FOREWORD

The Pond Dynamics/Aquaculture Collaborative Research Support Program (PD/A CRSP) represents an international community of researchers and institutions dedicated to strengthening health and nutrition in developing countries by improving the efficiency of pond aquaculture systems. It is one of several agricultural CRSPs supported by the U.S. Agency for International Development under the authority of Title XII of the International Development and Food Assistance Act of 1975.

The "Global Experiment" in Pond Dynamics/Aquaculture is the major CRSP research activity, covering the period from 1982 to 1987. The Global Experiment was designed to quantitatively describe the physical, chemical and biological principles of pond culture systems. The information gained from the Global Experiment will be used to improve production technologies and develop quantitative production functions to facilitate rigorous economic analyses of aquaculture systems.

Standardization is a key element of the Global Experiment. Standardization permits the comparison of data from diverse geographic locations. The experimental design involves monitoring specified environmental and fish production variables in accordance with standardized work plans in twelve or more ponds at each of seven geographical locations. The variables observed, frequency of observation, and materials and methods are uniform for all locations. The field data are filed in a centralized data base, called the CRSP Central Data Base. Statistical methods will be used to test hypotheses about correlations between variables and to evaluate the sources of variance within ponds, between ponds within locations, and between locations.

The CRSP Central Data Base will be used to develop predictive models of the processes occurring in pond culture systems. The models will be used to provide guidance for ongoing and future research, to predict the performance of existing and proposed pond systems subject to specific inputs and constraints, and to improve the operation and efficiency of pond culture systems.

The Global Experiment includes three cycles of experiments. Each cycle consists of two series of observations, one during the dry season and one during the wet season. The objective of the first cycle is to create a detailed baseline of chemical, physical, and biological data on all ponds treated with a standard level of inorganic fertilizer. In the second experimental cycle, ponds treated with inorganic fertilizer are compared to ponds treated with organic fertilizer. In the third cycle, the responses of ponds to different levels of organic fertilizer are compared.

The goal of the Pond Dynamics/Aquaculture Collaborative Research Data Reports (referred to as Data Reports) is to record the CRSP Central Data Base and to present interpretations of site specific results. The Pond Dynamics/Aquaculture CRSP has conducted the Global Experiment at seven project sites in six developing countries: Thailand, Indonesia, the Philippines, Panama, Honduras, and Rwanda. The first volume of these reports provides descriptive information for each CRSP site. It presents the physical characteristics of each site, including a geographical sketch, climatology, and water and soil analyses. Experimental cycles are described in CRSP Work Plans One to Three, which are summarized in the first volume.

Volume One will serve as the reference volume for the entire report series. Subsequent volumes will focus on each site separately. Each Data Report will include one cycle (wet and dry seasons) of the Pond Dynamics/Aquaculture CRSP Global Experiment. Therefore, with few exceptions, each project site will have three Data Reports devoted to it, representing the results of the three cycles of the Global Experiment. In addition to the hard copy of experimental data published as a part of each Data Report, data are also available from the PD/A CRSP in electronic form (on diskette) for computer analysis. Cycle I of the Global Experiment in Gualaca, Panama is presented in this volume.

INTRODUCTION

The Gualaca Freshwater Aquaculture Research Station was built in 1984 in Chiriqui Province, western Panama, to supply fingerlings of tilapia, carps, and other fish to producers in the area, and to conduct research in aquaculture. A description of the site and station facilities is given by Egna et al. (1987).

This report covers the dry and wet season studies of Cycle I of the CRSP Global Experiment, which were conducted during 1985 in Gualaca. The purpose of the studies was to establish a baseline of physical, chemical, biological, and hydrological characteristics for a set of ponds being fertilized solely with inorganic phosphorus. The climate at Gualaca is seasonal, with one rainy and one dry season each year. The Cycle I experiment was therefore conducted once each season to determine if there were differences related to season.

MATERIALS AND METHODS

The experimental design and data collection were the same for each season, except for differences which are discussed below. Twelve earthen ponds (868 m^2) were stocked with male *Oreochromis niloticus* (Nile tilapia) fingerlings at a rate of 1 fish/m^2. Males were manually separated from a mixed-sex population prior to the experiment. Fish mortalities observed during the week after stocking were replaced with fish of similar size. The water in all ponds was maintained at a depth of approximately 90 cm. Water was added only when necessary to replace evaporation and seepage.

Phosphorus fertilizer in the form of triple superphosphate (42% P_2O_5) was added every two weeks at a rate of 4 kg P_2O_5/ha. The fertilizer was mixed with water and dispersed over the pond surface as a liquid. Fertilizer that remained undissolved was placed on a platform in the pond.

Water samples for chemical analysis were taken between 0730 and 0930 hours with a 90-cm column sampler. Each water sample was a composite of at least five subsamples from different locations in the pond. Chemical analyses were carried out according to procedures described in *Standard Methods* (APHA et al. 1975). Early morning dissolved oxygen and pH were measured weekly; filterable orthophosphate was measured every two weeks; and total phosphorus, nitrate nitrogen, total ammonia nitrogen, total alkalinity, and total hardness were measured once a month. The fate of phosphate fertilizer was monitored by measuring filterable orthophosphate 1, 2, 3, 6, and 13 days after each monthly application of fertilizer.

