## A.1 Overview

RAMS baseline studies (see list of RAMS studies in Introduction) have been based on three main sources: previous reports, field observations and surveys. From September 1979 to November 1980, RAMS organized a series of surveys as a means of gathering new information where previous data did not exist, updating previous research where data were either incomplete or outdated, and testing on a wider scale field and on-site observations. In sum, the surveys were to constitute one part of the data base on which sectoral analyses were to be made.

Four principal categories of surveys were conceived, some with several components:

### 1. Household Revenue/Consumption/Nutrition consisting of

- Revenue
- Consumption
- Nutrition
- Food Preference
- Market Prices and Child Nutrition

### 2. Labor and Manpower including

- Employment (urban and rural)
- Business establishments
- Non-structured sector

### 3. Professional Skills for

- Cultivators
- Herders
- Fishermen
- Craftsman
- Women
- Shopkeepers

### 4. Rural Production divided between

- Crop by land form and
- Livestock by animal herd

## 1.1 Preparation of Survey Questionnaire

Analysis plans and questionnaires were formulated by the various research units of RAMS, to some extent in collaboration with certain government services: Agriculture, Livestock, Social Welfare, Statistics.

Questionnaires were field-tested and revised, and a preliminary set was established for a training seminar. An instruction manual for enumerators was also devised with a general explanation of survey techniques and instructions and a sampling procedure for each questionnaire.

## 1.2 The Sample

The survey was based on a two-stage sample. The first stage consisted of a random sample of 45 villages (primary units) based on the list of more than 2,300 villages compiled by the National Census Bureau (BCR) and used for the 1977 national census. These villages covered only the sedentary population.

The primary units were stratified by agro-ecological zones and organized by population size.

The second stage consisted of drawing individuals or households (secondary units) within the sample villages by methods adapted to each questionnaire (see sections below for description). The random selection was considered representative because every statistical unit, primary and secondary, had an equal chance of being selected.

### 1.2.1 Village Stratification and Selection

Five basic steps were followed in the village selection process:

1. Villages in the rural sector were arranged into 5 agro-ecological zones (AEZ), as defined by RAMS in the third quarter of 1979.
2. Villages were listed on cards by agro-ecological zone and therein by population size with the smallest villages first.
3. A "sampling interval" of 1,000 was retained.
4. A number between 1 and the total number of villages was selected, representing the first village in the sample. This card was withdrawn from the pack. Beginning with this village, the population was totalled until the village that had the 1,000th person was reached. The village card was pulled. This procedure was repeated until villages had been selected for each 1,000th person in the zone. These villages constituted the "pre-selected list".
5. Villages were randomly selected from the pre-selected list for each zone in proportion to the total number of villages in the zone. Due to a shortage of vehicles and other logistical problems faced by RAMS, the resulting 45 villages were reduced to 32 by random elimination. Later, in April 1980, well after the survey had been completed, the agro-ecological zones were revised.

The stratification was nevertheless retained, for it was determined that both the old and modified AEZ showed sufficient internal homogeneity and had enough differences among them to make the stratification exercise meaningful.<sup>(1)</sup>

---

(1) As the project progressed, it became apparent that for planning purposes stratification could have been more meaningful had it been conducted along Departmental and Regional lines, since the Administrative Region, and not the agro-ecological zone, is the basic planning unit.

While zonal conclusions/extrapolations were possible, the small number of sample villages accounted for in each zone rendered these tenuous. On a national scale, however, it was possible to locate both structure and tendencies within the base population.

Village Sample by Revised Agro-Ecological Zone and Population Size

Village Population	Zones						Total
	<u>1</u>	<u>2</u>	<u>3</u>	<u>4</u>	<u>5</u>	<u>6</u>

1.2.2 Selection of Secondary Units

Each questionnaire-type had its own manner of selecting the households, individuals or consumption units within the villages. These are discussed in the respective questionnaire sections.

Before the survey began, a RAMS reconnaissance team visited each locality in order to sensitize the population to the purpose of the survey and to establish the list of households or individuals to be surveyed.

Two adjustments resulted from this exercise. One village in the Hodh Charqui could not be located at the position given by the census. However, a village of the same name, with a roughly similar population and belonging to the same zone was found some 80 km away.<sup>(2)</sup> This village was retained. In the Gorgol, one village was logistically inaccessible. It was decided to apportion the scheduled secondary units between two neighboring survey villages, one in the same AEZ, the other in an adjacent zone.

1.3 Enumerators

Several sources were tapped to recruit enumerators: various government services (Agriculture, Labor, etc...), secondary level home-economics students at the ENECOFAS, and former enumerators from the 1977 census and from the ONVS socio-economic survey. Of 70 original participants in the first training seminar, 54 were selected on the basis of language requirements and performance in pilot tests.

One enumerator was expected to complete an average of 3 questionnaires per day, although the actual number varied according to the type of survey conducted in each locality.

The following table and map illustrate the distribution of questionnaire types by villages and by agro-ecological zone.

(2) The census village files have not been systematically updated. Not infrequently, old 'villages' (see definition in Section 2.3) have subsequently disappeared, and new ones created.

## A.2 Household Revenue/Consumption/Nutrition (R/C/N) Survey

The objective of the survey was to collect data on income structures, modes of food and non-food consumption and budget patterns among the rural population. Additional information sought concerned market price fluctuations, nutritional levels and foodstuff demand.

4-

Data gathered from this survey are analyzed in the following RAMS reports: Rural Household Consumption (AS-5), Rural Income (AS-6) and Nutrition (FSI-1) (For summary tables consult Chapter 4 of this report.)

### 2.1 Localities

For the Revenue/Consumption/Nutrition survey the initial group of 32 villages had to be reduced in half; thus, one out of 2 villages was randomly selected. This procedure was necessary due to the difficult nature of the survey. It required women enumerators in the four language groups (Hassaniya Wolof, Soninka, Poular) and it required 4 separate observations spread over the course of a year.

### 2.2 Secondary Units: Budgetary Units

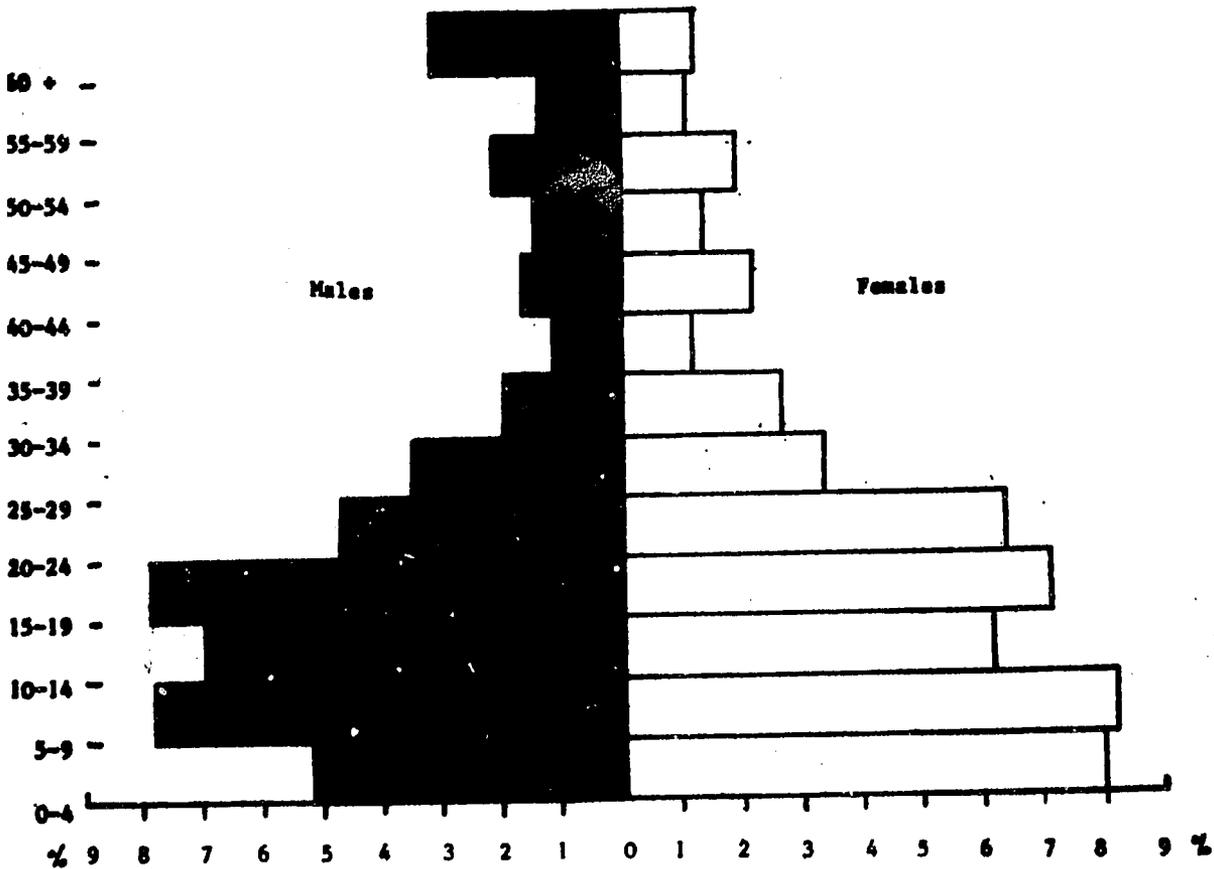

Sixty four Budgetary Units (BU) were sampled recurrently during the course of a year which represented a sampling of approximately 1 in 1000 of the rural BU's.

A minimum of 2 units were surveyed per village. In villages with large populations (over 1000), a proportionally greater number of consumption units were polled (See Exhibit A-1). Individual units were selected as follows: With the oldest mosque of the village to his back and facing north, the supervisor would walk five units north (blocks in towns, living units in villages), turn right and select the fifth unit on the right. Next, he would walk south and select the seventh unit on the right. Next, the supervisor turned west and selected the ninth unit on the right. This expanding spiral pattern of selection continued until the required number of households had been selected. In larger places like Kaedi, the sampling procedure was used on a ward basis.

Exhibit A-2 reconstructs the age pyramid of the sample population. It compares favorably with the national age distribution found in Chapter 2.

Exhibit A-2

Age Distribution of Individuals in RAMS  
Revenue/Consumption/Nutrition Household Survey  
(Sedentary and Nomad Population)

Total number of Males - 392  
 Females - 409

Total number of households - 76  
 Average size of households - 10.6

Source: RAMS 1979/1980 Revenue/Consumption/Nutrition Survey, 4th Observation including nomads.

### 2.3 Survey Organization

In order to gauge fluctuations in consumption and revenue patterns, four observations at approximately 3-month intervals (December 1979; March/June/July, and October/November 1980) were carried out within the same consumption units.

The enumerator spent 6 consecutive days per observation with each unit, allowing for a total of 24 days observation period during the course of the year.

At each observation, PAMS' enumerators found a small percentage (3 to 5 %) of budgetary units which had either moved to another location or had consolidated into larger units. In the former case, if the unit had moved more than 10 km, a replacement household was located by respecting size, ethnic grouping and type of housing. The supervisor located a surrogate by continuing on an easterly course until the unit with appropriate characteristics was selected.

In the second case, when the unit either increased considerably in size (due to the arrivals of extended family during the dry season) or decreased because of members moving on or getting married, no effort was made to find surrogates.

A nomad component was added to the fourth observation, surveying 34 revenue units and 12 consumption units in the Tagant, Adrar, Assaba and Hodh Charqui regions.

Encampments were selected randomly from a compass reading starting from a pre-determined site in each region. Each area selected represented a distinct type of nomadism based on predominant herd composition. Adrar for camel herding (long distance nomadism), Tagant and Assaba for goat herding (short distance nomadism) and the Hodh for cattle herding (medium distance nomadism).

### 2.4 The Questionnaires

The Revenue/Consumption/Nutrition Survey contained 5 essential components and supplementary sections. The main parts included:

1. Human Description of the Budgetary Unit (Exhibit A-4, Identification de l'Unité Budgetaire).
2. Meal Participants List (Exhibit A-5, Liste des Commensaux).
3. A Daily Acquisition Record (Exhibits A-6a through A-6f, Relevé Journalière des Acquisitions).
4. Meal Preparation List (Exhibit A-7, Repas Préparés dans la Concession).
5. Income (Exhibits A-8a through A-8f, Revenues des Ménages).

The three supplements included:

6. Food Preference Questionnaire (Exhibits A-9a & A-9b, Habitude Alimentaire).

7. Market-Price Survey (Same as Exhibit A-6, Enquête Marché).
8. Child Nutritional Level (Exhibit A-10a through A-10c, Fiche Alimentation des Jeunes Enfants).

A copy of each is included at the end of this section. A brief description follows:

1. A description of the Budgetary Unit lists in logical order the relatives who are dependents of the unit head. This situates members by age, sex, ethnic grouping, principal and secondary activity, and presence or absence at time of survey.
2. A meal-participant list required the name of each of the unit's members 2 years and older, plus visitors, and a place to mark their presence or absence at each of the 18 meals (morning, noon and evening) served during the six-day observation period. Nomads usually consumed one meal per day. Figures were adjusted accordingly. The purpose of this list was to determine per capita consumption and nutritional intake. The number of individuals participating in each meal varied daily and varied at each passage. Except for special occasions, there were fewer meal participants than members of the Budgetary Unit. Exhibit A-3 shows the variations in the number of meal participants and the size of the Budgetary Unit by ethnic grouping.
3. A Daily Acquisition Record consisting of 6 pages listed all food and non-food items generally consumed, their mode of acquisition (purchased, traded, received as gifts or home-produced), the quantity acquired, and the total price. Six sets of the list accompanied each questionnaire, one each for each day of observation. Enumerators were equipped with light-weight Roman scales for weighing. For goods obtained through non-monetary operations, a marked price study (see below) allowed enumerators to calculate a unit price. The Acquisition Record adequately gauged the flow of consumables obtained on a daily basis. However, it tends to seriously bias one-time or episodic expenses such as rent, transport, taxes, luxury items and clothing, for which a 24-day observation period is too short. Since the nomad component was conducted but once, expenditures were obtained on a recapitulative basis, e.g., number of veils purchased since the last Moslem New Year. This produced results for major items but is inconclusive for less significant goods.
4. The Meal Preparation List accounted for each meal during the 6-day observation period and the nutritional elements which went into cooking pots. The enumerator had to weigh each product, describe its form at the time of weighing (e.g., grain with husk, goat meat with bone) and define its mode of acquisition. This exercise required the presence of the enumerator at each meal preparation. After each meal, left-overs were measured and recorded.

Other food items, such as zrig (a form of diluted and sweetened sour milk) and tea consumed at irregular intervals, were not recorded on this form. Frequency and approximate amounts consumed were entered into an Observation Notebook which was kept by each enumerator. These were compiled and used by the RAMS nutritionist to estimate average per unit consumption of these products.

5. The Revenue Survey required a separate questionnaire specifically designed to derive income data for all major rural occupations. By inference, the respondent was asked the occasion for selling agricultural products and the frequency. For those with livestock, a recapitulative table was used to establish the size of the herd and the frequency of off-take. Respondents were questioned on barter habits and savings techniques. While this may have been the most delicate part of the survey (parts were addressed to the women of the Budgetary Unit, parts to the men), a cross-verification of information and data obtained during successive observations permitted the reconstruction of revenue per unit compatible with expenditures. Sedentary and nomad revenue patterns are summarized in Chapter 4 of this report.
6. The Food Preference Questionnaire was a separate sheet whose objective was to survey the reasons and motivations for consuming certain products. Respondents 15 years and older in the BU were asked to choose products they desired to consume more of, if they had the income or if the product was more readily available. See Chapter 4 for the findings of this component.
7. Market Price Survey. For each of the villages a market survey was conducted, using a set of Daily Acquisition Records. The enumerator used the village market (or small shops) as reference points for current prices. Each enumerator conducted the survey during the 2nd, 3rd and 4th observations.
8. Child Nutritional Level. A separate three page questionnaire directed to mothers of children three years and under. Its objective was to help determine age of weaning, types of supplementary foods and frequency of feeding. The questionnaire was repeated during the second and third observations.
9. Others. Several additional components were included in the Household Revenue/Consumption/Nutrition Survey. These include data on occupational changes, on individual displacements (temporary and permanent), and on the nature of the rural habitat. The latter two are summarized in Chapter 4. Questionnaires are available at the Direction des Etudes et Programmation of the Ministry of Economy and Finance and at the USAID Nouakchott library.

Note: The questionnaires below are reproduced in their original French form.

REVENUS DES MENAGES

Chef de Ménage \_\_\_\_\_

Village \_\_\_\_\_

Région \_\_\_\_\_

ZAE \_\_\_\_\_

Enquêteur \_\_\_\_\_

Visa du Contrôleur \_\_\_\_\_

Le questionnaire a 8 Sujets Principaux

Cette partie intéresse les cultivateurs, les éleveurs et autres. Il a pour objectif de reconstituer les revenus des unités budgétaires à travers les produits vendus, leur quantité et leur prix unitaire.

- Pour les agriculteurs ou cultivateurs les produits peuvent être mil, sorgho, maïs, ... Il suffit de compléter le tableau;
- Pour les éleveurs, le questionnaire permet de reconstituer les revenus à travers les ventes d'animaux par espèce et aussi les produits dérivés depuis une date déterminée (en général depuis le Ramadan).

Au No. 3 : Le questionnaire interroge si les membres de l'unité budgétaire ont des revenus secondaires comme: salariés, pêcheurs, commerçants, transferts d'argent;

Au No. 4 : Le questionnaire essaie d'estimer le revenu des unités budgétaires à travers le troc et d'en estimer la valeur;

Au No. 5 : Le questionnaire essaie d'estimer le revenu des unités budgétaires par les opérations en nature;

Au No. 6 : Le questionnaire interroge si l'unité budgétaire ne fait pas d'épargne à travers les bijoux, les dépenses de mariage, achat de radio, tente, nattes, etc.

1. Quelles sont les raisons essentielles pour lesquelles vous vendez une grande partie de  votre récolte ? (Crochez a, b, c ou d)

a)  Fêtes? Pour les    fêtes de l'année.

b)  Mariages? Avez-vous eu depuis le dernier Ramadan?  Oui  Non

c)  Autres raisons essentielles? Préciser

d)  Ne vend jamais.

4. Faites-vous du troc?  Oui  Non

Entre quoi et quoi? \_\_\_\_\_ et \_\_\_\_\_

Combien de fois par an? \_\_\_\_\_

4.2 Pouvez-vous évaluer la valeur du troc? \_\_\_\_\_ (mois/an)  
(Rayez un)

5. Recevez-vous des produits pour motifs de cadeau ou de charité?

Oui  Non

Si oui, lesquelles?

Quantité	Valeur	Nombre de fois/jour/mois/an (Rayez un)

6. Demander à l'homme (sans la présence de la femme)

6.1 Avez-vous acheter des bijoux depuis le dernier Ramadan?  Oui  Non

Si oui, pour combien? \_\_\_\_\_ UM

6.2 Demander à la femme (sans la présence de l'homme)

6.2.2 Portez-vous des bijoux?  Oui  Non

Si oui, donner la valeur des bijoux. \_\_\_\_\_ UM

6.2.3 Recevez-vous des bijoux depuis le dernier Ramadan?  Oui  Non

Si oui, combien de fois? \_\_\_\_\_ Valeur totale \_\_\_\_\_ UM

7. Combien avez-vous dépensé pour votre mariage? \_\_\_\_\_ UM

(quelle année? \_\_\_\_\_)

Combien avez-vous dépensé pour le mariage de:

vos fils? \_\_\_\_\_ UM (quelle année? \_\_\_\_\_)

vos filles? \_\_\_\_\_ UM (quelle année? \_\_\_\_\_)

8. Avez-vous acheter des objets de valeur (bicyclette, radio, voile, tente) depuis le dernier Ramadan?  Oui  Non

Si oui, quoi? \_\_\_\_\_

Combien? \_\_\_\_\_ UM

### 1.3 Labor and Manpower Survey

#### 3.1 Employment

The survey collected information from four categories of workers:

- self-employed
- non-paid family workers
- salaried non-domestic workers
- unemployed workers.

The major data elements collected from each worker were:

- occupational history
- secondary economic activity
- number of job changes in the last 5 years
- urban/rural job 5 years ago
- urban/rural job now.

RAMS reports which analyze the data gathered in this survey are: Employment Situation (FS 2-1) and the Employment Supplement (FS 2-2). For summary tables consult Chapter 3, Human Resources, of this report.

##### 3.1.1 Localities

Seven urban centers, Zourate, Rosso, Nouakchott, Atar, Akjoujt, Kaedi and Nouadhibou, were surveyed, in addition to the 32 rural villages, this in recognition of the importance of the urban labor market in relation to rural/urban migration.

##### 3.1.2 Secondary Units: Households

This survey consisted of a random sampling of 800 households, of which 132 were in the rural sector and 668 in urban centers.

The selection process in rural villages was similar to that used in the Revenue/Consumption/Nutrition surveys, using the locality's mosque as a point of departure (see Section 2.2 of this Annex).

For Nouakchott. The first step was to number each house, except for the shanty area. Maps for central Nouakchott were obtained from the Division of Statistics at the Ministry of Economy and Finance and from SONELEC (the national water and electricity distribution company). Once the houses were numbered, a random sample of 240 houses was taken of the central portion of the city. When a house was found to contain more than one household, the first household on the right of the entrance was selected for the study.

For the "external portion", defined as areas that contain residential tents and shanties not recorded on available maps, a different technique was used. The population was estimated to be half as large as the population in central Nouakchott, so the sample size was set at 120.

Households were selected for the sample in the external portion of the city in the following manner:

All water distribution points were located. In Nouakchott, the survey supervisor stood at each water point with his back towards the central mosque. He walked forward five houses and selected the fifth house on the right until he reached the desert. Next, he returned to the starting point and walked towards the central mosque, again selecting every fifth house on the right until he reached the edge of town. Next, he returned to the water distribution point, again with his back to the central mosque in the city, turned 90 degrees to the left and repeated the same procedure. If he had not selected 10 houses when he reached the desert, he returned and continued in a straight line in the opposite direction until a total of 10 houses were selected.

For Nouadhibou, maps existed for the central permanent portion of the town and for the mining company section referred to as Cansado, located about 10 kilometers to the south. Houses were numbered in Cansado and a random sample of 32 households was selected. The remaining portions of Nouadhibou, mapped and unmapped, were divided into seven neighborhoods. Judgements were made about the relative size of the seven neighborhoods. These proportions were used to distribute the remaining sample of 88 households.

Central points such as schools, major stores and mosques were selected and used as the starting location for the selection of households. The method of household selection was the same used in Nouakchott.

For all of the other urban towns in Mauritania, that is, Atar, Rosso, Kaedi, Akjoujt and Zouerate, the same system was used.

### 3.1.3 Questionnaire

A sample copy of the questionnaire is included in the Employment Supplement Report (FS 2-2).

### 3.2 Employment in Business Establishments

The survey was a census of the 199 businesses employing 5 or more persons in the six largest cities and towns in Mauritania: Nouakchott, Nouadhibou, Zouerate, Rosso, Kaedi and Kiffa.

Information collected included:

- Number of firms by size of labor force (1-14, 15-49, 50-99, and 100+ employees)
- Employment by sector/size/% male/% Mauritanian/% other foreigner
- Salaries by occupational group and grade
- Apprentices by trade
- Actual education, training and experience by occupational group
- Total average turn-over of workers
- Forecast of manpower shortage by occupational group
- Minimum desirable education, training and experience by occupational group
- Means of recruitment by occupational group

The Ministry of Employment & Professional Training's role in the Establishment Survey was to supply labor inspectors who assisted with the distribution and collection of the questionnaires.

### 3.2.1 Survey Organization

The survey was conducted during the period March through June 1980. Questionnaire distribution and responses are summarized below:

	Number of Questionnaires Distributed	Number of Questionnaires Returned	Rate of Response	Number of Partial Responses <sup>a)</sup>	Number of Non-Responses
Nouakchott	144	100	69%	36	8
Nouadhibou	29	29	100%		
Zouerate	13	13	100%		
Rosso	4	4	100%		
Kaedi	7	7	100%		
Kiffa	2	2	100%		
<b>Total</b>	<b>199</b>	<b>155</b>	<b>78%</b>	<b>36</b>	<b>8</b>

a) Employers refusing to complete the questionnaire but submitting a list of their employees by occupation.

### 3.3 The Non-Structured Sector Survey

This survey consisted of a census of all business establishments in Nouakchott employing less than five workers. It was undertaken in mid-1980.

A total of 11,677 establishments were identified, of which 80% were located in the central portion of town and the rest in the shanty and tent peripheries.

#### 3.3.1 Methodology

Members of the study team drove or walked through all streets in Nouakchott listing the establishments they saw that might be considered as part of the non-structured sector. The economic activity of each establishment was recorded.

Interviews were not conducted, however, with members of these establishments. Consequently, the specific number of employees in each is unknown; some may actually have had more than five; however, no establishment was counted in both this survey and the Establishment Survey.

Data gathered in this survey are analyzed in RAMS' Employment Situation Report (FS 2-1). A summary table is in Chapter 3, Human Resources, of this report.

### A.4 Professional Skills Survey

The 1979 RAMS skills survey gathered data to help develop a strategy to improve and create employment in towns and rural areas. Most employment generation efforts to date have centered on the urban modern sector.

51 X

Consequently, there is a lack of data on the traditional rural sector, particularly as concerns types of skills needed to increase productivity and expand employment.

The survey consisted of six questionnaires designed to assess skills and qualifications of the following categories:

<u>Questionnaire</u>	<u>Numbers in sample</u>
Herdsmen	107
Cultivators	389
Shopkeepers	62
Craftsmen	181
Fishermen	22
Women	318
	<u>1,079</u>

Data elements gathered for all groups (except women) were:

- Occupational shifts of father/son
- Time in occupation
- Functional description of occupation
- Manpower employed
- Duration of apprenticeship without pay
- Number of apprentices trained
- Number and reasons for trainee turn-over
- Business/work-related difficulties
- How knowledge was acquired
- Secondary activities
  - why practiced
  - how learned

Data elements analyzed for women were:

- Number of children by age/sex
- Responsibility for childrens' education
- Types of schools
- Family education
- Secondary activity
- Commercial activity
- Acquisition of trade

Information gathered in this survey is analyzed in the report on Non-formal Education (53-3). For summary profile tables, consult Chapter 3, Human Resources, of this report.

#### 4.1 Localities

For this survey a purposeful sample of 7 villages was added to the original 32, since not all the professions and types of agriculture practiced in Mauritania were sufficiently represented in the original group. Specifically the original list lacked representation in the number of workers in the following professions:

- Craftsmen
  - metal
  - leather
  - textile
- Traders
- Cultivators practicing
  - oasis farming
  - irrigated agriculture

The seven villages were selected from a list of ninety-five with a population of 1,000 or more, whose professional population equaled or exceeded the regional average for the five professional groups under study and whose type of agriculture was insufficiently represented in the earlier sample.

The increase in the sample is not considered to have significantly disturbed the randomness of the total sample. Moreover, the skills assessment was intended to provide primarily indicative trends, useful for follow-up studies.

Exhibit A.1 lists the sample villages, their 1977 population and the distribution of questionnaires by type.

#### 4.2 Secondary Units: Individuals

It was decided that approximately 1,000 individuals could be sampled within the primary units retained for this survey.

Using 1977 census village figures on total individuals in the five professional groups, 867 interviews were distributed in proportion to the size of each group in the primary units.<sup>(3)</sup>

In each village the enumerator conducted an interview with the wife of every third respondent. Thus, a total of 1,079 questionnaires was processed.

Specific individuals were selected as follows: the central village authority (chief or elder) was asked to help establish a list of individuals using criteria such as

- Members of existing cooperatives
- Beneficiaries of a food aid program
- Members of a professional group.

From this list names were taken randomly to obtain the appropriate number of persons in each group.

The households interviewed for the Rural Production survey were randomly selected from the Professional Skills listings in accordance with the number of Production Questionnaires required from each village. Under these circumstances, some individuals were surveyed twice in a locality, once as individual professionals, and secondly as members of the Production Unit.

---

(3) A total of 119 individuals either could not be reached or provided insufficient information.

### 4.3 The Questionnaires

Copies of the six skills questionnaires are not reproduced in the Annex due to their size. Bound copies are available at the Ministry of Economy and Finance Documentation Center and at the AID Library in Nouakchott.

### A.5 Production Survey

The objective of this survey was to gather data on modes of crop and animal production. Given the multi-occupational nature of the rural Mauritanian, it was decided at the outset to combine, in one questionnaire, sections on the five basic types of crop agriculture (Oualo, Fondé, irrigated, recessional, oasi and every type of animal farming -- cattle, camel, sheep and goat, donkey and poultry. This explains in part the complexity of the questionnaire. No single production area was found to practice all types of agriculture, although nearly 50% of the surveyed units practiced combined crop farming with some form of animal herding.

Data elements analyzed for all groups included a composite of the production unit. For animal production, key elements for each type of herd included:

- size, composition and movement
- production
- auto-consumption
- marketing
- modes and costs of herd up-keep

For crop production, key elements for each type included:

- surface cultivated and method of cultivation
- investment and tools
- labor use and costs
- auto-consumption and marketing

Information gathered in this survey is analyzed in all sub-sectorial studies, except the Fisheries (SSI-4). Unfortunately, the reliability of some responses was insufficient. It was evident that there had been inadequate questionnaire preparation and testing, and some questions were not well suited for the single observation model adopted.

