TASK ORDER F200

FEBRUARY 1984

TABLE OF CONTENTS

APPENDIX

1. SYSTEM SUMMARY

This document contains the design specifications for the Private and Voluntary Organization (PVO) Information System prepared by Computer Data Systems, Inc. (CDSI) and IRM/RS for the Bureau for Food for Peace and Voluntary Assistance (FVA). This system design effort represents the second step in the system development cycle and will be followed by a programming and implementation phase. A master work plan with detailed, time-phased tasks for the implementation phase is being submitted for approval along with these system design specifications.

1.1 Background

Introduction. An AID Policy Paper on Private and Voluntary Organizations was issued in September 1982 designating the FVA Bureau as the principal Agency information center on PVO matters. To assure effective administration of its responsibility under this mandate, FVA contracted with Booz-Allen & Hamilton to do a requirements study for a PVO Information System which would facilitate the flow of management information within AID and between AID and the PVO community. The study, which was completed in May 1983, was the first step in the process of developing a PVO Information System for FVA, and is the basis for the design specifications contained in this document.

Scope of the Design Task. To facilitate coherent decision-making and strengthen management effectiveness in implementing the PVO policy, AID has classified the diverse PVO community into a number of sub-groups within the following broad categories: cooperatives and credit unions, labor institutes, family planning groups, non-profit consulting firms and the traditional voluntary organizations (Volag).

The present PVO Information System design focusses on the traditional voluntary organization only to simplify the initial design task and thus assure that a fully operative prototype system is achieved within the time limitation imposed by the present task order. Information on the other types of PVOs, which constitute, in any case, only about 10% of the broader PVO community, will be incorporated into the system under a separate task at a later time.

Purpose. The design specifications of the PVO Information System will provide for the information needs of a number of end-users as shown in Exhibit 1.1, and will satisfy the following purposes:

1. To provide an Agency-wide perspective on AID's PVO program with improved access to a broader range of information.
2. To create an institutional memory which incorporates many features of the largely informal and unsystematic existing information exchange.
3. To provide information broker services between PVOs and AID through an active, two-way information flow.
4. To consolidate and disseminate information about PVO programs gathered by various AID offices and bureaus, missions and PVOs.

1.2 System Overview

The PVO Information System concept, graphically represented in Exhibit 1.2 is a refinement of the system overview which emerged from the Booz-Allen & Hamilton study. The primary difference in the new system is the incorporation of a Project Implementation Monitoring System tied directly to the quarterly portfolio review process in overseas Missions. The Regional and Central Bureaus will be responsible for monitoring projects in their respective geographic or functional areas, and for validation of data and maintenance of their component of the PIMS database. The PIMS is shown schematically as a database stored on the IBM mainframe and represented by the on-line storage symbol drawn with a broken line to denote that the system is not yet in existence. This system is described in greater detail in Section 2.4.3.

Additional systems, already in existence but managed by offices outside FVA, have also been identified as possible sources of PVO information. These are FACS, the Agency's major, new Financial Accounting and Control System, still being tested but not yet accessible; PAIS, the Project Accounting Information System; and the OYB Systems operated by various Bureaus in the Agency. Additional analysis of the contents and operation of these databases needs to be undertaken to assure that all sources of PVO related data have been taken into consideration in the design.

The main block in the schematic (Exhibit 1.2), IBM Mainframe Computer Applications, identifies the major functions or sub-systems which will be resident on the IBM 4341 mainframe. Each individual sub-system, its related information needs, primary resources and candidate applications are summarized in Exhibit 1.2.

EXHIBIT 1.2

Exhibit 1.4 contains a matrix which summarizes the frequency and the mode (interactive or batch) of interaction with each of the sub-systems and for each of the processes(editing/data entry, report generation and query) required in the operation of the system.

There are three kinds of PVO Information System applications:

1. Report Generating Applications
2. Index and Reference Applications, and
3. Telecommunications Applications.

Report generating applications will consist of a core PVO database and programs for generating eleven types of reports as follows:

a) AID Registry of Voluntary Agencies

b) Summary of PVO Support and Revenue

c) Non-US Government Support of PVO Overseas Programs

d) Summary of PVO Expenditures

e) Summary of Grants to PVOs

f) AID Experience & Technical Capabilities of Registered PVOs

g) AID Experience & Other Characteristics of Local PVOs

h) Selected PVO Private Non-Profit Characteristics

i) Summary of AID-Funded Projects
by PVO, Sector, Bureau/Country

j) Quarterly Shipping Reports

k) Other Ad Hoc Reports

R=Reporting

Mode=
I=Interactive
B=Batch
+=system to be linked
*=data base to be developed

Index and reference applications will include:

a) Evaluations and Audits by PVO, Country and Sector

b) Technical Assistance Resources by Technical or Functional Skill

c) Key Staff Contact Roster by PVO

d) PVO Project and Other Documentation by PVO

e) Frequently Referenced AID Handbook Procedures

Finally, the telecommunications applications will consist of programs and procedures for linking the core PVO database with external databases including:

a) PBDS

b) COORS

c) PVO Shipping Statistics

d) DIS

e) FACS

f) TAICH

g) PAIS

h) OYB

and eventually

i) PIMS

The AID/PVO Assistance sub-system is temporarily represented in the schematic as a manual system because of the unique, manual evaluation and auditing requirements associated with it. This component of the PVO Information System may be automated in the future, but is not included as part of the automated system in these design specifications.

Other than the changes noted above, the revised PVO Information System concept still retains the basic characteristics of the original. In general, the system concept schematic provides an overview of system

components which will be detailed in Section 2.1. It summarizes what the system must do to support FVA/PVC's information broker role. Further, it identifies where the system could potentially access the needed information from existing automated systems, what new systems must be developed to improve information retrieval, the various components of the system or mainframe applications and the process or type of information they each deal with, and finally, the standard reports which will be generated by the system.

This revised system summary will respond to FVA/PVC's most pressing needs for PVO information and to the PVO policy objectives concerning PVC's role as PVC information broker. It is also a system concept which assumes and expects further applications development, processing enhancements and equipment refinement in response to PVC's expanding role in the management of PVO information for the Agency.

2. DETAILED DESCRIPTION OF THE PVO INFORMATION SYSTEM

2.1 General System Procedures

The PVO Information System consists of both on-line and batch processes. The key procedures used for operation of the PVO Information System are:

a. Load - Initial loading of the PVO Information System databases will involve the modification of COORS & PBDS files to adjust to the PVO system network database organization. At the application or sub-system level, initial loading will consist of creating programs on AID's IBM 4341 mainframe computer and execution of extract/load programs to establish the basic files. For the new application, programs, panels and databases will be developed along with the detailed data dictionary. The application and system programs will be perfected during a period of system acceptance testing, and will be transferred to a production status and modified only through a controlled release process. The implementation plans to be followed for initial loading of files from proprietary databases such as COORS & PBDS will be prepared and approved by IRM, and applications described in these design specifications will be implemented by system development personnel.

b. Start - The system start-up procedures will be documented in a Computer Operations manual. The process for a user to sign-on to the system and start an application will be documented in the PVO Information System users manual.

c. Stop - The PVO Information System will use a specific set of halt procedures, within the operating system, for temporarily or permanently (one or more days) stopping the system functions. The procedures for a user to discontinue an application process will be documented in th Users manual.

d. Recovery - The procedures for recovering a system component that was terminated as a result of a hardware/software failure will be documented in the Computer Operations Manual for the operating system. The appropriate user action will be documented in the User Manual.

e. Restart - The procedures for restart of any system component upon recovery of the system will be documented in the Computer Operations Manual. Restart in the PVO Information System application functions completed and successfully posted to all data base files will be secure.

2.2 System Logical Flow

A complete description of the PVO Information System is shown in the form of a flow-chart for each sub-system in Exhibits 2.3 through 2.11.

2.3 System Data

2.3.1 Inputs. A comprehensive data elements chart lists the various inputs to the PVO Information System and relates them to their respective program function. Please refer to Appendix A - Comprehensive List of Data Element Sources, and Appendix C - PVO Interactive Screen Layouts.

2.3.2 Outputs. The output report layouts indicate the various outputs in the PVO Information System and relate them to their respective program functions. Please refer to Appendix D - Standard Report Formats.

2.3.3 Data Base - The PVO Information System database utilizes the INQUIRE database management system developed by Infodata Systems, Inc. Please refer to Appendix B for the file abstracts and record formats. Information on the file abstracts is self explanatory.

The PVO Information System data base was conceived using the features of the INQUIRE DBMS which consists of a group of files physically organized into a network database, each file of which contains a specific category of information.

The database structure of the PVO Information System is illustrated in Exhibit 2.1 on the following page. It contains five sub-systems. Some data-bases are delineated by a dotted line indicating they are to be developed. Other databases will be linked to existing proprietary databases. The overview of database status is illustrated in Exhibit 2.2. It describes databases to be developed and systems to be linked for each sub-system.

2.4 System Components and Relationships

This section presents the detailed characteristics of the five subsystems which constitute the PVO Information System. Each sub-system description contains the following elements:

- Objective: details the purpose of the sub-system in terms of specific PVO information requirements.
- General Description: describes the sub-system characteristics and reporting requirements. Includes a detailed flowchart graphically showing the input, processing, output and related characteristics.
- Input: lists the source documents required for sub-system processing and output.
- Process: describes reporting activities, updating, querying and other basic system processes.
- Output: describes the specific reports, updated databases or on-line query capability that result from the sub-system processing activities.
- Key data elements: lists and defines each data item required for operation of the sub-system.
- Interfaces: identifies the systems external to the PVO Information System which are linked to it by the sub-system.

2.4.1 PVO Registration Sub-system

Objectives. The objectives of the PVO Registration sub-system are to collect, maintain, and disseminate uniform registration information on PVOs. Information will be collected and maintained on all types of registered PVO's eligible to carry out AID-financed activities. The different types of PVO's to be included are:

1) Registered U.S. PVOs
2) Registered local PVOs
3) Registered International PVOs
4) Registered Regional PVOs

General Description. PVOs seeking AID grants must be registered by FVA/PVC. In order to be registered they must meet various administrative, technical and financial criteria established by AID. PVO registration materials (see registration checklist Exhibit 2.5) are submitted to AID for this purpose. Information is abstracted from Articles of Incorporation, By-Laws, minutes, audited financial statements, IRS statements of tax exemption, and other materials, and if all criteria are met, a determination of eligibility is made. Similar materials are required from each PVO on an annual basis to ascertain their continuing eligibility to receive federal funding.

The registration sub-system will store and process this information using three databases: (1) REGF - for financial data from the Statement of Support, Revenue and Expenditures (C-100), (2) REGS - for storage of textual material including technical capability statements of each PVO, and (3) REGM - for capturing information on local PVOs. The method for processing the latter will depend upon the transmittal medium used by the reporting organization.

The PVO registration sub-system is graphically presented in Figure 6.

Input. The PVO registration sub-system will include the following inputs:

- The revised C-100, Statement of Support, Revenue and Expenditures.

- PVO registration materials, which provide capability statements.

- Information on local PVOs registered by missions.

- TAICH will provide PVO technical capability information.

Some PVO registration data, such as that provided by third countries, international organizations, USAID missions, bureaus or other agencies may be submitted by cable transmission or via the proposed PIMS described in Section 2.4.3.

Process. The PVO Registration sub-system will consist of the input of PVO Registration information, a computation of percent non-U.S. government support and the production of PVO registration reports.

Data entry and editing may be done as frequently as required in a batch mode. Routine reports (see Outputs below) will be done annually in a batch mode. The query process will be available on an ad hoc basis in an interactive mode.

Outputs. There are eight major reports (D1 through D8) related to the PVO Registration sub-system: AID Registry of Voluntary Agencies (D1), Summary of PVO Support and Revenue (D2), Summary of PVO Expenditures (D3), Summary of Percent Non-U.S. Government Support of PVO Overseas Program (D4), Percent of Funds Received from U.S. Government (D5), AID Experience by PVO (D6), PVO Technical Capabilities Profile (D7), and ad hoc reports. These reports will be produced by following interactive screen procedures and batch mode report-generation programs.

For special inquiries concerning PVO registration information, authorized operators will use ad hoc reporting procedures which will require knowledge of INQUIRE DBMS.

Key data elements: The key data elements for the registration subsystem are listed in Appendix A.

Interfaces. The primary external system interfaces with the registration sub-system are with:

