m² pens within the ponds. On a whole pond basis, the stocking density was 3,000/ha but per pen stocking density was 66,666/ha. During the dry season trial, milkfish were stocked at an average weight of 21 g and averaged 90 g after three months. Survival was high (81-91%) and production averaged 118 kg/ha. There were no significant differences in average size at harvest between fish in circulated and uncirculated ponds. During the wet season trial milkfish were stocked at an average size of 24 g and harvested after two months at an average size of 40 g. Survival was high (83-98%) and production averaged 108 kg/ha. During the wet season, growth and production were significantly higher in the uncirculated ponds. This is most probably due to extensive lab growth, which was observed in two of three uncirculated milkfish ponds.

Plankton abundance and associated parameters were expected to be affected significantly by the polyculture treatments, because both bivalves and milkfish are filter feeders. In both trials, phytoplankton abundance was lower in treatments with bivalves and bivalves with fish (Figures 6 and 7). These differences were not significant, however, due to the large variability in phytoplankton counts (Tables 4 and 5). During the wet season trial, zooplankton abundance and chlorophyll *a* concentrations were significantly higher in the treatment with shrimp only (Figures 8-11, Tables 4 and 5). The existence of filter feeders affected water clarity because Secchi disk transparency was consistently higher in the polyculture treatments (Figures 12 and 13); this difference was significant during the dry season trial.

(Table 4). Plankton cropping in the polyculture ponds did not result in significantly different morning dissolved oxygen (DO) concentrations. The greater abundance of phytoplankton in the ponds with shrimp only, however, resulted in significantly higher afternoon DO concentrations during the wet season (Tables 3 and 5).

The primary purpose for culturing shrimp together with filter feeders was to improve water quality and reduce energy-intensive pond management practices. The most important potential benefit of this polyculture was the avoidance of low dissolved oxygen levels due to improved P/R ratios and reduced water column respiration. Low DO is one of the major reasons that intensive shrimp culture requires high-energy pond management techniques such as aeration or water replacement by pumping. In this experiment, despite evidence of cropping of plankton, morning DO levels were not significantly higher in the polyculture ponds than in the monoculture ponds.

One possible explanation for the insignificant change in morning DO levels in the polyculture treatments is that the stocking density of bivalves was not high enough to result in significant changes in the plankton populations. Bivalve stocking density may have been too low to begin with, and mortality further reduced bivalve density. The mussels that were stocked were generally small and a higher initial stocking density may be better for these smaller sizes. Plankton diversity would be expected to be higher in ponds where plankton are well cropped and kept in log-phase growth. The diversity of plankton among treatments was not significantly different, which indicates that plankton cropping rates were below optimal and not sufficient to keep the plankton in log-phase growth. More information on filtering rates, optimum stocking densities, and algal cropping rates is necessary. Shrimp stocking density was also low, which means that the system was not driven very hard with nutrient inputs. Secchi disks of greater than 30 cm indicate low nutrient input and low plankton density. This is the same problem that was surmised with the pond depth experiment during Cycle II. Perhaps it is necessary to increase shrimp stocking rates to $15/m^2$ or more (with corresponding feed input increases) in order to achieve significant changes in morning DO levels.

Harvest data are listed in Table 8. During the dry season trial there were no significant treatment effects on shrimp yields. During the wet season trial there were significant circulation effects and interaction effects between circulation and polyculture, but no significant effects due to the polyculture treatment alone. Survival and production were significantly higher in the circulated ponds. Two of the uncirculated ponds had heavy plankton blooms and subsequent periods of very low DO. This presumably contributed to mortality in these ponds and could account for the significant differences from the circulated ponds. Further tests with circulated versus uncirculated ponds are desirable to see if plankton blooms and their harmful effects are significantly fewer in circulated ponds. Feed conversion ratios (FCRs) were significantly higher in uncirculated ponds that were in polyculture. This effect may have been due to the die-off of bivalves in some of the uncirculated ponds. These dead bivalves may have served as an additional food source for shrimp.

