WORLD WATER FOR AGRICULTURE
(Climate, Precipitation Probabilities and
Adequacies for Rainfed Agriculture)

by
George H. Hargreaves

Prepared under support of
United States Agency for International Development
Contract No. AID/ta-c-1103

UTAH STATE UNIVERSITY

January 1977

CONTENTS AND CLASSIFICATION

	Page
Summary	1
Introduction	1
Climatic Data Analysis	2
Available Energy and Crop Production	4
Water Availability and Crop Production	5
Climatic Classification for Agricultural Production	8
Extension of Data	10
Tabular Presentation	11
Acknowledgments	13

Stations and Classification

Albania	
Shkoder	Temperate, moderately wet 14
Tirana	Temperate, moderately wet 14
Vlore	Subtropical, moderately wet 14
Algeria	
Alger/Dar-El-Beida	Subtropical, wet-dry 14
Bechar	Subtropical, very arid 15
Biskra	Subtropical, very arid 15
Laghouat	Temperate, very arid 15
Oran/Es Senia	Subtropical, semi-arid 15
Tebessa	Temperate, arid 16
Angola	
Luanda	Tropical, arid 16
Argentina	
Azul	Temperate, wet-dry 16
Bariloche	Temperate, wet-dry 16
Buenos Aires	Temperate, wet-dry 17
Ceres	Temperate, wet-dry 17
Comodoro Rivadavia	Temperate, very arid 17
Cordoba	Subtropical, arid 17
Corrientes	Subtropical, wet-dry 18
Formosa	Subtropical, wet-dry 18
Gualectuaychu	Subtropical, wet-dry 18
La Quiaca	Temperate, arid 18
La Rioja	Subtropical, arid 19
Mendoza	Temperate, arid 19
Parana	Subtropical, arid 19
Pilar	Subtropical, arid 19
Presidencia Roque Saenz Pena	Subtropical, semi-arid 20

Salta	Subtropical, semi-arid	20
San Antonio Oeste	Temperate, very arid	20
San Luis	Subtropical, very arid	20
Santiago del Estero	Subtropical, arid	21
Trelew	Temperate, very arid	21
Australia			
Swan Island	Tropical, wet-dry	21
Austria			
Graz-Thalerhof	Subtemperate	21
Insbruck-Univ.	Subtemperate	22
Klagenfurt	Subtemperate	22
St. Polten	Subtemperate	22
Salzburg	Subtemperate	22
Sonnblick	Polar	23
Wien-Hohe Warte	Temperate	23
Bahamas			
Massan Int. Airport	Tropical, wet-dry	23
Bahrain			
Al Muharraq	Tropical, arid	23
Bangladesh			
Bogra	Tropical, wet-dry	24
Chittagong	Tropical, wet-dry	24
Jessore	Tropical, wet-dry	24
Narayanganj	Tropical, wet-dry	24
Srimangal	Tropical, wet-dry	25
Belgium			
Uccle	Temperate	25
Botswana			
Maun	Subtropical, arid	25
Brazil			
Alegrete	Subtropical, somewhat wet	25
Alto Tapajos	Tropical, very wet	26
Aracaju	Tropical, wet-dry	26
Barra do Corda	Tropical, wet-dry	26
Belem	Tropical, moderately wet	26
Belo Horizonte	Tropical, somewhat wet	27
Boa Vista	Tropical, moderately wet	27
Caetite	Tropical, arid	27
Caravelas	Tropical, wet-dry	27
Coari	Tropical, moderately wet	28
Conceicao do Araguaia	Tropical, somewhat wet	28