Secchi disk visibility was measured weekly, and chlorophyll *a* and primary productivity were measured every two weeks. During the dry season, primary productivity was measured in light-dark bottles placed 35 cm below the pond surface. During the wet season, primary productivity was determined from changes in diel oxygen concentrations according to the method of Hall and Moll (1975).

Maximum and minimum water temperatures 25 cm below the surface and 25 cm above the bottom were recorded twice a week in two ponds during the wet season. Maximum and minimum water temperatures were not taken during the dry season, because of a lack of equipment. Evaporation, rainfall, and seepage were measured five days a week.

Photosynthetically active radiation was measured daily by photometry. Fish growth was monitored by sampling fish in each pond on a monthly basis. The dry season study began on 15 February 1985 and ended on 21 May 1985. The wet season study began on 8 July 1985 and ended on 2 December 1985.

Data were tabulated as means for each pond during each season. Unpaired t-tests were used to determine differences between seasons, using computer software by Feldman et al. (1988). Relationships among variables were examined by regression analyses. Differences were considered significant at an alpha level of 0.05.

RESULTS AND DISCUSSION

Hydrology and soils

The mean water temperatures for the dry and wet seasons were 25.8 and 28.3°C, respectively. Mean minimum and maximum water temperatures for the wet season are summarized in Table 1. Mean weekly rainfall ranged from 0 mm/d (January to March) to 40 mm/d (September) (Figure 1).

Mean weekly pond evaporation ranged from 1.2 mm/d during the rainy season to 10.6 mm/d during the dry season, with an annual mean of 4.0 mm/d (Figure 2). Solar radiation was lower during the wet season (Figure 3). Mean solar radiation for dry and wet season was 40.7 and 31.9 E/m^2/d, respectively. Mean pond seepage ranged from 19 to 58 mm/d. A water budget for the station is presented in Table 2.

Means for pond soil variables, measured before and after the dry season and after the wet season study, are summarized in Tables 3, 4, and 5. The most notable changes in soil constituents–increases in Ca and pH and a decrease in Al–resulted from heavy liming of ponds.

Water quality

Results of water quality analyses are summarized by pond in Table 6 and by season in Table 7. Data from pond #10 (wet season) were excluded from the analyses because of accidental drainage.

Concentrations of phosphorus peaked and then decreased rapidly following the application of triple superphosphate (Figure 4). The disappearance of phosphorus in the water column is attributed to adsorption by soils. Filterable orthophosphate was significantly lower in the wet season than in the dry season, but total phosphorus was significantly higher in the wet season.

Only traces of nitrate nitrogen were found during the wet or the dry season. Determinations of total ammonia nitrogen during the dry season were not considered reliable, so comparison between seasons was inappropriate.

Total alkalinity and total hardness tended to increase during the beginning of each season, as limestone dissolved, and decrease during the remainder of the season. Decreases in alkalinity and hardness levels were attributed to relatively high pond seepage. Total alkalinity and hardness levels were significantly lower in the wet than in the dry season.

Minor elements measured in the water column at the beginning and end of the wet season are summarized in Table 8.

Biological variables

Secchi disk visibilities sometimes exceeded pond depths, which averaged 100 and 105 cm during dry and wet seasons, respectively. In these cases, a visibility of 105 and 110 was arbitrarily assigned to ponds during dry and wet seasons, respectively. Secchi disk visibilities showed no trends during the dry season (Figure 5), but decreased to consistently lower levels during the second half of the wet season (Figure 6). There was no difference in secchi disk visibility between seasons.

Mean chlorophyll *a* values were low during both seasons, and showed no apparent trends during either season (Figures 5 and 6). There was no significant difference between seasons for chlorophyll *a* values.

Primary productivity was low during both seasons. Except for net primary productivity, which increased with time in the dry season (Figure 7), no temporal trends in primary productivity were observed (Figure 8). Differences between seasons could not be statistically tested, because different methods were used each season to determine primary productivity.

Gross fish yields during the dry (380 kg/ha) and wet (356 kg/ha) seasons were not significantly different (Table 9). Reproduction occurred during both seasons because of human error during fish sexing. Stocked fish ceased growing after two months in both seasons (Figures 9 and 10), partly because of competition from reproduction. Ponds yielding greater weights of stocked fish also had greater reproduction ($P < 0.05$; $r = 0.60$). Because the carrying capacity of ponds was apparently reached during each season (Figures 9 and 10), a good estimate of maximum fish biomass in ponds that receive inorganic phosphorus as the sole nutrient input has been demonstrated for Gualaca.

There were no simple correlations between chlorophyll *a*, secchi disk visibility, and gross primary productivity (GPP), or between chlorophyll *a* or GPP and water quality variables. The lack of correlation may have resulted from low variability among pond means for most variables. Gross fish yield was not significantly correlated with net primary productivity (NPP), GPP, or chlorophyll *a* (Figure 11) for combined data, but there was a significant relationship between gross fish yield and NPP ($r = 0.81$) and GPP ($r = 0.69$) during the dry season (Figure 12).