Circulation affected several pond parameters (Tables 4-7). In both trials, significantly lower pond temperatures were found in circulated ponds. This is probably due to greater heat loss in circulated ponds resulting from greater exposure to the air, i.e., stratification and higher surface temperatures were absent from circulated ponds. Greater evaporation rates or seepage rates versus refill rates may have been responsible for significantly higher salinity in the circulated ponds during the wet season. Circulated ponds had significantly higher available phosphorous in the water column during the wet season trial. This may have been due to bottom sediments being agitated by circulators, allowing phosphates trapped in sediments to become dissolved in the water. Shrimp from circulated ponds had significantly higher average weights during sampling periods. No immediate explanation for this is apparent.

Manure Loading Experiment

The means of all parameters measured and harvest data for each treatment are shown in Tables 9 and 10, respectively.

Few water quality parameters were significantly affected by the different fertilizer treatments (Table 8). Only chlorophyll *a* and available phosphorous were significantly higher in the treatments with high levels of fertilizer. This may have been due either to direct consumption of fertilizer or increased pond productivity. Survival at harvest was significantly higher in ponds with lower fertilizer application rates (Table 10). The inverse proportion of mean size and survival may be casually related. It is possible that increased levels of manure affected the incidence of lesions and hence survival. The incidence of lesions, however, was not significantly different among treatments during stock sampling. After only two months, survival averaged between 83 and 93%. Based on the incidence of lesions, if the experiment had been allowed to continue for five months it is likely that survival would have been very low.

The leading hypothesis for the high mortality of tilapia in our experiments is that mortalities were probably due to salinity-induced stress. The incidence of disease was much greater at the higher salinities, and it was much greater with the purer stocks of *Oreochromis niloticus* used during Cycles II and III. This problem needs further evaluation before tilapia are promoted for wide-scale culture in brackishwater. It is expected that considerable variation in salinity tolerance will be observed among strains and hybrids.

ACKNOWLEDGEMENTS

Table 11 lists personnel involved in the Cycle III CRSP research in the Philippines. Their contributions to the project are gratefully acknowledged.

Table 1. Deviations from the Third Work Plan

| Measurement | Deviation from Protocol |
|----------------------------------|--|
| Solar Radiation | Licor Model LI-550 used. Recorded hourly from around 0800 to 1630 Monday through Friday except holidays in dry season. During wet season, data recorded daily. |
| Rainfall | One rain gauge used during dry season. 4 gauges installed during wet season. Recorded daily in morning. Holidays and absences skipped during dry season. |
| Wind Speed | Florite Baccarach Wind Speedometer used. Recorded daily except for holidays and absences during the dry season. |
| Air Temperature: Maximum-Minimum | Two max-min thermometers used throughout the cycle. Recorded daily except for holidays and absences during the dry season. |
| Pond Depth | Read to nearest 1 cm. |
| Dissolved Oxygen | Taken at north and south ends of ponds near the dike. Readings are then averaged. During dry season, standard depth protocol followed. In wet season, an additional mid-depth was taken. Readings were taken on Mondays, Wednesdays and Fridays. |
| Pond Temperature | At same time as dissolved oxygen. |
| pH | Two samples taken once per week at north and south ends of ponds. No diurnal samples. |
| Secchi Disk Visibility | Twice a week in dry season. Once a week in wet season. |
| Chlorophyll | Twice a week in dry season. Once a week in wet season. Samples taken from north ends of ponds. |
| Ammonia | Twice a week in dry season. Once a week in wet season. Samples taken north and south ends of ponds. Samples always taken during the morning. Used method according to Strickland and Parsons. |
| Nitrate | Same sampling scheme as for ammonia. Analyzed using Strickland and Parsons. |
| Total Phosphorus | Not collected during beginning of dry season. Otherwise same collection routine as for ammonia. |
| Dissolved Orthophosphate | Same sampling scheme as for ammonia. |
| Fish/Shrimp Group Weight | Used 2.5% of initial stock for shrimp. 10% for fish. |
| Fish/Shrimp Mean Weight | Used 1.25% of initial stock for shrimp. 10% for fish. |
| Fish/Shrimp Mean Length | Used 1.25% of initial stock for shrimp. 10% for fish. |
| Primary Productivity | Three point method used twice a month in polyculture ponds. Light dark bottle method was used once a month in the manure loading experiment. |
| Phytoplankton Composition | Samples preserved in formalin and examined later. |
| Evaporation | Not recorded during dry season. Recorded daily during wet season. |