Corumba	Tropical, wet-dry	28
Cruzeiro du Sul	Tropical, very wet	28
Cuiaba	Tropical, wet-dry	29
Curitiba	Subtropical	29
Formosa	Tropical, somewhat wet	29
Manaus	Tropical, moderately wet	29
Natal	Tropical, somewhat wet	30
Olinda	Tropical, somewhat wet	30
Porto Alegre	Subtropical, somewhat wet	30
Porto Nacional	Tropical, somewhat wet	30
Porto Velho	Tropical, moderately wet	31
Quixeramobim	Tropical, semi-arid	31
Remanso	Tropical, very arid	31
Rio de Janeiro	Tropical, wet-dry	31
Salvador	Tropical, somewhat wet	32
Santa Cruz	Tropical, somewhat wet	32
Santarem	Tropical, moderately wet	32
Santa Vitoria do Palmar	Subtropical, somewhat wet	32
Sao Paulo	Subtropical, wet-dry	33
Turiacu	Tropical, moderately wet	33
Uapes	Tropical, very wet	33
Bulgaria		
Karnobat	Temperate, semi-arid	33
Lom	Temperate, semi-arid	34
Sofia	Temperate, semi-arid	34
Vratza	Temperate	34
Burundi		
Bujumbura	Tropical, wet-dry	34
Cambodia		
Pochentong	Tropical, wet-dry	35
Canada		
Chatham	Subtemperate	35
Edmonton	Subtemperate, semi-arid	35
Port Harrison	Polar	35
Prince George	Subtemperate	36
Regina	Subtemperate, arid	36
Sable Island	Subtemperate, somewhat wet	36
Sidney	Subtemperate, somewhat wet	36
Winnipeg	Subtemperate, semi-arid	37
(Ceylon) Sri Lanka		
Colombo	Tropical, moderately wet	37
Hambantota	Tropical, semi-arid	37
Mannar	Tropical, semi-arid	37
Trincomalee	Tropical, semi-arid	38

Chad	
Abeche	Tropical, arid 38
Am-Timan	Tropical, semi-arid 38
Ati	Tropical, semi-arid 38
Bousso	Tropical, semi-arid 39
Faya-Largeau	Tropical, very arid 39
Fort-Archambault	Tropical, somewhat wet 39
Fort-Lamy	Tropical, semi-arid 39
Mao	Tropical, arid 40
Moundou	Tropical, somewhat wet 40
Mongo	Tropical, semi-arid 40
Pala	Tropical, semi-arid 40
Taiwan (China)	
Hengchun	Tropical, moderately wet 41
Hwalien	Tropical, somewhat wet 41
Penghu	Subtropical, semi-arid 41
Taipei	Subtropical, somewhat wet 41
Congo, Republic of	
Djambala	Tropical, moderately wet 42
Dolisie	Tropical, somewhat wet 42
Gamboma	Tropical, somewhat wet 42
Impfondo	Tropical 42
Ouessou	Tropical, somewhat wet 43
Pointe-Noire	Tropical, wet-dry 43
Cyprus	
Nicosia	Subtropical, semi-arid 43
Czechoslovakia	
Brno/Turany	Subtemperate 43
Cheb	Subtemperate 44
Ostrava	Subtemperate 44
Poprad	Subtemperate 44
Praha/Ruzýne	Subtemperate 44
Sliac	Subtemperate 45
(Dahomey) Benin	
Bohicon	Tropical, semi-arid 45
Kandi	Tropical, semi-arid 45
Natitingou	Tropical, somewhat wet 45
Save	Tropical, wet-dry 46
Tchaourou	Tropical, somewhat wet 46
Denmark	
Alborg	Subtemperate 46
Dueodde	Subtemperate 46
Kobenhavn	Subtemperate 47
Thorshavn	Boreal 47