### 5.1 Localities

The Rural Production survey was conducted in each of the 32 sample villages. In order to obtain better representation in oasis production, two villages in the Adrar, Atar and Ksar Torchane, were added. These two villages figured into the sample of the Professional Skills survey.

### 5.2 Secondary Units: Production Units

RAMS decided that 6 production units (PU) could be interviewed within each of the 34 sample villages.

An additional 63 units were surveyed in 8 of the largest towns, giving a total of 267 surveyed production units. The distribution of PUs are shown in Exhibit A.1 of the Annex.

Production Units were selected from the list of individuals established for the Professional Skills survey (see Section 3, Professional Skills, of this Annex). The number of individuals in the Skills survey was divided by six. The resulting quotient was used to count off every n-th individual. The PU of which that person was a member became the selected secondary unit.

#### A.6 General Remarks

1. On the whole, RAMS met little resistance by local authorities to having their area surveyed. In fact, the opposite was often the case; a village tended to feel honored at being especially selected for attention by "Nouakchott". On occasion, the village head personally demanded that his family be included as a condition for undertaking a survey in his area. In certain isolated areas, the nutrition surveyors tended to be associated with anticipated food distribution programs. This perception may have caused a few households to modify their consumption downwards during the survey period.

2. The generally positive attitude towards participation in surveys was evident at the individual level as well, once people recognized their selection was entirely on the random basis. This is a traditionally familiar concept.

3. Nomads, however, tended to be considerably more uncertain, even apprehensive, their experience with outside elements having been generally negative. Accurate information on revenue and wealth were markedly more difficult to obtain.

4. It should be emphasized that all of the findings of the survey should be considered as indicative, and subject to further detailed investigations.

## 0.1 General Overview

A major task of the Rural Assessment and Manpower Surveys (RAMS) project was to produce baseline studies of the rural sector and other functional areas as tools for development planning. Compared to many other developing countries, reference material on Mauritania may seem somewhat limited. In RAMS' experience, however, a good deal of information was uncovered. It was more often than not laborious to track down, incomplete and, for lack of critical source reference, of unknown accuracy and relevancy.

This Compendium has a twofold purpose: (i) to distill the mass of data collected in the course of RAMS' research into a succinct and presentable format for the use of researchers, technicians, planners and students alike, and; (ii) to lead readers who may wish to locate in-depth studies on subjects briefly treated herein by providing annotated bibliographies for each section.

Since RAMS' focus was on the rural sector, so is the content of this Compendium. There is no pretense, however, that the material herein provided is complete. It is hoped, therefore, that the process of data collection and assimilation will be continued.

0.1

Selected Annotated ReferencesMauritania

Analyse de Situation de la Région du Tagant (RIM), avec Attention Particulière aux Aspects Socio-Economiques, Seminar für Landwirtschaftliche Entwicklung, Tech. Univ. Berlin, 1979 (354 pp.)

Area study on the Tagant region and parts of the Brakna and Assaba regions. Covers history, agricultural production, social analysis, current trends, constraints and strengths, as well as development possibilities and strategies. Annexed are case studies and miniature snapshots of 14 localities. Supplement to the master plan of the Tagant.

Atlas de la République Islamique de Mauritanie, Edition Jeune Afrique, 1977 (64 pp.).

A basic introductory synthesis. Contains maps and a page or two of text on topography, geology, hydrogeology, climate, soils, vegetation, history, ethnic groups, population, agriculture, livestock, industry, towns, education, health and trade. Geographical aspects are the best.

Bibliographie Mauritanie, B.V. Maele, Vol. 1, Ministry of Information and Culture/Ministry of Planning and Research, ed. prov., 1971 (108 pp.)

Covers some 1,400 titles grouped under the headings of social sciences, Islam, archeology and pre-colonial history, later history and contact with Europeans, descriptive geography and general (excludes technical studies).

The Economy of Mauritania, R.M. Westebbe, Praeger Special Studies, New York, 1977 (171 pp.)

Now dated but presents a good summary of the Mauritanian economy and its structure (which remains essentially unchanged) up to 1970 from a World Bank perspective. Summarizes then available statistics.

L'Elevage au Sud-Est Mauritanien, Pâturage Situation Actuelle, Programme de Développement, Fredet et al, SCET, FED, 1976. (unnumbered)

Four volume study (including Annex and Development Programs) of livestock herding in the southeast of the country. Includes inventory of physical resources, pasture carrying-capacity, animal production, consumption. Topographic maps 1:200,000.

The Guidimaka Region of Mauritania - A Critical Analysis Leading to a Development Project, War on Want, London, 1977 (166 pp.)

A thorough, well-written synthesis of the social and natural resources of the Soninke-inhabited region. Particularly strong on the relation between geographic environment and modes of production.

Good historical chronology.

Majabat al-Koubra-Contribution à l'Etude de l' "Empty Quarter" Ouest Saharien, Th. Monod, Mem. IFAN no. 52, Dakar 1958 (406 pp.)

Geographical study in the grand classical tradition, summarizing just about everything known on the Empty Quarter, from Ibn Battuta in 1352 to 1957. Covers climate, biology, history, voyages, toponymy, geomorphology.

Mauritania, A. Certeiny, Praeger, N.Y., 1967 (243 pp.)

Constitutes the only overall socio-economic survey of Mauritania in English. Dated, but useful general review of physical, historical, social economic, political and linguistic aspects of country. Excellent glossary and selected annotated bibliography.

La Mauritanie, C. Toupet, Que sais-je?, Paris, 1977 (125 pp.)

Short narrative chapters on the various aspects of Mauritania in the "Que sais-je?" tradition (text only).

Nouakchott-Capitale de la Mauritanie J-R Pitte, Paris 1977 (198 pp.)

Wide-ranging, solid and readable description of Nouakchott, in all its diversity. Although city's rapid growth has made certain points somewhat dated, it conveys a "feel" for the dynamics of urban life that still rings true.

Le Palmier Dattier en Mauritanie, P. Munier, Ann. IFAC no. 12, Paris, 1955 (66 pp.)

Includes all aspects of date-culture, agronomic, geographical, historical. Technical but rewarding for non-specialists.

3e Plan de Developpement Economique et Social, 1976-1980, Ministère du Plan et des Mines, Nouakchott (180 pp.)

Summary of 2nd Plan and performance of economy, including analysis of socio-economic situation up to 1975. Emphasis on sectoral approach to national planning combined with policies to improve the general well-being of the individual for the 1976-1980 period. Assesses human and national resources. Useful maps.

La Sedentarisation des Nomades en Mauritanie Centrale Sahelienne,  
C. Toupet, Paris, 1977 (490 pp.)

Covers the central area bounded by Atar, Tichitt, Aioun and Selibaby. Thorough analysis of ecological data. Describes pastoral life and organization, livestock, agriculture and irrigation, as well as transformations caused by drought and modern society. Extensive bibliography.

### 0.3 Selected Documentation Centers with Reference Material on Mauritania

Bureau de Documentation et des Archives (BDA), Direction des Etudes et de la Programmation, Ministère de l'Economie et des Finances, Nouakchott.

Some 3000 titles, currently being organized under RAMS auspices. The RAMS collection (600 titles) is being incorporated. Quite complete for technical studies and reports including specialized sub-reports up to about 1973. Incomplete for more recent work.

Centre Culturel Saint-Exupéry (French Cultural Center), Nouakchott.

Maintains a good, wide-ranging collection of several hundred titles, including major technical studies which are difficult to find elsewhere. Published bibliography available:

Catalogue des Ouvrages Concernant la Mauritanie, Panorama no.28, Nouakchott. Jan. 1980 (70 pp.) Author and subject index.

Meteorological Reference Center for the Sahel, Niamey (Niger).

Regional data analysis, training and coordination center.

Musée National, Nouakchott.

Small, but well-organized displays on the history and culture of Mauritania. A guided, convenient one-hour introduction to Mauritania.

OMVS Centre de Documentation pour le Programme de Developpement du Bassin Flueve Sénégal, St.Louis (Senegal)

Complete collection of documents on the Senegal valley. Publishes voluminous computerized bibliographical listings. (OMVS office in Dakar also has similar reference material).

Sahel Documentation Center, Mich. State Univ., East Lansing, Mich. (USA)

Large collection. Publishes quarterly Sahel bibliographic bulletins. Xerox or microfiche copies of titles can be supplied. Microfiche/paper copy selection of about 1000 titles has been distributed to Sahel institutions including BDA.

SONADER, Nouakchott.

Single most important source of technical material in Mauritania on irrigated agriculture.

62

USAID Library, Nouakchott.

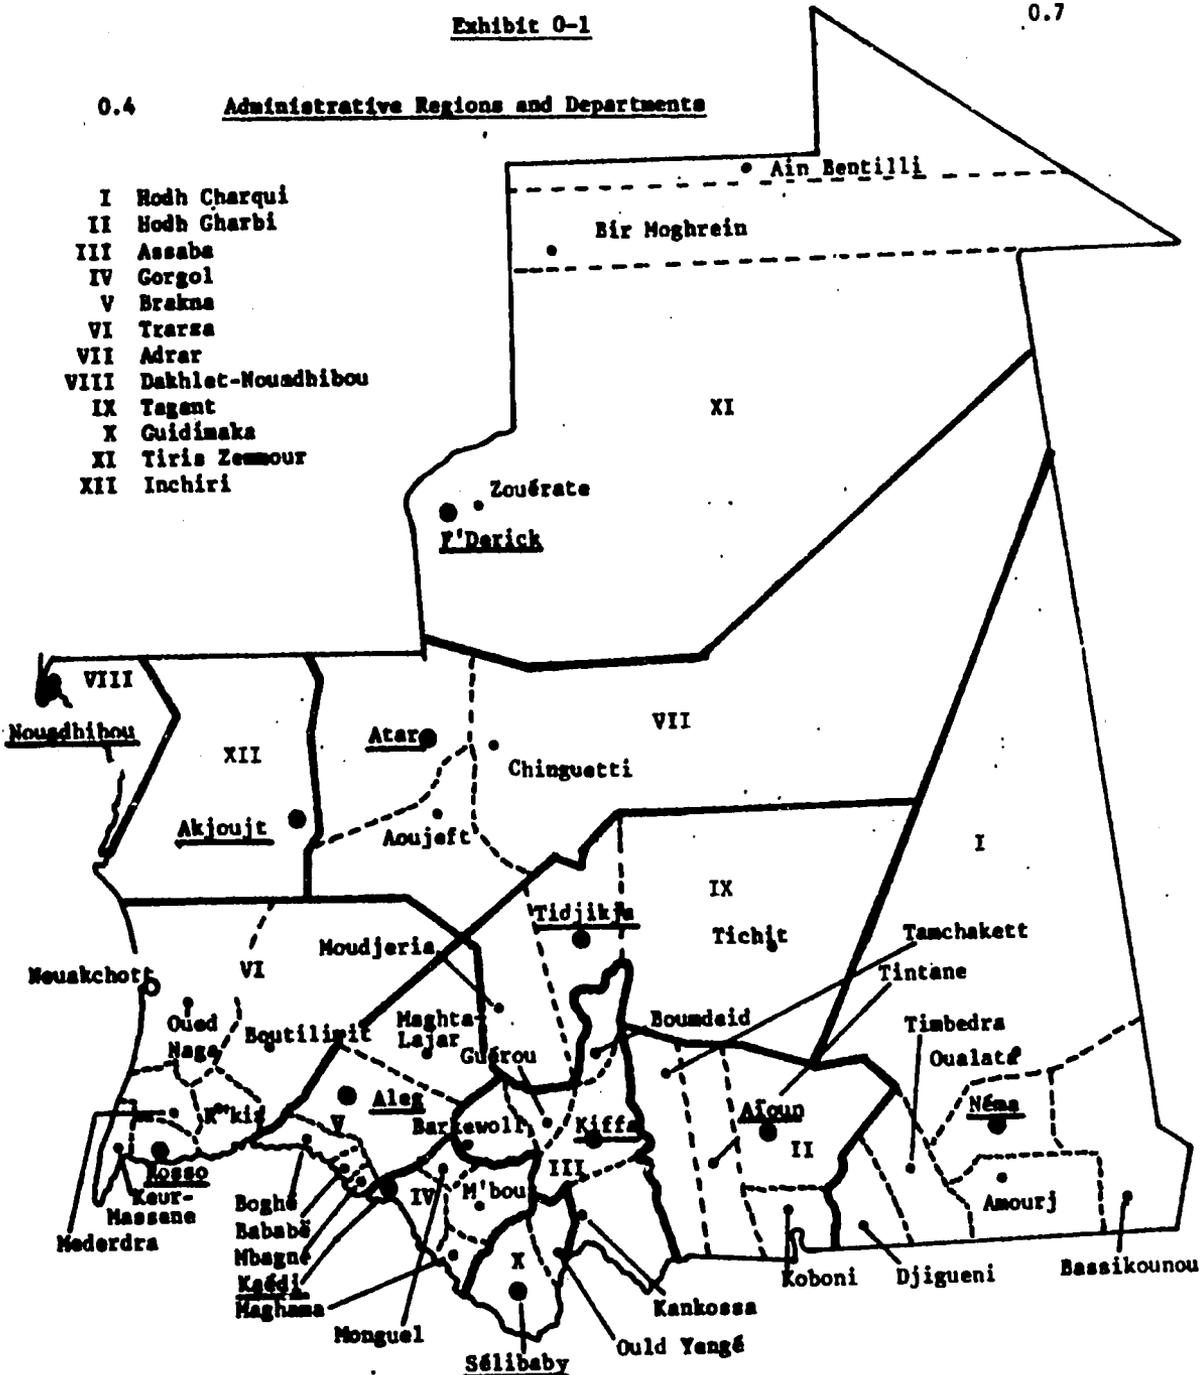

Maintains about 1000 listings, principally recent studies.

In addition to the above, various international aid organizations and specialized government services in Nouakchott have collections of varying sizes of reference material within their respective fields of interest. There are also several French research and study organizations in Paris, often with regional offices in Dakar (e.g. ORSTOM, Institut Geographique National). More details on these and others are referred to in:

J.M. Heyman, Report on Literature Search, Documentation and Related Information on Mauritania (for RAMS).  
AID/Afr-C- 1428. Agency for International Development,  
Washington, D.C., 1978 (57 pp.)

- a) Numbers correspond to codes used in the 1977 census and are used herein for ease of presentation.
- b) Until mid-1980, wards in Nouakchott were referred to by numerical order but this is now abolished. (See Chapter 2.)
- c) Excludes Ouadane because area is not treated as a separate Department in national census but as a prefecture of Chinguetti
- d) Excludes Ain Bentilli because town is uninhabited and 1977 national census did not recognize its existence.

## 0.6 RAMS Reports

RAMS (Rural Assessment and Manpower Surveys) has had three principal objectives: (a) Baseline inventory and analysis of the main sectors of the rural economy, manpower and demography (28 reports); (b) elaboration of development strategy options for medium and short-term (8 reports); (c) identification and formulation of projects (2 reports); and (d) several others (4 reports). An Annotated Statistical Compendium also was produced. The nearly two and one-half year; 396 man-month project was conducted in collaboration with the "Direction des Etudes et de la Programmation" of the Ministry of Economy and Finance.

The following is a list of reports produced and a short summary of contents of these reports.

### I. Phase I

#### (a) Baseline Studies:

- AS 1 Agro-Ecological Zones of Mauritania  
 Compilation of data and information on climate, water, soils vegetation, types of cultivation and pasture lands. Introduces and defines Agro-Ecological Zones. Many tables and maps.
- AS 2 Environmental Regeneration of Southern Third of Mauritania (Including Appendix)  
 Raw data collected of selected areas around towns and villages, around pastoral wells, rangeland, , forest preserves and oasis, totalling about 100 observation points. State of degradation and various causative factors presented.
- AS 3 Demographic Projections  
 Preliminary analysis of 1977 official data. Discussion of various factors affecting population growth. Regional and overall national population projections. Growth scenarios until year 2000.
- AS 4 Agricultural Production: Analysis of Selected Aspects of Mauritanian Agriculture  
 Summarizes RAMS agricultural production surveys, farm budgets. Presents cost and price data on livestock, rice production, processing, etc.
- AS 5 Rural Sector Consumption Patterns in Mauritania  
 Summarizes results of RAMS Household Survey (consumption component). Calculates demand elasticity and projects food and non-food demand to the year 2000. Survey methodology explained.

**AS 6 Rural Income in Mauritania**

Summarizes results of RAMS Household Survey (revenue component), cash income structure among rural, sedentary and nomad population groups, income distribution and Lorenz curves. Survey methodology explained.

**AS 7-1 Sociological Profiles: Black Africans Mauritania**

Reviews social organization of Toucouleur, Peulh and Soninké populations.

**AS 7-2 Sociological Profiles: The Moors**

Socio-economic organization of the Moors in an historical context. Bibliography.

**AS 8-1 Social Change: The Future of Pastoralism**

Case-study vignettes (Maghta Lahjar, Néma and Kankossa) on problems of adaptation to drought conditions.

**AS 8-2 Social Change: Social Organization of Agricultural Production**

With traditional land tenure as a background, discusses changes in agricultural production and social classes for Moor and riverine groups. Social constraints, positive and negative impact of change. Bibliography.

**AS 8-3 Social Change: Population Movements and Migrations in Mauritania**

Discusses from an historical perspective population mobility in response to changing patterns of trade and economic development. Establishment of modern sector and its effects.

**AS 8-4 Social Change: The Evolution of Modes of Accumulation and Social Change in Mauritania**

Concentrates on role of trade and commerce from pre-colonial days onward. Some analysis of historical price data.

**AS 9 Overall Synthesis of Sociological Studies**

Synthesizes major themes of sociological reports above.

**(b) Sub-sectoral Studies:**

**SS 1 Irrigated Agriculture**

Presentation of main factors governing development of irrigated agriculture. Discusses Senegal valley as well as traditional irrigation in the interior. Data on cultivated surfaces, production and farm budgets for various crops.

- SS 2      Dryland Agriculture
- Analysis in some detail of production for the various types of dryland agriculture (recessional, rainfed and walo). Covers crops, present and potential zones, production methods, labor, capital, land tenure, products and marketing, extension services and research facilities. Environmental impact noted. Cites current and on-going projects.
- SS 3      Livestock Sub-sector Study
- Presentation of main factors affecting livestock production. Includes camels, cattle, goat, sheep and poultry. Excludes donkeys and horses. Discusses resources, marketing and production systems. Details provided on herd production forecast through year 2000 using RAMS rainfall model.
- SS 3a     Supplement to Livestock Study: Range Management
- Discusses present and prospective grazing resources. Discusses Mauritanian rangelands, reviews major land management constraints to increase livestock production and formulates range management development alternatives.
- SS 4      Oasis Agriculture
- Wide-ranging detailed review and analysis of date-growing and oasis crops. Covers production methods, labor, capital, land tenure, marketing, extension and research services, environmental impact and current on-going projects. Bibliography.
- SS 5      Inland Fisheries
- Compilation of existing data.
- SS 6      Traditional and Maritime Fisheries
- Compilation of existing data. Discussion of cooperatives with particular emphasis on the Imraguens.
- (c)      Functional Studies:
- FS 1-1    Food and Nutritional Situation in Mauritania
- Summarizes results of RAMS Household Survey (nutrition component). Also discusses food distribution programs, cereal balance and nutritional status.
- FS 1-2    Rural Health: Outline of the Mauritanian Health Sector
- Briefly outlines national health system of Mauritania with its emphasis on curative medicine. Discusses organization of health delivery system.

- FS 2-1**     Employment Situation
- Presents data on labor stock, labor force and Employment Survey based on 1977 census data. Modern and informal sector based on RAMS surveys. Annex has data broken down by region and nomad/sedentary types.
- FS 2-2**     Supplement to the Employment Situation
- Summary and analysis of RAMS Employment Survey with particular emphasis on activity and employment status.
- FS 3-1**     Manpower Skills
- Similar to Employment Situation (FS 2-1) but with emphasis on education skills.
- FS 3-2**     Evaluation of the Formal Education System in Relation to Development Objectives (Including Appendix)
- Exhaustive, in depth description and analysis of primary, secondary, technical and vocational education system. Regional education statistics for 10-year period.
- FS 3-3**     Non-Formal Education
- Pioneering synthesis and analysis of institutions and programs in non-formal education, their relation to production and development discussed under headings: Traditional and Modern Agriculture, Herding, Fishing, Management, Non-Structured, Crafts, Health, Literacy, Culture. Also summarizes and analyzes results of RAMS Skills Qualification Survey of farmers, herders, fishermen, artisans, shopkeepers and women.
- AE 4-1**     Economic Activity of the Rural Private Sector
- Discussion and analysis of private and parastatal sectors, with emphasis on role and function of cooperatives. Operating budget for selected small-scale family enterprises (shops, baker, butcher, etc.). Estimates transport flux and trucking costs.
- AE 4-2**     The Public Sector: Organization and Operation of Rural Development Activities
- Analysis of selected government departments and public sector institutions as they apply to rural development. Provides in historical context evolution of the government's organization composition and in a functional context its policy formulation, planning, budgeting and implementation activities.

**AE 4-3 Annotated Statistical Compendium**

Distills data from RAMS studies, presenting them in annotated form. Also includes information obtained from census, and information available on geology and climatology.

**II. Phase II**

**(a) Option Papers:**

**1 Consolated Statement on Overall Development Strategies**

Draws on the analysis of the other seven Phase II RAMS papers and describes within the Mauritanian setting the methodology followed in reviewing rural development and manpower options and the major development alternatives that emerge for the GIRM's consideration. A listing of general issues for decision and action is provided if the development options presented are to be pursued.

**2 Macro-Economic Simulation Model for Assessing Development Priorities**

Describes and demonstrates a macro-economic simulation model which establishes the relationship between the financial constraints to development, particularly the debt service ratio, the government budget and the balance of payments, and investment and output. The Mauritanian experience since independence is analysed in these terms and Gross Domestic Product by major sector is projected on the basis of three sets of output/investment assumptions through the year 2000.

**3 Framework for Calculating Rural GDP from Basic Production Data**

Gross Domestic Product for the rural sector for the period 1967 through 1980 is derived by aggregating the available crop and animal production series. These data are compared with annual rainfall figures and three 20-year rainfall production patterns are selected. These patterns are then used to project three rural production possibilities through the year 2000. In addition, the disaggregate production series are used to compile and demonstrate a modified input-output table for the Mauritanian rural sector. This innovation should prove useful in helping to identify and analyze specific investment decisions in the rural sector.

#### 4 Basic Human Needs

Discusses the need and desirability of incorporating the BHN concept into Mauritanian development planning, while at the same time emphasizing the growth required to finance BHN. The major individual needs, including health and nutrition, education, shelter and energy, are analyzed in light of the Mauritanian scene. In addition, estimates are given of the costs that would be required to provide the lower 20% of the population with the basic minimum BHN.

#### 5 Rural Production Options

Presents the rural setting in Mauritania and examines production/ investment possibilities for the various subsectors of the rural sector: rainfall, recessional, irrigated and oasis agricultural, livestock, inland (river and pond), and maritime (artisanal/ and semi industrial) fishing. Options are presented for maximizing output, tracing current trends, and finding intermediate possibilities to achieve food self-sufficiency. Rainfall is explicitly examined as a constraint, as is manpower. From these components three options are compiled for the entire sector showing investment, production, value-added and manpower for each. This paper is the keystone to the other rural sector Option Papers.

#### 6 Agricultural Institutional Framework

Describes the need for State-supported service institutions to help remove the constraints and bottle-necks to increased agricultural production and income. It examines both the physical and human constraints. On the basis of this analysis, costs are derived and manpower and organizational requirements are compiled. The options range from a nationwide coverage of a full integrated system, to a series of regional centers of influence, to a continuation and growth of the present set of services now in existence.

#### 7 Employment Implications of Alternative Development Strategies

Analyses both the supply and demand for labor, reaching the conclusion that 70,000 new jobs are now needed to reach full employment without solving the problem of under-employment particularly prevalent in the rural areas. Employment opportunities are limited due to the small internal market and the lack of skills including literacy among the labor force. Projections to the year 2000 are made, indicating that if present policies do not change there could be 400,000 unemployed. The several options set forth are those which give different emphasis to the promotion of labor-intensive activities, particularly in regional centers, and to the

13X

design of an entrepreneurial code to replace the present investment code which favors capital-intensive activities. The need to organize a program to promote general educational levels and teach specific skills is emphasized.

8. Public Health and Nutrition

Part I of this paper, (Health System in Mauritania: Analysis of Problems and Alternative Solutions) presents and discusses a three-stage program of providing public health care to Mauritians. It consists of reorienting the present largely curative Nouakchott-based system to future needs while meeting present commitments. Subsequent phases involved improving program management, reorientation towards preventative medicine, expanding services to rural areas and eventually making health part of an integrated rural development program. Part II (Food Requirements and Nutrition Strategy - Estimates for year 2000) examines in detail the present state of nutrition in Mauritania and sets objectives and standards which are incorporated in the public health option paper.

(b) Project Identification and Formulation:

1 Project Dossier

Contains over 10 descriptions of proposed projects in environmental, including rangeland management, and employment-generation activities. These are presented as illustrative projects, some described more fully than others, using the CILSS project format. Costing is provided for most of the proposals. These projects flow from discussions in the Option Papers.

2 Education As a Development Tool

An outgrowth of the Phase I RAMS report on Evaluation of the Formal Education System in Relation to Development Activities. This special report recommends a thorough reform and decentralization of Mauritania's education system. Specific proposals range from elementary through professional and technical training. Its central theme is the need to readapt teaching to be more responsive to the development needs of the country.

(c) Other:

1 Seminar Evaluation

A special report, this evaluation puts into perspective the meaning and outcome of the seven seminars organized by RAMS under the sponsorship of the GIRM's planning authority.

Each seminar is reviewed in relation to the objectives established by the government, with copies of each final report being enclosed. Recommendations for the continuation of the seminar program are made.

## 2 Regional Profiles

In connection with the GIRM's effort to decentralize the planning process, RAMS has proposed a series of 10 regional profiles, each providing basic economic and social data collected in the course of RAMS' research. (Two of the country's 12 regions are not covered because they are considered more a part of the modern rather than rural sector.) The profiles were drafted with the intention of giving each of the 10 regions basic data to use, and to up-date periodically, as they elaborate their ideas for the Fourth Economic and Social Development Plan.

## 3 Synthesis

As the term implies this report is intended to encapsulate RAMS' two and one-half year experience, put it into perspective and glean the results. The operation is cast in an historical perspective to provide an appreciation of the context in which the project operated. The project's phases are discussed separately and integrally. The theme which emerges demonstrates that RAMS has been a part of a continuing planning process of the Mauritanian Government which will continue indefinitely. The data, findings and observations of RAMS will hopefully have provided a sounder and firmer basis of national planning for the future.

## Final Report

Provides a record of the project from the standpoint of its origins, its operation and its ending, covering essentially the manpower, and budgetary and organizational aspects. Comments are also made on project designs. A special section covers the project's institutionalization and the measures taken to continue the type of planning effort undertaken by RAMS.

## Chapter 1: Geography

### Table of Contents

		<u>Page Nos.</u>

1.9	<u>Rainfall and Climate</u>	1.33
1,10	<u>Selected Moor Geographical Terms</u>	1.54
1.11	<u>Selected Agro-Geomorphological Terms in the Senegal Valley</u>	1.56

## 1.1 Overview

This chapter presents in some depth the basic technical sources for the study of Mauritania's physical geography. For a more general introduction refer to the excellent series of annotated thematic maps in the Atlas Jeune Afrique (see Section 0.2 Selected Annotated Bibliography).

## 1.2 Topographic Maps

The basic map is the 1:200,000 Institut Géographique National (IGN, Paris) series covering the whole country (Exhibits 1-1, 1-2). The southern and the coastal areas are also covered by 1:500,000 sheets (Exhibit 1-3). The Senegal Valley from Bakel to Rosso is covered by 1:50,000 sheets (Exhibit 1-4).

There is also an IGN older series, without altimetry, at 1:100,000 (Exhibit 1-5). For the unified sheet designation system see Exhibit 1-6. Other series, dating from before 1960, have been completely superseded by the above. IGN also publishes a 1:2,500,000 general map (2nd ed. 1980).

The official Mauritanian repository is the Service de la Topographie et de la Cartographie at the Ministry of Equipment and Transport.

In preparation for the 1977 census, the Census Bureau (BCR) during 1974-75 exhaustively up-dated the IGN 1:200,000 maps for localities. Further up-dating was done at the time of the actual census (December 1976/January 1977) but without cartographic precision.

About half the localities thus identified were not marked on the then available IGN sheets. The BCR has a series of blue-print departmental maps at scale 1:200,000<sup>a)</sup> with all 2,300 or so localities marked with name and census number. There have been further changes since, especially in the Hodhs (where villages have disappeared) and the Gorgol and River areas (where new villages have appeared). Some localities in the north have also disappeared.