SUMMARY

Applications of limestone to pond bottoms during Cycle I increased soil pH and Ca, and decreased Al. The carrying capacity of ponds that had been limed to total alkalinity of 20 mg $CaCO_3$/L or higher, and that had received triple superphosphate as the sole nutrient input, was under 400 kg/ha. Mean gross primary productivity was less than 3 mg O_2/L/d, and mean filterable orthophosphate, total phosphorus, total ammonia nitrogen, and nitrate nitrogen were usually less than 0.05 mg/L, 0.11 mg/L, 0.3 mg/L and 0.00 mg/L, respectively. Differences between dry and wet seasons were reflected primarily in the climatological variables. Precipitation was greater during the wet season, while evaporation and solar radiation were less. Concentrations of chemical constituents in the pond water were usually lower during the wet season because of dilution by rainfall. However, chlorophyll *a* and gross fish yield were not different between seasons.

ACKNOWLEDGEMENTS

We thank Nelly Serrano and Ricardo Rios for assistance in the laboratory, and Victor Jimenez and other staff of the Instituto de Investigación Agropecuario (IDIAP) laboratory in Gualaca for their support of the CRSP project.

Table 7. Seasonal means (±SE) for variables measured during dry and wet seasons of Cycle 1, 1985, Gualaca, Panama. N = 12 and 11 for dry and wet seasons, respectively.

Variable	Season	
	Wet	Dry
Gross fish yield (kg/ha)	356 ± 26.9 a	380 ± 15.3 a
Total alkalinity (mg/L $CaCO_3$)	24 ± 1.2 a	50 ± 2.3 b
Total hardness (mg/L $CaCO_3$)	30 ± 1.5 a	40 ± 1.8 b
Total ammonia (mg/L NH_3-N)	0.28 ± 0.055	- na
Nitrate (mg/L NO_3-N)	0.003 ± 0.005 a	0.002 ± 0.0003 a
Total phosphorus (mg/L PO_4-P)	0.10 ± 0.003 a	0.08 ± 0.008 b
Filt. orthophosphate (mg/L PO_4-P)	0.03 ± 0.002 a	0.05 ± 0.004 b
Early morning pH	6.9 ± 8.03 b	6.8 ± 8.01 a
Secchi disk visibility (cm)	91 ± 2.8 b	80 ± 3.0 a
Gross prim. prod. (mg O_2/L/d)	2.3 ± 0.09	1.5 ± 0.15 na
Net prim. prod. (mg O_2/L/d)	1.3 ± 0.04	0.3 ± 0.07 na

a,b: Seasonal means followed by the same letter are not different ($P > 0.05$).
na: Statistical testing non-applicable or inappropriate.

Table 8. Major and minor elements found in ponds at the beginning (Initial) and end (Final) of the wet season of Cycle 1, 1985, Gualaca, Panama.

Initial

	ppm								
Pond	Na	K	Ca	Mg	B	Cu	Zn	Mn	Fe

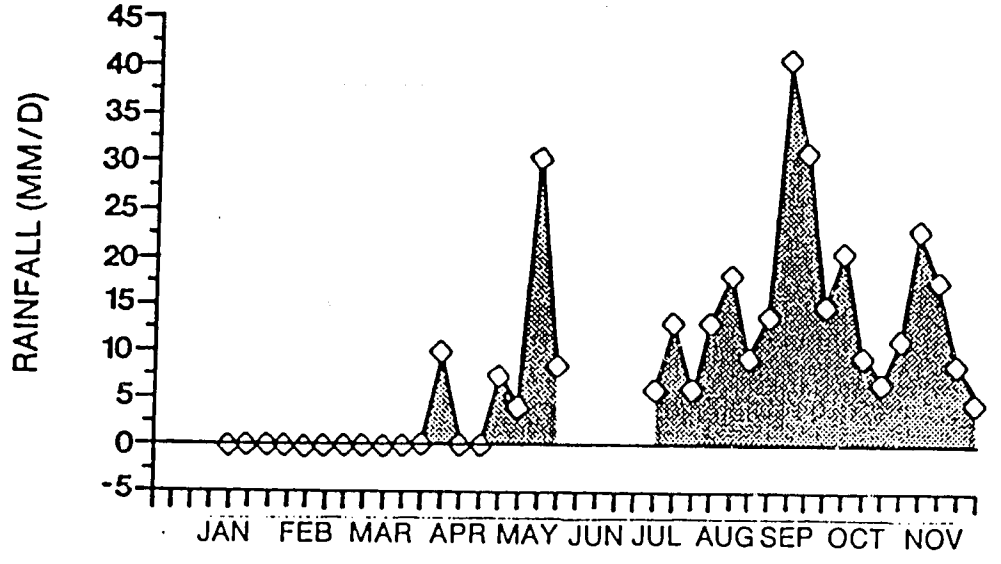

Figure 1. Mean weekly rainfall during Cycle I at Gualaca, Panama.