- TAICH
- Registration Contractor Systems

FIGURE 2.3

PVO REGISTRATION SUB-SYSTEM

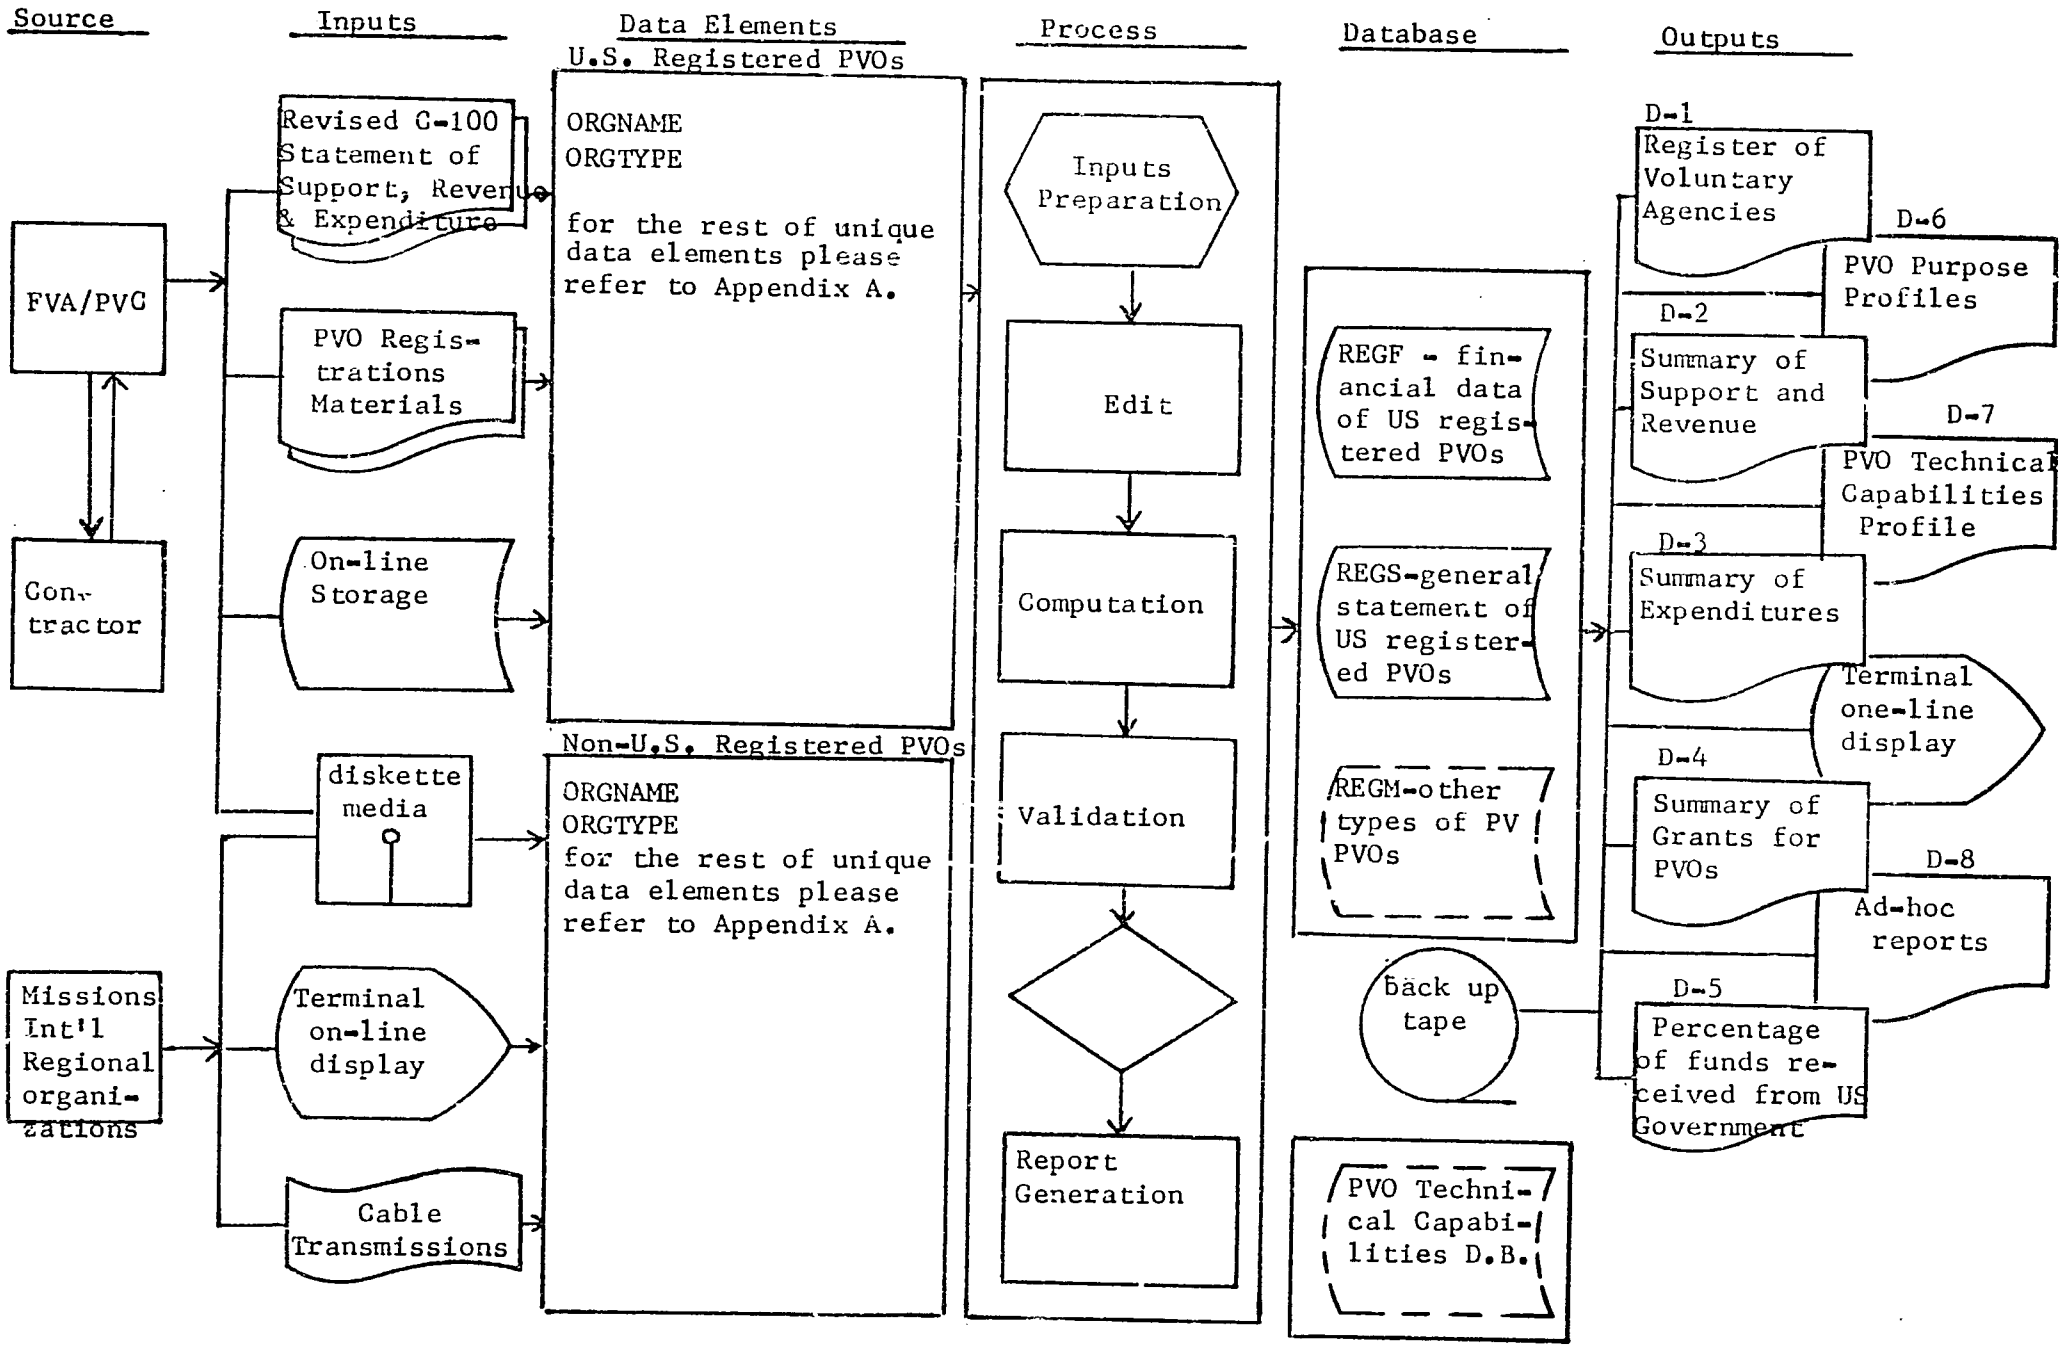

EXHIBIT 2.4 PVO REGISTRATION SUBSYSTEM FLOWCHARTS

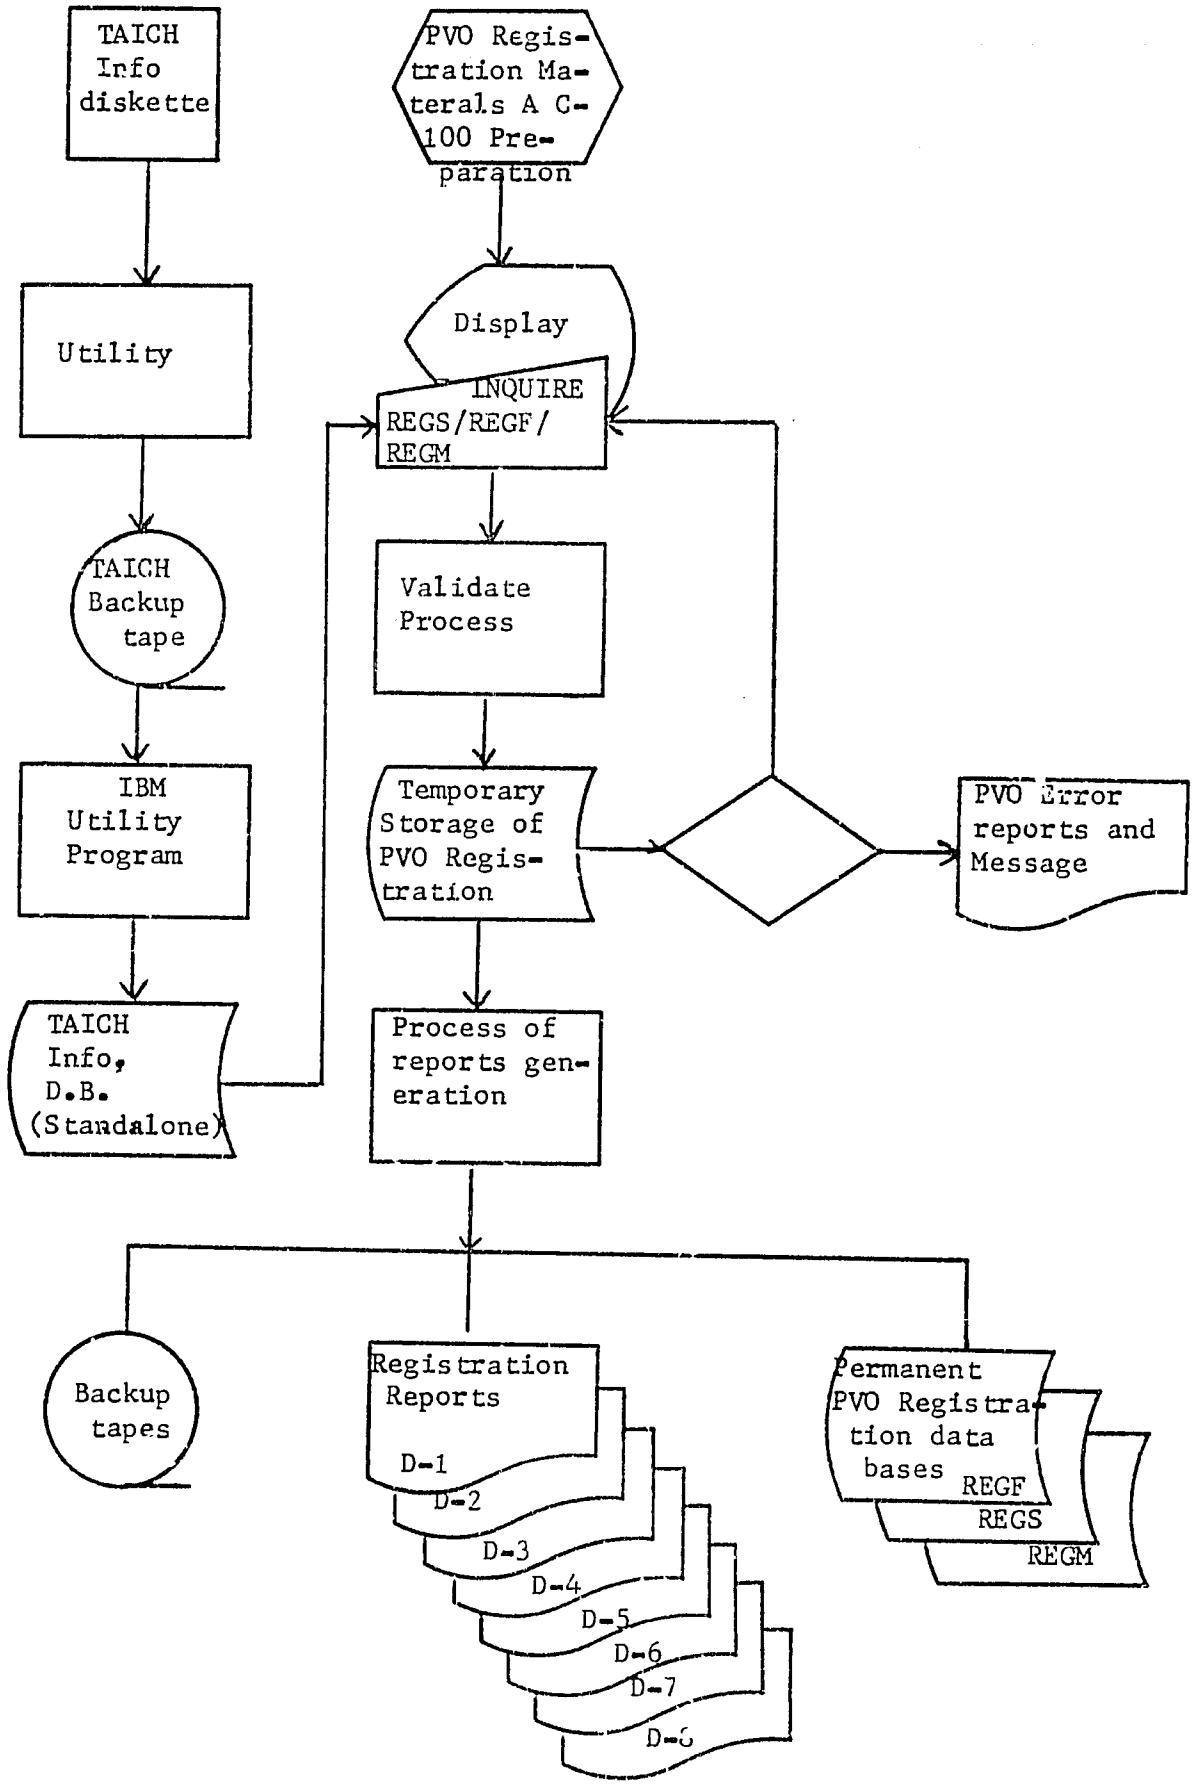

EXHIBIT 25 REGISTRATION CHECKLIST

_____ 1. Letter stating reasons for seeking registration and signed by the chief Executive Officer

_____ 2. Resolution of the governing body supporting the application for registration with A.I.D.

_____ 3. The articles of incorporation, by-laws and a statement as to the location of the organization's principal offices

_____ 4. Latest audited financial statements

_____ 5. Current annual budget

_____ 6. IRS Statement of Tax Exemption and a copy of IRS Form 990 or 990-PF

_____ 7. Latest annual report or similar document

_____ 8. A statement describing steps taken to date to undertake a program of development assistance overseas

_____ 9. A statement indicating that paid officers or staff members who serve on the Board do not constitute a majority in any decisions made.

_____ 10. A statment that members of the governing body do not receive compensation for their services on that body

_____ 11. Names and addresses of Board members

_____ 12. Minutes of meetings

_____ 13. Certification that audited financial statements are available to the public upon request

_____ 14. A statement indicating the salaries and allowances of the top 5 principal headquarters positions and country director positions

2.4.2 Ocean Freight Statistics Sub-system

Objectives. The objective of the Ocean Freight Statistics sub-system is to provide quarterly and annual shipping statistics for U.S. and non-U.S. flag shippers of ocean freight. PVO shipping statistics are used for allocation of AID funds and for reimbursement of qualifying ocean freight costs. Shipping data are also used to monitor the use of U.S flag vessels as required by law.

General Description. The Ocean Freight Statistics sub-system will maintain information on pounds shipped, value and freight cost of each commodity for each designated country.

This sub-system will also provide ad hoc reports for individual ocean freight shippers, including lists of agencies allowed to ship certain items in a given fiscal year.

Input: The Ocean Freight Statistics sub-system will include the following inputs entered and validated by the authorized operator. (For detailed procedures please refer to Section 4.1):

- Volag Quarterly Shipping Activity (AID 1550-6)
- Schedule D: Overseas Transport, Part 1 - Supplies to be Shipped (AID 1550-8)
- Schedule D: Overseas Transport, Part II - Estimate of Freight Cost, Value and Volume (AID 1550-9)
- Estimated PVO costs related to normal relief shipments.

Process. The Ocean Freight Statistics sub-system will consist of validation and input of the Ocean Freight shipping information, an INQUIRE process, and computation and production of Ocean Freight statistics.

Data entry/editing and reporting will be done in batch mode on a quarterly and annual cycle. Query processing will be available in an interactive mode as frequently as required.

Outputs. There are four major reports in the Ocean Freight Statistics subsystem: PVO Quarterly Shipping Report by Country (D9), Annual PVO Shipping Report (D10), List of Registered U.S. Voluntary Agencies (D11) and Ocean Freight Reimbursement Program Allocations (D12). Section 4.3 contains a detailed description of standard reporting procedures and batch mode report-generation programs. The Voluntary Agency Quarterly Shipping Report and the Voluntary Agency Annual Shipping Report will be made available to the Commerce Department and the Treasury Department.