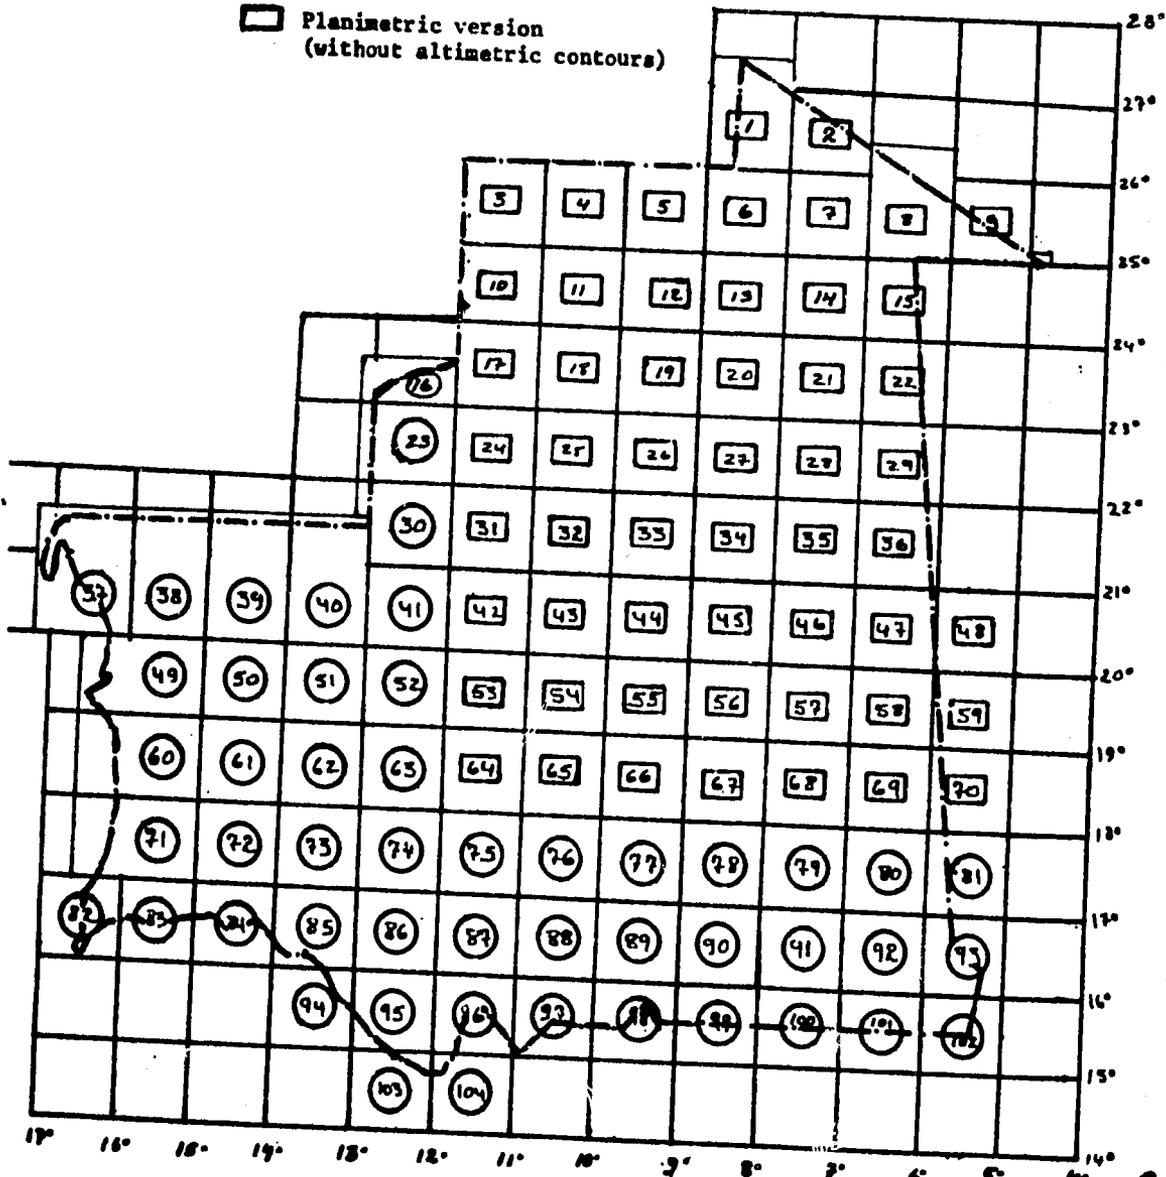

---

a) Except Oualata, Chinguetti, Bir Moghreïn and F'Derick at 1:1,000,000, and Tichitt, Inchiri and Adrar at 1:500,000.

### 1.3 Aerial Photography

The entire country is covered by high quality panchromatic aerial photos at a scale of 1:50,000 (occasionally larger; see Exhibit 1-7 for details) taken by the Institut Géographique National (Paris) between 1952 and 1973. Longitudinal overlay is 60%, lateral band overlap 15%. These form the basis for the IGN 1:200,000 topographic maps. Recently (1980), the southwestern part of the country including the Senegal river basin, has been covered by 1:50,000 color photos taken by Teledyne Geotronics (California) under OMVS auspices (Exhibit 1-8). These are, however, not always of the same high quality as the IGN photos.

For the Senegal Valley proper there is also 1:15,000 coverage from 1960 and 1:25,000 coverage of the delta (1958/1964), all by IGN. Besides these systematic regional series, there are various localized coverages, mainly by IGN, such as valleys and oases in the Adrar at 1:15,000 (1958, in conjunction with date palm inventory) and regional capitals (1958-1964 at 1:15,000).

The census bureau (BCR) took non-standard photos of several towns in 1974-1975. There is also a mid-1980 coverage of Nouakchott at 1:20,000a)

The official Mauritanian Government repository is the "Service de la Topographie et de la Cartographie" at the Ministry of Equipment and Transport. However, their collection, especially of miscellaneous older material, may not be complete.

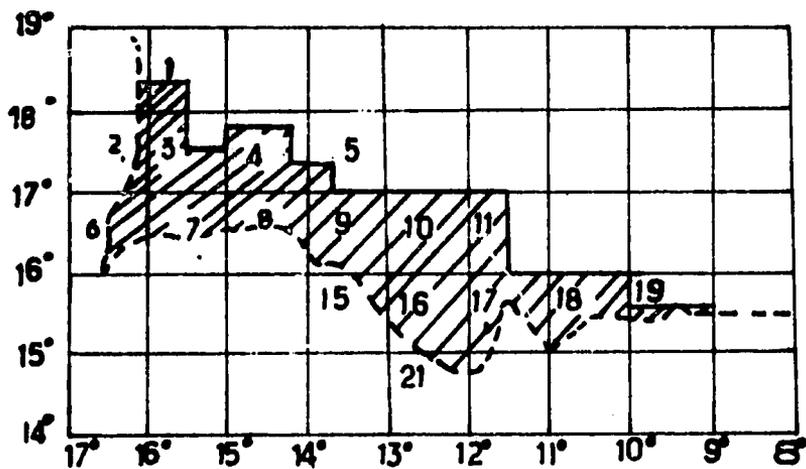

---

a) For other photos of Nouakchott see also Pitte, Nouakchott-la Capitale de la Mauritanie, Paris, 1977.

Exhibit 1-8Aerial Photography 1:50,000 OMVS/Teledyne 1980

Numbers designate degree-square zones. Coverage along the borders is shown somewhat schematically. Series also covers the Senegal and Mali portion of the Senegal basin (not marked).

85 X

1.4 Geology

The basic document is the 1:1,000,000 Carte Géologique de la Mauritanie of June 30, 1968, published in 1969 by the BRGM (Bureau des Recherches Géologiques et Minières, Paris) for the Direction des Mines of the Mauritanian Government. The companion descriptive volume (Notice Explicative de la Carte Géologique a 1:1,00,000 de la Mauritanie, BRGM, Paris 1975, 255 pp.), summarizes the state of knowledge in the form of a general overview together with regional monograph chapters. It also contains a summary up-dating to the end of 1973. Subsequently, a major report was published on the Tiris Zemmour area. (See map J, Exhibit 1-9.)

The official Mauritanian Government repository is the "Service Géologique" of the "Direction des Mines et de la Géologie". Apart from a map collection, it has a well-organized, almost complete collection of geological studies, as well as all published hydrological ones. The "Notice Explicative" contains a bibliography of more than 400 titles on geology and hydrology. A certain amount of geophysical surveying, notably in the coastal zone, the Inchiri-Adrar-F'Derick area and in the South-East also exists.

Exhibit 1-9Regional Geological Maps at Various Scales

Index letters refer only to the preceding list. Only published maps are noted. Various older or localized maps are not included, as well as those odd unavailable ones with unclear reference (most of these are mentioned in the Notice Explicative for the 1:1,000,000 map).

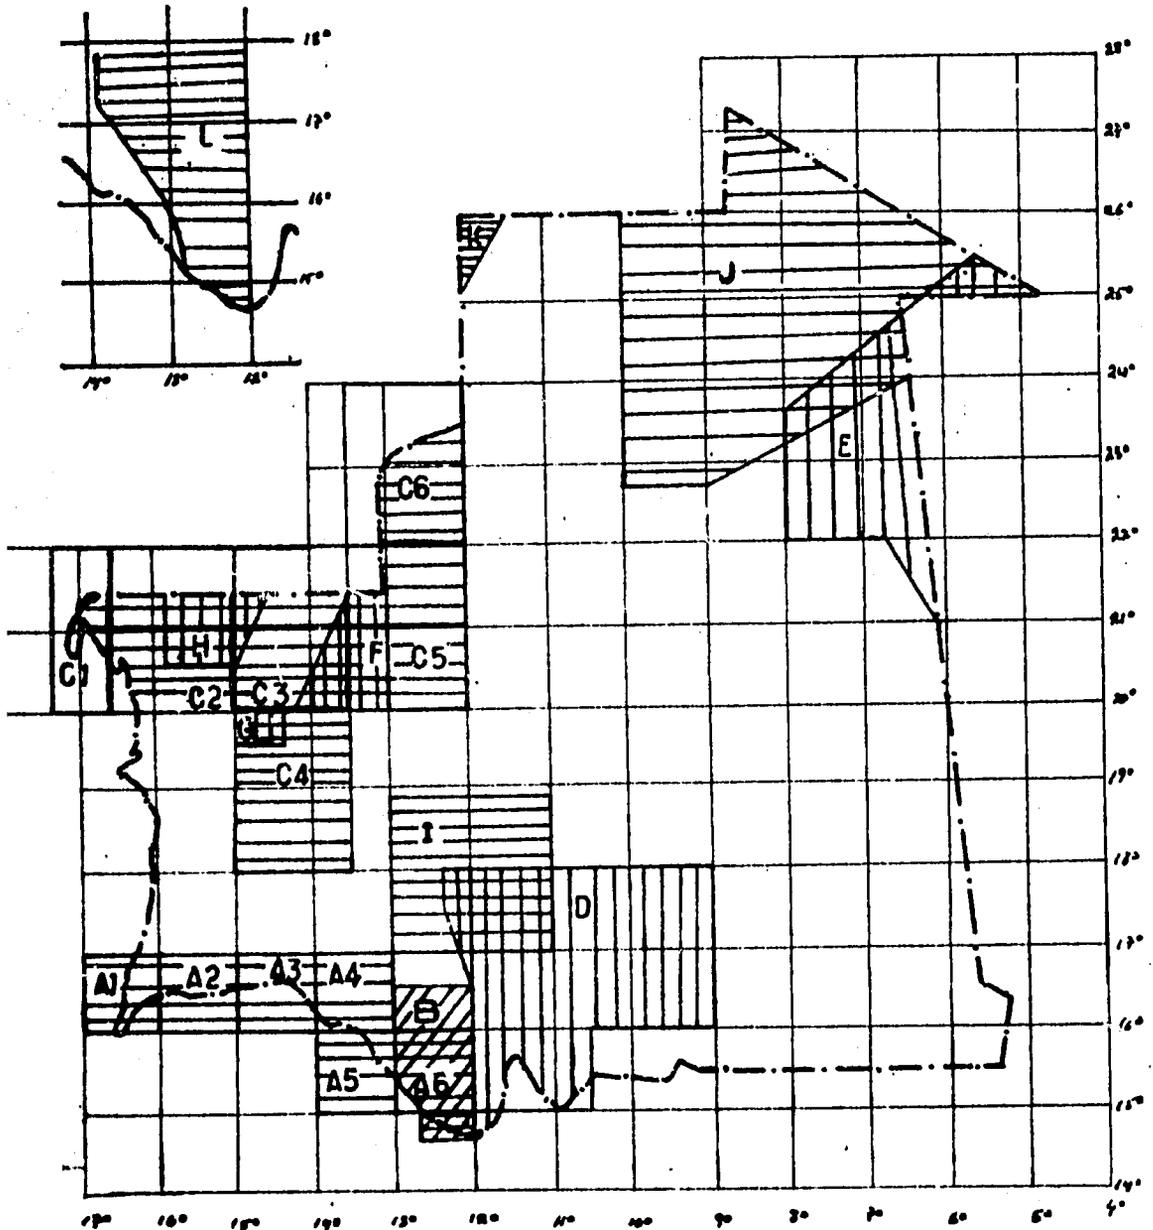

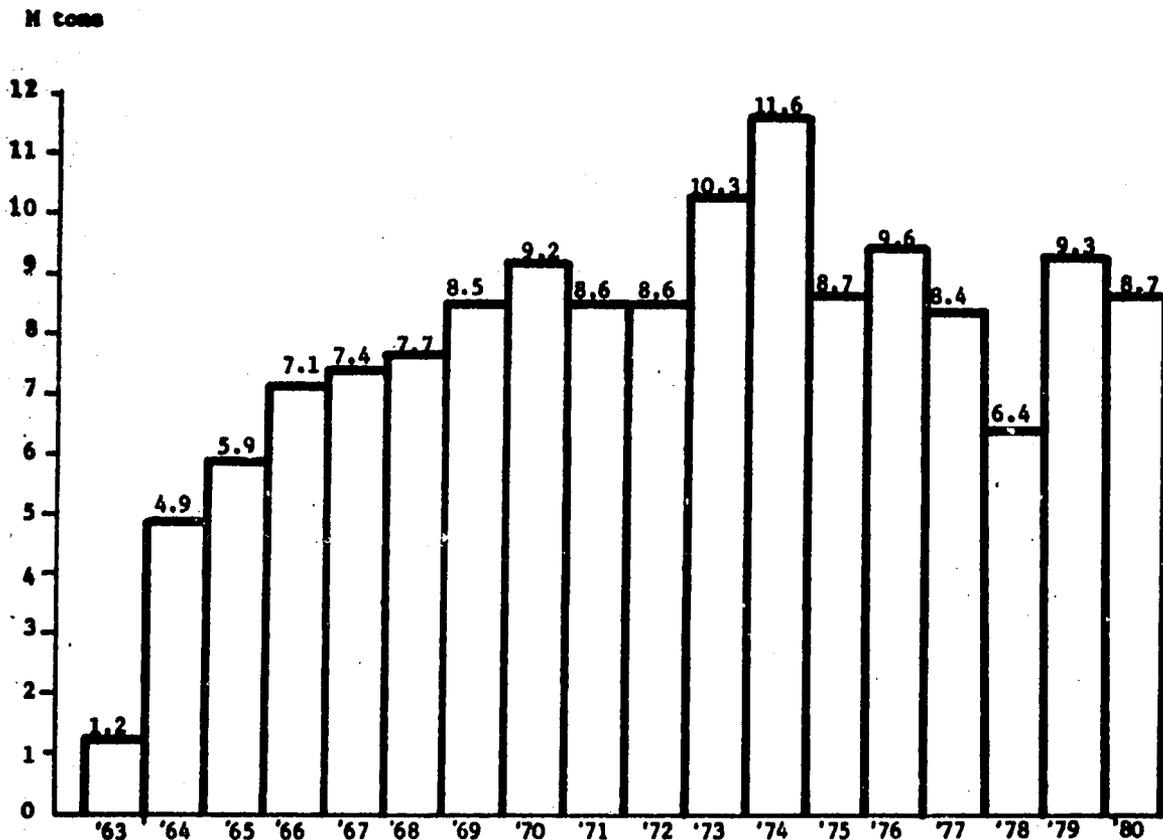

Exhibit 1-10Mineral ProductionExport of Iron Ore 1963-1980

The iron ore exports of the Kediet el Jill in the Tiris Zemmour, geologically studied since the first quarter of the century<sup>a)</sup>, have been exploited since 1963. The high-grade (average 64% iron) ore currently extracted consists essentially of hematite in the form of pockets or lenses and is evacuated 650 km to Nouadhibou by train, reportedly the longest in the world (2 km, 20,000 tons). The deposits will be worked out in some 5-6 years at current rates, by which time the "Project Guelbs" should have come on line. The Guelbs in question are situated within a 50 km radius to the northeast and west of Zouerate. The main ore is magnetic. The much lower iron content (average 37%) necessitates enrichment - dry magnetic separation before evacuation.

a) The "mountain of iron" mentioned by the Arab writer El Bakri in 1067 may be an early reference.

## Other Mineral Deposits

### Copper

The copper deposits of the Guelbs Moghrein by Akjoujt, worked since pre-historic times, was exploited industrially between 1970 and 1978. The deposits are of two types, oxides (2.7% copper, 4 gr/t gold), and sulfides (1.8% copper, 1 gr/t gold). The oxides ore, enriched by a complex process to 60% before evacuation by truck to Nouakchott, is now practically worked out. Preparations are currently under way for exploiting the remaining sulfide ores (approximately 0.3 M ton metal).

### Gypsum

Very pure (94%) eolian deposits - current extraction around 10,000 t/yr., and somewhat less pure (92%) marine deposits in the Sebkhya N'Drhamcha 70 km north and northeast of Nouakchott. Reserves of the latter estimated at around 17 M ton.

### Limestone

Consisting of layers of unconsolidated fossil shells from the quarterly marine transgression ("le falun Nouakchottien"). Small-scale exploitation for use of road fill, gravel, mortar, etc. Reserves around Nouakchott estimated at 5-8 M tons. Suitable for cement production.

### Salt

Found in numerous Sebkhya as well-crystallized compact 10-20cm thick rock salt layers, notably at N'Terert south of Nouakchott and in the Sebkhya ej Jil, north of P'Derik, where artisanal exploitation continues, though on a reduced scale compared to pre-colonial days (1967:1,200 tons, mid-1970s, approximately 600 tons/year). Reserves are estimated at about 10 M tons.

### Phosphates

Minor but exploitable deposits (ca. 150 K ton, under investigation) at Sive on the river

Future hopes for mineral finds are concentrated on the pre-cambian granite and metamorphic basement rocks of the "Dorsale R'gabat" covering most of the Tiris Zemmour as well as parts of Inchiri and Adrar. Some oil exploration has been conducted along the coast and in the Empty Quarter. Interest seems currently in abeyance.

Source: Notice Explicative de la Carte Géologique a 1:1,000,000 (BRGM 1975) and miscellaneous sources.

### 1.5 Geomorphology

The only major area covered in a systematic fashion is the Senegal valley, which was mapped at 1:50,000 for the OMVS by SEDAGRI (Societe d'Etudes et de Develoппement Agricole, Paris) in 1969 on IGN topographic background. Soils and geomorphology are mapped together (see Exhibit 1-11).

There is also a monograph study by P. Michel, Les Bassins du Fleuve Senegal et Gambie-Etude Geomorphologie, ORSTOM, Paris, 1973, (752 pp.).

Reference: Carte pedologique et geomorphologique de la Vallee et du Delta du Senegal. Etude hydro-agricole du bassin du OMVS/PNUD/FAO. AG:DP/RAF/65/061, Rome; 1975.

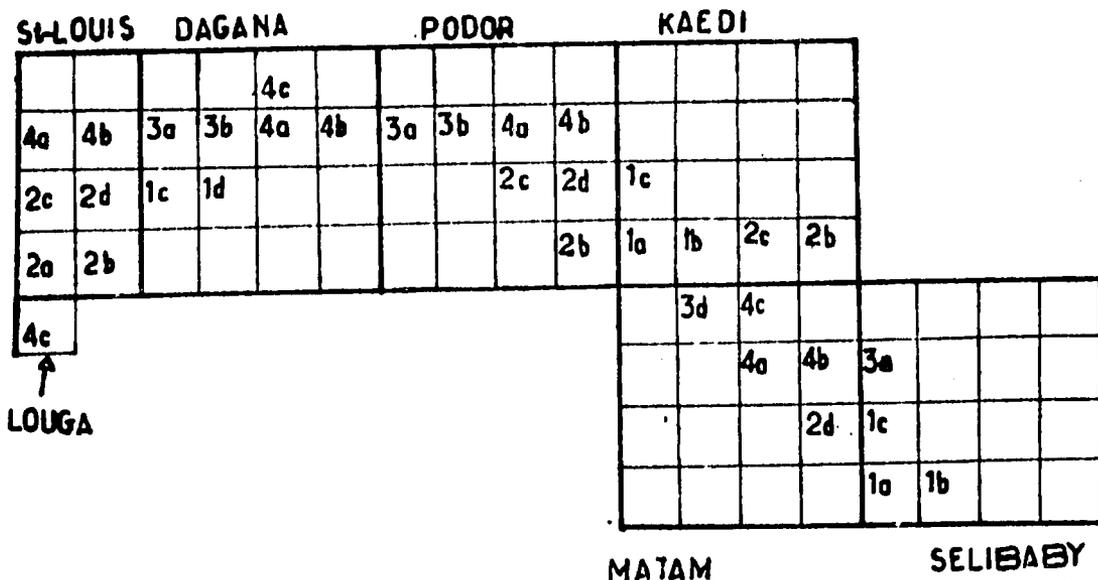

For explanatory details refer first to the Rapport de synthese des etudes et travaux, Rome, 1977, (320 pp.), and then to its bibliography of specialized sub-reports (Annex 1).

#### Exhibit 1-11

### Pedological And Geomorphological Maps - Senegal Valley 1:50,000

#### Etude Hydro-Agricole/SEDARGI

Sheet designation similar to the IGN topographic maps

## 1.6 Soils, Land Use and Vegetation

The Etude Hydro-Agricole is the major document for the Senegal valley. Soils are mapped with geomorphology notations (cf. above). In addition, SEDAGRI prepared in 1969 a 1:50,000 set in the same format (see Exhibit 1-11 for sheet designation) on irrigation suitability and land use: Carte d'Aptitudes Culturelles des Terres de la Vallée et du Delta du Sénégal. Soils are grouped into 6 classes: easily irrigable, irrigable, rice-cultivable (2 sub-classes with/without salt problem) and non-irrigable (2 sub-classes not irrigable at all and irrigable with difficulty). The area in each class is tabulated for each sheet.

Soil deficiency classification is also made (salt, other mineral, topographic, drainage). There is also land use mapping (gonakiers, bush, vetiver, grasses, cultivation, termite mounds). The soil and geomorphological units are repeated as background contours.

The Gorgol valley has been extensively studied in connection with the Fom Gleita dam project:

- Carte Pédologique du Oualo du Gorgol, ca 1:15,000.
- Carte de Classifications des Sols du Oualo du Gorgol en Fonction de leur Aptitude pour le Riziculture, ca. 1:15,000.  
(Categories: suitable, suitable with improvement, less and not suitable).
- Carte Pédologique du Oualo du Gorgol en Aval de Lexeiba, 1:50,000.

Text in Etude Pédologique du Oualo du Gorgol. Rapport technique, No. 5, (44 pp.) plus annex (143 pp., soil profile analysis), 1971.

- Carte Pédologique Semi-détaillée de la Vallée du Gorgol Noir entre Lexeiba et les Monts Wa-Wa, ca. 1:50,000.  
(Also some reconnaissance with main categories only.)
- Carte des Aptitudes à l'Irrigation de la Vallée du Gorgol Noir entre Lexeiba et les Monts Wa-Wa, ca. 1:50,000.  
(Categorizes rice, maize/groundnuts, sugarcane/cotton.)

Text in Etude Pédologique de la Vallée du Gorgol Noir entre Lexeiba et les Monts Wa-Wa. Rapport technique, No. 4 (24 pp.) plus annex (52 pp., soil profile analysis), 1970.

- Carte Pédologique de Reconnaissance Cuvette de Fom Gleita, ca. 1:50,000.

Text in Cuvette de Fom Gleita - Etude Pédologique de Reconnaissance.  
Rapport technique, No. 3 (19 pp.), 1971.

Topographic background for maps IGN aerial photos. Part of the Etude pour la Mise en Valeur du Bassin du Gorgol, AGL:SP/MAU 3 PNUD/FAO-SCET/SEDES, 1970-71.

The only other area for which something similar exists is the Tagant, or more accurately the departments of Tidjikja, Moudjeria, Maghta Lahjar, Boumeid and Guerou (same coverage as geological map "I" of Exhibit 1-9):

- Carte des Sols, 1:100,000;
- Carte de la Végétation, 1:100,000;  
Oases, Cultivated Areas and Pasture Land also delineated
- Carte des Potentialités Agricoles, 1:200,000;  
8 Classes: Intensive/Extensive Pasture with Various Assorted Crops, Rainfed Cultivation, Reforestation, Wasteland.

These are all based on LANDSAT imagery interpretation, supplemented by field checks and available documentation.

Reference: Développement Rural de la Région du Tagant.  
Plan Directeur RIM/SONADER - AAT/INSTRUPA/  
GTZ (West Germany), 1979. See Annex 1,  
"Ressources Naturelles", for description.

The USAID-funded project "Renewable Resources" is currently preparing "agro-physical" land classification maps based on LANDSAT imagery interpretation, schematically at a scale of 1:1,000,000 for the whole country, and more detailed at 1:500,000 for the south and southwest, roughly south of a line between Nouakchott and Tamchakett. These will cover soils, vegetation, pasture, forestry and other land use, geology, surface hydrology and land fragility. They are expected to be ready towards the end of 1981.

93 x

## 1.7 Water Resources - Hydrogeology

Not surprisingly, given the importance of the subject, there are a comparatively large number of studies, both published and unpublished, concerning the hydrogeology of Mauritania (see Exhibit 1-12, and 1-13). Nevertheless, information is far from complete, even for shallow aquifers. Very little is known, for example, about long-term potential yield capacities. Fossil water seems to dominate some important aquifers. Even less is known about deep aquifers (more than 100 m), although there is reason to believe that they may be quite significant in some parts of the country, such as the Trarza (Maastrichtian) and the Taoudeni basin/Empty quarter (Continental Intercalaire - Nubian Sandstone similar to the rest of the Sahara).

The government service responsible for water resources investigation is the Direction de l'Hydraulique of the Ministry of Rural Development, which should be consulted for detailed studies on particular areas. Two major nation-wide syntheses exist, one from 1965 and now somewhat dated, and a more recent one from 1975:

- (1) Ph. Roussel Carte de reconnaissance hydrogeologique de la Mauritanie, au 1,000,000 BIM - Bureau Hydrogeologique, 1968. Note explicative (100 pp. plus annexes and maps).

The narrative descriptively summarizes the state of knowledge by region. There is also a discussion of climatological data and surface hydrology. The main map shows geological series, water sources (static water level, yield class <1,1-3, >3m<sup>3</sup>/h, salinity >2 g/l) and delineates hydrological provinces, sterile and brackish zones. However, the technical quality (manuscript, blueprints) is such that the use of the map is very difficult.

- (2) Reinforcement du service des eaux souterraines, Mauritanie. Conclusions et recommandations du project. DP/UN/MAU-67-502/2. RIM-FNUD. N.Y. 1975/113 pp. plus annexes and maps).

The study was conducted from 1968 to 1975. Some 16 zones all over the country, covering about 180,000 km<sup>2</sup> were explored by drilling and geophysics (detailed map for each area). A classification and inventory were also prepared (see Exhibit 1-14 and 1-15).

The report also assesses the well inventory established by Ph. Roussel, systematically kept up to 1968, with only sporadic up-dating thereafter. This contained approximately 3,500 entries classified by map sheet and number as well as name. Project work and consultation of later reports lead to new estimate of approximately 9,500 wells for 1974, of which roughly 1/3 were useable. Boreholes account for 6% of the total, modern (improved) wells 21%, oglats and traditional wells 70% and natural sources 3%. Of the boreholes, very roughly 1/3 were estimated to be useable, of the modern wells 3/4 and of the oglats 1/6.

Notice explicative by Moussu et Trompette, RIM-BRGM Dakar, 1966, 20 pp. IGN topographic background.

The sheets of this set of maps show geological structures and series, oases by size group (excl. A 1) cultivated areas (excl. A 1), alluvial aquifers, ground water basins, run-off frequency zones (A 1 only) and water sources by type (oglat, wood-lined and stone-lined wells, ponds and springs). There are also data on static water-level and salinity (<2,2-8 and >8 g/l) where available. Yields are not indicated (only whether dry or in water). A typical profile showing the geological strata is also given. There are minor variations between the maps.

Title and Comment

Développement rural de la région du Tagant. Plan Directeur. RIM/SONADER-AAT/INSTRUPA/GTZ (W. Germany) 1979.

Refer to Annex 1 (Resources Naturelles) and Annex 6 (Infrastructure hydraulique) of the report for detailed comments.

The hydrogeologic map shows aquifers and strata, boreholes, wells and springs with depth, static water level, salinity and yield, where available.

The infrastructure map indicates water sources, dams and oases. For the dams information is provided on catchment area, volume and flooded area.