Units of Measurement and Abbreviations Used in the Appendix Tables

Daily Weather Measurements:

| | |
|-------------------------------------|------------------------|
| SOLAR1 (solar radiation)..... | E/m ² /d |
| SOLAR2 (solar radiation)..... | cal/cm ² /d |
| RAIN (rainfall)..... | cm/d |
| WIND (wind speed) | km/hr |
| ATEMPMAX (max air temperature)..... | °C |
| ATEMPMIN (min air temperature)..... | °C |
| EVAP (evaporation)..... | mm/d |

Daily Pond Measurements:

| | |
|---------------|------------------------------|
| DEPTH | m |
| INFLOW | m ³ /hr |
| OVERFLOW..... | Y/N |
| "nil" | <i>Oreochromis niloticus</i> |
| "mon"..... | <i>Penaeus monodon</i> |
| SALINITY..... | ppt |

Weekly and Twice-Weekly Measurements:

| | |
|---|------------------------------|
| All DO (dissolved oxygen)..... | mg/L |
| All TEMP (temperature) | °C |
| ALKA (alkalinity)..... | mg/L (as CaCO ₃) |
| HARD (total hardness)..... | mg/L (as CaCO ₃) |
| All N (Kjeldahl, NO ₂ , NO ₃ , Total) | mg/L |
| All P (Total, Ortho-PO ₄) | mg/L |
| SECCHI DISK..... | cm |
| CHLOROPHYLL a, b, or c | mg/m ³ |

Diurnal Measurements:

| | |
|--------------------------------|------|
| All DO (dissolved oxygen)..... | mg/L |
| All TEMP (temperature) | °C |

Fish/Shrimp Stocking, Sampling, and Harvesting:

| | |
|---------------------|------------------------------|
| "STK" | stocking |
| "SAM" | sampling |
| "HAR"..... | harvesting |
| "nil" | <i>Oreochromis niloticus</i> |
| "mon"..... | <i>Penaeus monodon</i> |
| POP. WEIGHT..... | kg |
| SAMPLE LENGTH..... | cm |
| REPROD. WEIGHT..... | kg |

Plankton and Benthos:

| | |
|---------------------------------|------------------------|
| NET (PRIMARY) PRODUCTION..... | mg C/m ³ /d |
| GROSS (PRIMARY) PRODUCTION..... | mg C/m ³ /d |

Water Quality Characteristics:

| | |
|---|------------------------------|
| ALKALIN (alkalinity), | mg/L (as CaCO ₃) |
| HARDNESS | mg/L (as CaCO ₃) |
| All N (NH ₃ , NO ₂ , NO ₃ , NO ₂ +NO ₃) | mg/L |
| All P (Total, Ortho-P) | mg/L |
| Cl ⁻ | mg/L |
| SALT | ppt |
| SO ₄ | mg/L |
| BORON | mg/L |
| CALCIUM | mg/L |
| COPPER | mg/L |
| IRON | mg/L |
| MAGNESIUM | mg/L |
| POTASSIUM | mg/L |
| SODIUM | mg/L |
| ZINC | mg/L |