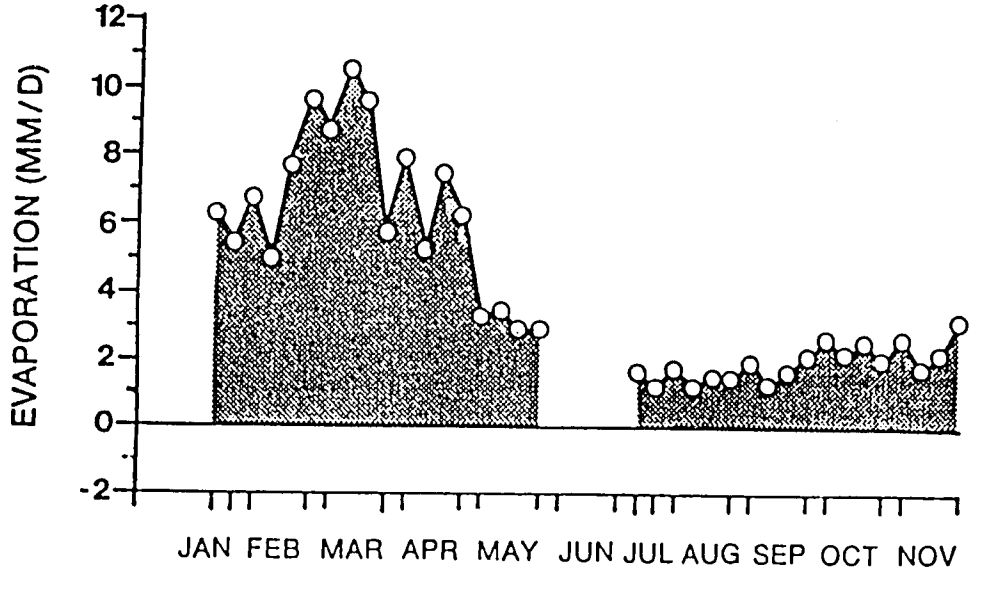

Figure 2. Mean weekly pond evaporation during Cycle I experiments at Gualaca, Panama.

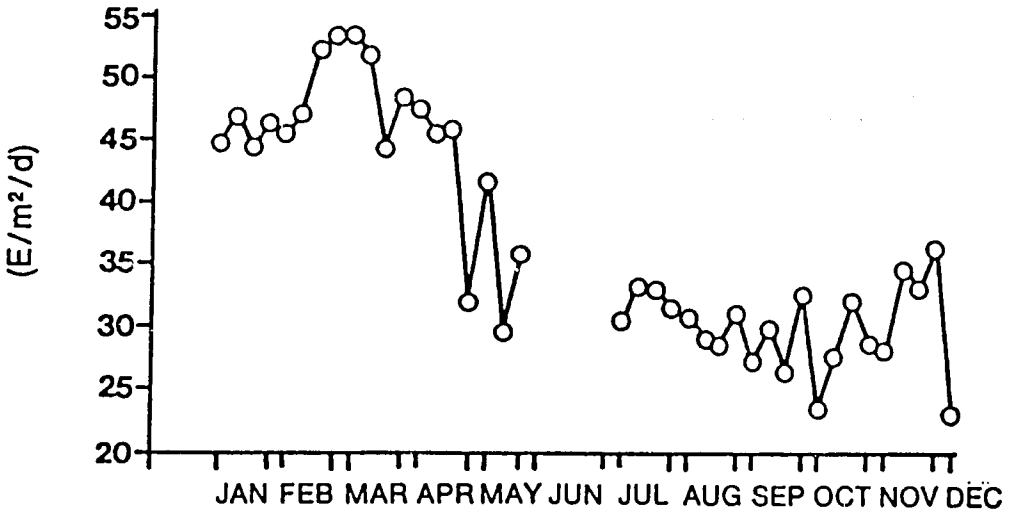

Figure 3. Mean weekly solar radiation during Cycle I at Gualaca, Panama.

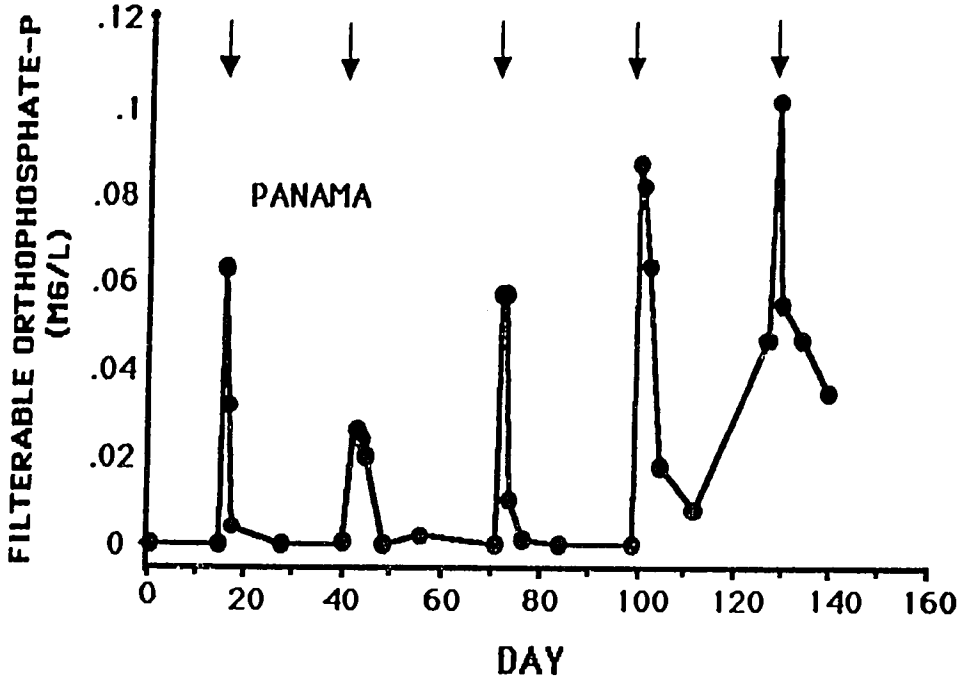

Figure 4. Mean filterable orthophosphate concentrations during the wet season experiment of Cycle I at Gualaca, Panama (n = 11). Arrows indicate applications of triple superphosphate.