H. Paloc, Carte hydrogéologique du bassin Sud-ouest Mauritanie au 500,000 et notice explicative. RIM-BRCM Dakar 1962, 35 pp.

Apart from the geological series, this source consists essentially of a well map. Each well is marked with inventory number, static water level; salinity, aquifer type (sandstone, clayey, etc.) and hexagonal diagram of chemical composition (Na, Ca, Mg, HCO<sub>3</sub>, SO<sub>4</sub>, Cl) as available. Contour lines for piezometry and salinity are drawn. Water sources are however, not classified by type as on the other maps.

Title and Comment

For detailed description refer to main report (and its bibliography of specialized reports):

(L. Bourget), Synthèse hydrogéologique et aménagement du sud-est Mauritanien. RIM-BURGEAP. Neuilly-sur-Seine 1966. Tome 1, 88 pp. (Tome II are the maps)

The field work for these maps was conducted during 1956-61 by BURGEAP (Bureau d'Etudes de Géologie Appliquée et d'Hydraulique Souterraine).

Apart from geological formations these maps contain a wealth of information on dams (state of repair, local or government) and water sources. These are classified as cement-well, oplat or unimproved well, spring, ponds. They are further identified as being permanent/temporary and saline (>2 g/l). Yields, where known, are classified as <1.5, 1.5-3 and >3 m<sup>3</sup>/h. Type of aquifer strata, static water level and reference number are also given. Oases - existing and potential - with size estimates and approximate cultivated area by village are also indicated, as well as pasture zones unutilized because of lack of water (>5 km from well).

The 1:1,000,000 sketch map shows the major aquifer formation and piezometric contours.

BURGEAP continued and up-dated this study in 1974-75 (i.e., after the drought), the results of which were published as:

Development de l'élevage dans le sud-est Mauritanien-étude hydrogéologique et implantation de puits nouveaux. RIM-BURGEAP 1976. Vol. I: report (including bibliography of detailed sub-reports). Vol. II annex (Hydrogéology and géophysics, borehole and site description for selected areas).

Water sources were systematically reinventoried. Of the total 1,530 visited, 34% were new, and 13% dry or had disappeared compared to the previous survey. The rainfall deficit had caused some lowering of the static water-levels but by no means in any catastrophic manner; wells were abandoned because of reduction in livestock numbers. Taken as a whole, there was no significant variation in the pasture area lacking water points, although a fair amount of local change had occurred.

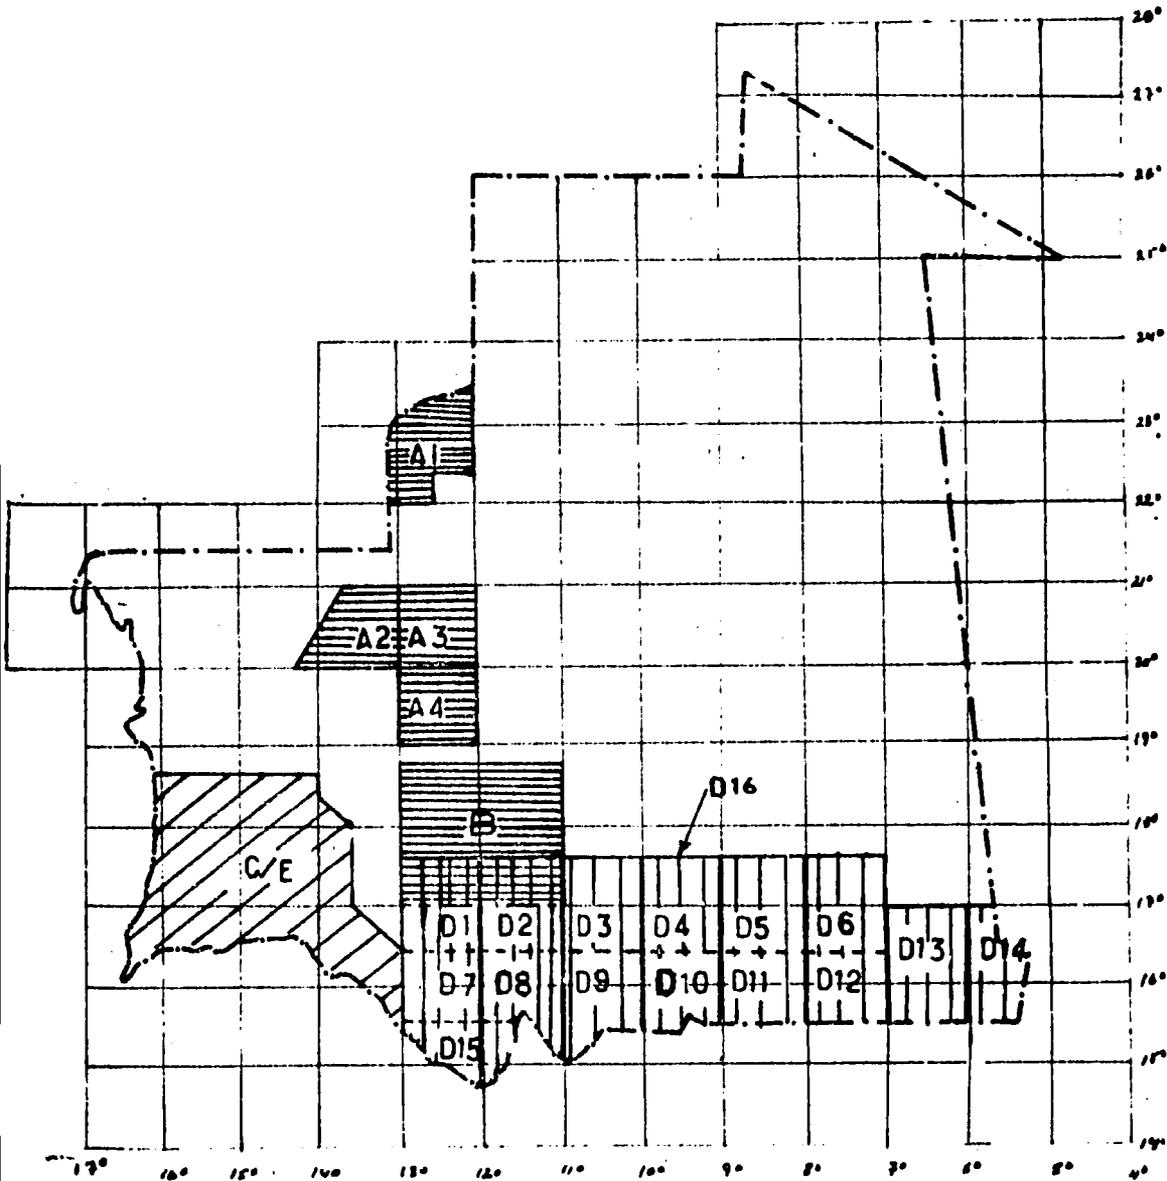

Carte hydrogéologique et structurale du sud-ouest Mauritanien-zone du lac R'Kiz. Essai de synthèse des données anciennes et nouvelles 1:500,000 RIM-PNUD 1975. Commentary Renforcement du Service des eaux souterraines. Shows shallow and deep aquifers. Piezometric contours. Wells are not mapped

## Main Characteristics of Aquifer Groups<sup>a)</sup>

### A - Superficial Aquifers

Very numerous, but localized, in alluvial or sand formation. Shallow (<10m) with water table at a few meters, generally limited to Oueds or topographic depressions between dunes. May be more extensive in sandy zones, especially in the south. Depend directly on rainfall for recharge. Exploited by thousands of low-yielding but functionally appropriate oglats. Also tapped directly by roots of date palms. Total production 25,000 m<sup>3</sup>/day.

### B - Generalized Shallow Aquifers

Cover large areas (100,000 km<sup>2</sup> for the Trarza aquifer), continuous in one or more aquifer strata, generally 10-100m below surface. Yields up to 20-100 m<sup>3</sup>/h possible but depend on variation in hydraulic parameters. Largely exploited by traditional wells tapping only 1-2m of the aquifer and yielding 3-10 m<sup>3</sup>/day. Also by boreholes for towns (Idini for Nouakchott, Bou Lanouar for Nouadhibou). About 50% of production for towns, 40% for rural wells, total 50,000 m<sup>3</sup>/day.

### C - Localized Shallow Aquifers

Associated with various localized geological structures (fissures, alterations, fractures, faults, Karsit, etc.). Characterized by hydraulic discontinuities, thus fragile when not located in good recharge zone. Yields often small, but highly variable 0-50 m<sup>3</sup>/h, though more typically <3m<sup>3</sup>/h. Difficult to find if the structure does not outcrop at the surface. Salinity also varies greatly <0.5-30 g/l. Total production is small, perhaps 7,000 m<sup>3</sup>/day, mainly for pastoral and village wells in southern regions.

### D - Others

Aquifers for which data are generally lacking are still numerous. Classification is very tentative. All deep aquifers fall into this category.

**Note:** Production totals represent estimates of order of magnitude.

**Source:** Renforcement du Service des eaux souterraines. PNUD 1975. Refer to pp. 69-78 for more detailed comments on the major subgroups.

---

a) See Exhibits 1-14 and 1-15.

#### 1.8 Hydrology

Hydrology studies are few and far between, except for the Senegal river (the only permanent stream). The few sparse studies that exist (only 3 before the mid-60s, mainly by ORSTOM) deal with rainfall/runoff and have only lasted 1 or 2 seasons which, given the highly variable and intermittent flows, is insufficient. The observed runoff coefficients vary greatly between areas, between years and between individual floods. There are no studies on infiltration for estimating ground-water recharge).

During 1964-66 a fairly ambitious rainfall/runoff investigation (some 50 rain gauges) was conducted in the Ghorfa and Niorde bassins (5,000 and 1,600 km<sup>2</sup>), covering a major part of Guidimaka.

Results are published in:

G. Jaccou et H. Camus, Etude Hydrologique des Oueds Ghorfa et Niorde et les oualos en amont de Kaédi.  
Rapport définitif 1964-66, ORSTOM, Paris 1967 (127 pp.).

An attempt at mathematical modelling of the Oued Ghorfa was also attempted (deterministic, grid-distributed rainfall/runoff model):

G. Girard, Application du modèle a discrétisation spatiale à un bassin versant semi-désertique, in Appl. of mathematical models in hydrology and water resource systems. Proceedings of Bratislava Symposium, September 1975 (IARS-UNESCO-WMO).

The Gorgol has also been studied in connection with the dam project:

Etude hydrologique du Gorgol. Rapport technique no. 1 (71 pp. total with annex + graphs). (Part of the Etude pour le mise en valeur du bassin de Gorgol, AGL:SF/MAU 3, PNUD/FAO-SCET/SEDES, 1971.)

Studies were conducted in 1970-71; earlier data are also analyzed but they are rather scanty. Contains discharges for Fom Gleita in the Gorgol Noir 1955-65 and 1970-71, and for Agueilat on the Gorgol Blanc for 1959 and 1971. Also daily discharges of the Senegal at Kaédi 1903-65, as well as corresponding statistical distribution of stages for the first and fifteenth days between July and January.

There is a summary of available hydrological data for the area covered by the "Tagant" study (Annex 1, also a special supplement suggesting an extensive hydrological network). For area covered and reference see Exhibits 1-12, 1-13 and Map. B.

100

Recently, the WMO project AGRHMET at the Direction de l'Hydraulique constituted a hydrological section which is gradually setting up a more permanent series of study areas. So far work has started at:

Gorgol Noir at Fom Gleita - flows (discontinued)  
 Gorgol Blanc at Agueilat - flows from 1975  
 Sénégal at Boghé - flow from 1979 (1978)  
 Oued Ghorfa - basin study, from 1980 (for SONADER)  
 Niorde - basin study, to start 1981  
 Lac d'Aleg - water levels and water balance (suspended)

There are plans to extend work to Atar and Kankossa. Two annual "rapports de campagne" have been published so far. A global inventory of hydrological data by station to date was recently published by the Bureau Hydrologique de la Mauritanie, Atlas Hydrologique (1981, 40 pp.)

### Senegal River

The hydrology of the Senegal river is quite well known, having been extensively studied in connection with the OMVS dam projects. Hydrometric observations on river stages started as early as the turn of the century for river navigation purposes. However, the quality and coverage (generally high water, August-December only) leave a lot to be desired and even more so as concerns discharge. Only since the early 1950's, have there been regular and generally accurate observations covering the whole year. There are several gauging stations with long, more or less continuous records along the Mauritanian and Senegalese portion of the river. However, at Matam, Kaédi and Salbé, set up in 1903, and Boghé from 1908, measurements as a rule only pertain to the minor bed. At Podor and Dagana from 1908, tide effects obscure low flows from January to July. This leaves only Bakel, about 800 km upstream from St. Louis, catchment area 218,000 km<sup>2</sup>, where a complete, good-quality series exists from 1903 onwards (up to 1950 July-November, thereafter all year round) (see Exhibit 1-16 to 1-18). Bakel is a key station in another sense also, since downstream there is essentially no further significant regular inflow, the intermittent contribution from the Gorgol being relatively very small. However, there is a net loss of about 3% between Bakel and St. Louis due to evaporation and infiltration.

The basic data source is the monumental ORSTOM monograph, in which all available data have been collected and critically edited. Several daily discharge series have been completed and reconstructed through correlation with other stations, the most important being Bakel.

101x

Monographie hydrologique du fleuve Sénégal, ORSTOM, Paris 1965-1968.

- Part 1: les facteurs conditionnels du régime. 1968 (123 pp.)
- Part 2: C. Rochette, les données d'observation hydrologiques.  
Vol. 1: Stations du haut-bassin, 1966 (119 pp.);  
Vol. 2: Stations de la vallée, 1966 (143 pp.)
- Part 3: C. Rochette, Analyse de éléments du régime hydrologique, 1967. (108 pp.)
- Part 4: C. Rochette, Recueil de données numériques. Vol. 1:  
Hauteurs limnimétriques Bakel-Kaédi, rev. ed. 1966;  
Vol. 2: Diorbivol-Podor, rev. ed. 1966;  
Vol. 3: Delta et Dons, rev. ed. 1966;  
Vol. 4: Débits journaliers aux stations du haut-bassin, 1965;  
Vol. 5: La vallée, rev. ed 1966.

A detailed presentation and analysis of the Bakel and upper basin data (including rainfall) are available in:

Etude de préinvestissement pour la régularisation du fleuve Sénégal - Projet d' un système de contrôle des débits dans le bassin du Haut-Sénégal.  
Nations Unies-Sénégal-Consult; Genève 1970. Vol. 3A:  
Hydrologie; Vol. 3B: Hydrologie-annexes (data listings):

The discharge figures by Senegal-Consult differ somewhat from ORSTOM data, certain adjustments having been made in the upper part of the rating curve. Further discussion and critique of the rating curve anomaly,<sup>a)</sup> as well as an estimate of long return period floods, can be found in:

Etude des crues-types du Sénégal à Bakel. Etude du barrage du delta-Etude hydro-agricole du bassin du fleuve Sénégal.  
SF/AFR/REG 61-10 AGL. FAO-SOGREAH, Grenoble, 1972. Rapport final, Vol. II, Annexe 1 (22 pp.)

As part of the "Etude hydro-agricole", a compartmentalized numerical model of the river was developed and used to test various dam operation scenarios. This model is described in detail in a 3-volume report "Modèle mathématique de la vallée du Sénégal" (SOGREAH, 1970, 384, pp + annexes).

a) The ORSTOM curve is considered an under-estimate.

1021

Use of the model is also made in the environmental impact study:

Partial report for river and estuary regimes (140 pp.)

This study, conducted in 1977-78 (Assessment of Environmental effects of the proposed developments in the Senegal river basin, OMS, Garnet, Fleming, Corddry & Carpenter Inc. Harrisburg, Pa/ORGATEC, Dakar, n.d.) also includes the only major study on water quality available.

Partial report for water quality (98 pp + annexes).

Synthesizes available literature, as well as field work undertaken on nutrient concentration, salinity intrusion and dissolved oxygen (for which little previous work existed). Two mathematical models - for dissolved oxygen and for estuary salt intrusion - were applied to assess effects of developments. Tributaries are not covered.

10/1

Exhibit 1-18The Duration of Active Flooding of the Senegal River at Bakel  
1904-64

Active flooding is assumed to commence when discharge exceeds 2,000 cubic meters per second and is portrayed by the bar.

Source: The Guidimaka Region of Mauritania (1977).

## 1.9 Rainfall and Climate

Systematic collection of meteorological data dates back to about 1920; earlier data is unreliable. However, this concerns rainfall; other variables are much more recent. The first synoptic stations opened in the 1930's in response to the growing needs of aviation. The full complement of measurements actually start during the 1950's. At present, there are 12 synoptic stations, 7 recently established agrometeorological stations and 45 simple rainfall gauges, of which 30 are very recent (1978-1980). See Exhibits 1-19 to 1-23 for details of data available.

There are currently two organizations actively collecting meteorological data in Mauritania, ASECNA (Association pour la Sécurité de la Navigation Aérienne) and, since 1977, the AGRHYMET project under the Direction de l'Hydraulique. An official meteorological service exists, but its functions are assured by ASECNA, whose chief focus, quite naturally, is in the requirements of aviation. AGRHYMET, on the other hand, has concentrated on micro-meteorological data of agricultural interest and improvement of rainfall coverage, as well as hydrology per se. At present, neither has the capacity to analyze data. All resources are devoted to network operation and data collection and verification. ASECNA sends its data to the regional center in Dakar where it is checked, computer-processed and disseminated. AGRHYMET relies on the regional meteorological center in Niamey, Niger, but plans eventually to have its own micro-computer in Nouakchott. However, transcriptions of available data (daily, monthly, yearly) are readily available upon request.

The archives of ASECNA contain the daily journals organized by month, as well as a secondary file with monthly and annual values. These, however, are not wholly free from occasional transcription and summation errors. ASECNA also receives copies of AGRHYMET data.

Exhibit 1-24 presents annual rainfall series for the long-term stations according to the ASECNA secondary file. Exhibits 1-25 to 1-25J presents isohyetal maps for the last 10 years, as well as the 30-year average, based on the same data.

- a) First complete year usually following the year indicated.
- b) A/M = agro-meteorological station (separate from ASECNA stations where such also exist). All others are rainfall gauges only.
- c) Old OMVS station.

1124

Exhibit 1-22Data Collected at Synoptic Stations<sup>a)</sup>

Maximin/minimim air temperature (standard cage)	Every third hour (not all stations do 00 and 21h.).
Vapor tension/relative humidity/dew point	As for air temperature. Wet/dry bulb method. Calculations checked in Nouakchott.
Minimim/maximum ground and soil (10 cm) temperature	06, 12, 18h. Soil temperature only a few stations.
Pressure	00, 06, 12, 18h. (not all do 00h.)
Insolation	Hours - AM and PM.
Cloudiness	Octets, times as for air temperature.
Wind direction and average speed	At 12m, direction to nearest 10 degrees. Times as for air temperature.
Evaporation	Piche evaporimeter. Per calendar day (previously day and night). Nouakchott also has a class A pan (variable data quality).
Rainfall amount and duration	Day (06-18h.) and Night (18-06h.). Not all do duration.
Narrative and Phenomena	Clouds, visibility, thunder, sand, etc. <sup>b)</sup>
Global radiation	Hourly totals from recorder. Nouadhibou, Nouakchott and Kaédi. Processed by AGRHYET. Gaps due to instrument problems.
Atmospheric profile (high altitude wind)	Atar, Nouakchott, Nouadhibou, Kiffa, Nema (00, 05, 12, 17h.) and Bir Moghreïn (12h.) Manusî tracking. Nouadhibou also has facilities for radio and radar tracking.

- a) Reflects the current (maximin) program. It shortens as one goes back in time. There is also some variation between stations. Older observations are usually 3 times a day at varying times (06, 13, 18h; 08, 13, 17h; 08, 16, 22h). Gaps of longer or shorter duration are not uncommon. The simple rain gauge stations report rainfall by day/night, as well as duration and phenomena. However, the supplementary data are of dubious reliability, except recently for the AGRHYMET-supervised stations.
- b) It is not known how complete and accurate recording of phenomena are, especially in the older records. There are 3 official categories for sand: "brume sèche" - dust in suspension, "chasse sable" - wind greater or equal to 7 m/s, and "vent de sable" - wind greater than 16 m/s and visibility less than 1 km. However, it is probably safer to subsume all 3 under the general label of "sandy days" for statistical use.

113

Exhibit 1-23Data Collected at AGRHYMET Agro-Meteorological Stations

Maximum/minimum air temperature <sup>a)</sup>	}	3 times daily (08, 12, 18h).
Maximum/minimum ground temperature (+10, +50, at -10 cm)		
Vapor pressure/relative humidity (dry/wet bulb)		
Cloudiness		
Insolation		
Evaporation		Class A pan, day (08-18h) and Night (18-08h)
Wind direction and average speed		At 12a, hourly (from recorder)
Rainfall amount and duration <sup>b)</sup>		Day and night
Phenomena		Daily

---

a) Thermographs installed.

b) Pluviographs have been installed, but no usable records have been produced due to sand clogging.

Equipment for soil moisture and wilting point measurements are available, but such data are only collected on demand.

Some Useful References

Ph. Roussel, Elements Statistiques pour une étude de la pluviométrie en Mauritanie, Bureau Hydraulique, Nouakchott, 1969.

Daily rainfall data up to December 1968.

Ph. Roussel, Données Climatologiques en Mauritanie, Bureau Hydrogéologique, Nouakchott, 1968 (35 pp.)

Mean monthly and annual values for rainfall, rain days, max. and min. temperature, relative humidity (at 06, 12, 18 h) and Piche evaporation for all 26 stations up to 1967. For rainfall, also frequency of rains greater than 10, 20, 50 mm, and intensity above 50 mm/h, as well as 24 h maximum rain.

The validity of Piche data as a measurement of evaporation is debatable. A correction factor of 0.6, based on Sahel experience, is normally applied to obtain estimated free-surface pan evaporation. However even these values should be treated with caution. Typically, the instrument is placed in the thermometer cage, thus reducing influence of wind and sun. Apart from instrument limitations (small area), handling problems are common.

Y. Brunet-Moret, Etude générale des Averages Exceptionnelles en Afrique Occidentale - Mauritanie, OESTOM, 1964.

Also contains discussion of rainfall data reliability. As might be expected there are various types of errors in the data, both systematic and random. Some stations are non-representative for their areas because of proximity to topographic anomalies (Moudjeria, Tamchakett). Other gauges are badly placed (close to trees, houses) or otherwise improperly set up; changes in location, sometimes a kilometer or more, have occurred without being noted. Before 1930, equipment was variegated and generally non-standard. The most common observation and recording errors are systematic recording of next higher full millimeter and confusion between 1/10 and 1/1 millimeter units. Small rainfalls tend to be ignored and are usually totalled with the next substantial rain, with evaporation loss in between, thus reducing the number of raindays and rains less than 10 mm. Morning dews have sometimes been reported as precipitation. Except at synoptic stations, standard measurement times have not generally been adhered to, the observer rarely venturing out before the end of the rain, thus introducing errors in day/night distribution. However, all things considered coverage and validity on the whole is good, especially after 1930, excepting major gaps during the war and just after independence.

116x

Ball - Transcription of ASECNA Records of Precipitation in Key Stations (Egyptic and Others), World Food Program, Nouakchott, 1974 (40 pp.)

Monthly mean rainfall series to 1973 for Aïoun, Aleg, Atar, Akjoujt, Bir Moghreïn, Boghé, Boutilimit, F'Derick, Nouadhibou, Nouakchott, Nema, Kiffa, Kaédi, Rosso, Selibaby and Tidjikja.

République du Mali. Précipitations Journalières de l'Origine des Stations à 1965, Comité Interafricain d'Études Hydrauliques, Ministère de la Coopération, ORSTOM, Paris, 1974 (1081 pp.)

Daily, monthly and annual totals. Rainfall data for Mali are relevant to studies concerning southeast Mauritania. Similar volumes exist for several other francophone countries in West Africa. Station locations and opening years are summarized and mapped for the zone of the Senegal basin (including Mali) in the Senegal - consult upper basin hydrology report (see Hydrology Section).

J. Bircoulon, Les Données Hydropluviométriques de la Sécheresse Écante en Afrique Intertropicale. Comparaison avec les Sécheresses "1913" et "1940", Cahiers ORSTOM 12:2, Paris, 1976 (174 pp.)

Detailed, thorough discussion. Selection of reliable long-term rain and discharge series included. Concludes that the 1968-74 drought was more severe than the 1940-44 drought but somewhat less severe than the 1910-14 one, which it otherwise resembles.

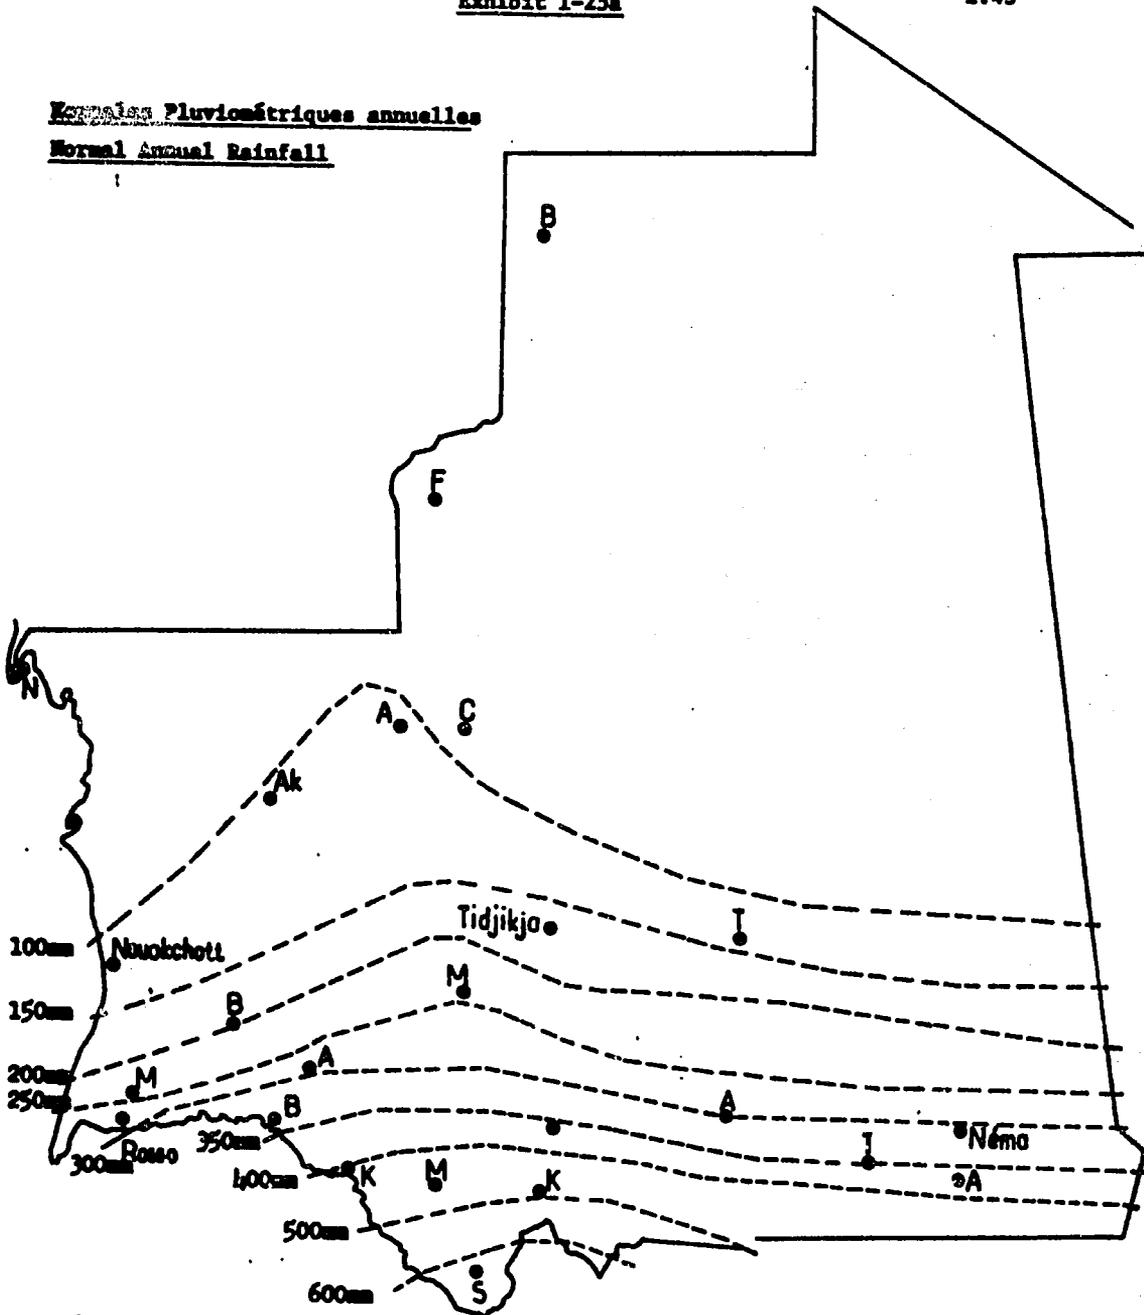

S.E. Nicholson, Climatic Variation in the Sahel and Other African Regions During the Past Five Centuries, Journal of Arid Environments 1:1978, (22 pp.)