Pond Soil Characteristics:

| | |
|----------------------|----------|
| CLAY | % |
| SILT | % |
| SAND | % |
| ORGANIC MATTER | % |
| SOIL-P | ppm |
| SOIL Ca | meq/100g |
| SOIL Mg | meq/100g |
| SOIL K | ppm |
| SOIL Na | meq/100g |
| SOIL N | % |
| SOIL NH ₄ | ppm |
| SOIL NO ₃ | ppm |
| SOIL CEC | meq/100g |
| SOIL SALT | mmhos/cm |
| SOIL Al | ppm |
| SOIL Fe | ppm |
| SOIL Zn | ppm |
| SOIL Mn | ppm |
| SOIL Cu | ppm |
| SOIL SO ₄ | ppm |

Pond Morphometrics

| | |
|--------|----------------|
| AREA | m ² |
| VOLUME | m ² |

Analysis of Nutrients and Lime:

| | |
|---------------|----------------------|
| All NUTRIENTS | % (dry matter basis) |
|---------------|----------------------|

Nutrient and Lime Inputs:

| | |
|----------------|-------------------------------------|
| All QUANTITIES | kg/ha |
| FD1 | feed type 1 |
| FD2 | feed type 2 |
| FD3 | feed type 3 |
| CHICK | chicken manure |
| TSP | "triple superphosphate" |
| "CaM" | CaMg(CO ₃) ₂ |
| "cac" | CaCO ₃ |

| 27 | 4 | 1986 | B09 | An offshore chemical spill was discovered while the pond was flooded. |
| 27 | 4 | 1986 | B10 | An offshore chemical spill was discovered while the pond was flooded. |
| 27 | 4 | 1986 | B11 | An offshore chemical spill was discovered while the pond was flooded. |
| 27 | 4 | 1986 | B13 | An offshore chemical spill was discovered while the pond was flooded. |
| 27 | 4 | 1986 | B14 | An offshore chemical spill was discovered while the pond was flooded. |
| 27 | 4 | 1986 | B15 | An offshore chemical spill was discovered while the pond was flooded. |
| 27 | 4 | 1986 | B16 | An offshore chemical spill was discovered while the pond was flooded. |
| 27 | 4 | 1986 | B18 | An offshore chemical spill was discovered while the pond was flooded. |
| 27 | 4 | 1986 | B19 | An offshore chemical spill was discovered while the pond was flooded. |
| 27 | 4 | 1986 | B20 | An offshore chemical spill was discovered while the pond was flooded. |
| 28 | 4 | 1986 | B01 | No mortality was monitored after the pond was flooded with chemical contaminated water. |
| 28 | 4 | 1986 | B02 | No mortality was monitored after the pond was flooded with chemical contaminated water. |
| 28 | 4 | 1986 | B03 | No mortality was monitored after the pond was flooded with chemical contaminated water. |
| 28 | 4 | 1986 | B03 | No mortality was monitored after the pond was flooded with chemical contaminated water. |
| 28 | 4 | 1986 | B05 | No mortality was monitored after the pond was flooded with chemical contaminated water. |
| 28 | 4 | 1986 | B06 | No mortality was monitored after the pond was flooded with chemical contaminated water. |
| 28 | 4 | 1986 | B07 | No mortality was monitored after the pond was flooded with chemical water. |
| 28 | 4 | 1986 | B08 | No mortality was monitored after the pond was flooded with chemical contaminated water. |
| 28 | 4 | 1986 | B09 | No mortality was monitored after the pond was flooded with chemical contaminated water. |
| 28 | 4 | 1986 | B10 | No mortality was monitored after the pond was flooded with chemical contaminated water. |
| 28 | 4 | 1986 | B11 | No mortality was monitored after the pond was flooded with chemical contaminated water. |
| 28 | 4 | 1986 | B13 | No mortality was monitored after the pond was flooded with chemical contaminated water. |
| 28 | 4 | 1986 | B14 | No mortality was monitored after the pond was flooded with chemical contaminated water. |
| 28 | 4 | 1986 | B15 | No mortality was monitored after the pond was flooded with chemical contaminated water. |
| 28 | 4 | 1986 | B16 | No mortality was monitored after the pond was flooded with chemical contaminated water. |

Table 3. Miscellaneous Observations, Including Fish Health. Iloilo, Philippines. Cycle III, Dry Season.