Dominican Republic			
Cindad Trujillo			
(Sto. Domingo)		Tropical, wet-dry	47
Puerto Plata		Tropical, somewhat wet	47
Ecuador			
Guayaquil		Tropical, semi-arid	48
Quito		Subtropical, somewhat wet	48
Egypt			
Alexandria		Subtropical, very arid	48
Baharia		Subtropical, very arid	48
Cairo		Subtropical, very arid	49
Dakhla		Subtropical, very arid	49
Helwan		Subtropical, very arid	49
Hurghada		Subtropical, very arid	49
Kharga		Subtropical, very arid	50
Manquabad/Asyut		Subtropical, very arid	50
Port Said		Subtropical, very arid	50
Siwa		Subtropical, very arid	50
El Salvador			
San Salvador		Tropical, moderately wet	51
Finland			
Helsinki		Subtemperate	51
Jokioinen		Boreal	51
Kajaani		Boreal	51
Luonetjarvi		Boreal	52
Turku		Subtemperate	52
Vaasa		Boreal	52
France			
Ajaccio/Campo del Oro		Temperate	52
Bordeaux/Merignac		Temperate	53
Bourges		Temperate	53
Brest/Guivapas		Temperate	53
Cayenne/Rochambeau			
Fr. Guayana		Tropical, very wet	53
Cherbourg		Temperate	54
Dijon		Temperate	54
Djibouti/Serpent			
Afars/Issas		Tropical, very arid	54
Dzaoudzi/Pamanzi			
Comoro Isl.		Tropical, semi-arid	54
Fort-de-france,			
Martinique		Tropical, wet-dry	55
Limoges		Temperate	55
Lyon/Bron		Temperate	55

Marseille/Marignane	Temperate	55
Moroni, Comoro Isls.	Tropical	56
Nancy	Subtemperate	56
Nantes	Temperate	56
Nice	Temperate	56
Nimes	57
Noumea, New Caledonia	Tropical, wet-dry	57
Paris/LeBourget	Temperate	57
Perpignan	Temperate	57
Pointe-A-Pitre/ Raizet Guad.	Tropical, wet-dry	58
Saint-Denis	Tropical, semi-arid	58
Strasbourg	Subtemperate	58
Tahiti-FAAA Fr. Polynesia	Tropical, wet-dry	58
Toulouse/Blagnac	Temperate	59
Trappes	Temperate	59
Germany		
Berlin/Tempelhof	Subtemperate	59
Brocken	Boreal	59
Emden	Subtemperate	60
Erfurt/Bindersleben	Subtemperate	60
Essen/Mulheim	Temperate	60
Fichtelberg	Boreal	60
Friedrichshafen	Subtemperate	61
Geisenheim	Subtemperate	61
Gorlitz	Subtemperate	61

SUMMARY

The 30 year climatic records (1931-1960) published by the World Meteorological Organization are used to develop and tabulate precipitation probabilities, temperature, humidity, sunshine percentage, potential evapotranspiration, potential evapotranspiration deficits at the 75 percent probability of precipitation occurrence and a moisture availability or precipitation dependability index. The relationships between available energy and adequacy of soil water from precipitation and other sources for crop production are briefly described. A classification of climate for agricultural purposes is proposed. The classification is related to agricultural production and relative needs for irrigation and drainage. Agricultural technology transfer can be facilitated by using the proposed climatic classification and by reference to the details presented in the tables. Suggestions are made for additional future country-wide or local area studies using climatic data from other sources. Basic data relationships are presented that would be useful in these studies.

INTRODUCTION

World food production depends to an important degree upon the availability of water for crop production. Crop production is principally a function of soil water availability, soil fertility and (within an optimum range) available energy. Either deficits or excesses of any of these factors result in reduced yields.

The World Meteorological Organization, WMO, (3) has published a summary of available worldwide climatic data for the 30 year period 1931-1960. This data summary provides a convenient basis for evaluating water deficits and excesses and for determining available energy for a large number of locations.

Uses of climatic data analyses are numerous and include the estimation of irrigation requirements, defining needs for drainage,

agricultural technology transfer, and other considerations that relate climate to agricultural production. Although the primary uses of the data presented here are agricultural, the information presented has many potential uses such as planning of industrial developments, transportation facilities and various other types of construction.

An explanation of the analysis procedure is included. A knowledge of this procedure can be used to extend the usefulness of the information presented and to make the studies using data from other sources.