Analyzes all types of disparate climate proxy information from historical sources (including Mauritanian chronicles) and compares with pleistocene conditions. It seems that in Mauritania and Senegal wetter conditions prevailed during the 16th and 18th centuries, though several severe droughts are recorded since about 1680. This was followed by a marked trend to increased aridity from the late 18th century, interrupted by increased rains in the late 19th century.

The rainfall data presented as annual isohyet maps are necessarily very schematic and should be treated as such. The number of stations is very small and their areal representativity is not always good. Spatial variability is very high; differences up to 200 mm within less than 30 km are quite possible.

1.10 Selected Moor Geographical Terms

adrar	- mountain range
aftout	- long, wide valley; by extension enlarged area with little sand
ain	- spring or masonry-lined well
ouinet	- small spring or well (diminutive)
ajar	- resident pond from oued flow at foot of slope or bank
aklé	- continuous field of live dunes
souligue	- residual pond, particularly behind a dam
archane	- small water hole, particularly in the bed of an oued or pond. By extension well dug in such a spot
barkhane	- crescent-shaped, highly mobile dune with horns facing down-wind
baten	- plain or depression, generally at foot of escarpment. Often generously covered with sand
batha	- sandy bed of an oued
bir (bouir)	- well, particularly a lined well
chelkha	- wooded depression, often site of pond during rainy season
chig (chgneig)	- cleft in rock, typically with a spring
dahr	- escarpment. By extension the plateau bordered by the escarpment
daya	- small, temporary pond formed on impermeable ground during rainfall
erg	- dune field
foum	- passage between or across a dune
grara (plural grair)	- cultivable, low-lying area flooded by oued flow
guelb	- isolated peak

guelta	- well
hassei	- small well
hofrate	- extensive basin collecting surface inflow
iriji	- spring
kedja	- isolated mountain
khat	- long straight depression separating two areas. By extension oued without visible flow
melzen	- backwater (marigot)
oglat (plural ogol)	- hand-dug shallow well tapping superficial aquifers (as in oases)
oued	- intermittent stream
sebkha	- depression containing salt or gypsum, deposited by evaporation. Often ancient lake bed
tamourt	- closed depression lacking outflow, generally wooded
tayaret	- long, fairly wide depression marking ancient river bed, often meandering

 Etude Mauritanienne No. 6  
 IFAN-Mauritanie. St. Louis 1955 (70 pp.)  
 Defines about 400 terms.

1.11 Selected Agro-Geomorphological Terms in the Senegal Valley  
(mostly of Toucouleur origin but used generally)

- walo - alluvial basin behind levee, flooded yearly. Recessional agriculture
- hollalde  
rapere - upper segment of walo. Also hollalde "blanc"
- hollalde  
wallera - lower segment of walo. Also hollalde "noir"
- falo - upper segment of river bank. Recessional agriculture
- fondé - river levee (top of bank). Dryland cultivation
- Note: The distinction between falo and fondé is not always clear, and they are often grouped together.
- diétri - general term for non-alluvial areas. Culture zone not reached by flood-water; by extension rain-fed. Dryland agriculture in general.

## 2.1 Overview

This section presents a selection of basic population and settlement data on Mauritania as they exist in preliminary and official form.

Any demographic analysis must essentially rely on national census data. In Mauritania, the most recent was undertaken over a four-month period from December 1976 to March 1977. It was carried out in two stages by the Bureau Central de Recensement (BCR or BCRP) at the Direction de la Statistique (Ministry of Finance), which is officially responsible for the collection and publication of population data. The first was exhaustive and concerned the sedentary population, considered by definition as people residing in a locality with at least one permanent structure used as dwelling or service activity. The second stage was a sample survey of the nomad population (covering approximately 12%) which classified as nomad any person who spent more than 6 months each year in a locality devoid of permanent physical structure (as defined above). The sedentary census distinguished between rural and urban sedentary and included, in addition to residential information, data on migration, language, literacy, skills and occupational status. For the nomads, the questionnaires added limited questions about fertility and mortality, movements and composition of herds.

The 1977 survey also included a village file (fichier village) which aggregates individual-level data (sedentary population) and village-level data for some 2,340 villages.

Demographic information is also available from a 1965 rural survey (approximately 10% sample). It was conducted over an entire year and includes fertility data. The excluded urban population was surveyed in 1961-62 as well as in 1975.<sup>(1)</sup> At the time of the 1965 survey, the nomad population was defined as persons not residing in a town or a village. It should be noted that, as a result of the dramatic changes in the sedentarization pattern which evolved during the 60's and 70's, the definition of nomad was altered in 1977; nomads were defined as (and limited to) individuals living in moveable encampments, thereby for example, allowing transhumant Peulhs to be counted as nomads. (See "Definition of terms used in 1977 Census" below.)

Earlier data are limited to the classic "Recensement Administratif" conducted regularly for fiscal purposes (see list of reference). However, the quality of these data is such that detailed demographic analysis is extremely difficult. These were discontinued in the early 1970's because of the drought.

On the whole, the RAMS has found that the 1977 census data are quite cohesive and can be trusted. Caution should, however, prevail regarding fine-line data, including detailed age-breakdowns, detailed professional categories (especially when the number of individuals falling into separate categories is small), and individual settlement data.

The Direction de la Statistique has experienced delays in compiling and publishing final tables of the 1977 census. In 1979, realignment of the administrative boundaries which existed at the time of the survey caused part of the delay. Data processing is still under way. The information which follows summarizes the tables made available to RAMS by the BCR as of March 1981 and draws on earlier censuses.

(1) Nouakchott was also covered in June 1964 as part of the pilot exercise for the 1965 survey. For a detailed summary of all population data for Nouakchott see Pitte, Nouakchott - Capitale de la Mauritanie, Paris, 1977.

## 2.2 Selected Annotated References

### Censuses and Major Socio-Economic Surveys

Enquête démographique 1965. Vol. 1: Methodologie. Vol. II Resultats définitifs. Secretariat d'Etat aux Affaires Etrangères/INSEE/SEDES, Paris, 1972 (190 + 330 pp.).

Vol. I also contains a detailed discussion of the procedure used to extrapolate to total population and to adjust age-sex data. The use of the administrative registers of nomad fractions is extensively discussed, since it was the base for the sample census-taking. Vol. II contains, apart from standard tabulations, detailed data of tent/concession and household composition and structure. There are also data on activities, occupation and enrolment, as well as a substantial section on fertility and other demographic parameters. The data are often broken down by Moor social categories and ethnic groups (or at least nomad/sedentary).

Etude socio-économique du bassin du fleuve Sénégal, Rapport général, OMVS, étude provisoire, aout 1980, 7 vol.

The field work for this study, which covers both the upper and the lower valley, was conducted in 1977-79 and consisted of a year-long qualitative observation part, as well as a series of quantitative surveys up-dating and expanding the MISOES study. The survey covered the following subjects:

- irrigated yields on some 900 fields in relation to agronomy, work budgets, social situation. A specialized study to identify socio-economic factors behind very high and very low yields is planned for separate publication.
- revenue/consumption budget survey of farmers cultivating traditionally or irrigated land.
- production system and cost of irrigated agriculture. To be published separately.
- construction and start-up of irrigation schemes. Problems of land tenure, organization and introduction of new techniques.
- production and consumption of wood and charcoal. Survey of actual family consumption (2 villages on Mauritanian side) as well as profile of professional charcoal makers. Detailed results to be published separately as a special report.
- urban environment and relation town/country. Four towns and some 420 families in 20 villages on the Mauritanian side. Also a smaller survey on village traders, as well as urban markets.
- artisanal and industrial activities. To be published as a special report.

The individual volumes are as follows:

- Avant-propos (16 pp. + maps). Includes bibliography.
- Partie A: Présentation générale du bassin du fleuve, (ca. 120 pp.) In addition to a short review of climate, hydrology, etc., presents historical, anthropological resumé and fairly detailed estimates of net irrigable areas (schematic map in the Foreword).

135

- Partie B: Le milieu traditionnel, (ca. 120 pp.)  
Main results (not covered by other parts) of the OMVS work, ORSTOM study (see below), as well as older work. Includes section on migration and on land tenure in the Soninké country. Also chapter on wood and charcoal (33 pp.).
  - Partie C: L'introduction de la culture irriguée, (ca. 200 pp.)  
Results of the surveys.
  - Partie D: Le milieu urbain et les relations ville/campagne  
Results of the surveys.
  - Partie E: Interprétation des résultats dans le domaine du développement rural, (ca. 100 pp.)
  - Partie F: Interprétation des résultats dans les autres secteurs. Les problèmes intersectoriels
- These last two parts contain syntheses, conclusions and proposals for action. Part E has an assessment of wood/charcoal production and consumption (11 pp.).

Partly in coordination with the above study, ORSTOM, under the direction of A. Lericollais, conducted an exhaustive survey (1970-74) of the population and areas concerned with recessional agriculture (up to Bakel). Some of the results have been incorporated in the above report, others have been published in various ORSTOM publications. Final report is being prepared.

Manuel de l'agent recenseur - Recensement des populations sédentaires, Recensement National de la population, 1976 (85 pp.)

In the absence of a definitive methodological description, this manual is the most detailed description of the census procedures available. Particularly useful for the operational discussion of the individual questions.

Le Moyenne Vallée du Sénégal - étude socio-économique, Ministère de la Coopération/INSEE, Paris, 1962 (368 pp.)

This is a well-known pioneering MISOES study, conducted in 1957-58 and covering the valley up to Demba Kane (area of the Dagana Dam), includes most of the Soninke country. Subjects covered in an exhaustive fashion by various surveys include demography, migration, agricultural production nutrition, health, family budgets (revenue/consumption), as well as schooling, dwelling and work budgets. The sample size varies according to survey and strata between 1/5 and 1/100, but generally 1/50 or 1/100.

Recensement démographie des agglomérations, (enquête 1961 - 1962), Bulletin statistique et économique, No. 3. Direction de la Statistique, Nouakchott, 1964

Covers 27 localities: urban centers as well as all then-existing chefs-lieux and some other administrative centers. Conducted between November 1961 and August 1962. Includes family and household socio-economic data, ethnic and professional breakdowns. Also fertility data (though of questionable quality). Summary tables of "recensements administratifs" population figures for the whole country 1944 - 1959.

Le Recensement des nomades mauritaniens, Y. Paccou, Groupe de Demographie Africaine, Paris 1979 (71 pp.)

Methodological description of 1977 nomad census. Also contains short discussion of the old "recensements administratifs".

Résultats de l'enquête sur la population et l'habitat dans les principaux centres urbains de la Mauritanie, Mars, 1975, (also titled: Rapport sur le stage effectué à la Direction Statistique . . . par . . . J. M. Dzouali . . . BCRP), Direction de la Statistique, Nouakchott/Centre Européen de Formation Statistique Economique des Pays en Voie de Développement, Paris, 1975 (67 pp.).

The survey, actually a census, conducted during January - March 1975, covered 17 urban centers (5,000 + population and other regional capitals). Results were presented on population structure (child/adult, sex, size of household), as well as on dwellings and other structures (type and size of dwelling by size of household, functional use).

Seconds résultats provisoires du recensement général de la population, (Population au les Janvier, 1977). BCRP, Nouakchott, 1978) (54 pp.)

So far the most recent published results. Data on sex-age distribution, literacy, economic activity for sedentary population based on 5% sample. Total population figures are based on enumerated presence at the time of census. Also contains definitions of key census concepts.

Various computer print-out tabulations of the final figures are available at the BCR. Since complete census data are stored on the Government computer (Direction de l'Informatique), it is possible, at least in theory, to run tailor-made tabulations. Publication of final results is awaited.

## 2.3

Definition of Terms Used in 1977 Census

(1965 survey terms given in parentheses where substantially different)

<b>Camp (ca mpement)</b>	Group of households normally staying together all year long. (1965: similar to encampement but may include permanent houses, "non-villages").
<b>Encampement (aire de campement:)</b>	Inhabited place composed exclusively of moveable dwellings (tents, huts).
<b>Household</b>	Group of people economically interdependent and living together. (1965: implicitly based on family connection, e.g., some servants considered as distinct households even though living completely together with their employer).
<b>Nomad</b>	Person staying more than 6 months per year in a camp. (1965: person, essentially Moor, not living in town or village).
<b>Place of census/ administrative affiliation</b>	<u>For nomads:</u> Place of census is department at time of census. Place of administrative affiliation (rattachement administratif) is traditional administrative point of registration with the authorities of tribal fractions (fakhad).
<b>Present resident</b>	<u>For sedentary:</u> present pertains to actual place (locality/department/region) at census time but also includes residents temporarily in the field or abroad for less than 6 months; resident living in village more than 6 months per year.  <u>For nomad:</u> presence is taken at household level (short absences and visits ignored). Resident is nomad who spends whole or major part of year within Mauritania. Non-resident (nomad abroad) is nomad administratively affiliated to Mauritanian department but spends major part of year abroad (essentially Mali). These may be included in total population figures (presence = affiliation) but not in structural analysis of nomads.

138 X

<b>Profession</b>	Principal profession which represents most important source of revenue, occupies largest portion of time, or last profession exercised and or which unemployed received training.
<b>Sedentary</b>	Person staying more than 6 months per year in a village or town. (1965: person living in village).
<b>Town/urban center</b>	Locality with 5,000+ inhabitants or regional capital. (1965: 27 administrative centers which had been studied in 1961/62)
<b>Village</b>	Inhabited locality not being a town, containing at least one permanent structure for use as dwelling or service activity (school, mosque, etc.,). Starting from center, all dwellings visible to naked eye from another dwelling in village were considered as belonging to the same village, except where two groups of dwellings traditionally considered distinct (different name, chief). (1965: locality defined as "village" according to administrative classification and local custom).

10 Guidimaka	63.4	83.2
11 Tiris Zemmour	15.8	22.5
12 Inchiri	24.6	17.6
<b>Total</b>	<b>1,029</b>	<b>1,339.7</b>

- a) 1965 figures adjusted to correspond to 1977 regional divisions. The 1965 survey was not stratified by region; therefore regional breakdowns should be treated as estimates (+/-5% to 7%). The 1965 report variously gives the census epoch as mid-1965 and January 1, 1966. Mid-1965 is retained as being the most correct since the survey lasted throughout 1965. The report estimates the coefficient of variation for the population as a whole (sedentary + nomads) at 3.6%. This gives a range of 995,000 - 1,005,000 total population at 95% confidence level, with corresponding growth rates 1965/77 of 2.1-3/4% per year. This does not take into account any systematic error in either estimates.
- b) Nouakchott 1965 extrapolated from 1964 SEDES census.

2.5 Urban PopulationNote on the Population of Nouakchott

At the time of the 1976/77 census, the capital of Mauritania was divided into 5 wards (arrondissements) commonly referred to by number.

In mid-1980, by government decree ward limits were modified to reflect population shifts and to reduce pressure on the more heavily populated wards. The numbers were replaced and a 6th ward was added to encompass Toujounine, a newly settled area some 7 km east of the main center.

The following map identifies the limits of the new wards. The 1980 population estimates are:

Tayaret	40,000 formerly 1st arrondissement
Ksar	10,000 formerly 2nd " "
Tevrakh Zeina	24,000 formerly part of 3rd "
Sebkha	40,000 formerly part of 4th "
El Mina	53,000 formerly part of 5th "
Toujounine	6,000 new arrondissement
Total 173,000	
Figures rounded.	

Source: Ward Prefects and RAMS adjustments

For a precise delimitation see Decree 70.199 of August 1980. It is important to note that the highly mobile and seasonal urban population can vary 30%, increasing during dry season (periode de soudure) and rainy (l'hivernage) season.

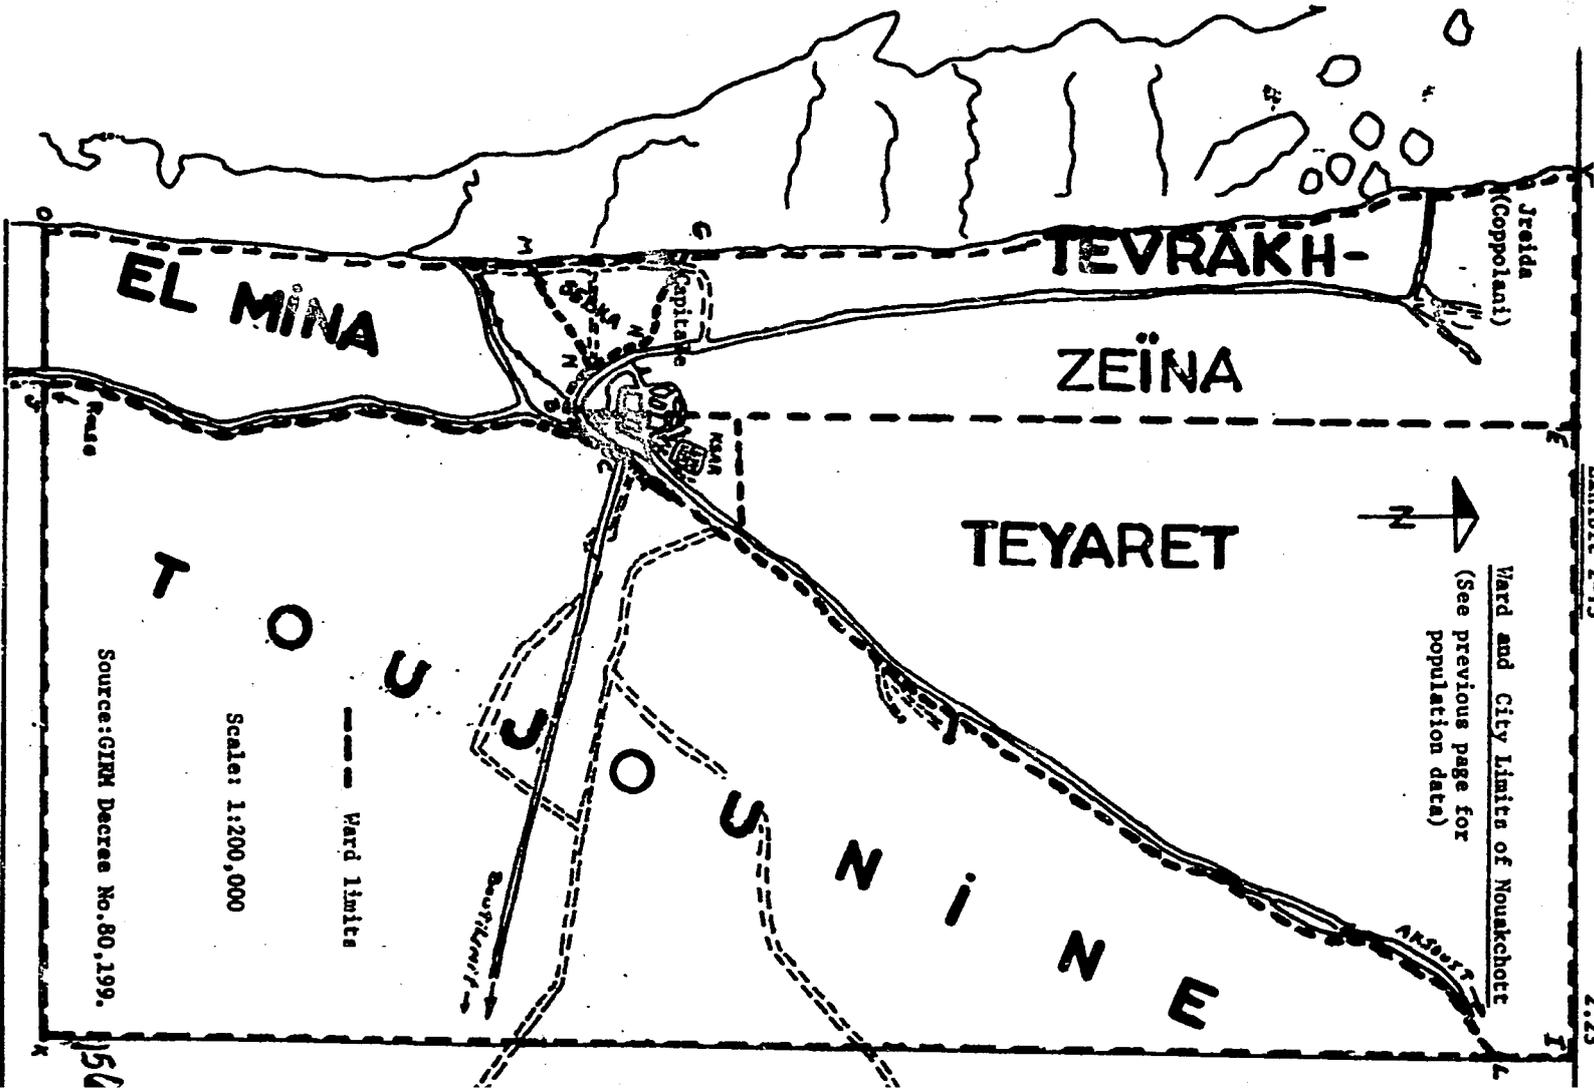

Exhibit 2-14

Evolution of Urban Population (1961-1977)  
 (By size in descending order as of 1977)

City	Population (000)		% Average Annual Growth Rate

Exhibit 2-17

2.6

Nomad PopulationsNomads: Intention to Sedentarize

	% of Nomads
Already settled	4
Plan to settle within coming year:	
Nouakchott	0.3
Other town	1
Village	4
Plan to settle later:	
Nouakchott	0.4
Other town	2
Village	13
No intention to settle	76
Total	100.0

Figures should be taken as indicative only. There have as yet been no follow-up studies on actual rates of sedentarization, nor of the permanence of settlement. Presumably, medium-term rainfall conditions play a significant role in determining actual behavior. Overall, 1975 and 1976 were better than the preceding three years but about 14% below 1967-1970 period.

Source: BCR, 1977 Census, provisional figures (numbers rounded).

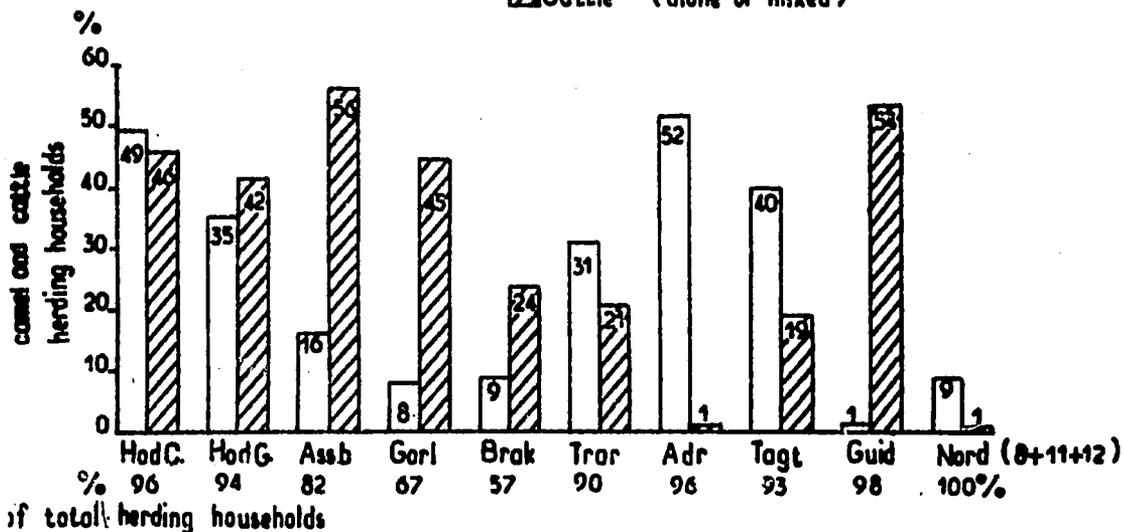

Exhibit 2-20Nomad Households by Herd CompositionNational

Type of Herd	Herding Households (%)
Camels only	4
Camels and cattle	7
Camels, sheep and goats	22
Cattle, sheep and goats	21
Cattle only	5
Sheep and goats	24
Goats only	16
Sheep only	1
<b>Total</b>	<b>100</b>

Number of herding households: 79,900 which represents 87% of total nomad households.

Regional

□ Camels (alone or mixed)  
 ▨ Cattle (alone or mixed)

Note: The difference between the percentage of herding households and the sum of Camel and Cattle herders depicted by the bar chart equals households who own only goat and sheep. (E.g., Hodh C. 49% camels + 46% cattle = 95%, therefore, 1% goats and sheep = 96% of total herding household.)

## 2.7 Population by Agro-Ecological Zones<sup>a)</sup>

The distribution of the sedentary population according to agro-ecological zones is established by assigning individual villages to zones in accordance with their geographical location (see Agro-Ecological Map in Production Section). Where there is inter-penetration of several zones, the village is located according to the predominant occupation of the inhabitants of the village as defined in the 1977 census lists (i.e., oasis agriculture, recessional agriculture, pastoralism).

The nomads are distributed among zones according to the area in which they were enumerated in 1977.

---

a) As defined in RAMS report Agro-Ecological Zones, 1980. See also chapter 6 of this report for greater details.

## Chapter 3 Human Resources

### 3.1 Overview

This section presents a selection of basic data on the human resources of Mauritania as reflected by data on education and manpower/employment.

There are essentially two major sources of nation-wide data<sup>1)</sup>, the 1977 census and the Ministry of National Education. These have been supplemented by several RAMS surveys covering the modern and urban formal sectors and rural skills.

Formal education statistics are obtained through questionnaires sent out annually to each Regional School director who, in turn, distributes them to all the schools in his region. The questionnaires are collected and verified, at least in theory, by him before being returned to the ministry. The data reflect the situation at the time of the survey rather than the yearly average. Depending on the weather, the year-end student population can fluctuate up or down 5-6% from the survey figure (usually around mid-year).

Non-formal education by its very nature has not and is not being covered systematically. At present the RAMS report Non-formal Education FS 3-3 (1981) is the only general synthesis available.

In terms of manpower/employment, only the modern, salaried sector witnesses a more or less regular collection of data through the Direction du Travail.

There is limited literature on the modern sector. One study, however, is particularly useful:

G. Khan, D. Dvir et R. Jourdain, Le Secteur non-'structure' "Moderne" de Nouakchott, BIT/ILO, WEP 2-33/Doc 4, Geneva, 1978 (150 pp.).

This most recent report is based on surveys of Nouakchott's non-formal sector. Includes analyses of data on apprenticeships, employment and investments. Contains information on salaries, value added by sector, training and modes of management. A useful composite of the Nouakchott entrepreneur is presented in Annexes along with questionnaire and instruction manual.

---

1) For the Senegal valley the various socio-economic studies contain a wealth of human resource data. (See references in the section on Population.

3.2 General Education and LiteracyExhibit 3-1Literacy Level by Urban/Rural and Sedentary/Nomad(in % of the Population Aged 6 and Over)

### 3.4 Non-Formal Education

For a good overview, see RAMS report Non-Formal Education, S3-3 in particular Table 1 "Types of Non-Formal Education Directly Linked to Productive Work", which groups activities by the following categories: agriculture, herding, fishing, rural development training, water resources, management, cooperatives, housing, crafts, vocational training, tertiary and government, maternal and child care, nutrition, public health, as well as adult literacy and environmental protection. Religious and cultural activities are also covered. For each activity there are data on clients, trainers and location.

#### RAMS 1979 Skills Survey

The survey consisted of a series of questionnaires (for methodology, see Annex A) designed to assess the qualifications or skills of people in traditional occupations. It covered over 1,000 cultivators, herders, shopkeepers, craftsmen, fishermen and women in 38 villages spread over the country. The questions focused on:

- what the general nature of existing skills is, including type of technology used, management procedure and financing.
- the means by which skills are gained and transmitted, including the influence of family background, schools, training centers and extension services.
- the felt needs of the members of each socio-professional group.

The main results are presented in the form of summary "profiles" of each group. For further details see Non-Formal Education report.