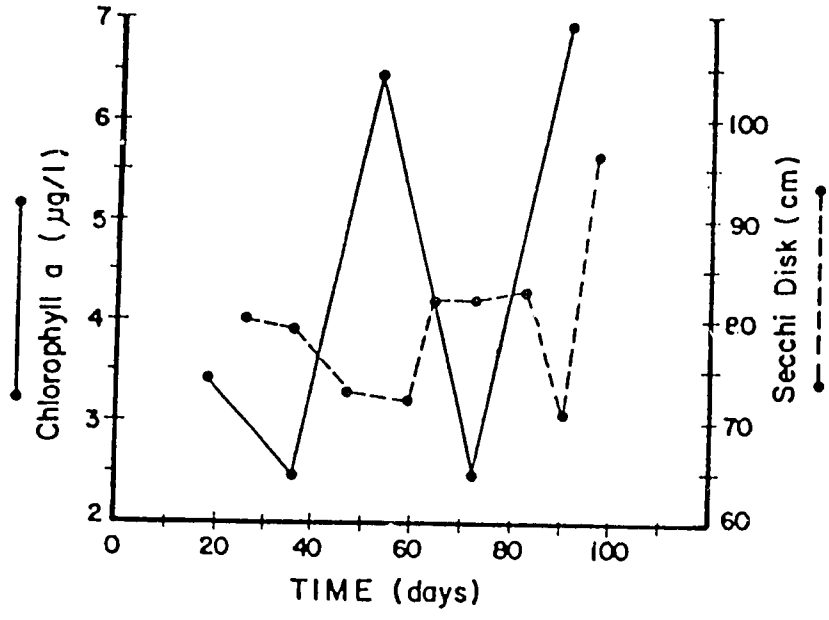

Figure 5. Mean Secchi disk visibility and chlorophyll *a* concentrations during the dry season of Cycle I at Gualaca, Panama.

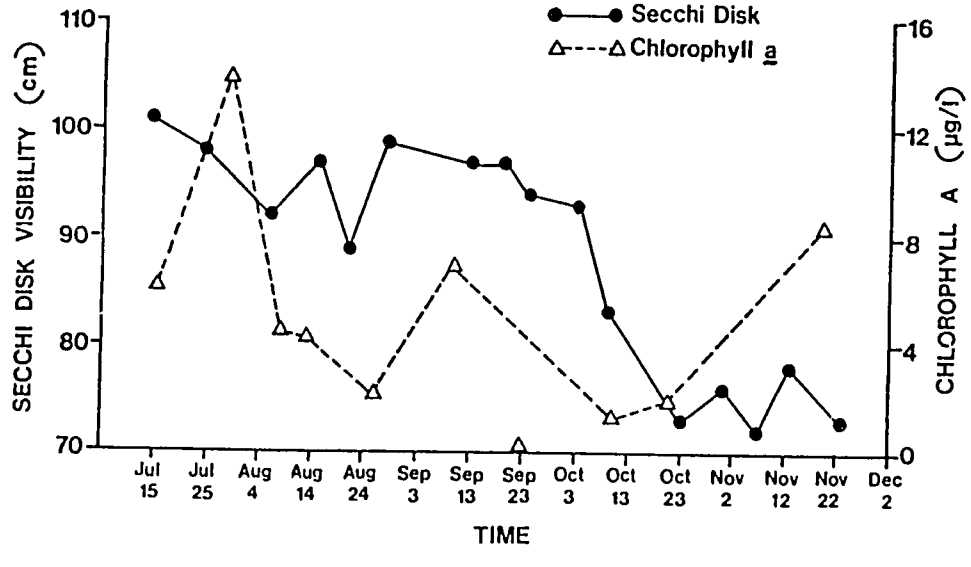

Figure 6. Mean Secchi disk visibility and chlorophyll *a* concentrations during the wet season of Cycle I at Gualaca, Panama.