CLIMATIC DATA ANALYSIS

Precipitation probabilities or frequency determinations can be determined by different methods. The accuracy of the analysis depends more on the length of record than on the method used. The World Meteorological Organization, WMO, (5) ranked the monthly values of total precipitation for the 30-year period 1931-1960 and published several kinds of probabilities. Probabilities of occurrence in percent were determined from the published values by using the equations:

$$F = \frac{m}{n+1} \quad (1)$$

and

$$P = 100 - 100F \quad (2)$$

in which m = the order number assigned to the data, ranked in ascending order, $m = 1, 2, \dots, n$, ($m = 1$ being the lowest recorded monthly rainfall); n = total number of data points, F = frequency number; and P = percentage probability of occurrence. The precipitation data published by WMO include the mean and the 97, 79, 60, 40, 21, and 3 percent probabilities of occurrence.

Mean monthly values of temperature, relative humidity and duration of sunshine were also taken from the WMO report and were used in the subsequent evapotranspiration analyses.

Crop water requirements are determined by climatic factors and crop characteristics, including rate and stage of growth, and by the climate. Crop water requirements can be accurately estimated from published climatic data. The most important weather elements influencing potential water use are ambient air temperature and solar radiation. The best relationships between these elements and crop water requirements exist when mean temperature is expressed in degrees Fahrenheit, TMF, and incident solar radiation, RSM, is expressed in equivalent mm of water evaporation.

When not measured directly, RSM can be calculated from tabular values of extraterrestrial radiation, RMM, in equivalent mm of water evaporation per month and from the percentage of possible sunshine, S, occurring at a given location. The conversion equation from RMM to RSM allowing for the differences in sunshine percentage can be written

$$RSM = 0.075 RMM \times S^{1/2} \quad . \quad . \quad . \quad . \quad . \quad (3)$$

Percentage of possible sunshine, S, is determined from the actual duration of sunshine in hours, SH, from day length, DL, and from the number of days in the month, DM. The equation is

$$S = 100 SH/DL \times DM \quad . \quad . \quad . \quad . \quad . \quad (4)$$

When sunshine hours are not available, S can be roughly estimated from mean monthly relative humidity, HM, using the equation

$$S = KS (100 - HM)^{1/2} \quad . \quad . \quad . \quad . \quad . \quad (5)$$

Values of the adjustment coefficient, KS, vary somewhat with climate and the manner and times of collecting the relative humidity data. A computer program has been developed to calculate values of KS for all stations having published values of SH and HM. For locations where either SH or HM data were not available, a KS value was assigned based on those values calculated in comparable areas having similar climatic conditions.

Within a range of climatic conditions including optimal conditions and extending somewhat beyond optimal, potential crop growth, yield of grain, and dry matter production tend to be linearly related to available energy, i.e. to temperature in degrees Fahrenheit times incident solar radiation. Various crops have differing optimum mean monthly temperature ranges for growth and production. Spinach, for example, grows best in the range of 10 to 16°C. Corn is a higher temperature crop and has an optimum growing range of 30 to 35°C. Additional information on crop suitability for temperature ranges and radiation is presented in Appendix I, Crop Physiological Response Characteristics.

Although optimum plant growth ranges are usually given only for temperature as a determinant variable, temperatures and incident solar radiation frequently both increase at the same time. However, the correlation between temperature and radiation is not very reliable. Since various experiments have demonstrated yields to be a function of potential evapotranspiration, it is proposed here that potential yields, within a range of favorable conditions be directly related to ETP computed from temperature in degrees Fahrenheit times incident solar radiation.

WATER AVAILABILITY AND CROP PRODUCTION

Crops have critical periods during which soil water stress produces much greater reduction in yields than is the case for other growth periods. The critical periods are usually during the flowering and fruit setting stages or the flowering and seed development periods.

Very little data are available showing the relationship between yield and moisture adequacy at seasonal water availability levels below one-third the potential crop water requirements. For most crops, one-third adequacy is close to a level below which production is no longer economical. For the range from zero

adequacy to one-third adequacy, the moisture availability yield function has not been well defined.