Exhibit 3-18Institutional Summary of Programs in Non-Formal EducationAccording to Administrative Affiliation of SponsorsA. Government of Mauritania

## . Rural Development Services

- Agricultural Extension Service
- Livestock Service
- Environmental Protection Service
- Cooperatives Service
- SONADER
- Water Resources Service (Service de l'Hydraulique)

## . Public Health Department

- Hospitals (certain cases)
- Dispensaries (certain cases)
- Maternity Clinics (certain cases)
- PMIs (Mother and Child Protection Centers) (certain cases)
- CRNs (Nutritional Recovery Centers) (certain cases)

## . Ministry Education (adult literacy)

- . Ministry of Culture, Youth and Sports (National Library, Museum, Sports program)

B. Autonomous Public Agencies

## . SNIM (National Mining and Industrial Company)

- Industrial Training Centers

## . SONELEC (National Electricity Company)

- Worker Training Centers

C. Private Companies, Modern Sector

## . Apprenticeships

## . On-the-job-training

## . Counterpart training (for Mauritanization)

207

**D. Traditional and Non-Structured Sector**

- . **Apprenticeships**

**E. Indigenous Systems and Organizations with Little or No Government Assistance**

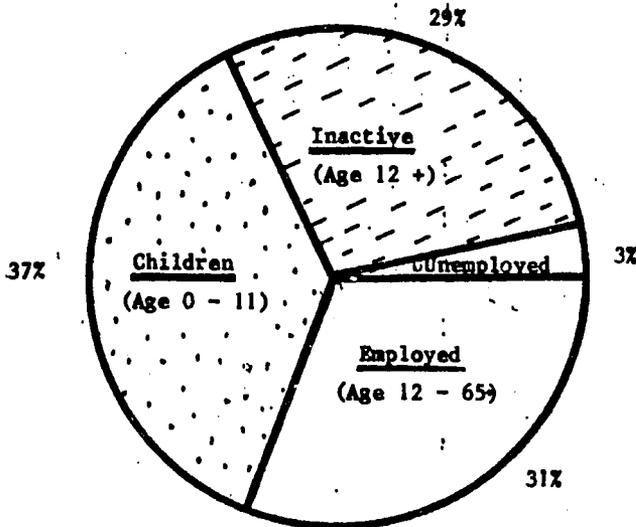

- . **Mahadras**: (Traditional Islamic learning primarily for adolescents and young adults. Some teaching of "modern" subjects in the larger ones. Certain Mahadras receive a small subsidy from the Ministry of Justice and Islamic Affairs).
  - **Ecoles Ben Aneur**: (Traditional Islamic learning oriented to native Arabic speakers taught in classical Arabic. Some 143 schools in the country, 3 of which in Nouakchott, rest in the rural sector. Appear to have highest female enrolment figures of any coeducational institution. Some teaching of "modern" subjects).
  - **Ecoles Fellahis**: (Transitional schools offering Islamic learning as well as "modern" subjects to youth and adults).
- . **Déligués Sanitaires** (Community Health Workers)
- . **Non-formal Private Schools** (mainly urban, giving literacy in French or Arabic as well as tutoring to those who tend to take exams for the formal educational system; no government subsidy).

#### 4.1 Overview

Health and nutrition are inter-related factors in the context of a country's socio-economic development. This chapter presents basic data selected to assist in the identification and in the planning of integrated health/nutrition program at the national and regional/local levels. It begins with a sociological profile of Mauritania's dominant ethnic groups, presented schematically for purposes of simplification.

It concludes with a section on income and consumption which provide data on the purchasing capabilities of rural populations and current consumption patterns which are intended to be used in association with the Nutrition and Health tables.

## 4.2 Sociology

The diagrams which follow (accompanied by descriptive notes) represent the social structure, the socio-political organization and the socio-economic relationships of the three major ethnic groups of Mauritania: the Moors, the Halpoularen (Toucouleur and Peulhs) and the Soninké. They express generally accepted information for each of these societies. Missing are the nuances, the complexities of the rural-urban relationships, the upheavals of change in all its forms, as well as the changing relationships within and between the different ethnic groups, which cannot be shown schematically. Diagrams should be thought of, therefore, not only as outlines but as memory charts, best understood after reading the literature on the societies considered.

For bibliographic references and analyses on the traditional and changing social groups, see Sociological studies of the RAMS:

### I. Sociological Profiles:

- 1) The Moors
- 2) Black-African Mauritania

### II. Studies in Social Change:

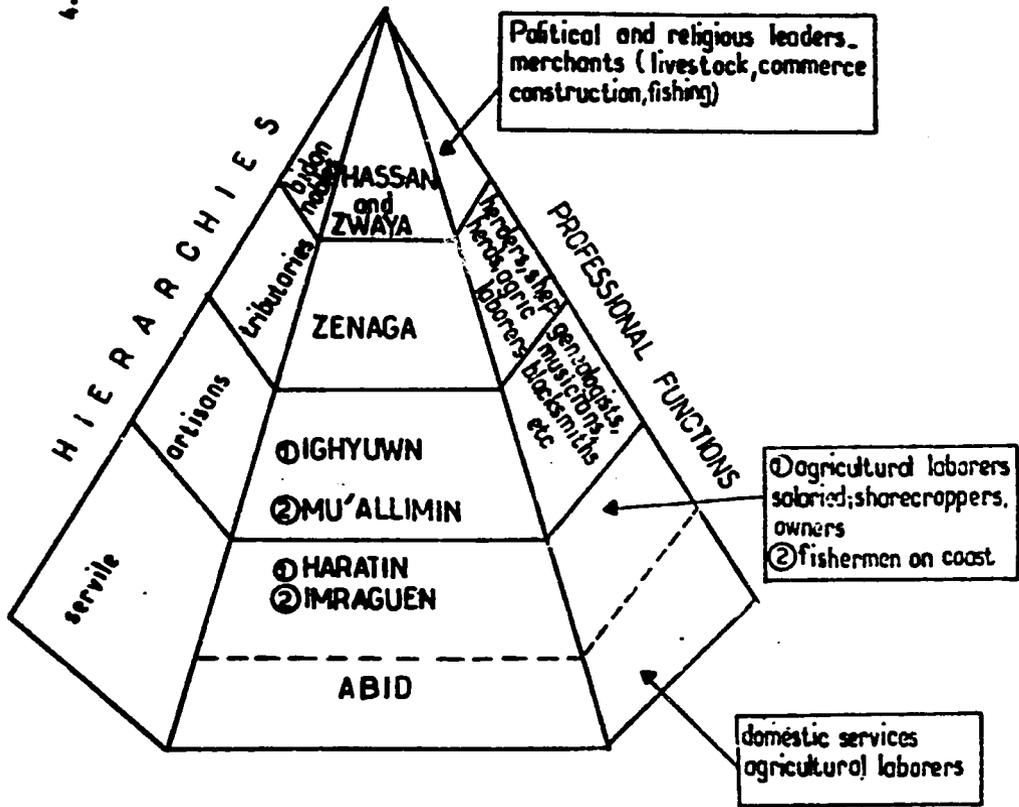

- 1) Social Organization of Agricultural Production
- 2) Population Movements and Migrations in Mauritania
- 3) Evolution of Modes of Accumulation and Social Change
- 4) The Future of Pastoralism in Mauritania

# THE MOORS

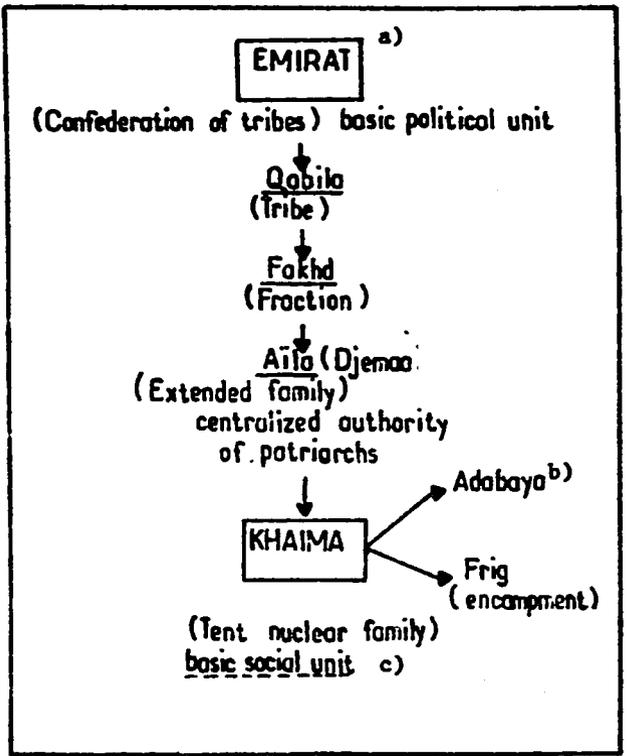

Exhibit 4-1

127

4.3

SOCIAL STRUCTURE

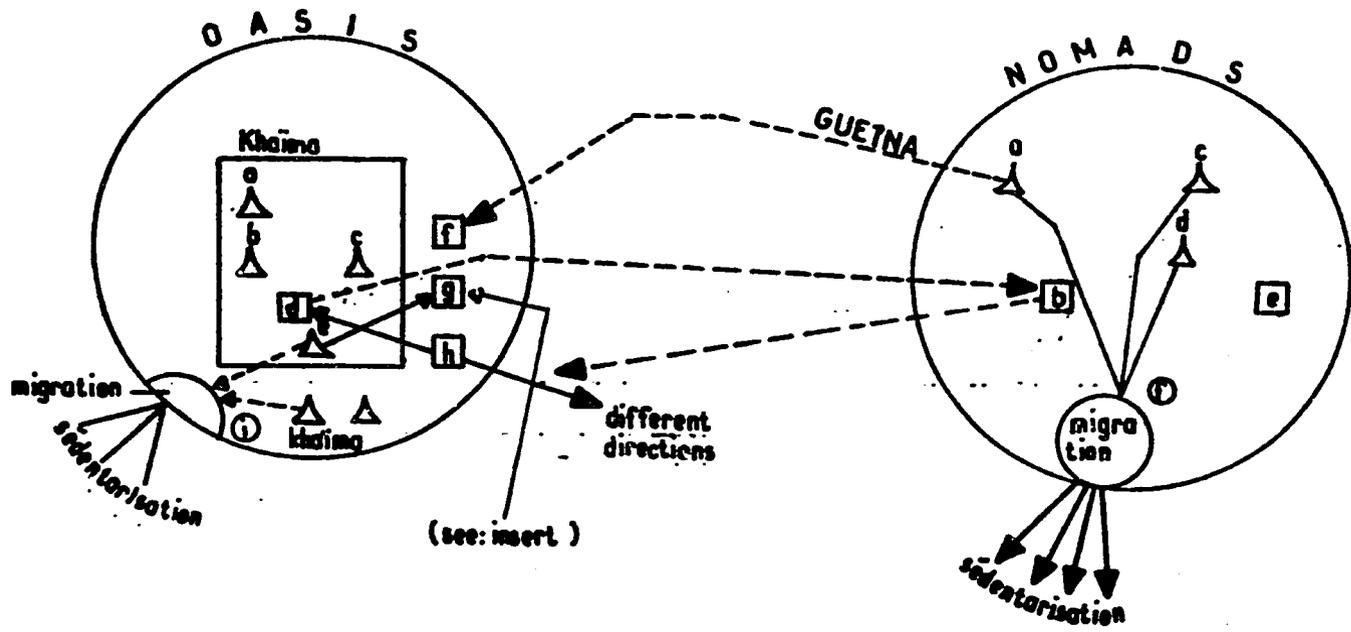

SOCIO-POLITICAL ORGANIZATION

- a) Personified today in figure of politically strong Emir.
- b) A Haratine agricultural village; plural is known as Adouaba.
- c) The nuclear family is the most constant characteristic of the Moor family structure, enabling an easier adjustment in moving from rural to urban center. The Haratin who have settled near black African communities tend to create a communal-based social or decision-making organization similar to those of the river peoples.

DIAGRAM OF SOCIO-ECONOMIC RELATIONS OF MOORS

4.4

228

Notes for Diagram on

The Socio-Economic Relationships of the Moors

4.5

6229

Oasis

- a) Djemas: Patriarchs = make all decisions in an encampment.
- b) Abid: Servants who are linked to the tent.
- c) The woman is owner of the tent and all items in it. She is frequently a merchant. The Bidane woman especially is economically autonomous.
- d) Trade: Bidane merchants are also frequently big herd owners.
- e) Haratines work the fields. They are those who migrate the most.
- f) Palm groves: Majority of owners are Bidanes. Individual ownership exists within clan ownership. The dates are either for home consumption and eaten during the annual guetna cure or are commercialized.
- g) Field: Wheat, henna, sorghum. Owned by Bidanes; cultivated by Haratines. Rural exodus of Haratines forces many Bidanes to cultivate.
- h) Herds of camels = Bidane owners. Shepherds = poor Bidane or Zenagas. Haratines may own small ruminants.
- i) Migration is particularly heavy among Haratines forcing Bidanes to cultivate.

Nomads

- a) Guetna: Annual date cure serving also social and economic functions between groups.
- b) Nomads sell camels to merchants of oasis and buy staples (or exchange).
- c) Women are in charge of Khaima while men are away on long stretches.
- d) Abid: Servants of Khaima.
- e) Herds: Owned by Bidane nomads. Milk is never sold but leather is worked and sold by women, both Bidane and Haratine.
- f) Migration and sedentarization are intensive and directed towards major roads and urban centers.

Insert: Land Tenure

- . Land is held by majority of Bidanes who cultivate only if destitute.
- . Cultivators: Haratines and Zenagas working as sharecroppers or salaried laborers.
- . Land, inalienable (habous), is property of clan with individual ownership allowed within clan.
- . Tithes vary according to region and clan.
- . Traditional ownership rights of palm trees are offered to Haratines.

## THE TOUCOULEURS

SOCIAL STRUCTURE OF TOUCOULEURS

## THE PEULHS

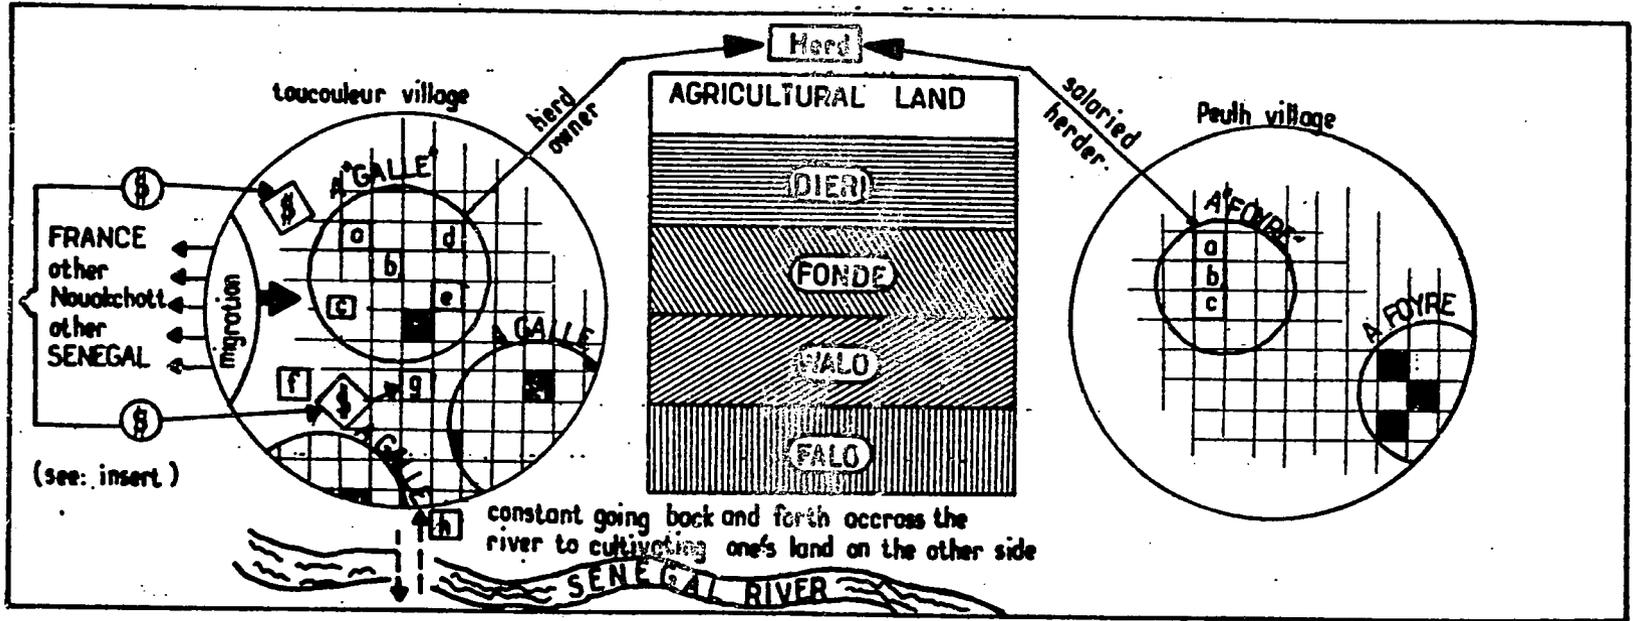

Walo Peulhs	Sedentarized (Agriculture-Livestock)
Dieri Peulhs	Semi-Sedentarized (Agriculture-Livestock)
Foulabes	Transhumant (Herders)

SOCIO-POLITICAL ORGANIZATION

\* These two traditional functions exist no more, having been replaced by government appointed District

### DIAGRAM OF SOCIO-ECONOMIC RELATIONSHIPS OF TOUCOULEUR AND PEULH VILLAGES

the Socio-Economic Relationships of the Toucouleurs and Peulh Villages

4.8

232

Toucouleur

- a) Head of foyré = decision-maker in the distribution of food and harvest: Cash coming from migrants goes to the foyré.
- b) Chief of concession (gallé) = decision maker in the distribution of land to individual foyrés and in labor on communal land.
- c) Artisans and griots = attached to each gallé, they live on commissions. Today, artisans and griots of all ethnic groups have individualized their professions and can live outside the gallé.
- d) Herd owner = individual owner of herds who employs Peulh herder as a salaried shepherd for herd.
- e) Trader = often a bidan Moor owning a small grocery shop in the village.
- f) Cash from migration is channelled to foyré and mosque to the detriment of investment in agriculture.
- g) Mosque = most important center of investment, most obvious in village.
- h) Traditional frontiers of Fouta Toro have not been destroyed by national frontiers.

Agricultural Land

Dieri = rainfed agriculture land: communal ownership, individual distribution.

Fondé = highland between Dieri and Walo. Land of Fondé and Walo remain uncontested until development actions with irrigation and individualization of land catalyze problems of change. Laborers become owners, such as the Macube who lost traditional rights of ownership reclaimed by Torobe and Marabouts.

Walo = recession agriculture land. It is communal property of Torobe owners.

Falo = river bank. Property belongs to Subalbe owners who have also traditional rights to fishing.

Peulh

- a) Father = herd owner and decision maker in all herd transactions. Since drought and loss of cattle, he works as shepherd for Toucouleur herd owner.
- b) Male children = shepherds for family herd; start owning herd at 15.
- c) Mother and daughters = they have no traditional rights of inheritance in cattle; they trade milk produce and leather.

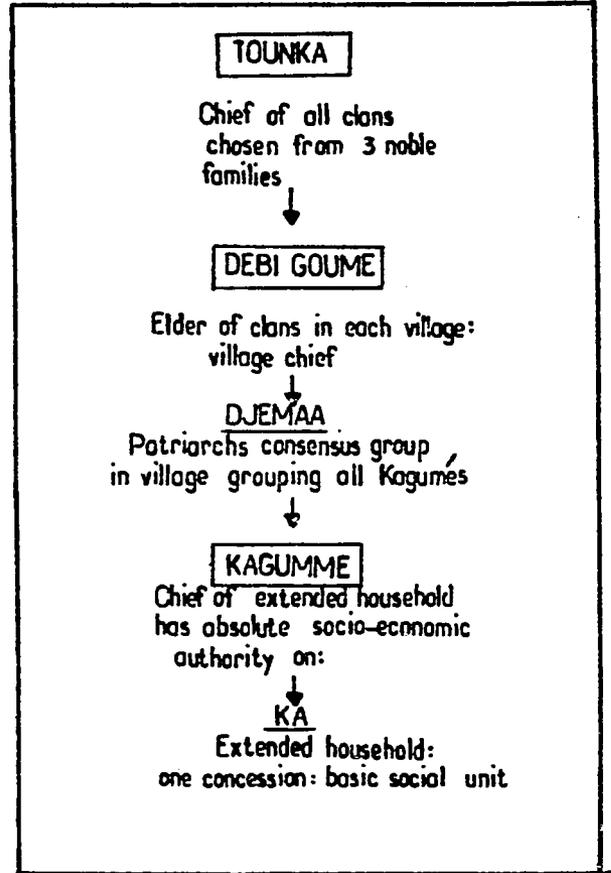

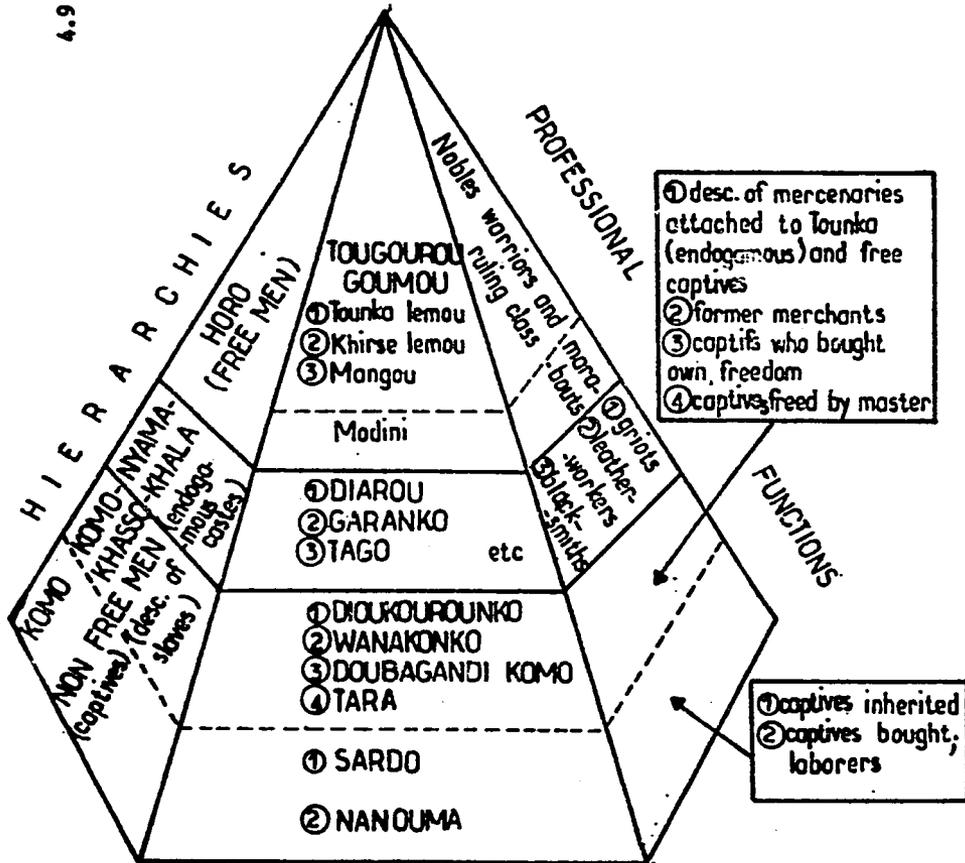

Insert: Toucouleur Land Tenure

- Sixty percent of the land is held by the Torobés. All classes cultivate but share-croppers and laborers are essentially slaves and ex-slaves.
- Numerous forms of usufruct rights and titles exist according to area.
- Land is inalienable, although a small beginning of selling for construction is found, especially in Dieri and Fondé lands.

# THE SONINKE

Exhibit 4-7

4.9

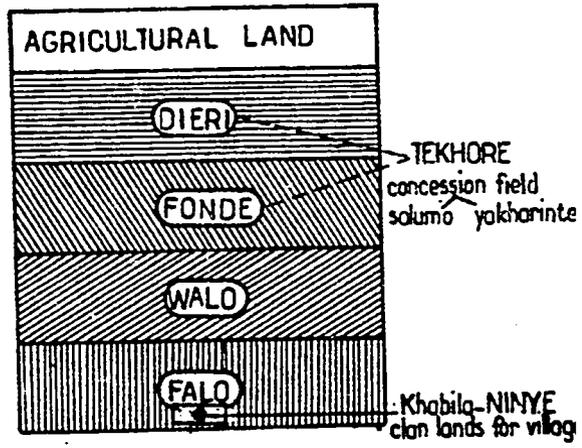

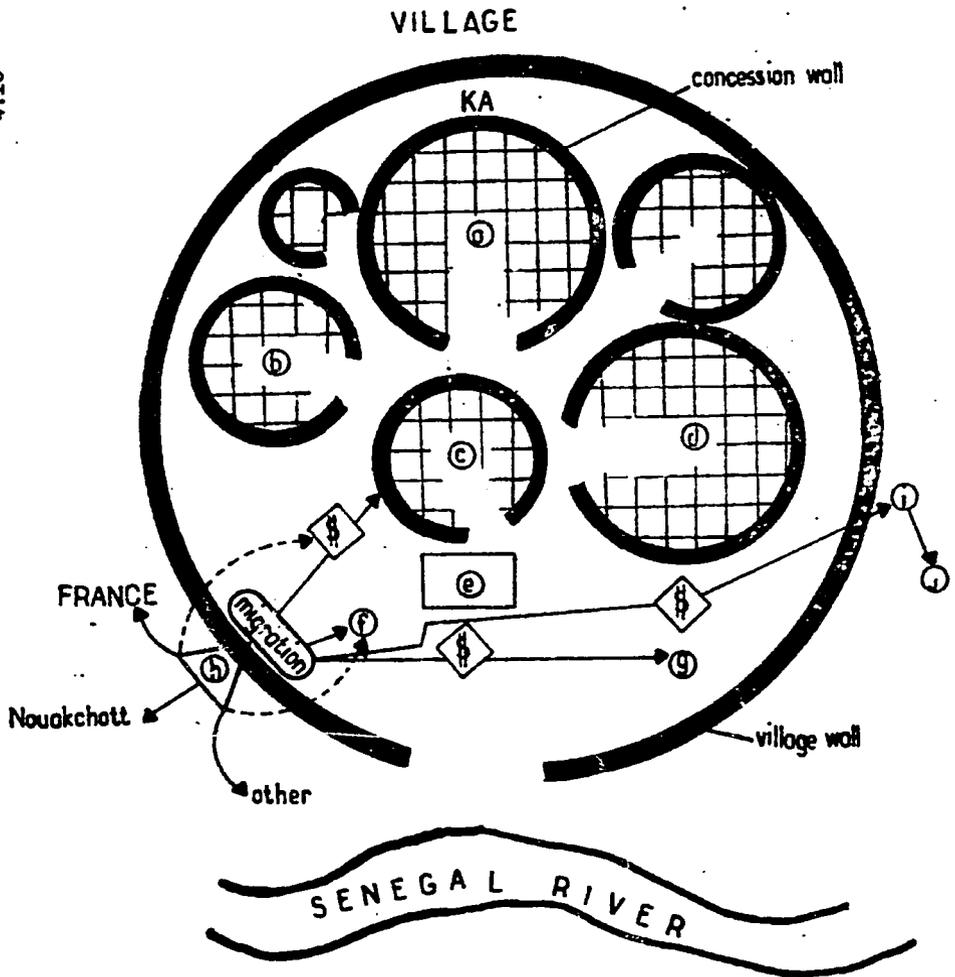

331

THE SONINKE: SOCIO-ECONOMIC RELATIONSHIPS

234

4.10

Notes for Diagram onthe Socio-Economic Relationships of the Soninké

535

4.11

The Village

- a) A multiplicity of concessions close to each other and surrounded usually by a wall is characteristic of the Soninké village. High population density and concentration of concessions render village a veritable maze and the concession heavily concentrated.
- b) Concessions farthest away from center of village belong to slaves; concessions closest to center belong to nobles.
- c) Chief's house - the Debigoume - is closest to village center.
- d) Head of extended household - Kagummé - has absolute responsibility for distribution of land, labor force, daily food rations, etc.
- e) Village courtyard: Djemaa's meeting place.
- f) Commerce: Owners are the "Free Men".
- g) Mosque: Most important investment target.
- h) Migration is very heavy among the Soninké for men of all categories, between 15-45 years old. Return from migration is mandatory. Cash is invested in mosque, family and for individual purposes in commerce and herds.
- i) Herd of cattle: New but important form of individual investments.
- j) Salaried Peulh herder takes care of Soninké herd.

Agricultural Land

Diéri: Land farthest from village. Usufruit rights for servile classes and castes; ownership: community of nobles. Family fields may exist there or on Fondé.

Household field: Tekhore = cultivated by all members with specific functions according to role and place held in concession.

Husband's plot: Salumo = for family consumption.

Wife's plot: Yakharinte = (esp. rice and peanuts) also could be in Falo (total economic autonomy).

Fondé: Usufruit rights for most cultivators. Newly reclaimed for irrigated perimeters.

Walo: Does not consistently exist in all of Guidimaka, giving Fondé and Falo greater importance. Ownership: majority of nobles and Marabouts.

Falo: Majority of owners are nobles with servile classes as laborers ("Non-Free").

Land Tenure

- . All land is owned by nobles and Marabouts.
- . Head of concession has absolute authority on all communal land.
- . Land is inalienable and indivisible.
- . Tithes vary from area to area.

### 4.3 Nutrition and Food Requirements

On the basis of its research and sample field surveys, RAMS has made a series of calculations for the nomadic, sedentary rural and urban populations which are shown in the following tables. Coverage includes:

#### 1. Food Ration

The national food balance sheet, which takes into account domestic production, imports, exports and deductions due to losses, seed and set-asides for animals, indicates that the current average food intake in Mauritania is 2,200 K calories per person per day. The level has increased in recent years (expressed in K calories):

1974	1,921
1975	1,938
1976	1,971
1978	2,167
1979	2,223

Apparent food consumption, measured by weight during RAMS Household Consumption Surveys over a one-year period (3 technical observations, yielded the data shown in Exhibit 4-10). The term "apparent" is used because left-overs were not weighed after meals.

There are of course, variations from the average among different ethnic groups, even among the sedentary population. The food ration of the Moors is inferior to that of the other ethnic groups, reflecting the relatively lower consumption of cereals. Wolofs, Toucouleurs, and Sarakolles also consume a significant amount of edible oils, relatively more than the Moors.