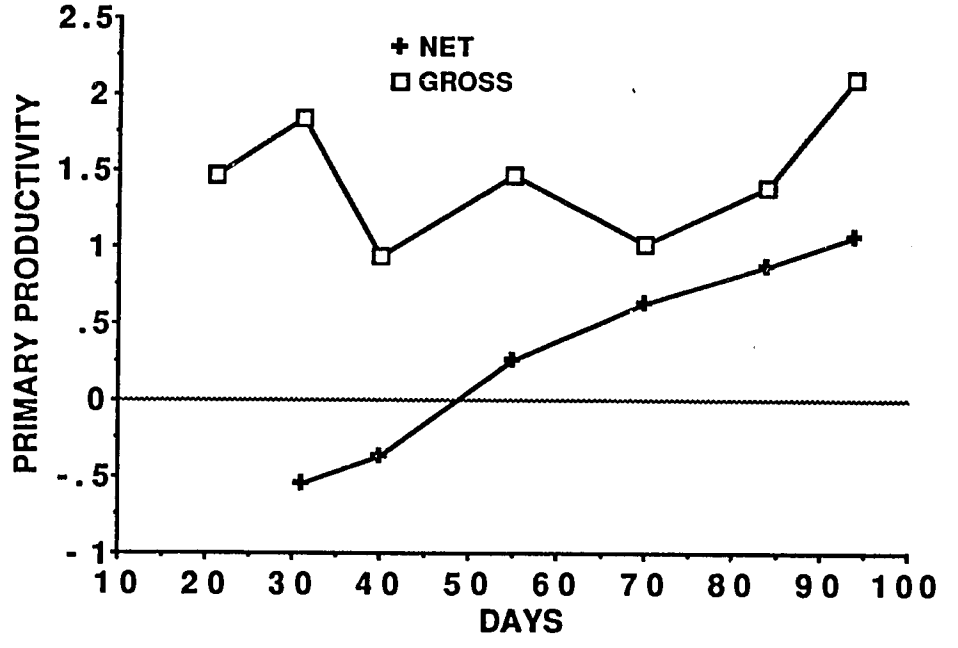

Figure 7. Mean net primary productivity (mg O_2/L/d) and gross primary productivity (mg O_2/L/d) during the dry season of Cycle I at Gualaca, Panama.

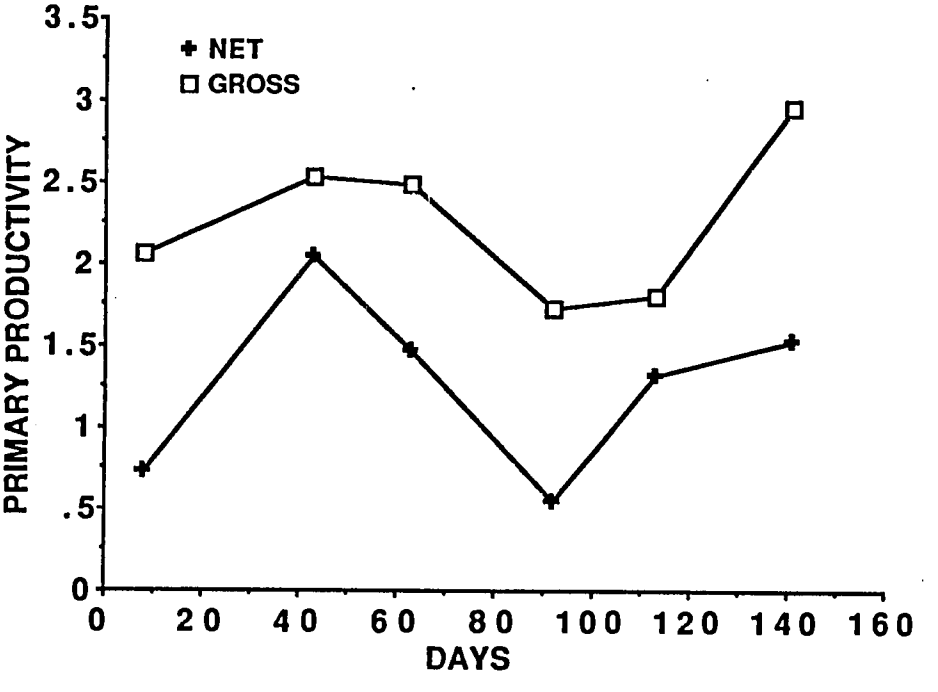

Figure 8. Mean net primary productivity (mg O_2/L/d) and gross primary productivity (mg O_2/L/d) during the wet season of Cycle I at Gualaca, Panama.

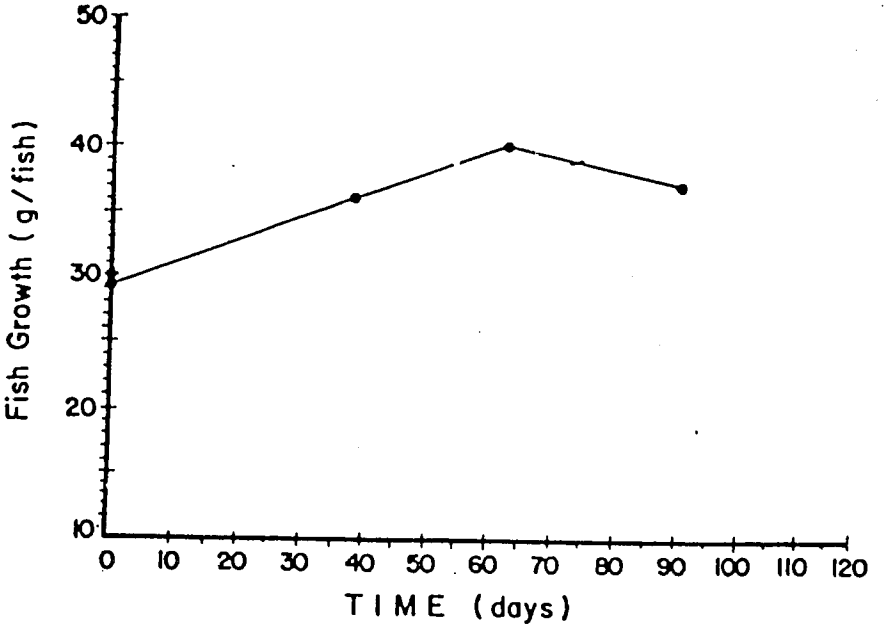

Figure 9. Mean weight of adult *Oreochromis niloticus* during the dry season experiment of Cycle I at Gualaca, Panama.