Yield relationships to water availability can be examined if Y is used to express a ratio of actual yield to maximum yield at full moisture adequacy under the prevailing fertility, climatic and cultural conditions and X is the ratio of actual moisture available during the crop season to the potential amount for which the yield is a maximum. Y can then be expressed as a function of X. This procedure permits yields in differing units to be analyzed on the same graph.

If moisture stress is not concentrated in a critical crop development period and moisture adequacy is maintained above about one-third ($X > 0.33$) in any period then many crops demonstrate similar production functions. Based on data from several crops grown in various countries the following equation can be written:

$$Y = 0.8X + 1.3X^2 - 1.1X^3 \quad (8)$$

The incremental change in relative yield with change in relative water availability is given by the first derivative. The equation can be written

$$dY/dX = 0.8 + 2.6X - 3.3X^2 \quad (9)$$

For the range $X = 0.086$ to $X = 0.701$, the value of dY/dX is 1.0 or greater with a maximum of 1.31 at $X = 0.394$. Above about 70 percent adequacy of water, dY/dX is less than 1.00 declining to zero as expected at full water adequacy. The greatest response of yield to water occurs at $X = 0.394$. (Due to some approximation in the equations, dY/dX is 0.1 for $X = 1.0$.)

Equation 8 is useful for comparing potential yield at one location with yields possible at another location with a different climate. It also provides a means for rapidly estimating possible increases in yield that might result from increased availability of an adequate water supply from irrigation development.

The daily data analyzed were from areas having fairly normal rainfall distributions. For arid climates with more skew in the distribution, mean precipitation for these time periods would need to be correspondingly greater in order to meet the water requirements of crops and plants.

Although the limitations described above are of significant importance, the moisture availability index, MAI, correlates reasonably well with potential production under conditions of rainfed agriculture. In most cases, correlations between MAI and average production over a period of years are quite good.

CLIMATIC CLASSIFICATION OF AREAS FOR AGRICULTURAL PRODUCTION

Current climatic classifications are not fully adequate for agricultural technology transfer. Most classifications are based primarily on temperature and precipitation. Crop production technology transfer, to be successful, should also consider radiation, sunshine hours and relative humidity.

The climate classification used in this study for technology transfer of agricultural practices for crops is general and will at times require a more refined breakdown for specific crops than that proposed here. The following climatic types are proposed.

<u>Climatic Type</u>	<u>Criteria</u>
Polar	All months below 10 degrees Celsius
Boreal	1 to 3 months above 10 degrees Celsius
Subtemperate	4 to 5 months above 10 degrees Celsius
Temperate	6 to 9 months above 10 degrees Celsius
Subtropical	10 to 12 months above 10 degrees Celsius
Tropical	All months of 17 degrees Celsius or above

In addition to the six temperature based climatic types given above, seven additional classifications are suggested, relating to adequacy or excess of precipitation for agricultural production. These classifications are as follows:

<u>Criteria</u>	<u>Climate Classification</u>	<u>Map Symbol</u>	<u>Productivity Classification</u>
All months with MAI in the range of 0.00 to 0.33	Very arid	△	Not suited for rain-fed agriculture
One or two months with MAI of 0.34 or above	Arid	□	Limited suitability for rainfed agriculture
Three or four months with MAI of 0.34 or above	Semi-arid	○	Production possible for crops requiring a 3 to 4 month growing season
Five or more consecutive months with MAI of 0.34 or above	Wet-dry	X	Production possible for crops requiring a good supply of water during 5 or more months
One or two months with MAI above 1.33	Somewhat wet	■	Natural or artificial drainage required for good production
Three to five months with MAI above 1.33	Moderately wet	●	Good drainage required for normal agricultural production
Six or more months with MAI above 1.33	Very wet	▲	Very good drainage required for normal agricultural production

All climates are easily typed using the above criteria. However, not all can be adequately described by the seven classifications related to potential productivity given above. The principal reason for assigning the types and classifications is to facilitate identification of similar growing conditions so as to make planning and technology transfer easier. It would be difficult to develop enough categories to precisely define all conditions. It is therefore proposed that the types and classifications presented above be used only as a rough guide or as an outline for further study and that the detailed climatic and index data for each station be used in the process of technology transfer and for purposes of development planning.