#### 2. Recommended Rations

Different food rations were calculated for each population grouping (Exhibit 4-11 and 4-15). "Recommended rations" were established for planning purposes in order to evaluate future food requirements. The average net requirement per person per day computed has a safety margin of 10%, to account for losses due to distribution.

#### 3. Food Requirements

Calculations were made to indicate what is considered to represent the food needs of the population taking into account food habits identified during RAMS' Consumption Survey (Exhibit 4-16).

A full exposition and interpretation of the foregoing data are provided in the RAMS Option Paper entitled "Food Requirements and Nutrition Strategy - Estimates for Year 2000".

#### 4.4 Health

Recognizing the fact that there are no precise data in Mauritania to reflect the health situation of the country, RAMS has assembled the available morbidity and mortality information to make a preliminary assessment of the health sector. The tables and charts which follow highlight some of the salient data, showing the causes of death among women and children (Exhibit 4.17), the prevalence of five diseases by age group (Exhibit 4.18) and statistics on health personnel and facilities (Exhibit 4.19 and 4.21)

RAMS Option Paper on Health and Nutrition --  
Part I: "Health System in Mauritania: Analysis of Problems  
and Alternative Solutions" -- provides a detailed analysis

#### 4.5 Rural Consumption and Income

Consumption and Income data presented herein are based on findings gathered in RAMS' 1979/1980 Revenue/Consumption/Nutrition Survey. Sixty-four households were observed quarterly for a total of 24 days. Additional nomad households (12 for consumption and 34 for income) were surveyed at the end of 1980.

Households surveyed were actually units whose composition included food and non-food consumers and both present as well as absent contributors to the household budget. (See Annex A for a discussion of RAMS' surveys.) As a result of this definition, the size of household units (averaging 11 for sedentary population and 6.4 for nomads) is larger than the National Census figure of 5.4 individuals per household, members of which were defined as those actually present or had spent the previous night there. (See Definition of Terms Used in 1977 Census, Chapter 2.)

A Food Preference Table is presented as a possible guide to project identification in the agricultural crop sub-sector. The information provided is intended to show, on the basis of a sample of the sedentary population, the food items for which there is additional demand.

Food Preference Table

In the food preference survey conducted as part of the third observation of RANS' Revenue/Consumption/Nutrition Survey, respondents 15 years and older<sup>1)</sup> were read a list of 21 food products most commonly found in Mauritania. They were then asked to name the product they wanted to consume more if they could. The item was noted as their first choice. Successively, they were asked the next product which they wanted to increase consumption, and so on up to five choices. These became respectively their second, third, fourth and fifth choices of preference.

In the accompanying summary table, it is evident milk was the most commonly cited item, yet one-fourth of the respondents selected millet as their first choice.

The food item appearing in the list included:

1. beef	8. lamb	15. niébé (cow peas)
2. millet/sorghum	9. mais	16. potatoes
3. sweet potatoes	10. fresh fish	17. dry fish
4. bread	11. camel	18. chicken
5. sugar	12. butter	19. fruit
6. rice	13. tea	20. oil
7. milk	14. vegetable	21. ground nut

## Chapter 5: Services and Infrastructures

### Table of Contents

		<u>Page Nos.</u>
5.1	<u>Overview</u>	5.1
5.2	<u>The Public Sector</u>	5.2
5.3	<u>Parastatal Organizations and Utilities</u>	5.10
5.4	<u>Cooperatives and Pre-Cooperatives</u>	5.18
5.5	<u>Rural Private Sector</u>	5.20
5.6	<u>Road Transport</u>	5.27

## 5.1 Overview

The following section regroups administrative and economic activities affecting the rural economy which are not covered elsewhere in this report.

It begins with summary tables on government services, the public share of GDP and civil servants in various ministries and agencies, particularly the Ministry of Rural Development. Included as well are tables of the government's regional budgets which are allocated for development projects and the regional distribution of agricultural and livestock extension agents.

Semi-public institutions, or parastatal organizations, are briefly presented in terms of their function and nature of operation. Several tables on utilities provide information on water and energy production (which equals consumption) for both the country's rural and urban areas.

Finally, cooperatives, the economic activities of the rural private sector and road transport are treated separately as a means of providing the reader with a rapid overview of these topics.

258 X

## 5.2 Public Sector

The Mauritanian civil service has grown substantially over the past decade. The number of government employees has increased on a yearly average of 7% since 1973. During the same period, government services accounted for 12.2% of GDP in 1973, increasing to 18.2% in 1979.

Public institutions and their management have been characterized by a highly centralized structure, frequent reorganizations, and a multiplication of agencies. The avowed aim of the government is to decentralize authority and to delegate responsibility to the territorial levels of government. As a result, regional governments are gradually becoming more involved in identifying and implementing development programs.

The following tables provide a summary of government departments and public institutions as they relate to rural development. For a more comprehensive discussion of public institutions, consult RAMS' report Public Sector: Organization and Operation of Rural Development Activities.

Civil Servants by Ministries and Categories, 1980

The Government is the principal employer in Mauritania. In 1980, almost 10,000 people were on the government payroll. The best source for a breakdown of employment by ministries is the payroll computer printout which lists recipients according to five salary categories. Since it may take several months to process a new employee and may take considerably longer to delete the name of an individual who has left a service, figures may be slightly inflated.

<u>Category</u>	<u>Minimum Level</u>
A	University or higher Post-secondary degree
B	Lower secondary certificate supplemented with technical training or further studies.
C	Primary certificate plus either supplementary advanced secondary studies or technical training at lower level than for Category B.
D	Some primary studies and/or sup- plemental technical training or work experience.
Other	According to post. No minimum school level required.

5.3 Parastatal Organizations and UtilitiesExhibit 5-7Parastatal Organizations1980/1981

Name <sup>a)</sup>	Function	Nature of Operation
(Date Created)		
SONIMEX (1966)	- Controls prices, regulates supply and demand of basic consumer products, reduces speculation.	- Monopoly on imports and wholesale distribution of rice, tea, sugar, Guinea cloth. - Monopoly on export of gum arabic.
SONICOB (1975)	- Controls purchasing, processing, marketing of livestock sector with a view to supply export market and urban/mining regions of country.	- Operates large centralized slaughter, processing and refrigeration facilities in Kaedi.
OMC, (1975)	- Controls distribution and commercialization of cereal production with intent on stimulating production.	- Determines surplus and deficient cereal areas of country, sets prices, purchases, receives and stores grain for distribution.
SONADER (1975)	- Stimulates rural farm output.	- Channels national and international rural development assistance. Predominantly involved with irrigated rice production.
ONPP (1981)	- Encourages and orients fishing sector particularly artisanal.	- Not operational as of May 1981.

Exhibit 5-8Grain and Cereal Storage

Total public storage facilities are estimated at 12,500 tons. These are distributed among five regional centers (Boutilimit, Aleg, Atar, Selibaby and Nouadhibou), each with 500-ton holding capacity, and 20 portable rubber butyl silos for Nouakchott.

With the aim of increasing these facilities, OMC (Office Mauritanien de Cereales) is constructing storage centers of 1,000 tons each for an additional storing capacity of 52,000 tons.

Construction is being carried out in two phases: the first will be completed in 1981 providing 20,000 tons of storage in Nouakchott, Rosso and Nouadhibou; and the second will affect Néma, Aioun, Kiffa, Kaédi, Selibaby, Boghé, Aleg, Tidjikja, Maghta-Lahjar, Moudjeria, Atar, F'Derick and Akjoujt.

OMC's 1980 storage charges for a ton of cereal are calculated as follows:

	<u>UM</u>
Overhead costs (5% depreciation)	650
Upkeep	260
Equipment maintenance	64
Agency management and other salaries	129
Treatment and disinfection	400
Loss of stock (3% of cereal value)	300
	<u>1,803</u>

### Utilities

SONELEC (Société Nationale d'Eau et d'Electricité) is responsible for the provision of potable water and electricity in the country. However, SNIM, the National Mining Company, supplies water and electricity to the mining town of Zouerate.

Nouakchott's water supply comes from Idini, a region 70 km east of the capital. Present utilization according to SONELEC is less than one half of the aquifer's daily output capacity. Nouadhibou is supplied by an 80 km pipeline from Bou Lanouar where present utilization is approximately one-third of capacity.

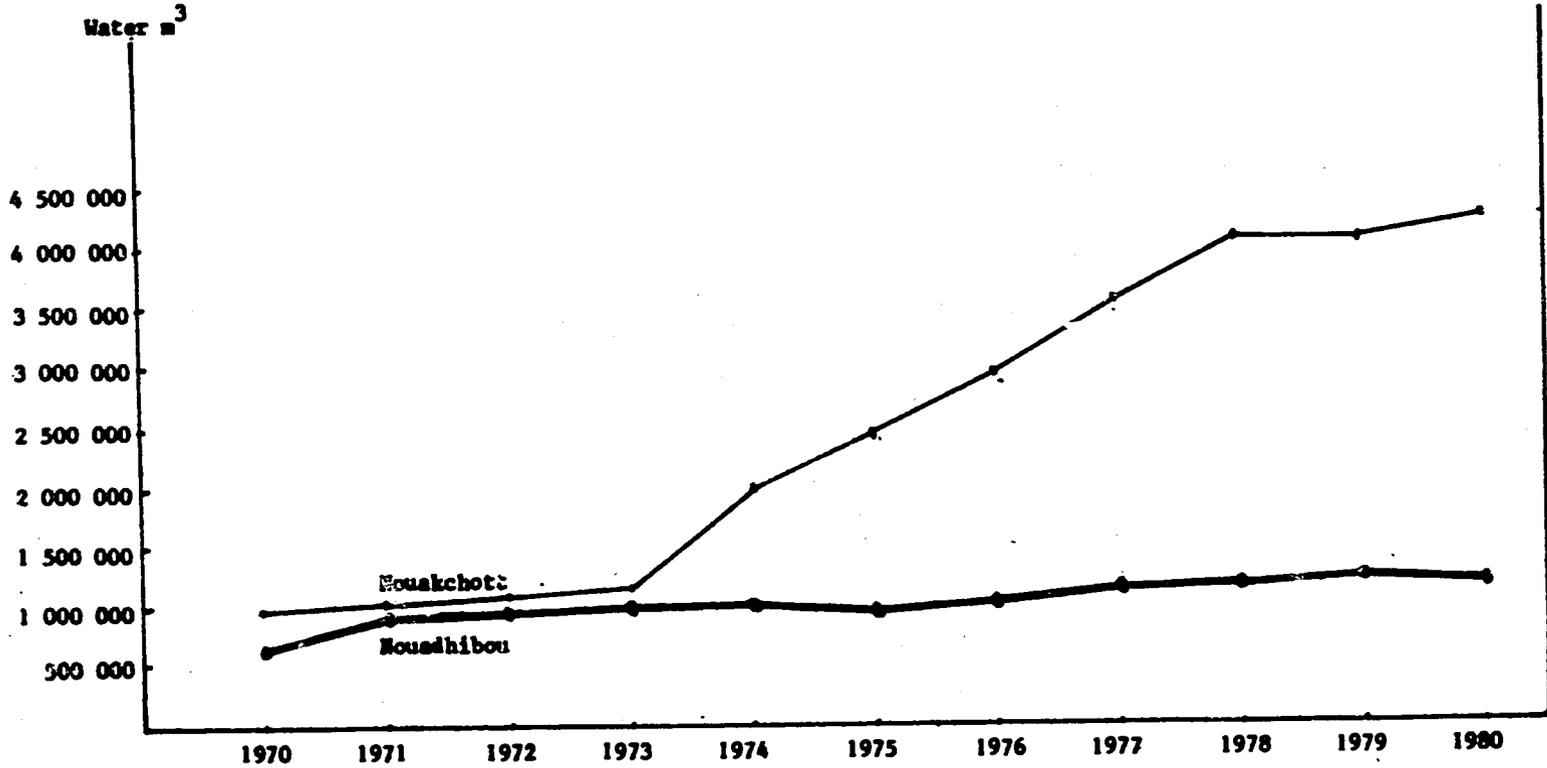

All electricity is diesel generated for Nouakchott as well as for 7 rural urban centers. Installed generating capacity for Nouakchott is roughly 13,500 Kw, with plans to nearly double this by 1982. Nouadhibou's facilities include a 14,800 Kw SNIM plant which guarantees 2,500 Kw to SONELEC. Akjoujt's plant has the capacity to generate 6,800 Kw. The other rural centers combined capacity (Kaédi, Rosso, Atar) totals approximately 2,500 Kw.

The following tables trace water and electricity production for the areas served by SONELEC.

#### 5.4 Cooperatives and Pre-Cooperatives

Cooperatives traditionally encourage group work ("Touiza" in Hassaniya). They have enjoyed a legal status since 1967, when a statute regulating the creation and operation of cooperatives was promulgated. Cooperatives come under the auspices of the Cooperative Division in the Ministry of Rural Development, which registers new groups and determines their status. Groups are first recognized as pre-cooperatives (minimum 2 year period) or as full-fledged cooperatives, qualifying for certain procurement privileges.

In 1980, the roster of the Cooperative Division and SONADER (which sponsors its own cooperatives) included 485 pre-cooperatives or cooperative groups, of which:

451 were agricultural  
19 were artisanal  
11 were consumer  
4 were fishing

The regional breakdown is as follows:

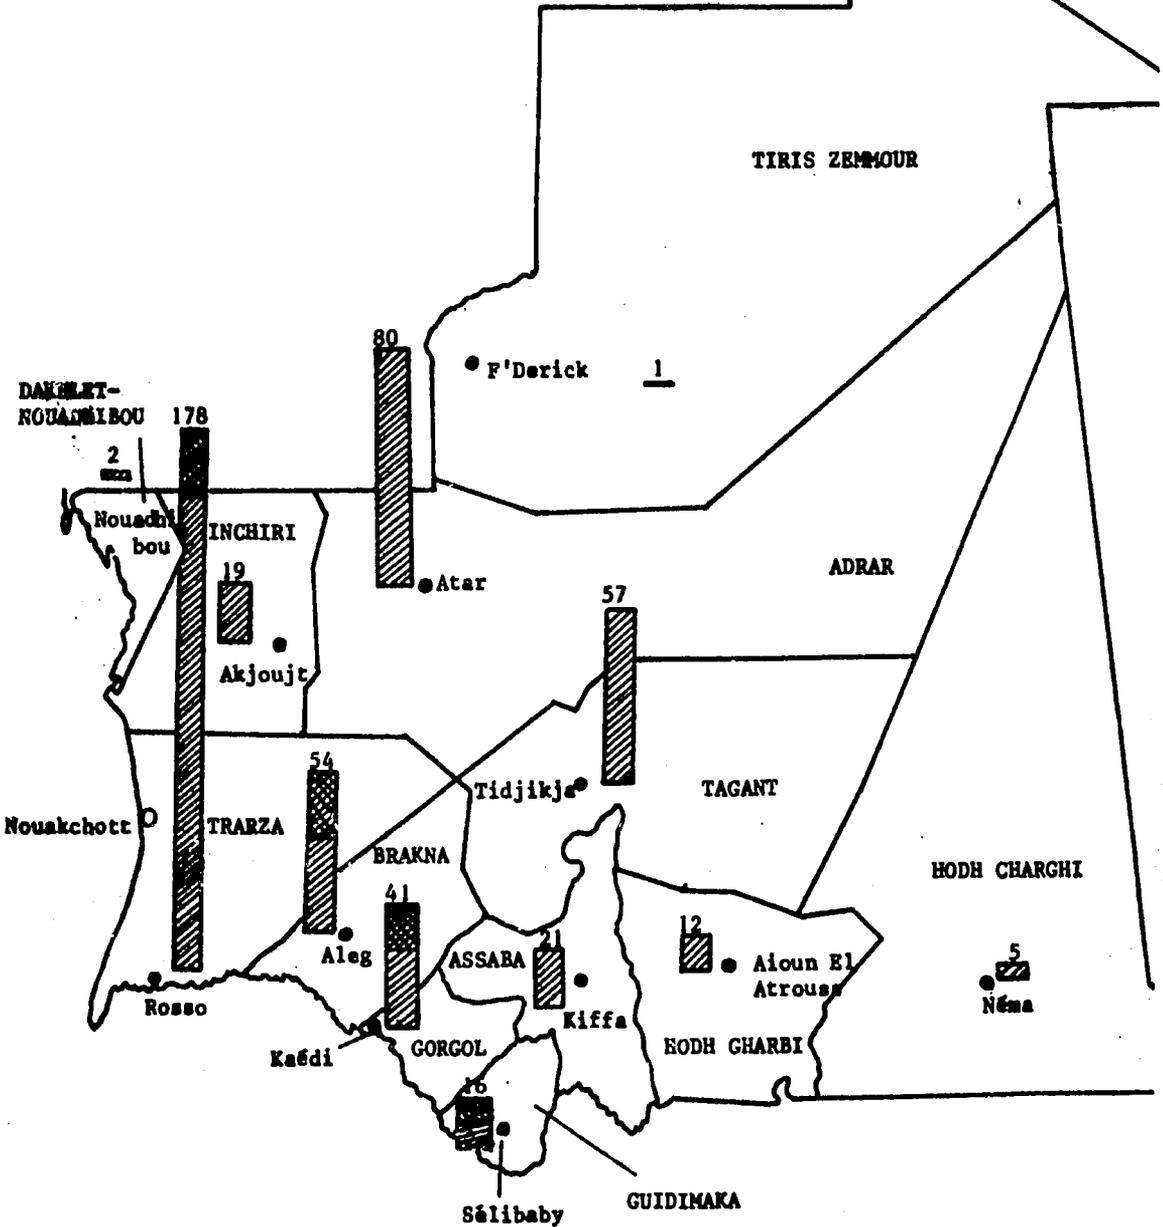

Region	Total No. Cooperative Groups	Membership	% Employed Population as Member of Cooperative
Hodh Charqui	5	98	0.4
Hodh Gharbi	12	245	1.4
Assaba	20	291	1.1
Gorgol	41	3,383	10.2
Brakna	54	4,440	17.7
Trarza	178	9,804	37.6
Adrar	80	1,609	15.9
Dakhlet Nouadhibou	2	1,171	13.6
Tagant	57	1,979	21.4
Guidimaka	16	2,045	7.5
Tiris Zemmour	1	19	0.3
Inchiri	19	381	15.0
<b>Total</b>	<b>485</b>	<b>25,465</b>	<b>Average 11.8%</b>

It should be noted that the Division register is not necessarily up to date. Some registered cooperatives may in fact be defunct, others not yet registered. This is particularly notable in the Guidimaka, where various types of cooperative-like organizations exist.

### 5.5 Rural Private Sector

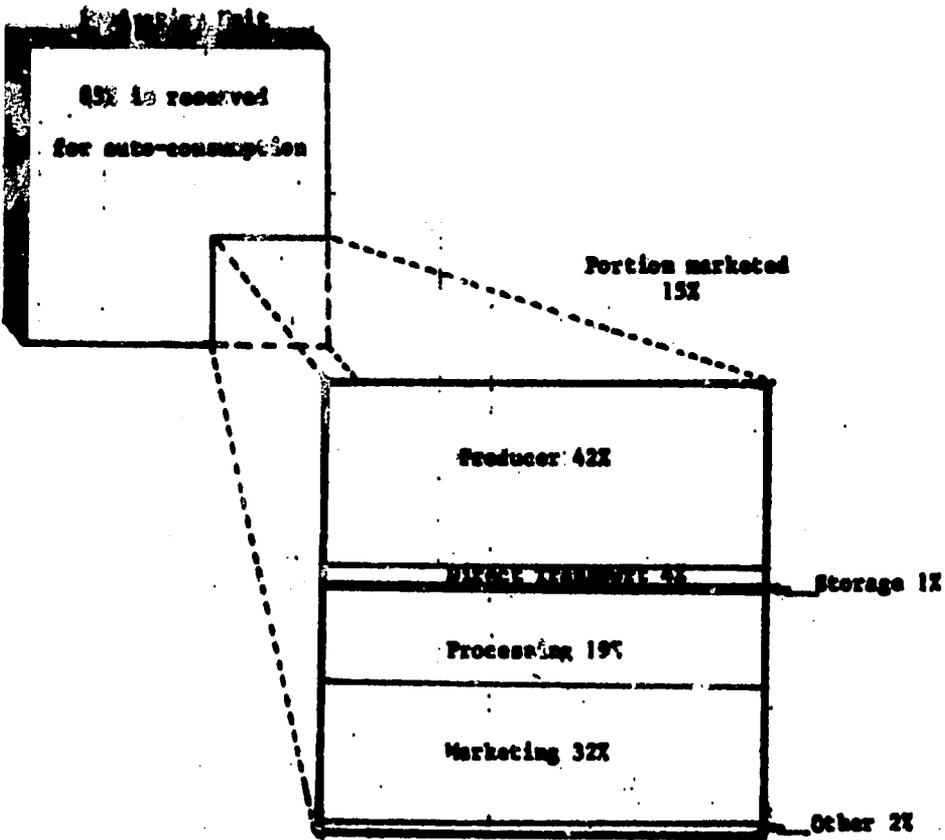

The private sector of small-scale family businesses at the rural level gives evidence of significant vitality. These enterprises are characterized by a remarkable ability to adapt to the demands imposed by accelerated sedentarization. These businesses are working because they are capable of offering the products and services demanded by the affected population. In addition, the small-scale businesses follow and help to create circuits of monetarized exchanges.

The following exhibits provide some data on intermediary consumption and on production and labor budgets for a few select number of small rural businesses. They can be used in comparison with the manpower and employment exhibits in Chapter 3.

277x

Exhibit 5-15

Breakdown of Intermediary Costs  
in Relation to a Unit of Production

Exhibit 5-16

Production and Labor Budget of  
a Grain Mill Processor  
 (UM)

	Per day <sup>a)</sup>	Per month	Annual
<u>Costs</u>			
Grain mill	261	3,924	47,000 <sup>b)</sup>
5 l. gas/day	150	2,250	27,000
Labor	120	4,000	21,600
Tax 400/mo.	27	400	4,800
License	9	135	1,600
Rent 1,000/mo.	66	1,000	12,000
Parts and other exp.	33	500	6,000
<b>Total Costs</b>	<b>666</b>	<b>12,209</b>	<b>120,000</b>
<u>Receipts</u>			
Averages 450 kg/day at 6 UM/kg	= 2,700/day	x 180 day/yr	486,000
Less yearly costs (above)			120,000
	<b>Net Profit</b>		<b>386,000</b>

a) Based on average of 180 working days/year.

b) Purchase cost: 100,000 UM at 15% interest, machine lasting 3 years.

Note: Major constraints to operation are maintenance and spare parts. Mills are found predominately in larger towns, are capital intensive and operate an average of 180 days/year. It has been observed that the presence of a mill in a village accomplishes the work of approximately 30 women who normally would receive 9 UM to handpound a kilo of millet or wheat as opposed to a cost of 6 UM/kg by a mill.

							Total Yearly Profits (54,150 + 2,100)
							56,650
							Average Daily Income (230 days worked)
					UM/day		246

a) Often produced in Bouisa, a form of cooperative labor organization. The work is reserved predominantly for Moorish women to earn supplementary income. Income is calculated as an average of male and female cushions.

Notes: Artisanal labor, the more distant it is from sedentarized centers, is exchanged for goods and therefore falls outside the monetarized circuit. This is especially the case among nomads where an itinerant craftsman travels from encampment to encampment exchanging goods for services.

## 5.6 Road Transport

The following exhibits provide data on the domestic road transport system. Other modes of domestic transport include the railroad between Nouadhibou and Zouerate serving the SNIM mining operation, but also providing passenger transport between these towns and Nouakchott (via Choum); Air Mauritanie with at least weekly or bi-weekly flights to regional capitals; and traditional caravans. As far as is known, no study exists on this latter mode, nor any systematic data.

The volume of freight in 1980 in rural sedentary areas has been estimated at between 200,000 and 225,000 tons/km. This traffic circulated at an average rate of 8.26 UM/ton/km, providing an income evaluated at 159.7 million UM of added value. Truck transport represents 12% of the transport GDP, generally estimated as 2,130 million UM for 1980. Volume of freight presented in the following exhibits include only inter-regional transport and this only for traffic exceeding 1,000 tons for the year.

Truckers' profit margins are generally set by government decree. The decree establishes a scale of road transport charges for freight, which is evaluated with a 15% profit. Freight distributed by parastatal organizations to private transporters (for whom the Food Aid Commission provides 40% of their work during certain periods) tends to substantiate the official rates.

For complementary information see RAMS Economic Activities of the Rural Private Sector. Report AE-4

6.5	<u>Production Tables</u>	6.68

## 6.1 Overview

This chapter is divided into two parts: the first includes selected descriptive data of each major production subsector, the second regroups detailed past and present production data.

The first part is introduced by a section on agro-ecological zones, to which the subsequent tables are keyed. These zones also serve as pivotal points to the various sections that follow. There is a discussion of farm and labor budgets, and a presentation of agricultural activities on a calendar basis. A composite table in the General Section compares cost, yield and returns of various crops by type of cropping system.

The second part consists of production tables from which GDP calculations were formulated. Additional details on these subjects can be obtained by consulting studies and texts referred to in the selected bibliography and RAMS reports (see list in Introduction).

Collected data originate from these principal sources:

- Mauritania and FAO publications
- RAMS surveys and reports
- Special studies

Selected Annotated ReferencesRural Production

Cultures vivrières dans la zone fluviale du Sud-Est Mauritanien (possibilités de développement), B.D.P.A., Secrétariat d'Etat aux Affaires Etrangères, 1967 (124 pp.)

Object of study was to formulate a development plan that would enhance and promote agricultural production in the southeast. Data on agricultural and livestock productions are presented together with economic evaluations of production. Recommendations cover the entire range of agricultural activity.

Déplacements Saisonniers des Éleveurs en basse et moyenne Mauritanie, F. Bonnat-Dupeyron, Ministère de la France d'outre-mer, 2 maps 1:500,000, 1950

Superbly detailed work representing seasonal movements of herdsmen by tribe and group of tribe. Includes axes used in periods of various rainfalls, types of herds moved along the axes<sup>a)</sup> and cultivated and protected fields. Pinpoints wells and watering points according to depth and salinity, permanent and temporary villages serving as cattle trading and transport centers and palm groves. Shows that seasonal movements are not always on a north-south basis.

Développement Rural de la Région du Tagant, SONADER, Agrar - und Hydrotechnik. GMDH. INSTRUPA, 1979

A professional study of the agricultural development potential using a water-resources approach.

Evaluation des effets sur l'environnement d'aménagement prévus dans le bassin du fleuve Sénégal, rapport partiel sur le développement agricole, O.M.V.S., Gannett, Fleming, Corddry and Carpenter Inc., Harrisburg, Pa. en association avec ORGATEC, 1976 (also in English)

Thorough review of factors limiting or contributing to the development of the Valley and in particular to irrigation. The impact of the proposed dams at Diama and Manantali on the existing agro-ecosystem is discussed.

La Moyenne vallée du Sénégal - Etude Socio-Economique, J.L. Boutilier, et al, Ministère de la Coopération/INSEE, Paris, 1962 (368 pp.)

Considered as the classic study on agro-socio-economical conditions of the Senegal river valley. Chapter 2 treats extensively traditional agricultural practices and patterns of the ethnic groups inhabiting the banks and cultivating the diéri and the walo.

---

a) Accompanied by shepherds or by population.

295x

Projet de développement du Sud-Est Mauritanien, BDPA, L.C. Beaudoin, Tomea  
I-IV: République Française - Ministère de la Coopération, 1975

An exhaustive study of the agro-pastoral system existing in the southeast. From the crop aspect, agronomic characteristics of local varieties of millet and sorghum are presented, as well as yields and the economics of production. The role played by livestock as an element of the agro-pastoral system is also considered, as well as its utilization for cultivation by animal traction.

Projet de développement intégré dans la vallée du fleuve Sénégal, CARITAS,  
Mauritanie, Région Administrative de Kaédi RIM, 1974 (82 pp.)

Constitutes a project proposal for the development of perimeters in four villages in the Kaédi and Maghama Departments. An excellent guide to the nature and wide range of conditions to be taken into consideration in designing such projects.

### 6.3 Agro-Ecological Zones

At the inception of the Project, RAMS sought to identify coherent agro-ecological zones intended to "constitute the interior framework within which sample surveys and impact analyses of investments and development strategies"<sup>a)</sup> could be implemented.

The Zones were to permit the identification of sub-zones where human and physical potentials of development existed, as well as to identify associated constraints which limited such developments.