For some requests for information concerning selected ocean freight agencies, the authorized operator will use ad hoc reporting to provide the necessary information. Knowledge of INQUIRE DBMS is required.

Key data elements. The key data elements for the Ocean Freight sub-system are listed in Appendix A.

Interfaces. There are no external system interfaces.

FIGURE 2.6 OCEAN FREIGHT STATISTICS SUBSYSTEM

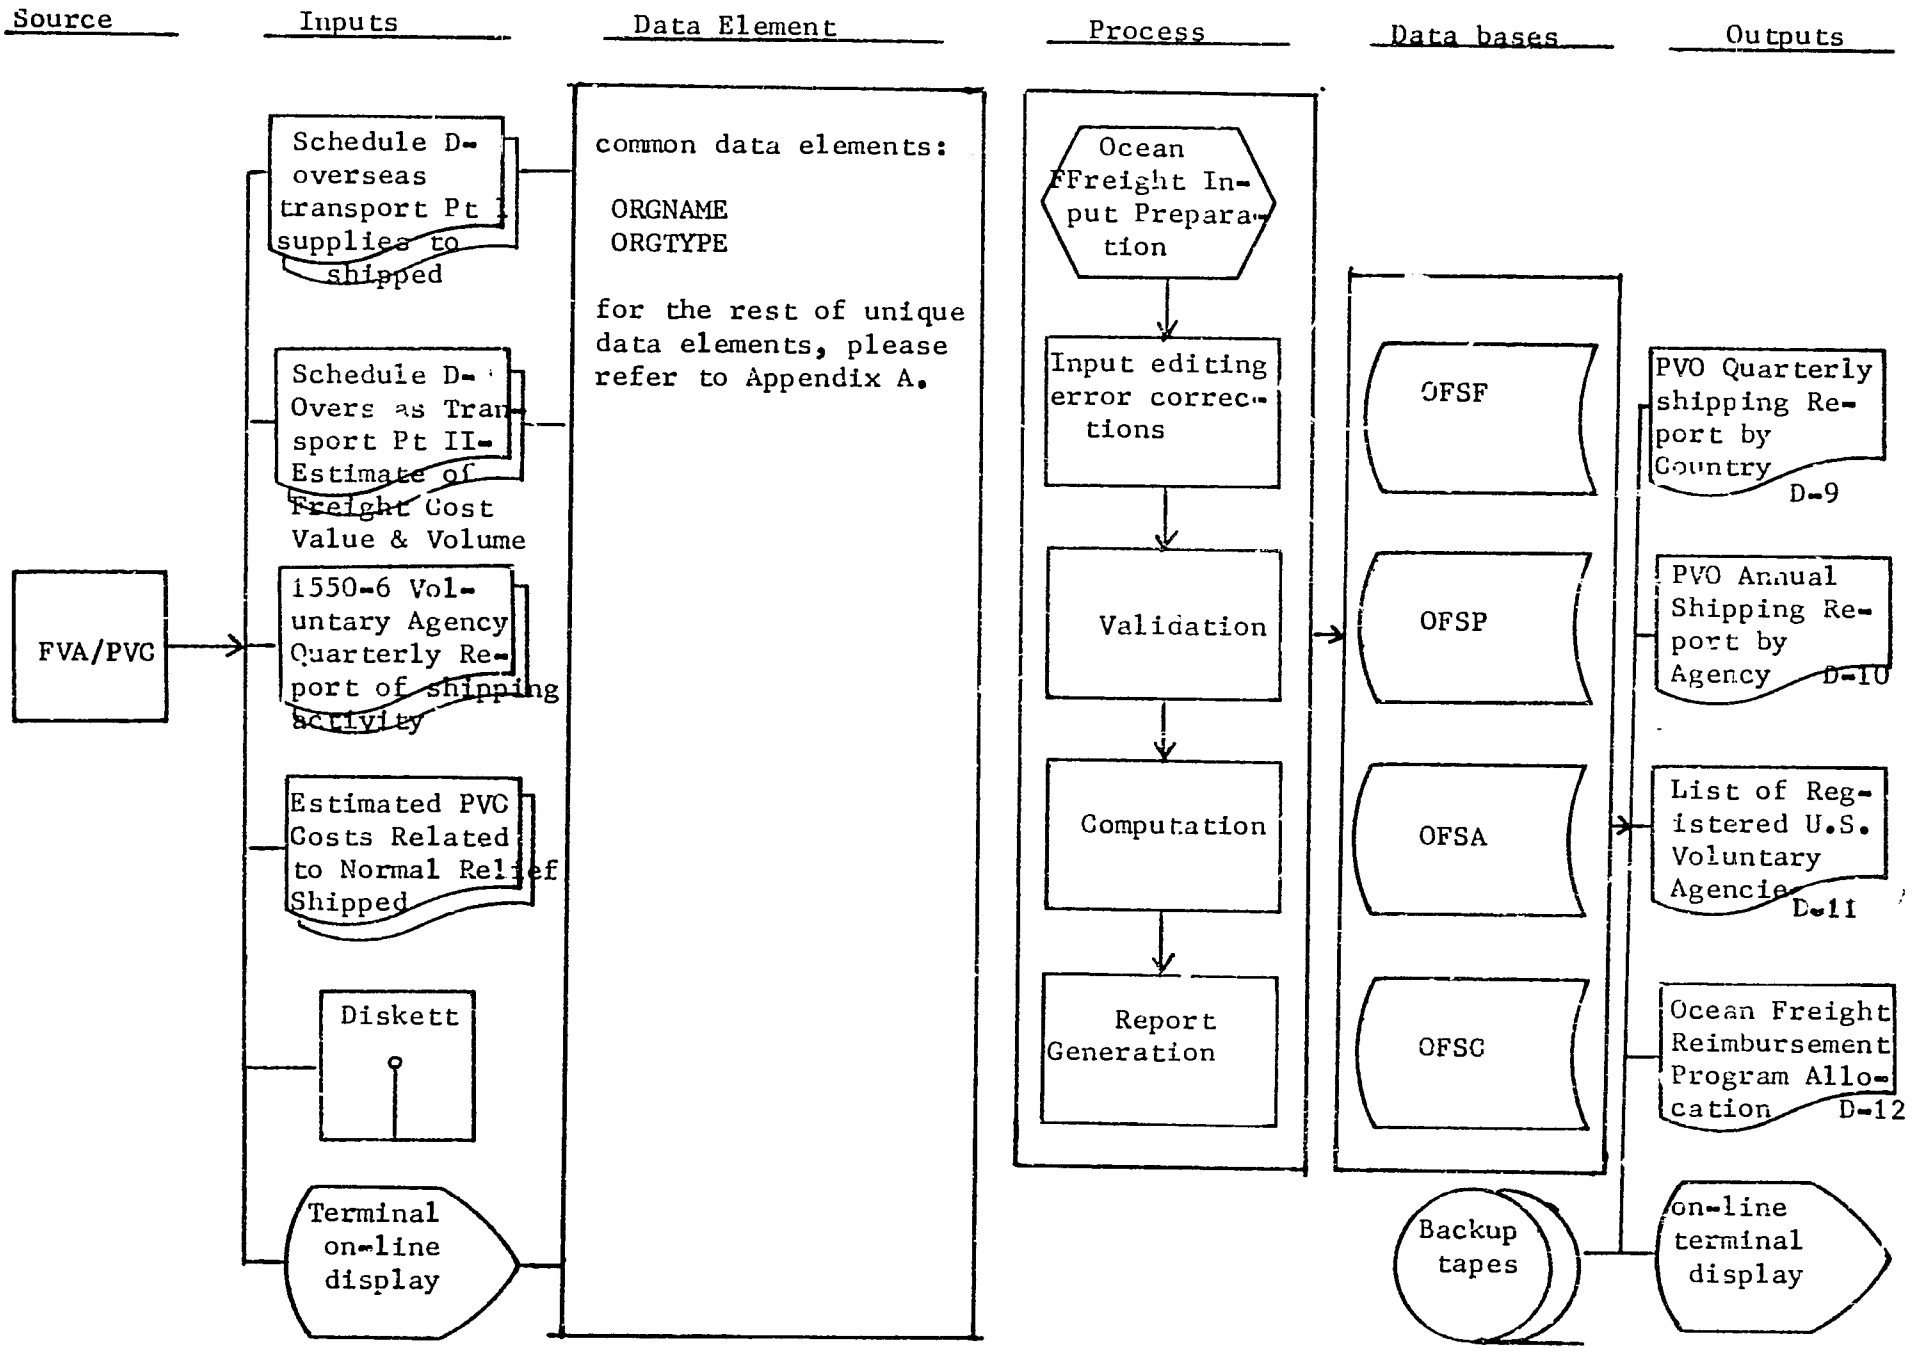

FIGURE 2.7 OCEAN FREIGHT STATISTICS SUB-SYSTEM FLOWCHART

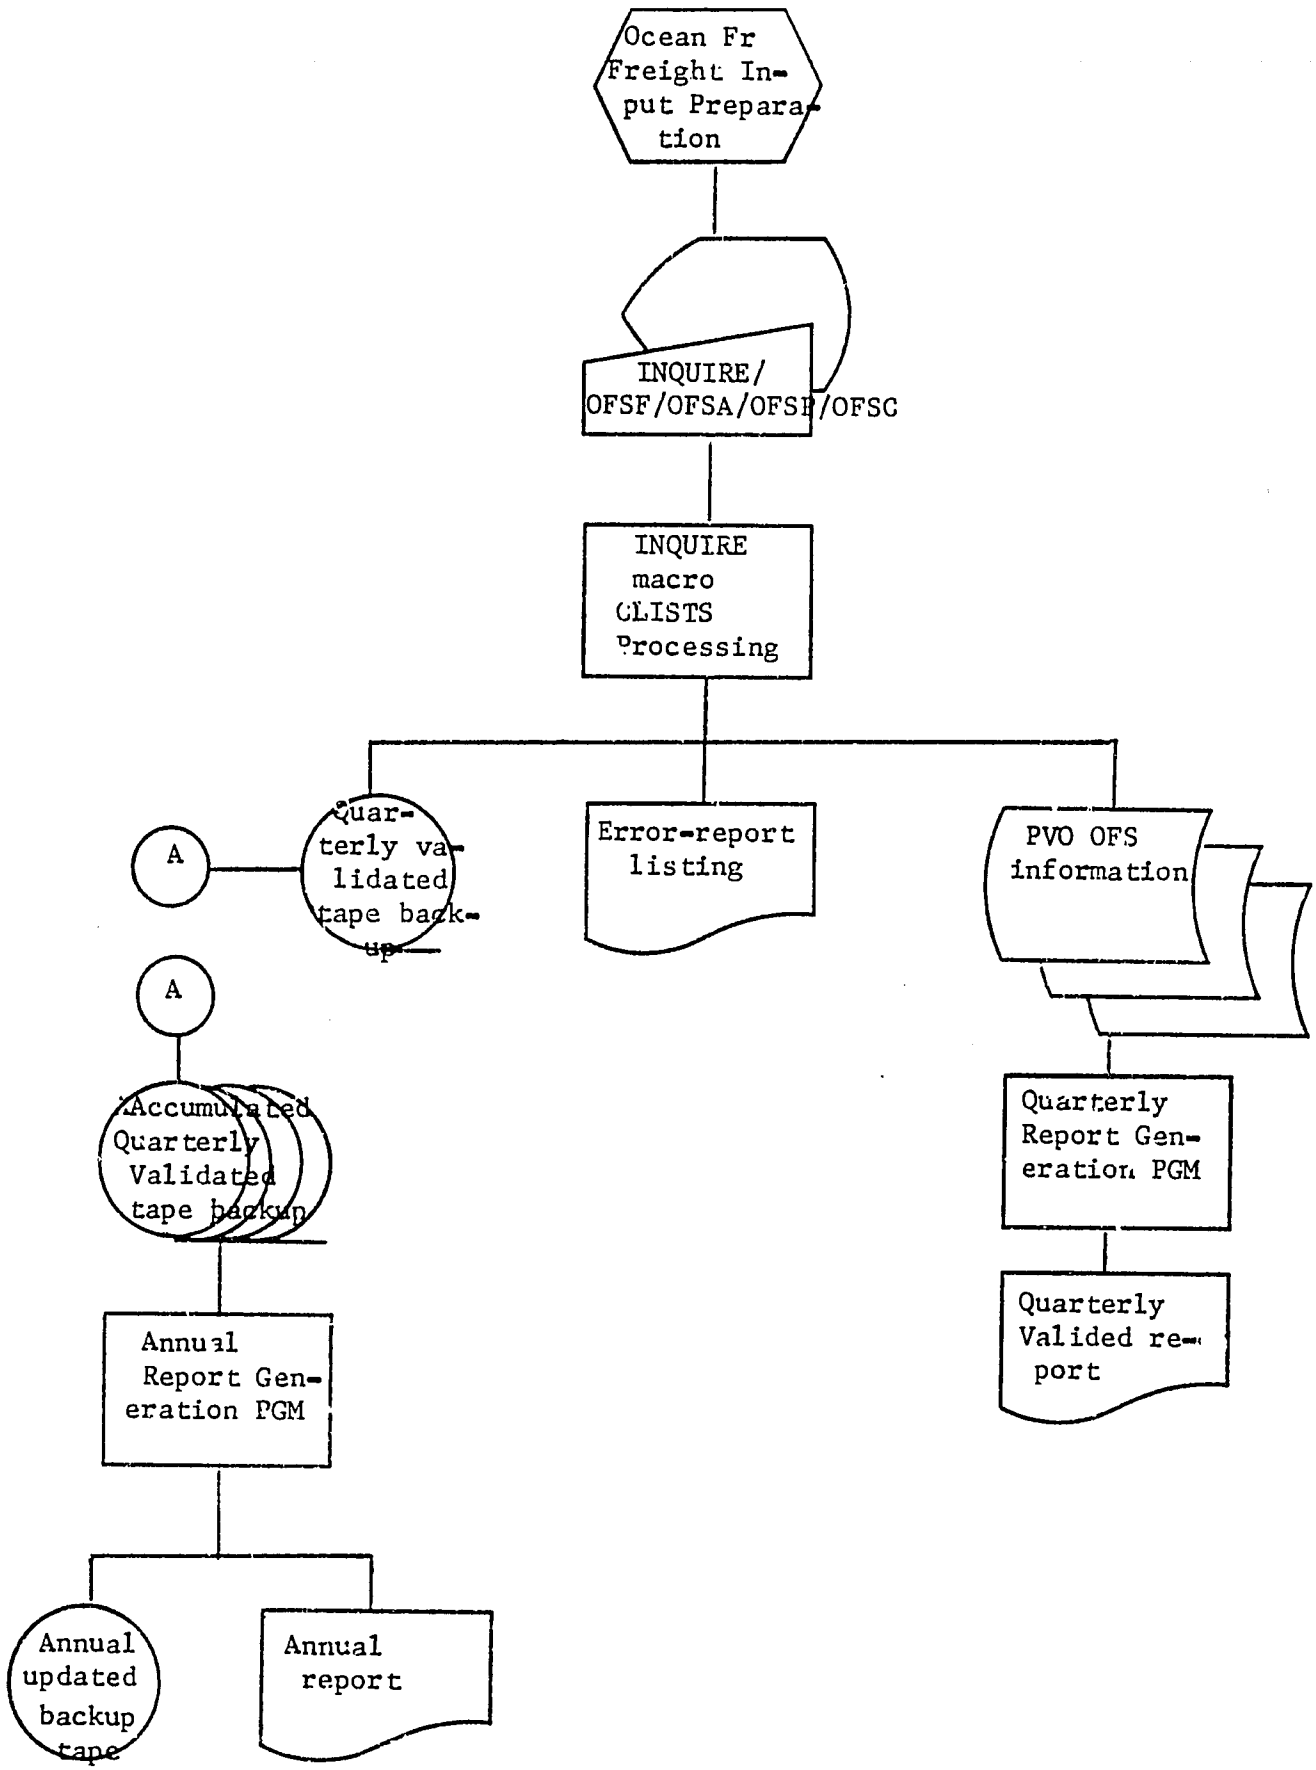

2.4.3. PVO Project Sub-system

Objective. The objective of this sub-system is to collect, maintain and disseminate information on PVO project development and implementation activities.