EXTENSION OF DATA

For some important countries climatic data are not available in the WMO publication. In some cases the data are available but are not complete enough to permit the use of the computer program developed for this study. Special studies can be made in the future for these areas using data from other sources.

Various additional published and unpublished sources of climatic data are available for extending the coverage published herein. Precipitation probability analyses require fairly long periods of record and use of monthly data from the individual years. This analysis process can be made easier by use of the tables in this paper. For climatically similar areas, the 75 percent probability of precipitation occurrence, PD, is related to mean monthly rainfall. PD can be graphed as a function of mean monthly precipitation, PM, or can be estimated by regression analyses. The relationship is normally linear and has the form

$$PD = A + B \times PM \quad . \quad . \quad . \quad . \quad . \quad . \quad (11)$$

For most climates A will vary from -10 mm to -20 mm and B from 0.70 to 0.80. For precipitation distribution patterns with exceptional skew, the slope of the line of equation 11 (the B value) can be expected to be significantly flatter. Values of PD of less than about 25 to 30 percent of the estimated value of ETP should not be used in the graphical or regression analyses for the purpose of determining the appropriate values of A and B.

Wernstedt (4) gives long term mean monthly precipitation data and mean temperatures for world wide coverage. With use of long term monthly precipitation means, equations (Eq. 11) derived from the 30 year records can be expected to provide the 75 percent probability of occurrence with as good or better accuracy than probabilities calculated directly from significantly shorter records.

World wide potential evapotranspiration can be estimated from the temperature data provided by Wernstedt (4) and from radiation provided by Loff, Duffie, and Smith (3) or from radiation estimated from relative humidity by using equations 3 and 5. The KS values for use in equation 5 can be calculated from data in the above tables by selecting similar climates. Equation 5 produces satisfactory results for most interior or continental types of climate. In coastal areas, values of KS can be quite variable.

Temperature measurements are not available at all locations where precipitation records are available. Data are, however, generally adequate to provide a reasonably good indication of the change in temperature with elevation for each latitude. These relationships then can be used to estimate missing temperature data.

By using climatic data from various in-country sources combined with the above referenced climatic atlases, it is possible to make a fairly complete evaluation of climatic conditions in most countries. Such analyses are of particular value in estimating excesses and deficits of water for agricultural production.

One example of possible use of the MAI is related to prediction of drainage needs. For climates with one or two or more months with MAI above 1.33, surface drainage has generally been found to produce large benefits on slopes up to 2 percent and irregular slopes up to 3 percent. Subsurface drainage may be required if MAI is above 1.1 for a period of some months.

Once complete, country wide or area wide studies will have numerous uses in planning agricultural programs for irrigation, for drainage, and for most aspects of agricultural technology transfer.

TABULAR PRESENTATION

For those locations where appropriate data are presented by the WMO publication, (5) tables were prepared presenting the following information:

<u>Heading</u>	<u>Description</u>
PM	Mean monthly precipitation in mm
PMI	Minimum monthly recorded precipitation (30 years)
P79	The 79 percent probability of precipitation occurrence
P60	The 60 percent probability of precipitation occurrence
PMX	Maximum monthly recorded precipitation
TMC	Mean monthly temperature in degrees Celsius
HM	Mean monthly percent relative humidity
HMC	Percent relative humidity calculated from sunshine (Eq. 5)
S	Percentage of possible sunshine
SC	Percentage of sunshine calculated from HM (Eq. 5)
PD	Dependable precipitation - the 75 percent probability of precipitation occurrence
ETP	Potential evapotranspiration (Eq. 6)
ETDF	Potential evapotranspiration deficit (ETP - PD)
MAI	Moisture availability index (PD/ETP) (Eq. 7)

For each location the station name, elevation in meters, latitude, longitude and the annual average KS value are printed at the top of the table.