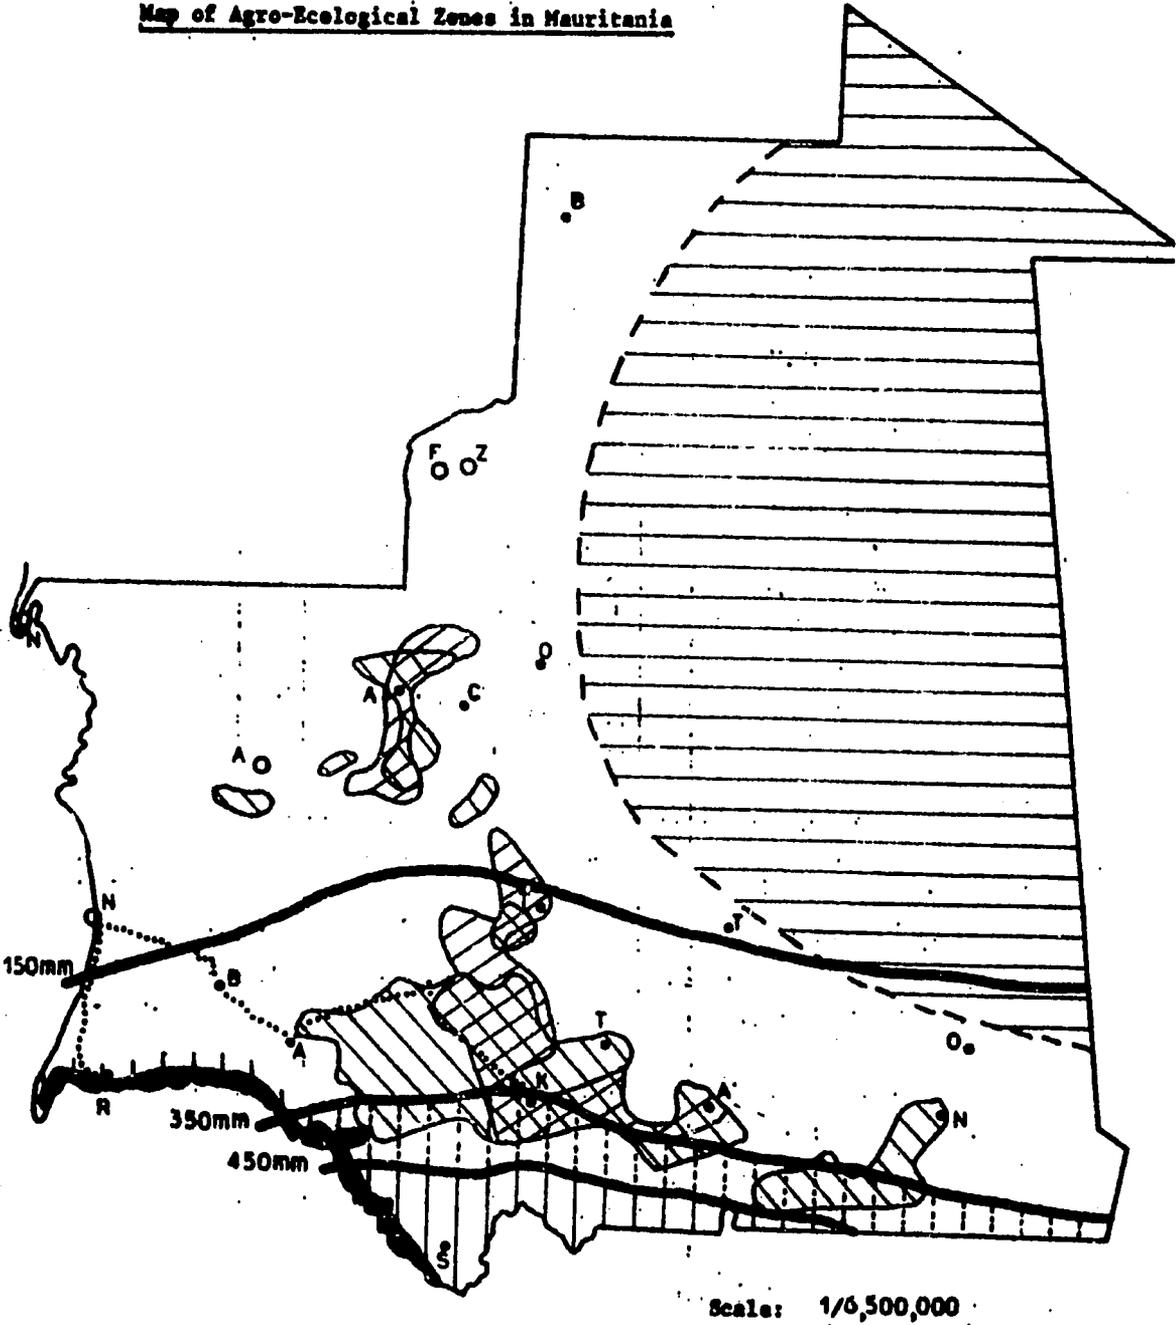

A map and a description of each zone is included. The zones represent the four dominant agricultural production systems practiced in Mauritania: irrigation, dryland, oasis and livestock herding.

For planning purposes, however, administrative regional divisions were considered more appropriate for data collection and classification. Thus, a chart is included which presents an integration of the regions with the agro-ecological zones from a surface area perspective.

## Description of Agro-Ecological Zones<sup>a)</sup>

### Zone 1 : Senegal River Valley Zone

Zone has more agricultural potential than other zones. Annually enriched by silt deposits (floods from June through October).

- a) Climate: Rainfall varies from 650 mm in the southern-most part of the zone (Guidimaka) to 300 mm in the north. Inter-annual rainfall variations are great.
- b) Soils: Essentially hydromorphic gleyey (of varied chemical richness), developed on alluvia.
- c) Natural Vegetation: Dominant tree in the periodically flooded lowlands is Acacia Nilotica. On the edges of the valley, Acacia sieberiana, Acacia seyal, Zisiphus mauritania. Grasses are presented by Vetiveria nigriflora.
- d) Agriculture and Population: Millet and sorghum are principle cereal crops. Types of agriculture practiced are: floodland cultivation (oualo), irrigated cultivation (rice) and rainfed cultivation (dieri) on non-flooded banks.

Compact and impermeable soils (clayey) are planted in rice and sorghum. The valley represents more than 80% of the crop production of Mauritania. Traditional agriculture is practiced by the Wolofs in the lower valley, downstream from Rosso, by Soninke or Sarakoles in the Guidimaka, and by Toucouleurs between Rosso and Maghama. These are all sedentary farmers.

### Zone 2 : Rainfed Cultivation

Agriculture directly dependent on spatial distribution of rainfall rainfall volume and distribution over time. Usually practiced regularly each year to the south of the 450 mm isohyet. To the north, rainfed cultivation can extend up to the 300 mm isohyet during good years.

Zone is located approximately between the 15° latitude north (for the southern part of the zone) to above the 16° latitude north (for the northern-most part, around Kiffa).

---

<sup>a)</sup> For more detailed information and relevant tables, see RAMS report Agro-Ecological Zone.

Livestock raising is the dominant activity.

- a) Climate : Rainy season lasts from 3 to 4 months, shorter towards the north. Dry season lasts from 8 to 9 months.
- b) Soils : Zone covers great variety of soils. Classified as follows:
- hydromorphologic soils of the Gorgol Noir, Gorgol Blanc and Karakoro valleys
  - little complementary soils (central Guidimaka)
  - erosion and crust soils (raw material) - (Assaba, Affolé)
- c) Natural Vegetation
- Combretum glucinosum in the south (Guidimaka and along the Malian border) and grass savannas, with baobabs and palm trees.
  - Scudanian savanna to vegetation of the Sahelian steppe type towards the north.
  - Acacia senegal (Trarza), Comiphora africana (Brakna), Ziziphua mauritania (Aftout de M'Bout), Acacia tortilis (Assaba, Guidimaka), etc., from east to west.
- d) Agriculture and Population

Zone of extensive agriculture, devoted essentially to millet and sorghum ("little millet" in the northern-most part of zone). Also pastoral zone.

Peulhs and Moors lead their herd in search of pastures (the Peulhs practice transhumance, the Moors practice nomadism). The rainfed cultivation zone is the domain of cattle raising.

Herd movements are from the south to the north during rainy season, and towards the south in dry season. Also east-west migrations according to the distribution of rainfall.

Population is composed of sedentary farmers and semi-sedentary nomads which include Toucouleurs, Soninke or Sarakoles, Moors (and Haratins).

During periods of severe drought, the nomads, both Moors and Peulhs, abandon nomadism and practice agriculture part-time.

### Zone 3 : Oued Floodland Cultivation (recessional)

Zone is intermixed with Palm Grove Zone (see Zone 4).

Floodland cultivation is located along oueds, and is practiced after the floods. Small dams are built across favorable spots of oueds in order to store rain water up-stream. As water recedes (controlled by the farmers), humid banks are cultivated. Type of agriculture depends directly on rainfall which fills dam reservoir through runoffs from up-stream catchment basins.

Also included in this zone are ponds in the lowlands fed by rains which dry up progressively, allowing cultivation of the edges, and the Adrar grairs. In low zones of the oueds, cultivation is possible one year out of five.

#### a) Climate and Hydrology

Zone located between the 350 isohyet and the 100 mm isohyet (where floodland cultivation is very "risky"). Aleg to Moudjeria axis marks western limit (sand-covered expanses to the west). Towards east, floodland cultivation is found up to the Dhar Nema, below the isolated reliefs.

Floodland cultivation found essentially to the south of the 150 mm isohyet. But also exists in the Adrar above the 150 isohyet. High sandstone reliefs which can rise to 800 m in altitude, having a high runoff coefficient, capture and concentrate the runoff oueds. This permits extension of floodland cultivation towards the north.

#### b) Soils

Cultivation is practiced on oued alluvia, which are generally sandy (with varying proportions of clay, silt and gravel). Around ponds, hydromorphic pseudo-gley soils are found in areas which are submerged the longest. In the grair flow zones of the oueds, soils are sandy and stoney.

#### c) Natural Vegetation

Species found only in the south advance towards the north along oueds. Acacia nilotica is common along

302X

oueds becoming scarcer towards the north. Vegetation distribution is a function of micro-climate and geomorphology.

d) Agriculture and Population

Intensive cultivation is practiced along the oueds; sorghum is main crop. Other crops include millet, corn, wheat, niébé, sweet potatoes.

Most storage dams are traditional structures (about 95%), composed of an earth dike, sometimes consolidated by slabs of sandstone built across a narrow part of the oued (they are several meters high), not solid and poorly maintained. Slowly being replaced by modern dams, composed of a compacted earth dike, with a cement spillway and drainage structure. Floodable surface areas vary considerably from year to year.

Populations which cultivate these areas are Moors and Harratins.

Herding is dominant activity. Cattle raising can attain the 150 mm isohyet in the north. Paulhs lead their herds (Zebu gobra) in search of pasture; they rarely go above the 350 mm isohyet coinciding with extreme northern limit of rainfed cultivation. Moors and Harratins, practice cattle raising above the 350 mm isohyet (Zebu Maure).

Since the drought which began in 1968 and the disappearance of cattle resources, many Harratins left their Moorish "protectors". Agricultural production also decreased as storage dams remained unfilled. This has reduced food self-sufficiency based on cultivation of sorghum and cattle raising.

Zone 4: The Palm Groves

Palm groves are distributed over a vast area which includes the highlands: Adrar, Tagant, Assaba, Affole, Dhar Nema and Dhar Tichitt.

The main cultivation is of the date palm (Poenix dactylifera).

303

a) Climate and Hydrology:

The date palms require average temperature higher than 28°C, an absence of rainfall during fructification but large amounts of water (8000 m<sup>3</sup> per hectare), which explains their extension into mountainous massifs at the foot of springs or on the edge of oueds.

b) Soils : Light, developed on sandy alluvia.

c) Vegetation : See Agriculture.

d) Agriculture and Population

Major date-producing regions are the Adrar, the Tagant, the Assaba, the Affole and the region of Nema-Oualata. Surface area covered by all these palm groves is not greater than 3,000 hectares, and the number of date palms is about 1 million.

Palm groves are generally small, the largest only a few dozen hectares. There are two types of palm groves: wild and farmed.

The farms are more numerous, surrounded by thorn fences (Zeriba) or low stone walls. Plots are small, generally 30 m<sup>2</sup>. Wild palm groves are actually abandoned groves without fencing. Visited by nomads at harvest time (Guetna).

Some Harratins and even a few "noble" Moors (Bidan) practice permanent date cultivation in the farmed palm groves. Some groves are devoted solely to date production, others to inter-cropping (millet, wheat, barley, henna, lemon trees, beans, nicbé, potatoes, carrots, turnips, onions, etc.)

Irrigation is important and is carried out by water drawn from the délou, with balanced beams or motor pumps or ditch networks.

**Zone 5 : Pastoral Zone**

This zone is a vast area in which livestock raising is predominant.

a) Climate:

Extends to the north of the 200 mm isohyet but also descends to the Senegal River Zone.

Rainfall is quite variable from several mm to 200 mm.

304 X

Climate is basically arid, with high temperature in the summer (16 to 49°C), and cool temperature in the winter (0 to 33°C).

b) Soils: Desert and steppe soils dominate.

c) Vegetation

Vegetation is of the steppe type, more sparse towards the north, main vegetation groups being Acacia tortilis ss. raddiana. Grasses are mainly Panicum turgidum ("Markba") and Stipagrostis pungens ("Sbatt").

d) Population and Livestock

Pastoral migrations are linked to the distribution of rainfall. The "Acheb", or "spontaneous pasture", appears after the first rains. Moors follow the rains with their herds.

Some who live on the edge of the Sahelo-Sahara and the Sahara stay south in the dry season, to benefit from winter rains, and move southwards in the Sahel during the summer rains.

In the Saharan zone, dromedaries are the main resource. In the Sahelian zone, livestock consists primarily of cattle.

### The Ecological Zone of East Mauritania

#### Zone 6 : The Desert

This zone is nearly devoid of human activity. It is known as the "Majabat al-koubra" ("land of the great crossing"), or as the "west Saharan Empty Quarter" (Theodore Monod).

Desert covers about a third of Mauritania's surface area, most of which is covered by an erg, is to cross due to extreme rarity of water holes.

- a) Climate: No climate observation stations exist; rainfall is known to be extremely low and temperatures very high.
- b) Soils: Desert soils, and complementary desert soils on eolian sand.
- c) Vegetation: Sparse vegetation. The areal richness rate is 4, one of lowest in the world. Stipagrostis pungens (a grass) is dominant vegetation group; very sparse and only found in a few areas.

305

Gum Arabic

The *Acacia Senegalensis* (gum arabic), found mostly in the south-western third of the country, has greatly decreased in number since 1973. The tree product, collected from October to May, once represented the second most important item (after salt) in traditional Moorish trade. SONIMEX (see Chapter 5) is now the exclusive exporter of gum. Amounts commercialized since 1972 by the company are reproduced in the following table.

Exhibit 6-13Gum Arabic Commercialized by SONIMEX

#### 6.4.2 Irrigated Agriculture

Irrigated agriculture practiced along the Senegal river employs approximately 8,000 persons, or 10% of the total active population. Since the drought, crop irrigation is seen as a means to ensure high output and security during difficult years.

Rice is the predominant crop encouraged by SONADER, the parastatal organization charged with the planned development of irrigated agriculture.

The following maps detail the Mauritanian bank of the Senegal river region, identifying irrigated perimeters according to their types; i.e., large perimeters or those under preparation, small SONADER perimeters either cultivated or under preparation, and existing small private plots.

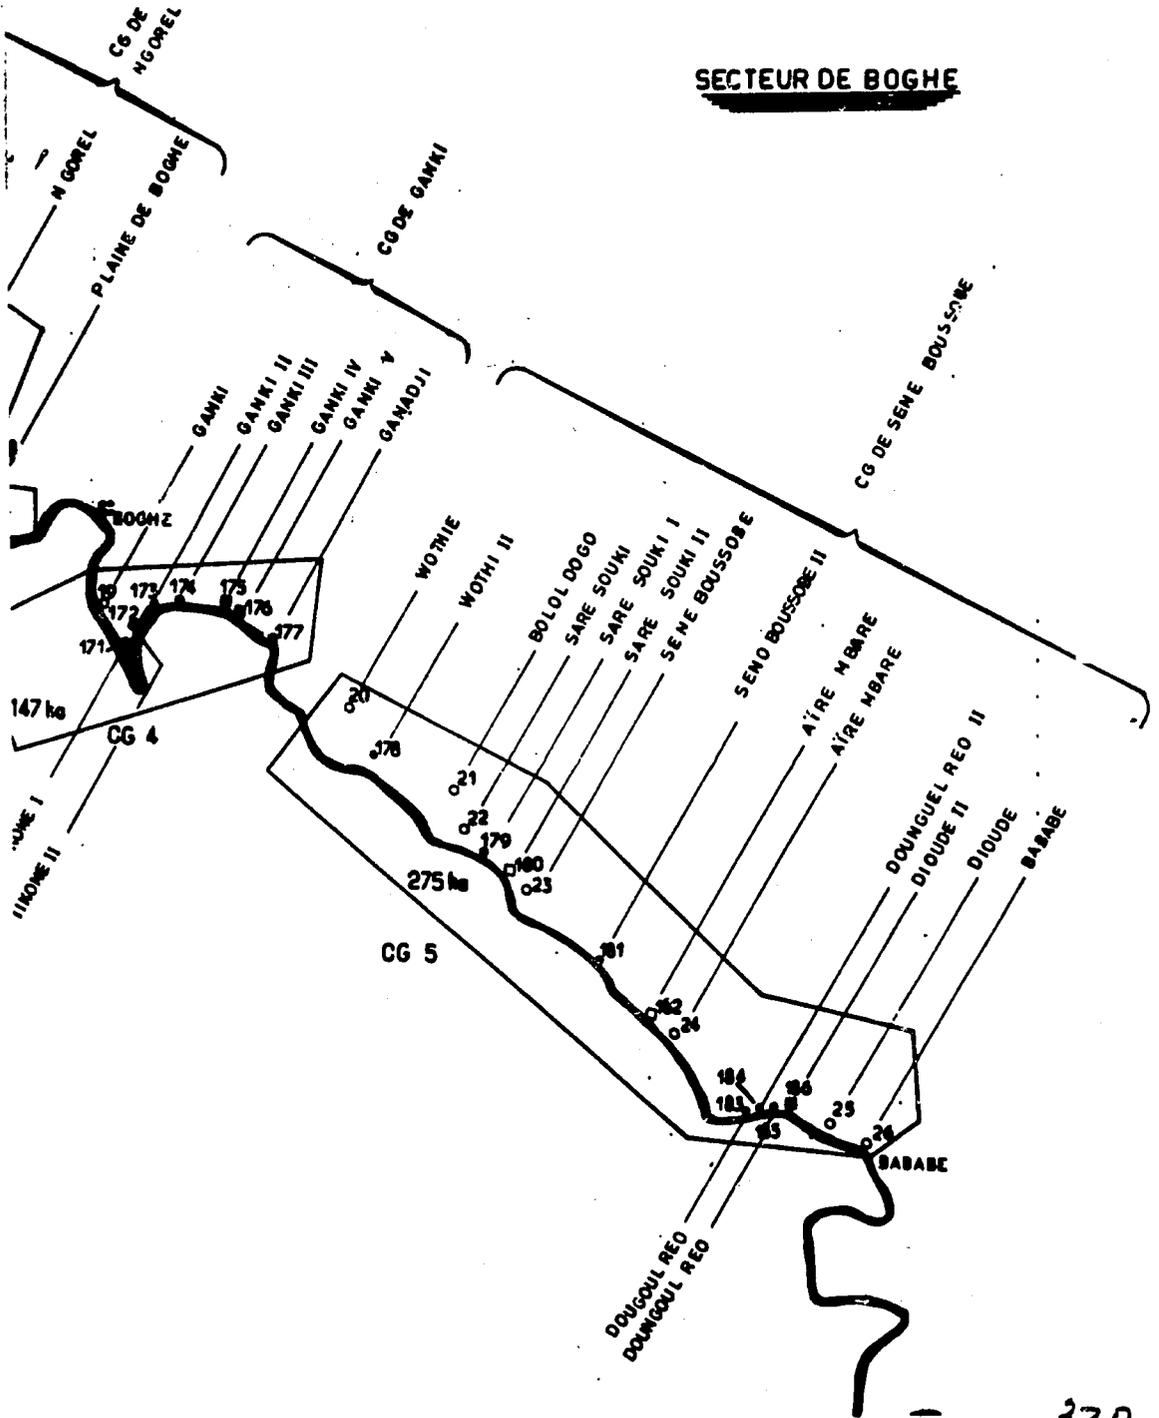

Each is regrouped in Administrative Centers ("Centre de Gestion", marked "CG" on maps), their function would be to provide, at the local level, technical, financial and material support to farmers for the purpose of improving production by integrating livestock and crop agriculture. (The idea of the proposed centers was not, in the final analysis, accepted by RAMS.)

### 6.4.3 Oasis Agriculture

Three dominant types of oasis production systems exist in the country. The following map and labor budget tables are classified accordingly. They have the following characteristics:

- Type 1: Systems in state of relative disintegration, due to physical (drought, sand encroachment) or socio-economic (rural exodus, social mobility) factors. Typically, the old "urban" oases and those easily accessible via roads. Usually has associated cultures.
- Type 2: System in equilibrium with environment. Part of semi-nomad/transhumant domain, typically tended by Haratin and visited during the Guetna. Generally difficult to access and lack associated cultures.
- Type 3: Newly created oases in non-traditional date-palm areas. Varied social mix. Technical knowledge and practices rarely applied.

Total			560	818		1,000	957	1,025	1,064

Note on date palm estimates: No systematic, national census of date palm exists. The only notable exception concerns the Adrar in 1958/59. Patching together the various estimates in the above table gives the following growth rates estimates.

6.3% for 1936-49  
 5.1% " 1949-58  
 1.5% " 1958-73

The 1958-73 rate gives a total of 1.09 million palms for 1980. A completely comparable total, though lower, is obtained by summing up independent regional estimates obtained from various available data, supplemented by field observations. See Chapter 2.1.1 of the RAMS' Oasis Agriculture report for further details.

#### 6.4.4 Dry-Land Agriculture

This type of agriculture employs the largest portion, approximately 70%, of the rural population. It is in large part a subsistence production system localized in three major zones: the Senegal River Valley, the southern rainfed zone, and the oued floodland (see following map).

Cereal is the predominant crop grown, although 20% of cultivated lands are associated with Niébé beans, béréf (watermelon cultivated for its seeds), ground nuts, sweet potatoes, yams and certain condiments.

#### 6.4.5 Livestock

The following tables include basic budget and price data on four classes of livestock in Mauritania: cattle, sheep, goats and camels. Production data and herd composition are included apart in Section 5 of this chapter.

Knowledgeable estimates indicate that the total Mauritanian herd averages 6 million animals, of which 1 to 1.5 million are estimated to move across the border into Mali and Senegal during the rainy season. Similarly, about 1 million animals move north into Mauritania from the two neighboring countries, thereby bringing the herd size to between 4.5 million and 7.5 million at various times of the year.<sup>a)</sup>

Livestock budgets for the three major species of livestock are shown in Exhibit 6-36. In contrast to crop budgets which evaluate cost and returns per hectare regardless of farm size, these are operating unit budgets in which the number of animals that can be attended by one herder constitutes the operating unit. Furthermore, these budgets in each case apply to a specialized herd (i.e., cattle only), whereas under actual conditions cattle and camel herds usually contain some sheep and goats.

The results show that returns per labor day for herd owners are exceeded only by oasis culture which is severely constrained by land availability. In addition, the rate of return on investment by non-herders, although quite moderate, is probably higher than most other available investment in rural Mauritania. The high return on the sheep and goat enterprise (nearly double the other two) is not unexpected, since prices are favorable, costs are low and demand in urban markets is high, while supplies are often limited.

RAMS estimates from the various surveys show that about 30% of the nomads and 40% of the sedentary rural residents who own livestock hire herders. In addition, livestock is a popular investment for urban dwellers so that a reasonable estimate might be that about 40% of the national herd is owned by non-herders.

Value of animals	1,000,000	1,000,000	200,000
Gross herd increase			
Percent	7.5%	6.2%	20.0%
Value	75,000	62,000	40,000
Milk production			
Quantity (liters)	8,750	10,000	3,150
Value	43,750	50,000	15,750
Hair	-	2,700	3,600
Total income	118,750	114,700	59,350
<u>Expenditures</u>			
Feed, veterinary, etc.	6,200	2,300	1,780
Other and miscellaneous (10%)	11,875	11,400	5,935
Sub total	18,075	13,700	7,715
Herder cost	21,000	21,000	21,000 <sup>b)</sup>
Total cost	39,075	34,700	28,715
Net return	100,675	101,000	51,635
Labor days	365	365	180 <sup>b)</sup>
Return per labor day	276	277	287
Investment income (non-herder)	79,679	80,000	30,625
Return on investment	8.0%	8.0%	15.3%

a) Typical herd size that can be tended by one herder. RAMS survey data show that about 30% of the nomads and 40% of the sedentary rural livestock owners hire herders. Including urban livestock owners, about 40% of the national herd is estimated to be owned by non-herders. Budgets apply to specialized herds only, whereas most cattle and camel herders also have some sheep and goats.

b) Assuming herd is on trek for 6 months. The remainder of the year herding is done part-time by children and other family members.

Mean	3.2	2.4	1.8	3.9	3.1	2.3
High	4.5	4.2	3.0	5.5	4.5	3.5

<sup>1)</sup> Size of animals is a relative measure based on carcass weight on the specific slaughter day. In general, however, the following categories apply (kg/head).

	Large	Medium	Small
Camels	200 +	150 - 200	Less than 150
Cattle	180 +	140 - 180	Less than 140
Sheep	30 +	20 - 30	Less than 20
Goats	30 +	20 - 30	Less than 20

<sup>2)</sup> Number of head slaughtered during 10 visits.

<sup>3)</sup> Number of head slaughtered during the year as reported by the Inspection d'Elevage.

Multiple Hook line	Diolinke	3,200 UM	2 yrs.	20 %	1	45 kg. x 2 days	12 months.

Based on information gathered from fishermen and authorities along Senegal river and its tributaries. Prices are an average of costs of equipment in Dakar and Nouakchott. Yields take into account the life of the material and maintenance costs.

A family may have one or two canoes for 5 to 7 fishermen. Canoes usually belong to head of family. They are used by family members without payment, either for fishing or to transport merchandise.

#### 6.4.7 Forestry and Pasture

Lacking other studies on the subject, the following approach to forestry production was used in order to develop RAMS' Rural GDP projections.<sup>a)</sup> The method consists essentially of calculating the supply side by examining land area, rainfall patterns and approximate vegetal growth (not including agriculture) at the various rainfall levels. The demand on this growth consists essentially of live-stock biomass demand and human wood needs which are in large parts covering needs.

#### Supply

Estimates on the supply side are based on pasture, brush and woodland in combination with the density of trees shading off into brush and then open pasture. This growth is referred to as dry-matter whether it is grass, brush or trees. A rainfall scale is then applied to growth rates available from various sources both in and out of Mauritania and is classified as follows:

1976-1978 Rainfall Zones, mm	Dry-matter Production Kg/ha.	Land Area by Zones Km <sup>2</sup> , 000	Dry-matter Production mt 000
50	40*	488.0	976
50 - 100	70*	251.5	1,408
100 - 150	115	77.5	891
150 - 200	190	78.3	1,488
200 - 250	320	70.1	2,243
250 - 300	540	25.7	1,388
300 - 350	900	14.7	1,323
350 - 400	1,500	18.0	2,700
400 - 450	2,420	6.6	1,597
Total		1,030.4	14,014

\* This production is spread so thinly over vast areas that an estimated 50% and 20%, respectively, is judged to be beyond utilization.

a) For more detail on the calculation. consult RAMS' option paper on Rural Sector GDP.

From the foregoing, it is possible to deduct that 14 million metric tons of biomass growth available for livestock grazing and browsing, which RAMS has estimated with reference to UBT (Unite de Betail Tropicale) measure to approximately 10.6 million tons of equivalent dry-matter. Fifty percent of this amount is consumed and the other half is left on the pasture and dies at the end of each season, a normal biological process.

The remaining 2.7 million metric tons is in shrub and trees from which removals are made as reeds, leaves, green and dead wood for: cooking fires, charcoal, timber poles, housing, fencing, mats and other uses. The aggregate estimate for these uses is approximately 730,000 mt for 1980. The residual portion includes losses due to sand dune damage, decomposition and return to soil. In summary, the disposition of the above supply is:

Livestock	10,592,000 mt
Wood Material	730,000 mt
Decomposition and losses	2,692,000 mt
	<hr/>
Total Supply	14,014,000 mt

Demand

Total livestock biomass demand, with reference to UBT and calculated for each type of herd (camel, cattle, sheep, horses and donkeys) for Mauritanian as well as Malian and Transhumant animals totals 5,292,000 metric tons.

Total human cooking needs, measured in kilos of wood equivalent per person per year, and weighted according to rural, nomad and urban consumption totals 695,050 mt.

The following table sums the above:

	(000 mt)	
	Supply	Demand
Livestock	10,592	5,292 <sup>a)</sup>
Wood Material	730	696
Decomposition and losses	2,692	2,692
<b>Total</b>	<b>14,014</b>	<b>8,680</b>

a) Cooking wood equivalent only.

Gum Arabic, which was a significant forestry product before the drought, has been obliterated in the last few years. Exhibit 6-13 traces the quantities of Gum Arabic commercialised by SONIMEX, the national company which has the monopoly on the purchase of the product.

365

## 6.5 Production Tables

The following sets of tables summarize selected FAO data printouts. They regroup first by food-type and then by type of crop, basic data on total crop production, area under cultivation, and the amount used for seed, feed, waste, and consumption. Additional data on kilo-calories are included for each food-type.

The kilo-calorie analysis shows the data to be complete and a fair statement of Mauritania's agricultural production for the period 1973-1979.