General Description. The PVO Project Sub-system will maintain information on physical and financial status of project development and implementation activities carried out by registered PVOs. In the short-term, information sources for this sub-system will be limited to those presently available in existing automated systems such as PBDS and COORS. The Project Implementation Monitoring System (PIMS), being developed as a parallel but separate activity, will eventually be a primary source of project implementation information provided on a routine basis by USAID Missions and Central Offices which have project management responsibilities.

Input. The only PVC input to this sub-system will be that already routinely required by PBDS, COORS or other existing systems.

Process. Information will be downloaded from the above mentioned systems and processed and formatted using INQUIRE.

Outputs. Four reports will be produced by the PVO Project Sub-system: Summary of AID Funded Projects by Sector (D13), Summary of AID Funded Projects by PVO (D14), PVO Grant/Contract Unter Implementation (D15), anf FVA/PVC Grant Portfolio (D16).

Key data elements. The key data elements for the PVO project sub-system are listed in Appendix A.

Interfaces. Primary interfaces with external systems will include:

- PBDS
- COORS
- PAIS
- FACS (if available)
- and PIMS (when developed)

EXHIBIT 2.8 PVO PROJECT SUB-SYSTEM

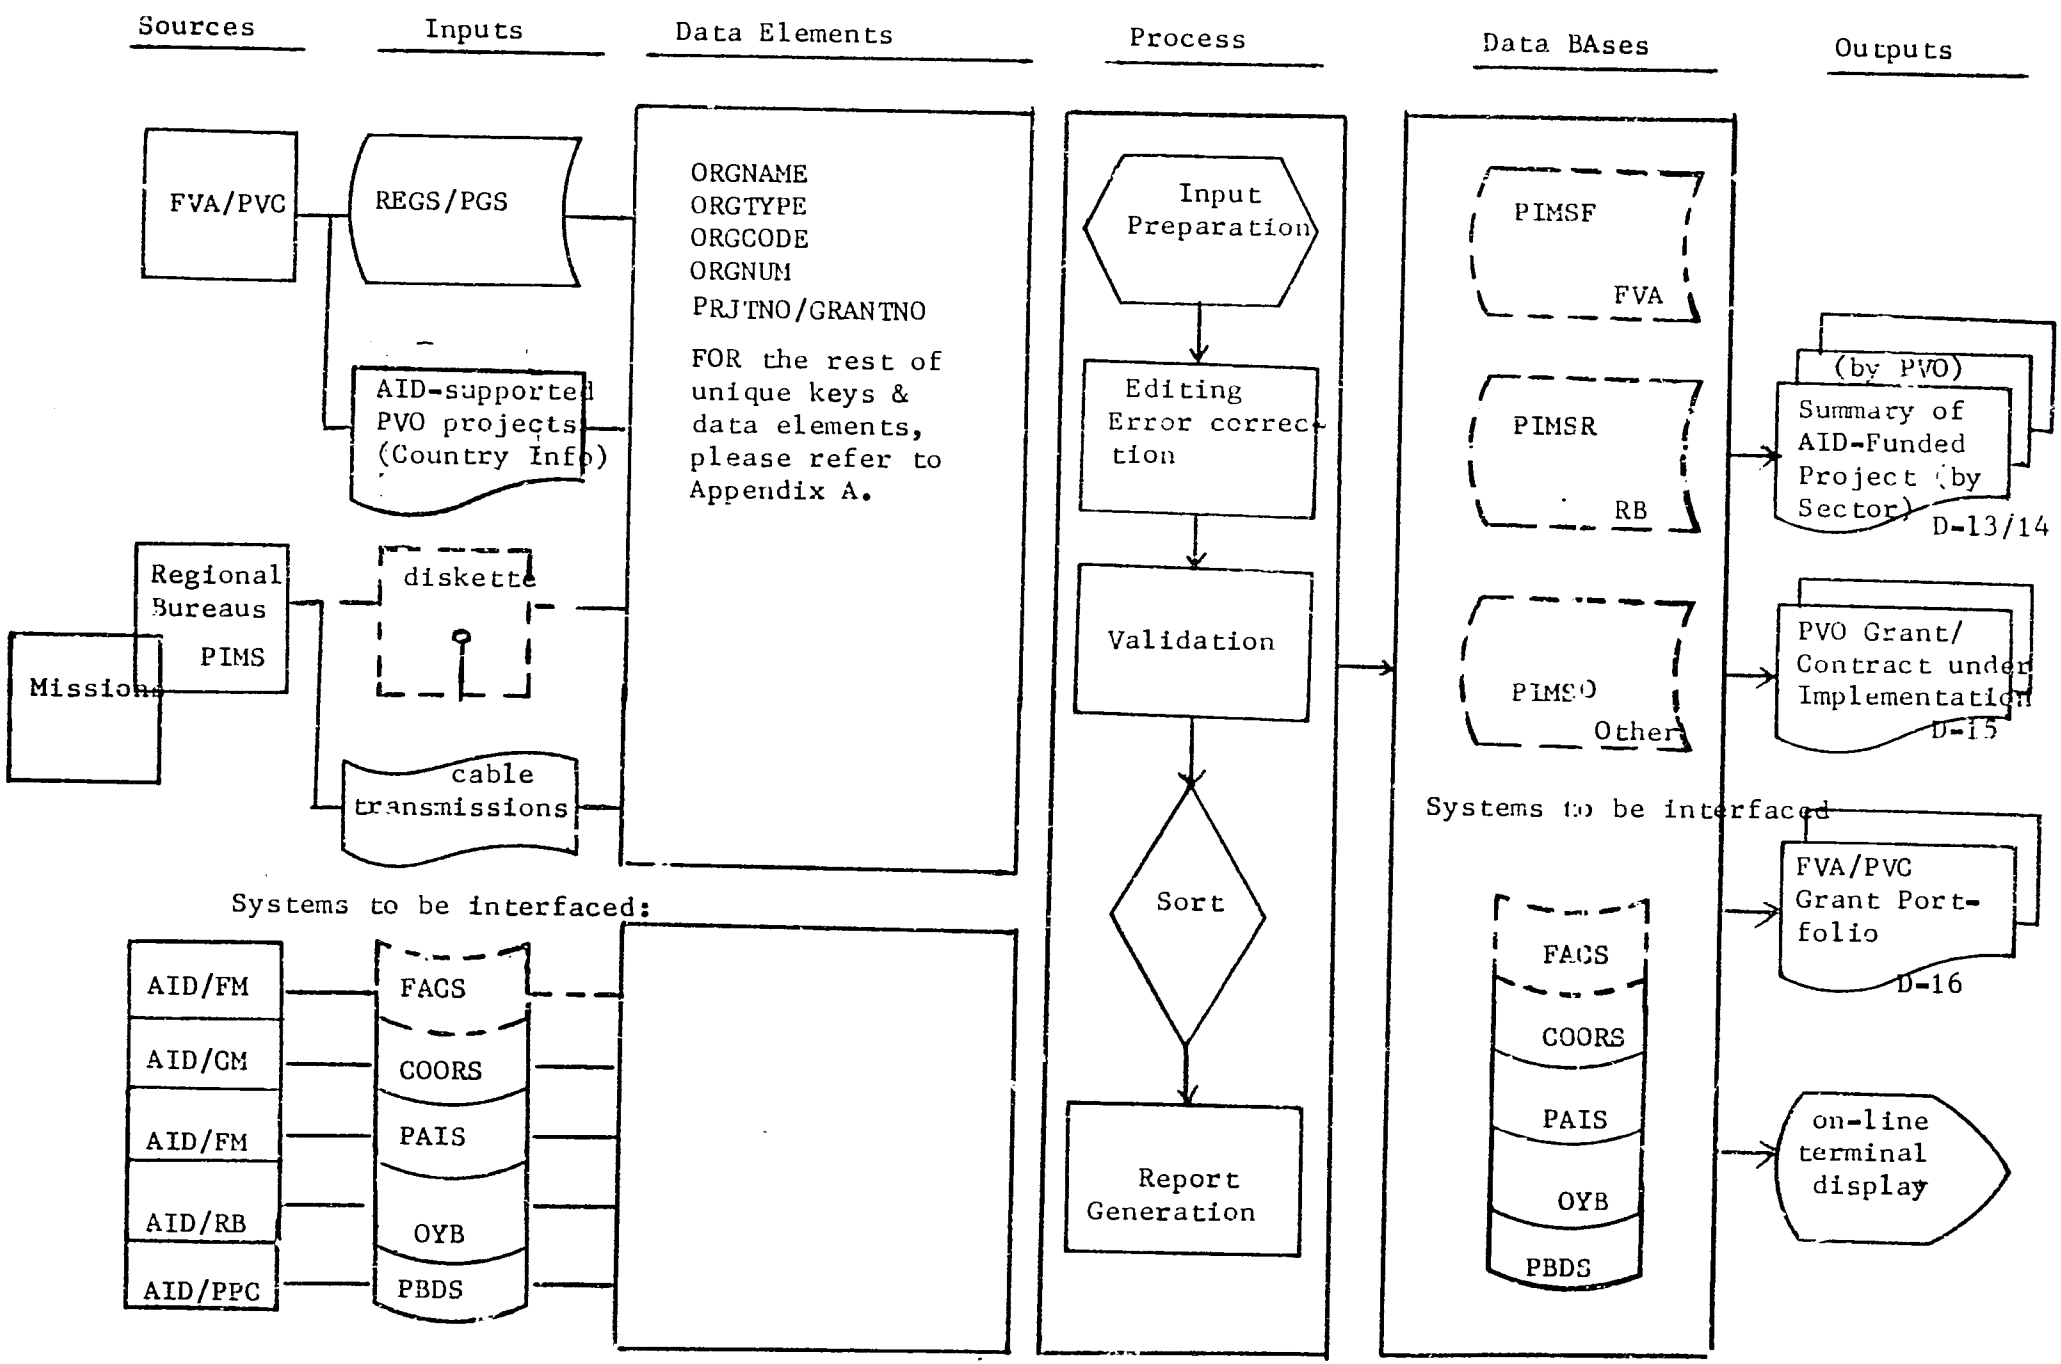

EXHIBIT 2.9 PVO PROJECT SUB-SYSTEM FLOWCHART

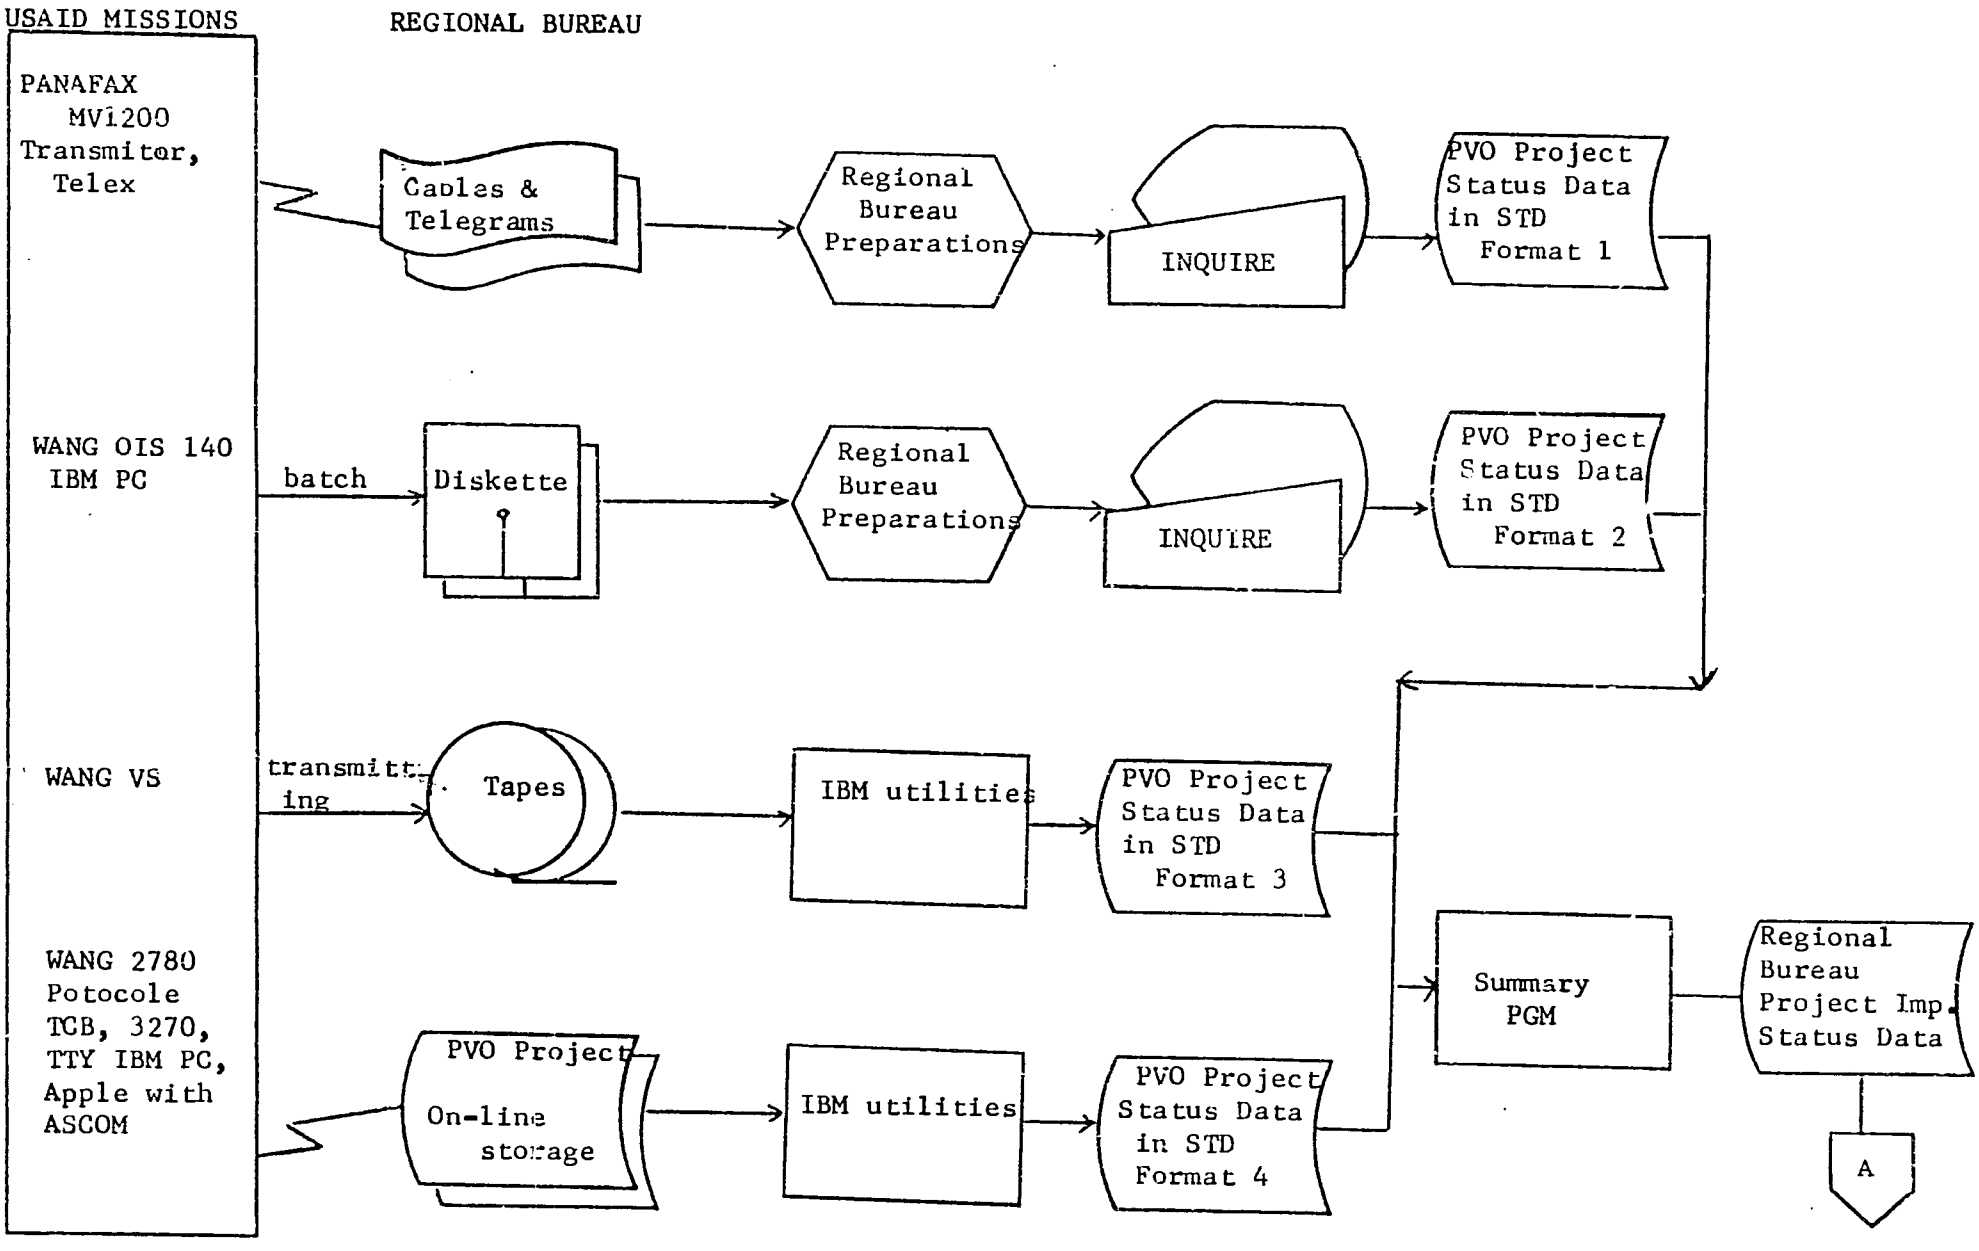