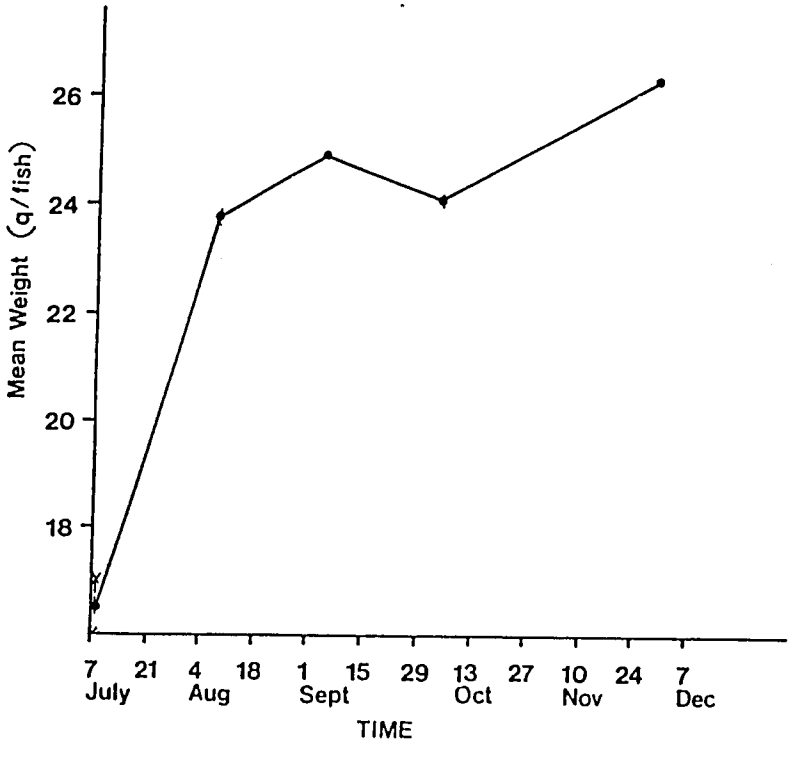

Figure 10. Mean weight of adult *Oreochromis niloticus* during the wet season experiment of Cycle I at Gualaca, Panama.

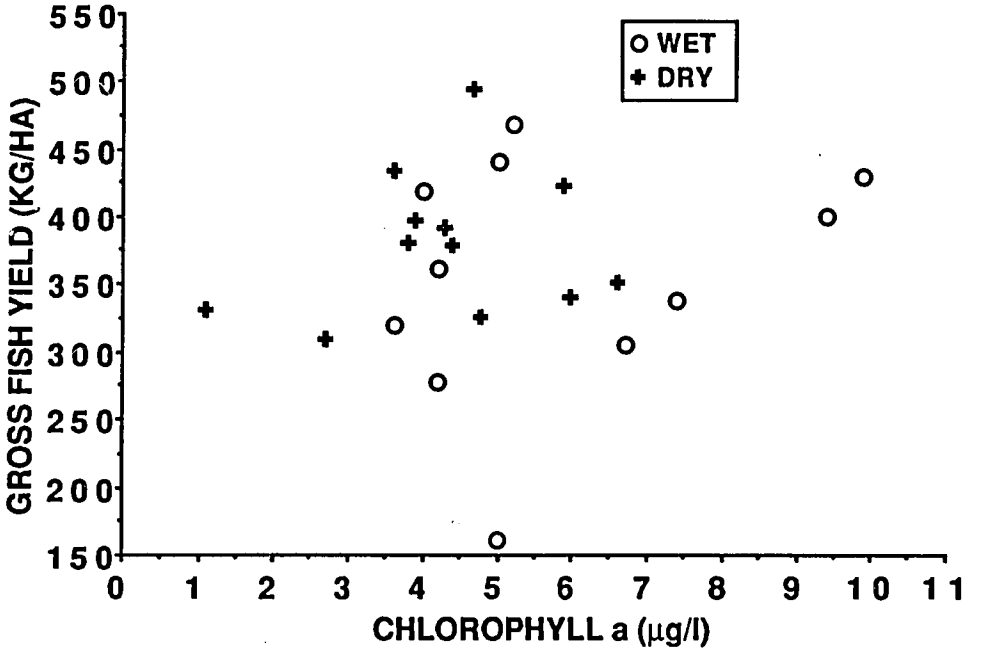

Figure 11. Correlation of mean chlorophyll *a* and mean gross fish yield for wet and dry seasons of Cycle I at Gualaca, Panama.