| DAY | MONTH | YEAR | POND# | OBSERVATIONS |
|-----|-------|------|-------|--|
| 28 | 4 | 1986 | B18 | No mortality was monitored after the pond was flooded with chemical contaminated water. |
| 28 | 4 | 1986 | B19 | No mortality was monitored after the pond was flooded with chemical contaminated water. |
| 28 | 4 | 1986 | B20 | No mortality was monitored after the pond was flooded with chemical contaminated water. |
| 11 | 5 | 1986 | B20 | A phytoplankton (<i>tetraselmis</i>) bloom occurred which caused the surfacing of the stock. |
| 12 | 5 | 1986 | B14 | Surfacing of shrimp occurred, color of pond water was very green. |
| 12 | 5 | 1986 | B15 | Shrimp were also found surfacing, color of pond water was very green. |
| 12 | 5 | 1986 | B16 | Shrimps were found surfacing at around 300 to 600H. |
| 12 | 5 | 1986 | B18 | Shrimp were found surfacing. |
| 12 | 5 | 1986 | B19 | Stock were found surfacing. |
| 12 | 5 | 1986 | B20 | Surfacing of stock occurred. |
| 23 | 5 | 1986 | B03 | Prawns were found surfacing and mortalities were collected. |
| 23 | 5 | 1986 | B19 | Prawn were found surfacing and several mortalities were collected. |
| 24 | 5 | 1986 | B19 | Surfacing still occurred. |
| 1 | 6 | 1986 | B01 | Oysters were found to be of 50% survival. |
| 1 | 6 | 1986 | B02 | Survival of oysters was 5.67% only. |
| 1 | 6 | 1986 | B03 | Oyster survival was 13.33%. |
| 1 | 6 | 1986 | B04 | Survival of oyster was 8.44%. |
| 1 | 6 | 1986 | B07 | Oyster survival was 50%. |
| 1 | 6 | 1986 | B08 | Oysters were found to be of 50% survival. |
| 1 | 6 | 1986 | B10 | sixty percent of the oyster stocked survived. |
| 1 | 6 | 1986 | B11 | Survival of oyster was high being 73.33%. |
| 1 | 6 | 1986 | B13 | Oyster survival was 30%. |
| 1 | 6 | 1986 | B14 | Survival of oysters was 44.41%. |
| 1 | 6 | 1986 | B15 | only 20% of the oysters stocked survived. |
| 1 | 6 | 1986 | B19 | Only 8.38% of oysters stocked survived. |
| 10 | 6 | 1986 | B04 | Mean weight of <i>Chanos chanos</i> decreased. |
| 11 | 6 | 1986 | B11 | Shrimp samples were difficult to collect. |
| 20 | 6 | 1986 | B01 | Oysters were replaced with mussels. |
| 20 | 6 | 1986 | B02 | Oysters were replaced with mussels. |
| 20 | 6 | 1986 | B03 | Oysters were replaced with mussels. |
| 20 | 6 | 1986 | B04 | Oysters were replaced with mussels. |
| 20 | 6 | 1986 | B07 | Oysters were replaced with mussels. |
| 20 | 6 | 1986 | B08 | Oysters were replaced with mussels. |
| 20 | 6 | 1986 | B10 | Oysters were replaced with mussels. |
| 20 | 6 | 1986 | B11 | Oysters were replaced with mussels. |
| 20 | 6 | 1986 | B13 | Oysters were replaced with mussels. |
| 20 | 6 | 1986 | B14 | Oysters were replaced with mussels. |
| 20 | 6 | 1986 | B15 | Oysters were replaced with mussels. |
| 20 | 6 | 1986 | B19 | Oysters were replaced with mussels. |
| 27 | 6 | 1986 | B01 | Mussels were found to attached on any non-moving object in the pond. |
| 27 | 6 | 1986 | B02 | Pond water became clear. |

Table 3. Miscellaneous Observations, Including Fish Health. Iloilo, Philippines. Cycle III, Wet Season.