EXHIBIT 2.9 PVO PROJECT SUB-SYSTEM FLOWCHART (con't)

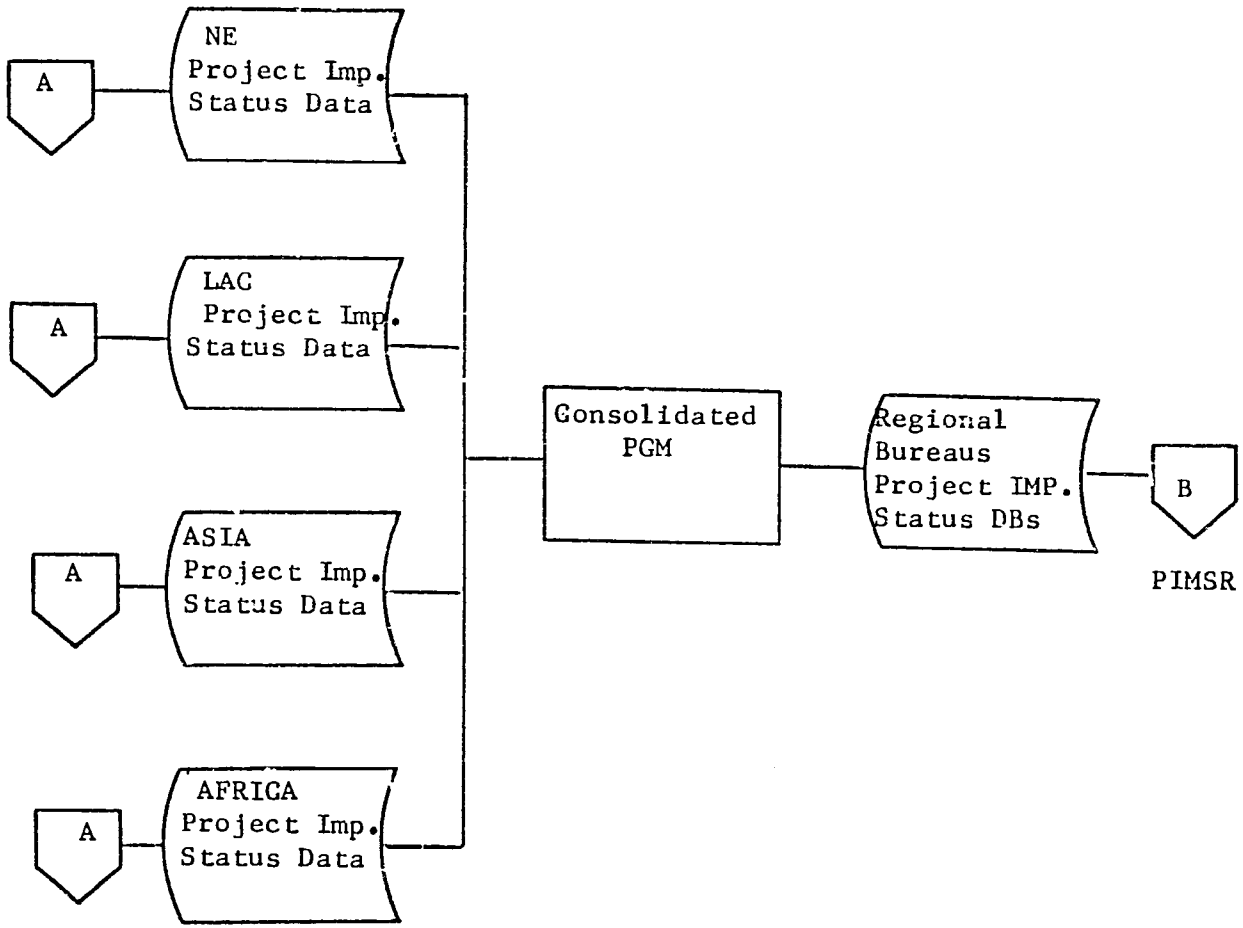

2.4.4 PVO Performance Sub-system

Objectives. The objectives of the PVO Performance Sub-system are to collect, maintain and disseminate information on past performance of PVOs in designing or implementing AID-financed projects.

General Description. The PVO Performance sub-system is an indexing application designed to facilitate access to the Development Information System (DIS). It will provide summaries of, or bibliographic references to AID-funded PVO project evaluations, assessments and audits in response to ad hoc inqueries.

Input. The PVO Performance sub-system will include the following inputs:

- PVO project performance information from DIS.

Process. The PVO Performance sub-system will consist of extracting the PVO related performance information from DIS.

The query process will be available on an ad hoc basis in an interactive mode.

Output. There are two major reports (D17 and D18) produced by the PVO Performance sub-system: PVO Progress Report Portfolio (D17) and Evaluation Profile of PVO Field Support Grants (D18). These reports will be produced by following interactive screen procedures and batch report-generation programs.

For special inquiries concerning PVO performance information, authorized operators will use ad hoc reporting procedures requiring knowledge of INQUIRE DBMS.

Key data elements. The key data elements for the PVO Performance sub-system are listed in Appendix A.

Interfaces. The primary external system interface is with:

- DIS

Figure 2.10 PVO PERFORMANCE SUB-SYSTEM

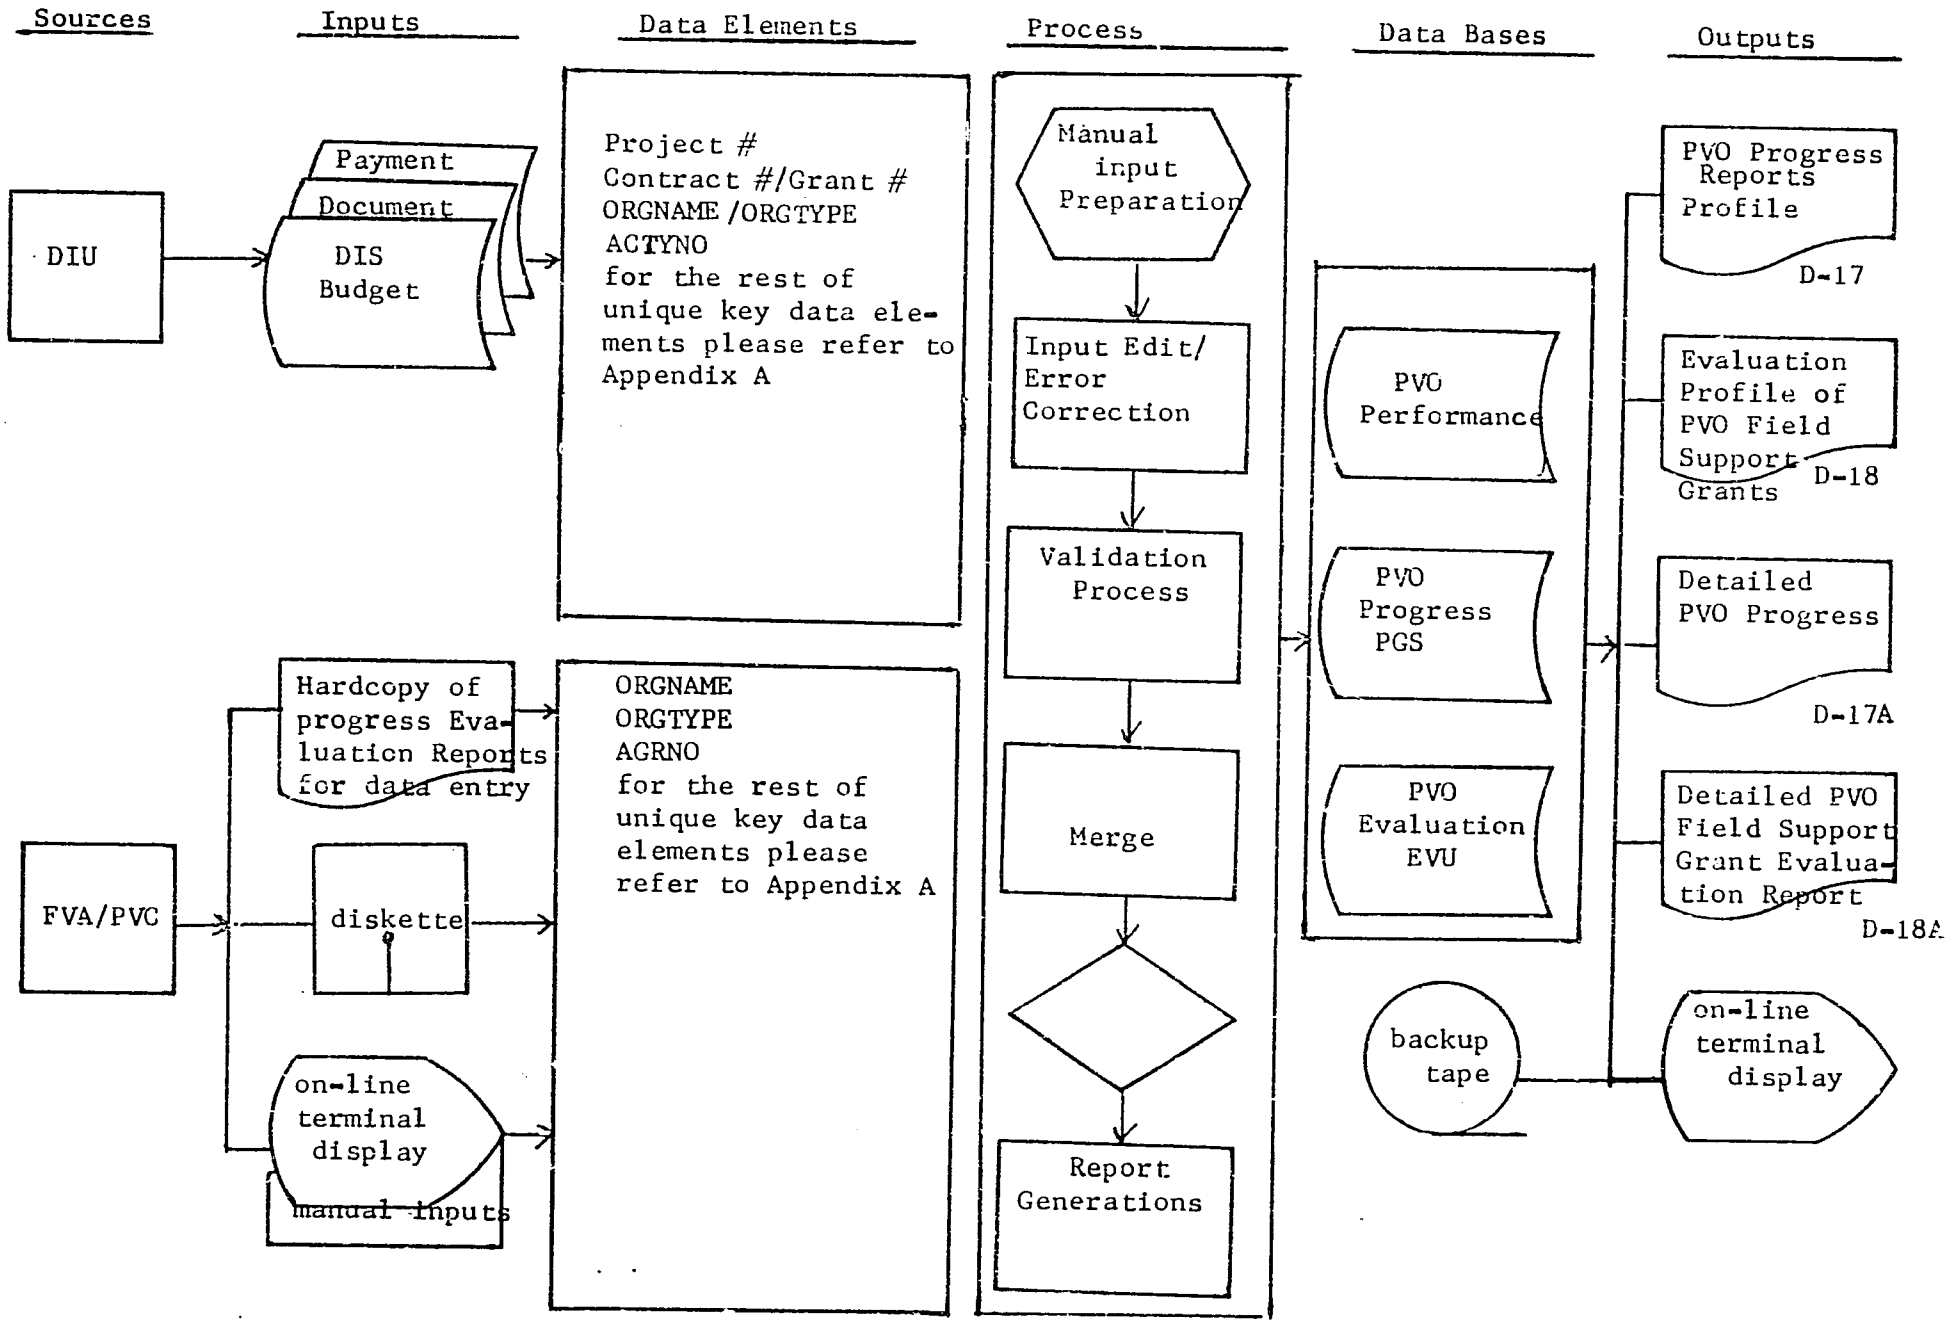

EXHIBIT 2.11

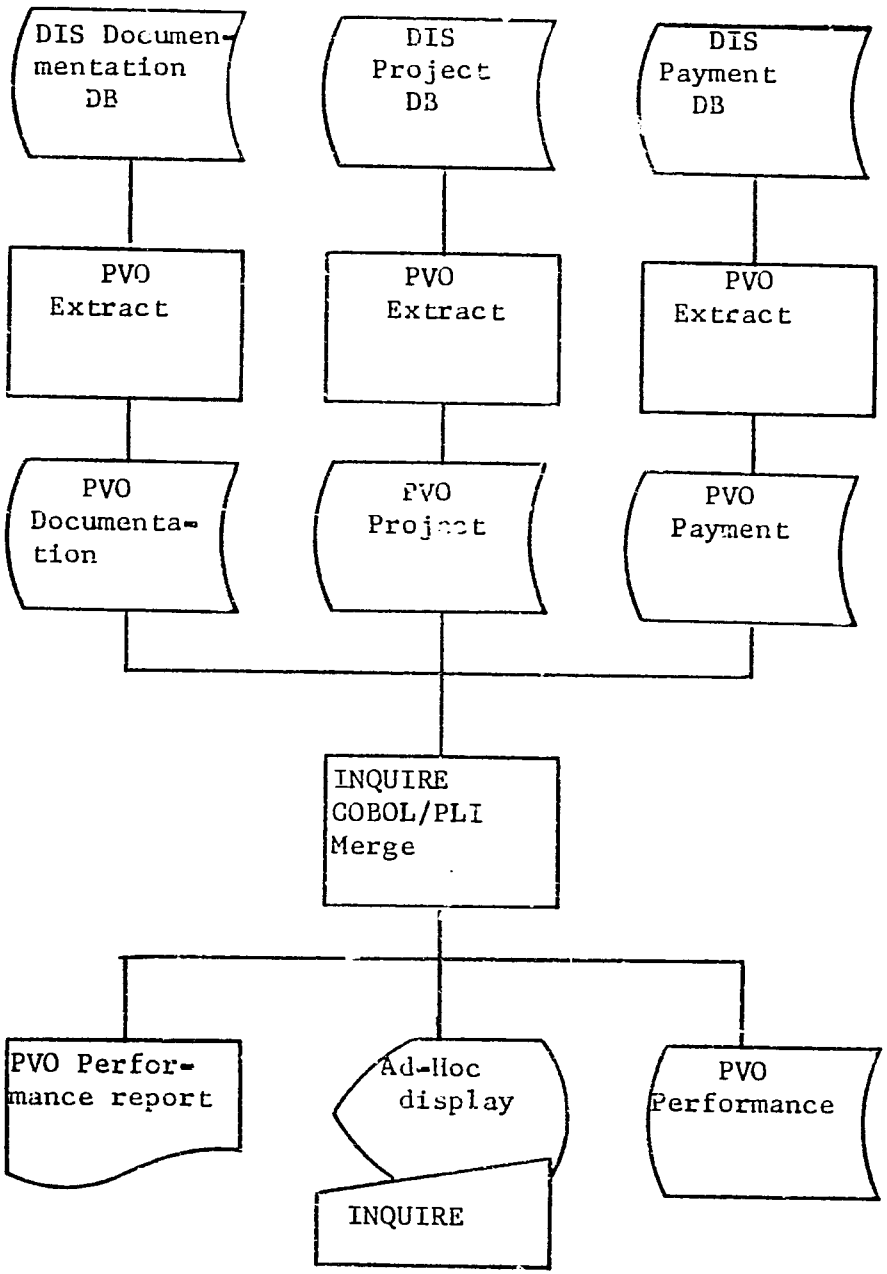
PVO PERFORMANCE SUBSYSTEM FLOWCHART



2.4.5 AID/PVO Assistance Sub-system

The AID/PVO Assistance Sub-system will serve as an information and technical assistance resource for PVOs presently registered or wishing to register with AID. This sub-system is basically a word processing application in which basic AID information sources are listed for PVO reference. This sub-system will not be developed under the present task order.

3.0 Hardware/Software Configuration

3.1 Hardware Requirements.

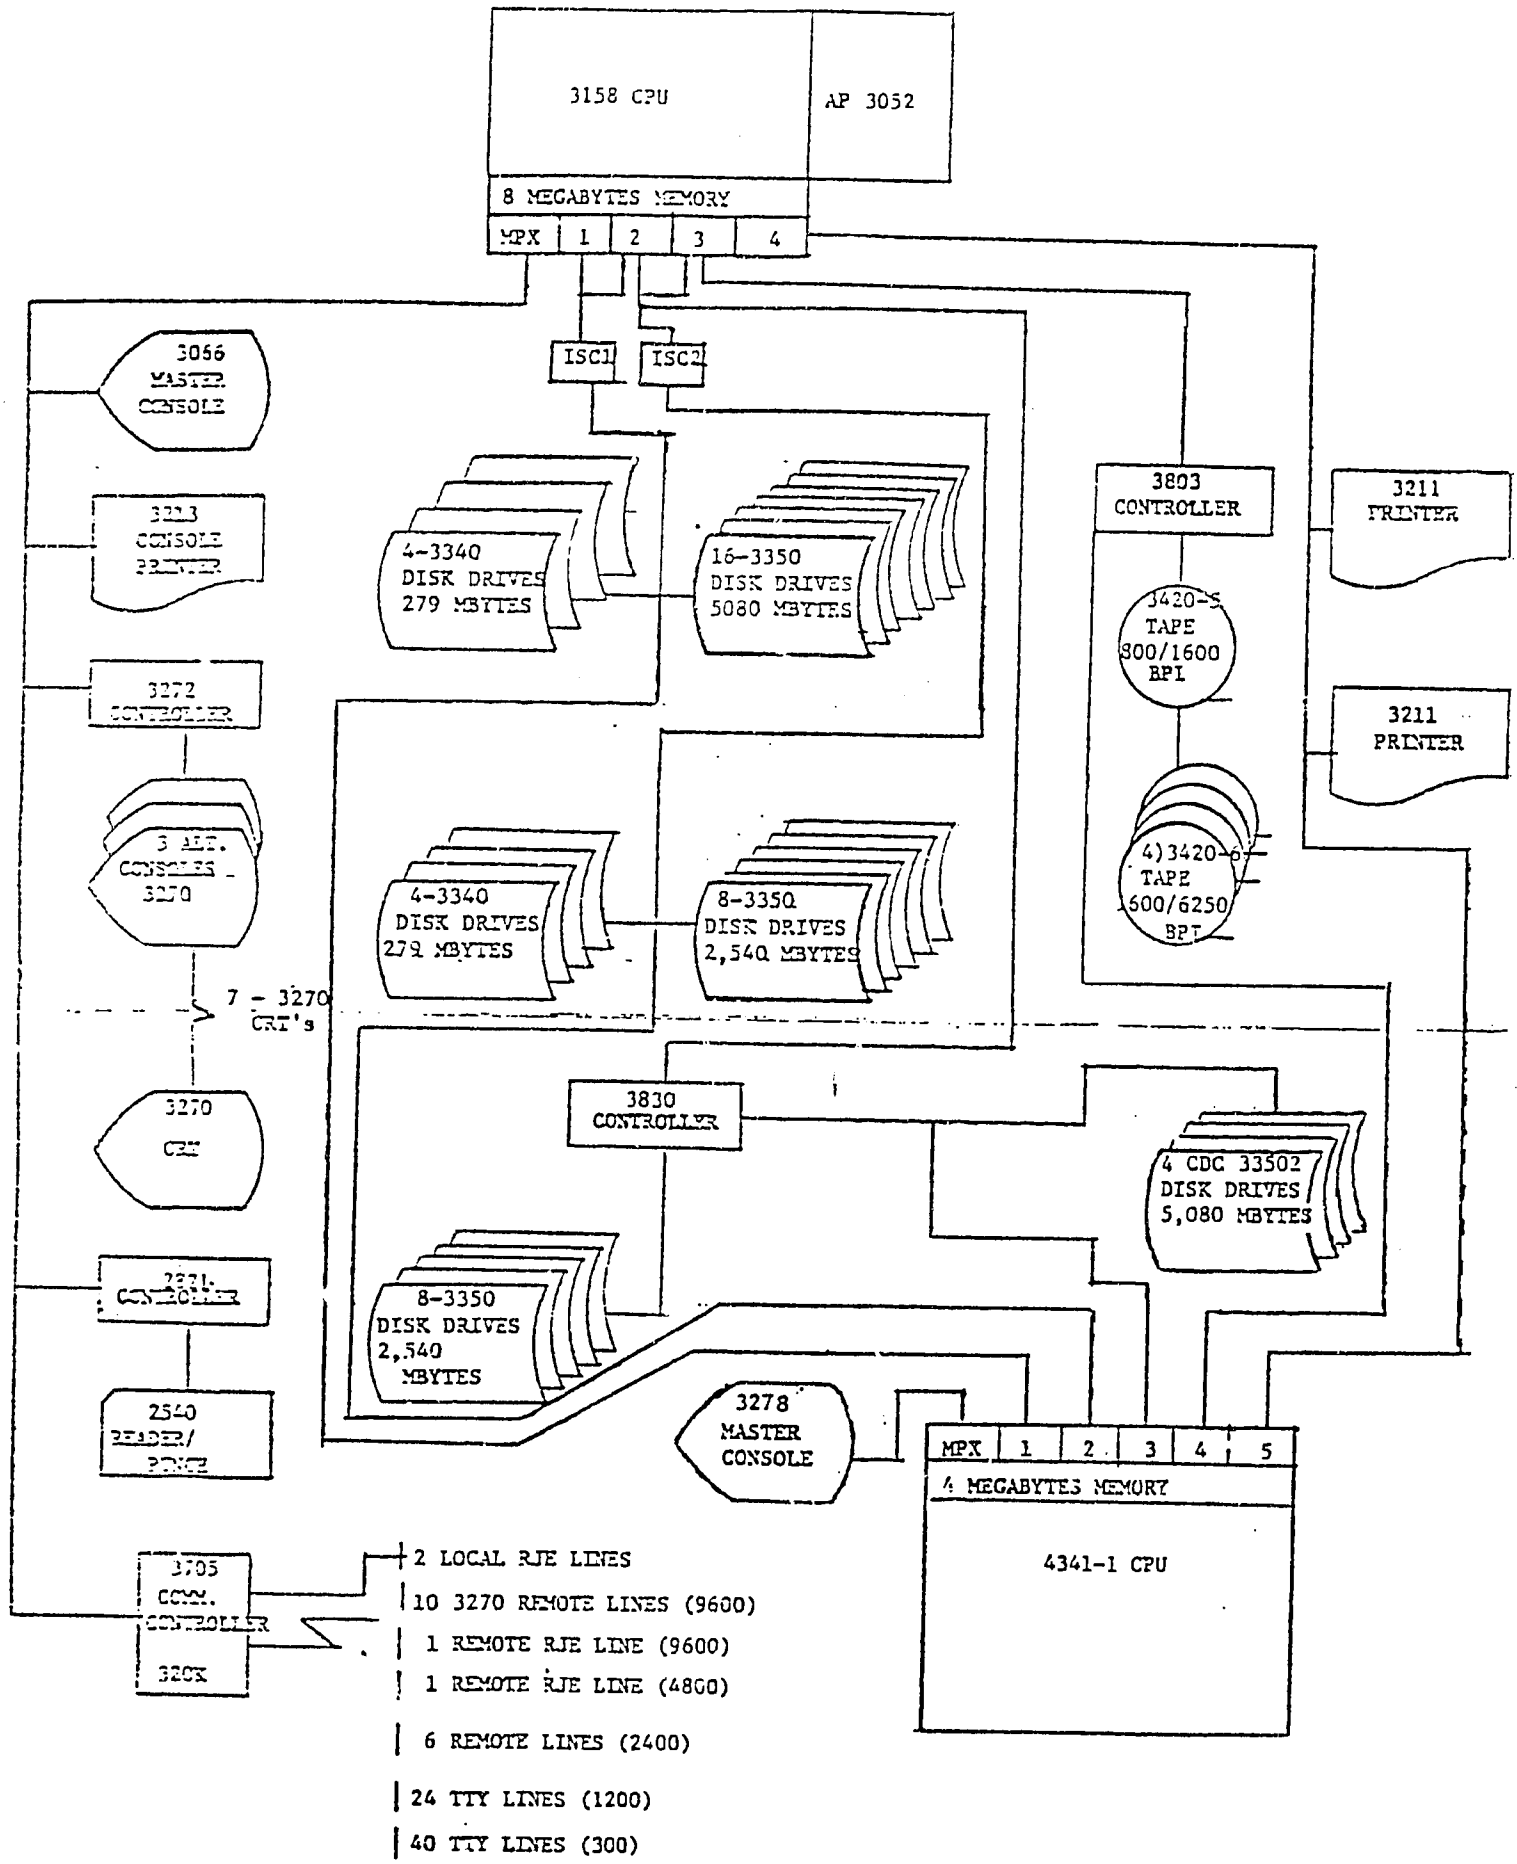
Mainframe. The decentralized characteristics of the PVO Information System require data storage and processing in AID distributed office environments, and data transmissions between installations via telecommunications. The IBM mainframe system includes a teleprocessing monitor and sufficient hardware to support 19 hardwired and 54 dial-up terminals operating simultaneously. The PVO Information System will utilize 2 Megabytes of direct access storage in the IBM 4341 in the M/SER/IRM facility at SA-12 (Universal North). A nine track tape drive with 6250 BPI will be required for processing tapes. The PVO Information System needs a 3350 disk drive, 3270 compatible terminal, and 2780 batch process protocol.

The INQUIRE database management system, the teleprocessing monitor and the application programs are expected in a partition of 2 Megabytes of core during peak operating periods. An additional 0.5 Megabytes may be required for maximum efficiency. The processing resources and storage devices for PVO Information System development are currently available at AID. Unclassified databases will be created and linked with current databases being used on AID's in-house IBM 4341 for the PVO Information System development and test phases.

It is planned that PVO Information System implementation will begin in March 198. on AID's in-house 4341. The IBM 4341 and Wang VS will provide sufficient resources and a secure facility to implement the PVO Information System for production.