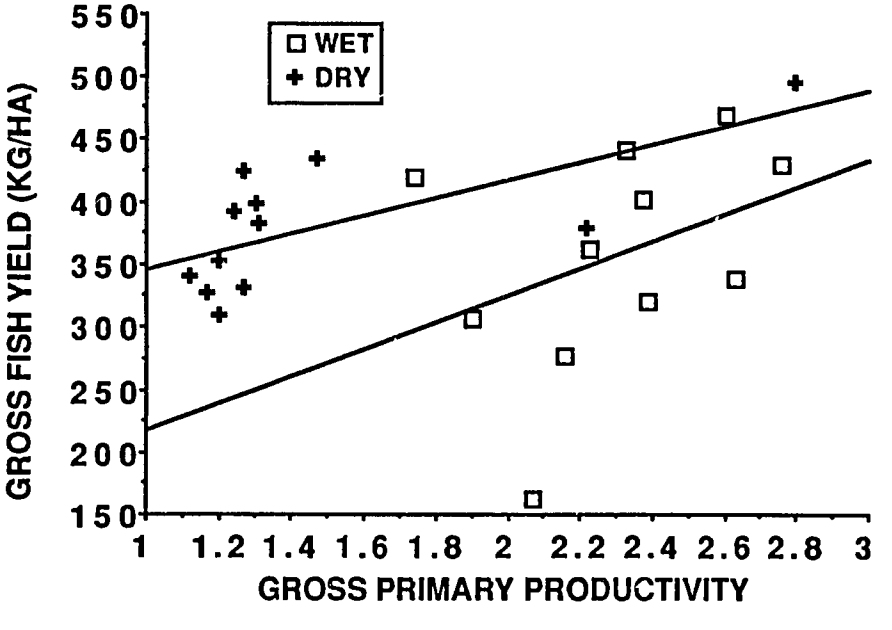

Figure 12. Regression of gross fish yield on gross primary productivity (mg O_2/L/d) for wet and dry seasons of Cycle I at Gualaca, Panama.

APPENDIX

Complete Set of Data from Cycle I of the Pond Dynamics/ Aquaculture CRSP in Gualaca, Panama

Units of Measurement and Abbreviations Used in the Appendix Tables

Daily Weather Measurements:

- SOLAR1 (solar radiation) ..... $E/m^2/d$
- SOLAR2 (solar radiation) ..... $cal/cm^2/d$
- RAIN (rainfall) ..... cm/d
- WIND (wind speed) ..... km/hr
- ATEMPMAX (max air temperature) ..... °C
- ATEMPMIN (min air temperature) ..... °C
- EVAP (evaporation) ..... mm/d

Daily Pond Measurements:

- DEPTH ..... m
- INFLOW ..... m^3/hr
- OVERFLOW ..... Y/N
- "nil" ..... *Oreochromis niloticus*

Weekly and Twice-Weekly Measurements:

- All DO (dissolved oxygen) ..... mg/L
- All TEMP (temperature) ..... °C
- ALKA (alkalinity) ..... mg/L (as $CaCO_3$)
- HARD (total hardness) ..... mg/L (as $CaCO_3$)
- All N (Kjeldahl, NO_2, NO_3, Total) ..... mg/L
- All P (Total, Ortho-PO_4) ..... mg/L
- SECCHI DISK ..... cm
- CHLOROPHYLL *a*, *b*, or *c* ..... mg/m^3

Diurnal Measurements:

- All DO (dissolved oxygen) ..... mg/L
- All TEMP (temperature) ..... °C

Fish/Shrimp Stocking, Sampling, and Harvesting:

- "STK" ..... stocking
- "SAM" ..... sampling
- "HAR" ..... harvesting
- "nil" ..... *Oreochromis niloticus*
- POP. WEIGHT ..... kg
- SAMPLE LENGTH ..... cm
- REPROD. WEIGHT ..... kg

Plankton and Benthos:

- NET (PRIMARY) PRODUCTION ..... mg $C/m^3/d$
- GROSS (PRIMARY) PRODUCTION ..... mg $C/m^3/d$

Water Quality Characteristics:

ALKALIN (alkalinity)	mg/L (as $CaCO_3$)
HARDNESS	mg/L (as $CaCO_3$)
All N (NH_3, NO_2, NO_3, NO_2+NO_3)	mg/L
All P (Total, Ortho-P)	mg/L
Cl^-	mg/L
SALT	ppt
SO_4	mg/L
BORON	mg/L
CALCIUM	mg/L
COPPER	mg/L
IRON	mg/L
MAGNESIUM	mg/L
POTASSIUM	mg/L
SODIUM	mg/L
ZINC	mg/L

Pond Soil Characteristics:

CLAY	%
SILT	%
SAND	%
ORGANIC MATTER	%
SOIL-P	ppm
SOIL Ca	meq/100g
SOIL Mg	meq/100g
SOIL K	ppm
SOIL Na	meq/100g
SOIL N	%
SOIL NH_4	ppm
SOIL NO_3	ppm
SOIL CEC	meq/100g
SOIL SALT	mmhos/cm
SOIL Al	ppm
SOIL Fe	ppm
SOIL Zn	ppm
SOIL Mn	ppm
SOIL Cu	ppm
SOIL SO_4	ppm

Analysis of Nutrients and Lime:

All NUTRIENTS	% (dry matter basis)

Nutrient and Lime Inputs:

All QUANTITIES	kg/ha
TSP	"triple superphosphate"
"cac"	$CaCO_3$

Table 1. Daily Weather Measurements. Gualaca, Panama, Cycle I, Dry Season