| DAY | MONTH | YEAR | FONDO | OBSERVATIONS |
|-----|-------|------|-------|--|
| 21 | 8 | 1986 | B01 | The first batch of prawn fry stocked were weak. |
| 21 | 8 | 1986 | B02 | The first batch of prawn fry stocked were weak. |
| 21 | 8 | 1986 | B03 | The first batch of prawn fry stocked were weak. |
| 21 | 8 | 1986 | B04 | The first batch of prawn fry stocked were weak. |
| 21 | 8 | 1986 | B05 | The first batch of shrimp fry stocked were weak. |
| 21 | 8 | 1986 | B06 | The first batch of prawn fry stocked were weak. |
| 21 | 8 | 1986 | B07 | The first batch of prawn fry stocked were weak. |
| 21 | 8 | 1986 | B08 | The first batch of prawn fry stocked were weak. |
| 21 | 8 | 1986 | B09 | The first batch of shrimp fry stocked were weak. |
| 21 | 8 | 1986 | B10 | The first batch of prawn fry stocked were weak. |
| 21 | 8 | 1986 | B11 | The first batch of prawn fry stocked were weak. |
| 21 | 8 | 1986 | B13 | The first batch of shrimp fry stocked were weak. |
| 21 | 8 | 1986 | B14 | The first batch of prawn fry stocked were weak. |
| 21 | 8 | 1986 | B15 | The first batch of prawn fry stocked were weak. |
| 21 | 8 | 1986 | B16 | The first batch of prawn fry stocked were weak. |
| 21 | 8 | 1986 | B18 | The first batch of prawn fry stocked were weak. |
| 21 | 8 | 1986 | B19 | The first batch of prawn fry stocked were weak. |
| 21 | 8 | 1986 | B20 | The first batch of prawn fry stocked were weak. |
| 3 | 9 | 1986 | A29 | Fishes were treated with antibiotic before they were released to the pond. |
| 3 | 9 | 1986 | A31 | Fishes were treated with antibiotic before they were released to the pond. |
| 3 | 9 | 1986 | A32 | Fishes were treated with antibiotic before they were released to the pond. |
| 3 | 9 | 1986 | A33 | Fishes were treated with antibiotic before they were released to the pond. |
| 3 | 9 | 1986 | A34 | Fishes were treated with antibiotic before they were released to the pond. |
| 3 | 9 | 1986 | A37 | Fishes were treated with antibiotic before they were released to the pond. |
| 3 | 9 | 1986 | A38 | Fishes were treated with antibiotic before they were released to the pond. |
| 3 | 9 | 1986 | A39 | Fishes were treated with antibiotic before they were released to the pond. |
| 3 | 9 | 1986 | A40 | Fishes were treated with antibiotic before they were released to the pond. |
| 3 | 9 | 1986 | A41 | Fishes were treated with antibiotic before they were released to the pond. |
| 3 | 9 | 1986 | A43 | Fishes were treated with antibiotic before they were released to the pond. |
| 3 | 9 | 1986 | A44 | Fishes were treated with antibiotic before they were released to the pond. |
| 6 | 9 | 1986 | B11 | Plankton bloom occurred. |
| 10 | 9 | 1986 | B11 | Mass mortality of mussels was found out. |
| 11 | 9 | 1986 | A32 | Surfacing of fishes occurred. |
| 11 | 9 | 1986 | A33 | Surfacing of fishes occurred. |
| 11 | 9 | 1986 | A39 | Surfacing of fishes occurred, DO reading was low. |
| 21 | 9 | 1986 | B01 | Plankton bloom occurred, color of pond water was very dark green. |
| 22 | 9 | 1986 | B01 | Mass mortality of mussels was monitored. |
| 23 | 9 | 1986 | B01 | Film-like substance was observed on the water surface in the morning until around 1000H. |
| 26 | 9 | 1986 | A31 | Fishes were surfacing from 530 to 930H. |
| 27 | 9 | 1986 | A33 | Fishes were found surfacing. |
| 3 | 10 | 1986 | B11 | Prawn representative samples were hard to collect. |
| 3 | 10 | 1986 | B14 | Gathering of shrimp samples took a long time. |
| 3 | 10 | 1986 | B15 | Prawn samples were hard to collect. |
| 6 | 10 | 1986 | A29 | Lesions occurred mostly in female fish. |
| 6 | 10 | 1986 | A31 | Occurrence of lesions are more on female fish. |