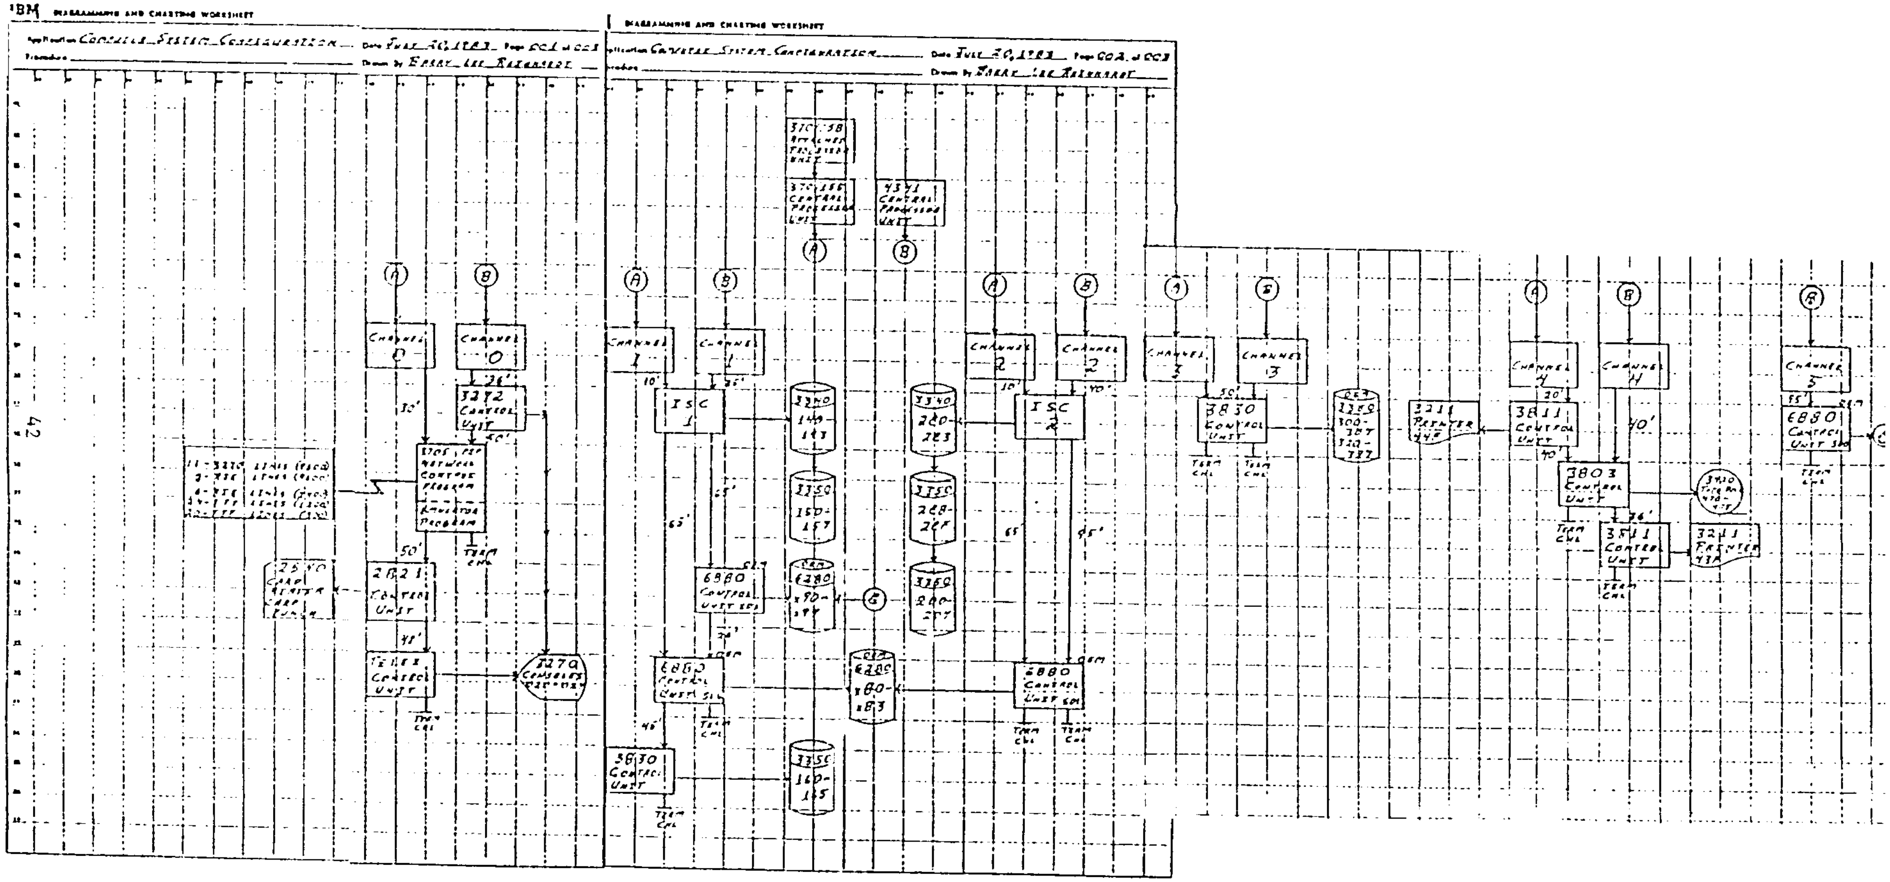
EXHIBIT 3.1

AID COMPUTER SYSTEM CONFIGURATION



Herb Deiss

EXHIBIT 3.2



A detailed schematic of AID's equipment is presented in Exhibits 3.1. & 3.2., Computer System Configuration. The AID computer system configuration describes the type of CPU, disk drives, tape devices, printers and master console available.

Mini/Micro Computer Interface. The PVO Information Network system will operate in both an interactive and a batch environment on the IBM 4341, interfacing with IBM and Wang PCs, and Wang OIS and VS equipment.

Microcomputers will be used as a front-end data collection/editing facility to upload data to an INQUIRE Data Base Management System (DBMS) utilizing INQUIRE's Full-Screen Processor capability on the mainframe.

The capability of eventually fitting into local area networks (LANs) and office automation (OA) systems is the primary criterion for selection of this configuration. Wang OIS with 2780 emulation, Datagraphic Terminals with dial-up arrangements, or Wang-PC via Wangnet will be used to access the mainframe computer.

For a detailed description of microcomputer specifications, please refer to the Microcomputer Information Package issued by M/SER/ERM/TS on May 20, 1983.

Exhibits 3.3 through 3.6 provide an inventory of mini and micro computer equipment in AID/W and overseas missions.

3.2 Support Software Requirements

A. Vendor Supported Software

1. INQUIRE - Version 13 of INQUIRE is a relational database management system developed by Infodata Systems, Inc. of Falls Church, VA. It will be employed to develop data bases on the IBM 4341 mainframe. Eventually data will be able to be downloaded to microcomputers when the new version 1.0 of PC INQUIRE is released the 1st quarter of 1984. But a minimum of 256K memory and 2 DS/DD floppy disk drives are required for the microcomputers.

2. INQUIRE/DMS/Full Screen Processor - A facility of INQUIRE will be utilized to process different types of transactions. It is a useful tool and user-friendly language which will be built into the PVO Information System.

3. Utilities - The following utility service programs will be used to create and maintain the PVO Information System Databases:

a. DATALOD Program - DATALOD is an independently executable utility program used for creating or updating a component of a database by initializing and loading records into this file.

b. DCODUTIL Program - DCODUTIL is an independently executable utility program used for creating, listing, updating and back-up of a decode file.

c. FDUTIL program - FDUTIL is an independently executable utility program designed to modify the Fields Definition Table (FDT) and various database options.

d. IMGUTIL program - IMGUTIL is an independently executable utility program used to access the data, search, search overflow and index file components of a database to create a back-up copy, or to restore a DASD or previously created backup.

e. INDXBLD program - INDXBLD is an independently executable utility program used to process a key data file to be further processed by SRCHLOD and INXUTIL programs to create or update the search, search overflow and index file components of a keyed database.

f. INDXDLT program - INDXDLT is an independently executable utility program used to recover space in the database, re-connect links and key chains in the search, search overflow and index file components of a keyed data base which has become damaged as a result of OS or hardware failures.

g. INQDUMP program - INQDUMP is an independently executable utility program used to list the contents of database components, support and intermediate files on a print data set.

h. INQUTIL program - INQUTIL is an independently executable utility program used to copy the files from DASD to DASD, unloads the files from DASD to tape, reloads the file from tape to DASD and deletes records.

i. INXUTIL program - INXUTIL is an independently executable utility program used to load or unload the index file component of a keyed database, or to list the keys for the database contained in this file.

j. KCUTIL program - KCNTIL is an independently executable utility program used to process key maintenance transactions against the search, search overflow and index files.

k. SRCHLOD program - SRCHLOD is an independently executable utility program used to create or update the search and search overflow file components of a keyed INQUIRE database.

l. DBINIT program - DBINIT is an independently executable utility program used to initialize a database.

B. In-house

1. OS/MVS - The MVS operating system developed by IBM will be utilized on the IBM 4341 which will enable multi-programming a variable number of tasks.

2. JES2 - Provides input/output spooling for local and remote unit record devices and class scheduling of batch jobs.

3. COBOL - ANSI COBOL 74 will be used to implement application programs not interfacing with the INQUIRE databases.

3.3 System Interfaces

An interface occurs between the PVO Information System application functions and the INQUIRE/FSP application in the passing of transactions generated by user functions. The data gathered by CLISTs will collect transactions from the INQUIRE/FSP facility and place them on a direct access file accessible from the INQUIRE/FSP. Transactions placed on this file are later processed by the INQUIRE query CLIST or INQUIRE report CLIST based on the types and needs of the process.

The anticipated interfaces with other systems, such as FACS, COORS, PBDS providing the PVO related data should continue to be needed even as other modules are implemented. For the detailed data extract method, please refer to data retrieval procedures and the related sub-systems.

3.4 Communication linkages

AID/W's telecommunications configuration uses a 3705 PEP network control and emulation program to receive data transmissions either by 3270 lines (9600 BAUD rate), Remote Job Entry lines (RJE 9600 BAUD or 2400 BAUD) or TTY lines (1200 BAUD or 300 BAUD). For the existing telecommunication system configuration, please refer to Exhibits 3.7 & 3.8

The telephone "dial-up" arrangement will allow the operator wishing to communicate to initiate an ordinary telephone call using modified telephone equipment for low-volume and infrequent types of communication.

4. The PVO Information System Operating Procedures

4.1 Data Entry/Editing Procedures

Data entry and editing procedures are designed to provide either interactive or batch mode processing by authorized operators. Procedures will vary depending on the types of sub-systems, schedules of processing and accessing methods.

4.1.1 Interactive data entry/editing

An interactive data entry capability will be available to authorized operators for entering transaction data on-line via a 3270 compatible terminal. The interactive data entry/editing function will provide access control to ensure that only authorized users execute the authorized function. Access control boundaries will be established at multiple levels. A security check will be performed for valid user-ID and password via a table lookup at sign-on. The user cannot proceed until a correct combination is entered and a valid PVO application system has been requested.

The data entry function will display the interactive PVO main menu screen first. In successive steps, the authorized operator will be prompted to select the appropriate application menu, database menu and transaction menu of his request. The screens will be designed using the Full Screen Processor/Data Dictionary package of Infodata Systems, Inc.

The screen display will permit data entry or updating functions together with the facility for indicating error fields both by means of user messages and highlighted fields. The interactive data entry screen formats will be developed to support the functional requirements for each specific update or data entry function. Appendix C - PVO Interactive Screen Layouts, describes data entry formats for each application.

The authorized operator will fill in the data element and enter the transaction for editing. Each data field will be edited by alphabetic, numeric and range checks. The system will detect errors and prompt the operator for error correction. Complex multi-field edits will be performed later by the batch applications.

Once accepted by the system, the transactions will be stored for subsequent processing by the PVO Data Input Processor. The PVO Data Input Processor will be designated for validation or consolidation of different databases.

The editing capability operates in an interactive environment utilizing interactive programming and data transactions entered via a terminal located in the authorized operator's office. Operators will be allowed to add, change and delete records on the master files depending on the access code.

4.1.2 Batch data entry/editing

A batch data entry/editing capability will be available to authorized operators for entering transaction data. This facility will provide more

flexibility to data entry points without 3270 emulation capability. Batch data entry/editing will be processed on a 2780 compatible terminal using IBM utilities.

The PVO Information System will provide the facility to accept external automated source data originating from other computer or word processing systems. These transactions will, in general, be transmitted on tape or diskette, and will be reformatted to correspond with the standard transaction formats.

Next, the characteristics of the data entry/editing procedures will be described in terms of accuracy, validity, response time, control and flexibility.

Accuracy. All calculations in the data entry process will be performed using fixed point arithmetic and will be accurate to the degree of precision required by the application.

Validity. All application data elements will be validated in the date entry process by means of a core resident table for single field edits. The data validation requiring complex edits will be deferred and reconciled during batch processing.

Response Time. The data entry processes will be economically responsive to user's requirements. With 20 terminals on-line, the response time for CRT display will not exceed 5 seconds. The processing of batch data entry via external automated sources will provide overnight turnaround.

Control. In the interactive data entry mode, user access will be monitored to ensure that only authorized users execute the authorized functions. The controls for batch data entry from external automated sources will be provided by various audit trails, record counts and the job synchronizer function.

Flexibility. Both interactive and batch data processing modes will be available.

4.2 Data Retrieval Procedures

Data retrieval procedures provide interactive query capability for authorized operators. For example, the following query information elements will be available in order to respond to each information need:

a. PVO Registration Sub-system:

1. Total funding of overseas programs by fiscal year
2. Total U.S. Government funding of overseas programs by fiscal year.
3. Total AID funding of overseas programs by fiscal year.
4. Legal status under Articles of Incorporation.
5. Years of operation.
6. Audit statements by fiscal year.
7. Evidence of bankruptcy or pending suits.
8. Purpose of PVO and its affiliations
9. Countries where currently and recently operating.
10. Technical qualifications of current personnel.

b. Ocean Freight Statistics Subsystem:

1. Commodity value and freight cost by PVO and country of destination for U.S. and non-U.S. flag ships
2. Ocean Freight agencies of registered U.S. Voluntary Agencies.
3. Reimbursement allocation by Ocean Freight agency.

c. PVO Project Sub-system:

1. List of projects by PVO, sector, level of funding, life-of-project or project officer.
2. Total funding level by PVO.
3. PVOs in regional/country profile by grant expiration date.
4. PVOs in regional/country profile for proposals to be reviewed in FY.

d. PVO Performance Sub-system:

1. Compliance with Project objectives.
2. PVO strengths and weaknesses.
3. Project impact.
4. PVOs qualified for specific AID projects.

e. AID/PVO Assistance Sub-system:

1. Sources of in-house technical assistance by area.
2. Eligibility requirements by type of grant.
3. AID Handbook references.
4. AID grant award process.

The functional characteristics of the on-line query procedures will be described in terms of accuracy, validity, response time, control and flexibility.

Accuracy. The on-line query process will not require any arithmetic operations. However, the data displayed will be accurate to the degree of precision required by the application.

Validity. The on-line query function will not require any application data element validation. The User ID, password, interactive system menu selection and query selection will be validated and only authorized users will be permitted to access the data base.