The relationships presented have been tested using world wide data. Equation 3 was evaluated at 68 world wide locations having 5 or more years of measured radiation data. Equation 6 appears to provide a better fit of world wide lysimeter data than other commonly used evapotranspiration formulas including the 18 methods evaluated by the Technical Committee on Irrigation Water Requirements of the Irrigation and Drainage Division, American Society of Civil Engineers (1).

Potential evapotranspiration computed by Equation 6 does not account for the norm of reduction in evapotranspiration due to plant maturity, to winter kill or frost damage or for the lower potential ET that occurs at extremely high temperatures. For the

lower range of monthly temperatures, below 10°C, there is also a reduction in accuracy. An arbitrary lower limit of 3°C for use of Equation 6 was selected and ETP was arbitrarily assigned a value of zero for mean temperatures below 3°C. This, however, is somewhat misleading since significant evaporation and some transpiration can take place even though mean monthly temperatures are below 0°C. For this reason total annual potential evapotranspiration is not shown for those locations having mean monthly temperatures below 3°C.

ACKNOWLEDGMENTS

The work presented herein was financed in part by the Agency for International Development through its contract AID/ta-c-1103 with Utah State University. The data processing and computer programming were performed by Pi-Chien Chi and Karl Hancock, Research Assistants. APPENDIX I - CROP PHYSIOLOGICAL RESPONSE CHARACTERISTICS

Sarraff and Kowal¹ divided crops into three groups depending upon crop physiological characteristics. An exact definition of the optimum temperatures and radiation conditions for individual crops is difficult because of the numerous different climatic ranges given in various texts and plant physiology handbooks. The characteristics defined by Sarraff and Kowal should be considered as provisional and subject to possible future refinement. They divided crops into three groups having similar physiological requirements.

Group I crops include African spinach, the millets, tef, sorghum, corn, sugar cane, and some of the forage crops.

Group II crops include peas, buckwheat, broad beans, French beans, cabbage, tomatoes, flax, safflower, potato, barley, wheat, rye, oats, onions, lentiles, sugar beets, pyrethrum, some perennial grasses, olives, grapes, date palm and figs.

Group III crops include cowpea, sesame, tobacco, peanuts, rice, soybean, kenaf, sunflower, sweet potato, jute, castor beans, roselle, cotton, sisal, taro, pineapple, yam, citrus, papaya, banana, casava, cacao, coffee, cola, coconut, rubber, and palm oil.

The optimum temperatures and the range of acceptable temperatures for the three crop groups are given as follows:

Crop Group	Optimum Temperatures	Acceptable Temperature Range
I	30 - 35 degrees	25 - 45 degrees
II	15 - 20 degrees	5 - 30 degrees
III	25 - 30 degrees	20 - 35 degrees

¹Sarraff, S., and J. Kowal, "Provisional Groupings of Main Crops in Respect of their Eco-Physiological Responses and Characteristics with Draft, Soil and Land Suitability Criterion," FAO, Rome, Unpublished.

Crops in Group I are high users of available energy increasing in growth rates and yield with increasing radiation up to full sunlight. Crops in Group II have much lower requirements for radiation. Light saturation for maximum photosynthesis occurs at fairly low levels. Group III crops are intermediate in their requirements for light and radiant energy.

The crops from Group I should, for best results, be produced in areas having near the optimum monthly temperatures, long days during the growing season and high percentages of possible sunshine. The crops in Group I vary in length of growing period from as short as 45 to 55 days to annual growing seasons. Moisture availability during the growing period should be carefully evaluated in order to determine the probabilities of the level of moisture adequacy required for high yield. Periods of excess water should be noted and where necessary, good drainage should be provided prior to attempts at commercial scale planting.