Table 3. Miscellaneous Observations, Including Fish Health. Iloilo, Philippines. Cycle III, Wet Season.

| DAY | MONTH | YEAR | POND# | OBSERVATIONS |
|-----|-------|------|-------|---|
| 6 | 10 | 1986 | A12 | Lesions were found mostly in female fish. |
| 6 | 10 | 1986 | A34 | Occurrence of lesions are more in female fish |
| 6 | 10 | 1986 | A38 | More lesions were observed in females. |
| 6 | 10 | 1986 | A40 | Few lesions were found and mostly on the female fish. |
| 6 | 10 | 1986 | A41 | More lesions were found on the female fish. |
| 6 | 10 | 1986 | A43 | Fishes with lesions were mostly female. |
| 6 | 10 | 1986 | A44 | Female fish had the most number of lesions. |
| 7 | 10 | 1986 | B06 | Plankton bloom occurred, pond water was very green. |
| 8 | 10 | 1986 | B06 | A film-like substance was observed on the water surface in the morning. |
| 11 | 10 | 1986 | B04 | A very big leak was found on the side of the gate. |
| 20 | 10 | 1986 | B11 | Feeds were found on feeding trays and were not fully consumed. |
| 23 | 10 | 1986 | B08 | Milkfish were observed eating the floating lablab inside the pen. |
| 3 | 11 | 1986 | B09 | Size of milkfish was larger than in other ponds. |
| 5 | 11 | 1986 | B01 | Prawn samples were still hard to collect. |
| 5 | 11 | 1986 | B06 | Samples were difficult to gather, survival was estimated to be below 50%. |
| 6 | 11 | 1986 | B01 | Feeds were not totally consumed, feeding rate was adjusted. |
| 6 | 11 | 1986 | B02 | Feeding rate was adjusted based on the estimated survival of 25%. |
| 6 | 11 | 1986 | B03 | Feeding rate was based on 25% survival only. |
| 6 | 11 | 1986 | B04 | Feeds were found on feeding trays and not consumed by the stock, feeding rate was adjusted. |
| 6 | 11 | 1986 | B05 | Feeding ration was adjusted based on the estimated survival of 25%. |
| 6 | 11 | 1986 | B06 | Feeding rate was adjusted based on 25% survival. |
| 6 | 11 | 1986 | B07 | Feeding rate was adjusted based on 25% estimated survival. |
| 6 | 11 | 1986 | B08 | No prawn were found eating on feeding trays, feeding rate was adjusted based on 25% survival. |
| 6 | 11 | 1986 | B09 | Feeding was half of the ration. |
| 6 | 11 | 1986 | B10 | Feeds given was only half of the feeding ration. |
| 6 | 11 | 1986 | B11 | No shrimps were found on feeding trays, only half of the ration were given. |
| 6 | 11 | 1986 | B13 | Half of the ration was given to the stock. |
| 6 | 11 | 1986 | B14 | The feed given was adjusted to half of the feeding ration. |
| 6 | 11 | 1986 | B15 | The feed given was adjusted to half of the feeding ration. |
| 6 | 11 | 1986 | B16 | The feed given was adjusted to half of the feeding ration. |
| 6 | 11 | 1986 | B18 | The feeding ration was adjusted based on the estimated survival of 25%. |
| 6 | 11 | 1986 | B19 | Feed given was adjusted to half of the ration. |
| 6 | 11 | 1986 | B20 | Feeding ration was adjusted based on 25% estimated survival. |