Response Time. Response time to queries of a single project record will not exceed 10 seconds with 30 terminals on-line. Data queries, required parameter logic and internal processing will respond in proportion to the number of parameters, number of logical comparisons and calculations and the system workload.

Control. In the online query process mode, user access will be monitored to ensure that only authorized users have access to the data base information.

Flexibility. The online query function will be adopted to allow different retrieval needs. The detailed data retrieval procedures will be described in the User's Manual.

4.3 Standard Reporting Procedures

Standard reporting procedures will produce selected reports on request in batch mode, please refer to Appendix D - Standard Report Formats. Data is selected from the files, sorted into the required sequence, and formatted and printed for distribution.

Standard reporting procedures will provide the facility for historical reporting of either ad-hoc, monthly, quarterly or annual reports depending on the applications. Historical data will be captured from the end-of-month process, accumulated on the end-of-quarter or the end-of-year cycle and will make available for reporting requirements of either project changes, registration change, shipping update, PVO technical update, or PVO performance update.

The reporting characteristics will be described in terms of accuracy, validity, response time, control and flexibility.

Accuracy. Standard reports will have built-in calculations and perform fixed point arithmetic and will be accurate to the degree of precision required by the application. A conventional rounding algorithm will be used.

Validity. Standard reporting validity is contingent with the end-of-period processes. Record counts of input vs output, syntax of specific data elements, and transmitted data validation will be provided.

Response Time. Standard reporting response time is dependent on the sub-system throughout and the total number of records to be processed. Each job will be initiated in the interactive environment and run in the batch mode. Total clock time will be constrained by the availability of the appropriate system resources (tape, disk, etc.) as a result of other tasks being performed in the operating system.

Controls. Standard reporting will be controlled by the system using audit trails, record counts and the job execution criteria.

Flexibility. The standard reporting procedures will provide varied reporting and processing requirements of the PVC Information System.

ID #1012

Subsystem	Data Base	PGM	Descriptions	File Name	File Type	Media			
A. PVO Registration	REGS	DATALOD	Utility Service Program	DATAFIL	Data	Disk			
	REGF	SRCHLOD	Utility Service Program	SRCHFIL	Search	Disk			
	REGM	SRCHLOD	Utility Service Program	SRCHFIL	Search overflow	Disk			
	TAICH	INXUTIL	Utility Service Program	INXFIL	Index	Disk			
		DCODUTIL	Utility Service Program	DCODFIL	Decode	Disk			

Notes: 1. REGS = represents registration statement.
REGF = represents registration financial statement (C-100).
REGM = represents PVO registration by the mission.
TAICH = represents PVO Technical Capabilities.

2. Four data bases may be created by batch mode.

B-1

Appendix B PVO Database Profiles

Subsystem	Data Base	PGM	Descriptions	File Name	File Type	Sources	Media	Distri-bution	Reten-tion
B. Ocean Freight Statistics	OFSA	DATALOD	Utility Service Program	DATAFIL	Data		Disk		
	OFSP	SRCHLOD	Utility Service Program	SRCHFIL	Search		Disk		
	OFSF	SRCHLOD	Utility Service Program	SRCHFIL	Search overflow		Disk		
	OFSC	INXUTIL	Utility Service Program	INXFIL	Index		Disk		
		DCODUTIL	Utility Service Program	DCODFIL	Decode		Disk		

Notes: 1. OFSA represents Ocean Freight Statistics - Reimbursement Allocation.
OFSP represents Schedule D Overseas Transport Part I - Supplies to be shipped.
OFSC represents Schedule D Overseas Transport Part II - Estimate of Freight Cost, Value and Volume.

2. The above four databases may be created by batch mode or by FSP.

OFSF represents Voluntary Agency Quarterly Report of Shipping Activity (AID 1550-6).

B-2

Appendix B PVO Data Base Profiles

Subsystem	Data Base	PGM	Descriptions	File Name	File Type	Sources	Media	Distri-bution	Reten-tion

PVO INFORMATION SYSTEM

INTERACTIVE SCREENS LAYOUTS/FORMATS

Screen 1. - Description of the PVO Information System.

Method - The project officer or the authorized operator turns on the terminal power, then signs on using the authorized USER-ID and PASSWORD, the user cannot proceed until a correct combination is entered. The system will prompt the following messages once the access both is validated and approved for proceeding.

```
**********************************************************
*                                                        *
*    ***WELCOME TO THE PVO INFORMATION SYSTEM!***        *
*                                                        *
**********************************************************
```

What is the PVO Information System?

-- The PVO Information System is a decentralized system which provide an agency-wide perspective on AID's PVO registration capabilities, Ocean Freight Statistics, PVO project PVO Performance and AID/PVO assistance information.

How to access the interactive Full Screen Processor of the PVO Information System?

-- Choose the appropriate code of the sub-system you desire to enter and then enter for successive processing. For the detailed instruction, please refer to Sections 4.1-4.3 of the system specifications of the PVO Information System.

Screen 2 - PVO Information System Main Menu

Method - The project officer or the authorized operator must enter the subsystem code of his choice. For the detailed description of each subsystem, please refer to Section 2.4 - System Components and Relationships of the system specifications for the PVO Information System.

Enter the data entry base code =____

Screen 6. - PVO Registration Entry Menu

Method - For the detailed data entry/editing procedures of PVO Registration information, please refer to Section 4.1 of the System Specifications for the PVC Information System.

If the database code A1 is entered, the system will prompt a data entry format similar to the Statement of Support, Revenue and Expenditures (C-100) for accepting financial data entry. The authorized operator must enter each field of the C-100 of each PVC Registration.

If the database code A2 is entered, the system will prompt a data entry format similar to the PVO Registration Roster list for accepting PVC statement entry.

If the database code A3 is entered, the system will prompt a non-U.S. registered PVC data entry format for accepting data entry.

If the data base code A4 is entered, the system will prompt a PVC technical capabilities data entry format for accepting data entry.

Method - The authorized operator must enter each field of the U.S. Nonprofit organizations in Development Assistance Abroad. This menu is provided for the data entry/editing of the following organization information:

1. Name of organization
2. Street/postal address and telephone number
3. Telex number/cable address
4. Founding and incorporation dates (in U.S.)
5. Name and title of agency executive(s)
6. Director(s) of overseas programs (in U.S.)
7. Objectives
   Overall objectives of overseas development assistance programs.
8. Program(s) of assistance
   Major program activities of the organizations are presented under category headings. The reader is referred to the category index for complete listing of the categories of assistance.
9. Countries of assistance
   In most cases, the categories of assistance as well as the listing of countries of assistance correspond to the particular fiscal year data reported by the organization. It should not be assumed that all of the project activities listed for an organization are conducted in every country, although it is true that there is at least one project activity in each country. Entries for some organizations do not include categories of assistance or countries of assistance listings because their program information could not be adapted conveniently to such listings.
10. Resources:
    Financial data
    (a) Total income including a breakdown of sources.
    (b) Total expenditures in overseas development assistance in personnel, money and gifts in kind. Wherever possible expenditures are broken down by region as well as refugee assistance and emergency/disaster.

    Income and expenditure data are based on the fiscal year most recently completed at the time that TAICH solicited the information.

PERSONNEL
Program personnel figures are broken down by U.S. working overseas, host country and international, with statistics given for numbers of salaried and volunteer workers. Host country personnel are nationals of the country in which the development program is carried out. Any personnel who are neither host country nor U.S. are referred to as "international". Personnel statistics on host country or international members of Roman Catholic religious orders are not given due to inconsistency in the availability of such information. Personnel figures are given for U.S. members of religious orders who are working abroad, but they are not designated as "salaried" or "volunteer".

11. Publications & audiovisuals
Agency publications related to development assistance programs and available for distribution.

Profile information is maintained and updated in a word processing file and is retrievable by fields containing key data about an organization and its operations. The major portion of the TAICH database includes country and sector-specific program data which is used to provide up-to-date reporting on the development assistance programs of U.S. nonprofit organizations.

PROJECT DESCRIPTION

To provide eleven shelters at selected sites each with a building for fish storage on the High Dam Lake for organized groups of fishermen. Each site will be provided with a diesel powered water pump and enough water pipe to irrigate a small vegetable garden and trees planted as a windbreak for the shelters.

STATUS:

PROGRESS

The last site (No. 12) was selected for construction - work was started on March 24 and is expected to be finished in June. A small plot of land has been cleared and levelled for the garden plot. The water pump and a small concrete water reservoir have been installed to provide water for citrus trees and vegatables. Summer planting seeds and fertilizers were distributed to various sites.

PROBLEMS

None

ANTICIPATED ACTION

CARE will complete shelter No. 12 hence, complete the project
CARE will submit final progress and fiscal reports
USAID will issue closure letter

SUBJECT: The Delivery of the Master Work Plan for the PVO Information System

Computer Data Systems, Inc. (CDSI) is pleased to submit the proposed master work plan for the PVO Information System to the Office of Information Resource Management, Agency for International Development.

The master work plan proposes an 81 man week effort to complete the detailed programming, testing, implementation, installation and training phases of the PVO Information System in accordance with the submitted system specifications.

Please review and have comments to CDSI within 5 days of receipt. If we have not received comments by this date, we will assume concurrence/agreement.

cc: Distribution

Mr. Linwood A. Rhodes, M/SER/IRM
Mr. William King, CDSI
Ms. Ronnye McIntoch, FVA/PVC
Ms. Rita Hudson, FVA/PVC

TABLE OF CONTENTS

150

PVO INFORMATION SYSTEM IMPLEMENTATION
MASTER WORK PLAN

Section 1. Purpose

The purpose of this master work plan is to provide a detailed technical work plan to complete the development and implementation of the PVO Information System. The System Specifications for the PVO Information System will be the primary guideline for the following subtasks.

Section 2. Task Definition

Subtask #1 - Review and Approval of the System Specifications.

This subtask is overlayed with the prior task order F200. The following two subtasks were scheduled for completion by March 9, 1984. The implementation task will begin with subtask #2 after the approval of the system specifications and the master work plan.

Subtask 1.1 - Participate in review of preliminary design documentation and the master work plan with FVA/PVC, perform adjustments to these documents as required, deliver the final version of the System Specifications and master work plan to IRM.

Subtask 1.2 - Make oral presentation and obtain IRM's approval.

Subtask #2 - Develop detailed data dictionary and panels/menus

This subtask is to develop panels/menus and a data dictionary by interfacing with the database administrator and users. Task #2 should be completed by June 18, 1984.

Subtask 2.1 - Develop detailed data dictionary.

151

Subtask 2.2 - Develop fifty-one panels/menus using panel builder: one main menu, one processing mode menu, one transaction code menu, twenty data entry menus, twenty-two regular reporting menus, twelve most frequently used retrival menus and four instruction menus.

Subtask 2.3 - Two CDSI's programmer orientation to the system specifications.

Subtask #3 - Define a maintenance staffing plan recommendation to the FVA.

This subtask is to provide FVA/PVC with a staffing plan recommendation. Subtask #3 should be completed by April 30, 1984.

Subtask 3.1 - Prepare maintenance staffing plan recommendations to FVA.

Subtask #4 - Data Collection

This task is to create the data bases by the gathering of relevant historical data by FVA/PVC and the utilization of the forms or panels prepared in Subtask #2 for data entry. Subtask #4 should be completed by June 27, 1984. Subtask 4.3 - The gathering and preparation the historical data will be conducted by FVA/PVC or a third party designated by FVA/PVC.

Subtask 4.1 - Define the databases needed to be created.

Subtask 4.2 - Develop data collection procedures.

Subtask 4.3 - FVA/PVC will gather and prepare the historical data. CDSI will create the databases.

Subtask 4.4 - Load the databases and obtain the IRM's approval.

Subtask #5 - Write and debug programs

This subtask is to prepare the program specifications, write the programs and conduct testing efforts. Subtask #5 should be completed by July 6, 1984. There are five programs in the PVO Registration Subsystem: Two programs are to reformat the TAICH directory and the registration reports of Lucas, Tucker & Co. Three programs are to process registration and PVO capabilities not obtained by Lucas, Tucker & Co. There are two programs in the PVO Ocean Freight Statistics Subsystem: One program is to produce the quarterly report and the other program is to produce the annual report. There are eleven programs in the PVO Project Subsystem: Five programs are to be interfaced with the five subsystems, and six programs will produce the PVC Project Information Reports. There are three programs in the PVO Performance Subsystem: One program will generate the PVC Performance Report, and two programs will be interfaced with the Development Information System (DIS) and the PVO Registration subsystem. The AIL/PVO Assistance Subsystem is basically a word processing application and will not be developed under the present task order.

Subtask 5.1 - Determine the development priority of the subsystems, and prepare written program specifications for IRM approval.

Subtask 5.2 - Prepare program flowcharts.

Subtask 5.3 - Code programs.

Subtask 5.4 - Prepare Job Control Language for program compilation and execution.

Subtask 5.5 - Unit test programs using test data provided by IRM.

Subtask 5.6 - Delivery of unit tested programs for IRM's approval.

Subtask #6 - System Test the Four Subsystems

This subtask is to system test the PVO Information System. Subtask #6 should be completed by August 17, 1984.

Subtask 6.1 - Prepare a system test plan for IRM approval.

Subtask 6.2 - System Test the four subsystems.

Subtask 6.3 - Modify the systems where appropriate.

Subtask 6.4 - Present test results for IRM approval.

Subtask #7 - Prepare system documentation

This subtask is to develop system documentation using the FIPS 38 standard. Subtask #7 should be completed by September 7, 1984.

Subtask 7.1 - Prepare operations manual.

Subtask 7.2 - Prepare user's manual.

Subtask #8 - Implement user training program

This subtask is to assist in the training and user orientation provided by IRM. Subtask #8 should be completed by September 21, 1984.

Subtask 8.1 - Assist in the user's orientation of the PVO Information System. (User's must have prior INQUIRE knowledge provided to them by IRM).

Subtask 9 - System Turnover to IRM

This subtask is to provide the operation assistance while turning the PVO Information System over to IRM. Subtask #9 should be completed by September 28, 1984.

Subtask 9.1 - Turnover system operation of the PVO Information System to FVA/PVC.

Subtask #10 - Maintain the PVO Information System

This subtask is to provide technical assistance in maintaining the PVO Information System. Subtask #10 should be completed by November 2, 1984.

Subtask 10.1 - Provide maintenance support for the PVO Information System for six weeks.

Section 3. Deliverables

The following schedule of deliverables is based upon the specifications in the statement of work.

(1) A staffing plan recommendation to FVA will be due on April 30, 1984.

(2) A detailed comprehensive data dictionary will be due on June 18, 1984.

(3) Program specifications and program listings including JCL will be due on June 27, 1984.

(4) System test plan will be due on July 20, 1984.

(5) System test results will be due on August 17, 1984.

(6) User's manual will be due on September 7, 1984.

(7) Operation manual will be due on September 7, 1984.

(8) Document with recommendations and procedures for future system maintenance will be due on November 2, 1984.

Refer to Attachment C for the Schedule of Deliverables.

Section 4. Resources

Following is the estimated support effort suggested to complete the aforementioned tasks.

4.1 Staffing - This task will be conducted by one automated systems analyst, two programmer/analysts with programming skills in INQUIRE, COBOL, documentation experience, the writing of program specifications, user manuals and operation manuals.

Staff	Workdays
Frank H. Chuang (Specialist)	170
Two (Programmer/Analysts) Total	235
Total workdays	405
Total costs	

4.2 Travel - Local travel as needed.

4.3 Access to computer.

4.4 Refer to Attachment D for the Staff Plan.
