FOREWORD

The Pond Dynamics/Aquaculture Collaborative Research Support Program (PD/A CRSP) represents an international community of researchers and institutions dedicated to strengthening health and nutrition in developing countries by improving the efficiency of pond aquaculture systems. It is one of several agricultural CRSPs supported by the U.S. Agency for International Development under the authority of Title XII of the International Development and Food Assistance Act of 1975.

The "Global Experiment" in Pond Dynamics/Aquaculture is the major CRSP research activity, covering the period from 1982 to 1987. The Global Experiment was designed to quantitatively describe the physical, chemical and biological principles of pond culture systems. The information gained from the Global Experiment will be used to improve production technologies and develop quantitative production functions to facilitate rigorous economic analyses of aquaculture systems.

Standardization is a key element of the Global Experiment. Standardization permits the comparison of data from diverse geographic locations. The experimental design involves monitoring specified environmental and fish production variables in accordance with standardized work plans in twelve or more ponds at each of seven geographical locations. The variables observed, frequency of observation, and materials and methods are uniform for all locations. The field data are filed in a centralized data base, called the CRSP Central Data Base. Statistical methods will be used to test hypotheses about correlations between variables and to evaluate the sources of variance within ponds, between ponds within locations, and between locations.

The CRSP Central Data Base will be used to develop predictive models of the processes occurring in pond culture systems. The models will be used to provide guidance for ongoing and future research, to predict the performance of existing and proposed pond systems subject to specific inputs and constraints, and to improve the operation and efficiency of pond culture systems.

The Global Experiment includes three cycles of experiments. Each cycle consists of two series of observations, one during the dry season and one during the wet season. The objective of the first cycle is to create a detailed baseline of chemical, physical, and biological data on all ponds treated with a standard level of inorganic fertilizer. In the second experimental cycle, ponds treated with inorganic fertilizer are compared to ponds treated with organic fertilizer. In the third cycle, the responses of ponds to different levels of organic fertilizer are compared.

The goal of the Pond Dynamics/Aquaculture Collaborative Research Data Reports (referred to as Data Reports) is to record the CRSP Central Data Base and to present interpretations of site specific results. The Pond Dynamics/Aquaculture CRSP has conducted the Global Experiment at seven project sites in six developing countries: Thailand, Indonesia, the Philippines, Panama, Honduras, and Rwanda. The first volume of these reports provides descriptive information for each CRSP site. It presents the physical characteristics of each site, including a geographical sketch, climatology, and water and soil analyses. Experimental cycles are described in CRSP Work Plans One to Three, which are summarized in the first volume.

Volume One will serve as the reference volume for the entire report series. Subsequent volumes will focus on each site separately. Each Data Report will include one cycle (wet and dry seasons) of the Pond Dynamics/Aquaculture CRSP Global Experiment. Therefore, with few exceptions, each project site will have three Data Reports devoted to it, representing the results of the three cycles of the Global Experiment. In addition to the hard copy of experimental data published as a part of each Data Report, data are also available from the PD/A CRSP in electronic form (on diskette) for computer analysis. Cycle II of the Global Experiment in Iloilo, Philippines is presented in this volume.

INTRODUCTION

Cycle I of the PD/A CRSP experiments aimed to characterize and quantify the properties, ecosystem dynamics, and fish production performance of earthen ponds under standardized management protocols (low nutrient inputs) at several tropical sites worldwide.

The Work Plan for Cycle II outlined experiments designed to test the hypothesis that organic fertilizer inputs would perform better, in terms of fish production and maintenance of water quality, than inorganic inputs with equivalent contents of total nitrogen and phosphorus. The CRSP freshwater experimental sites used *Oreochromis niloticus* (Nile tilapia) as the primary test organism, whereas the brackishwater sites used appropriate species of penaeid shrimp.

The Brackishwater Aquaculture Center (BAC), College of Fisheries, University of the Philippines in the Visayas (UPV), grew both *O. niloticus* and *Penaeus monodon* (the giant tiger prawn) during the dry and wet seasons of Cycle II (late 1984-early 1986). The data referred to in this report were collected and transmitted to the CRSP Program Management Office by the principal investigators soon after the completion of the experiments. The text of this report is being prepared after the fact by referring to the data and to lengthy technical reports submitted previously, from which some text, tables, and figures have been taken.

The BAC is located about 17 km north of Iloilo City on the island of Panay. The facility is described in Volume One of this Data Report series (Egna et al. 1987). Earthen ponds of 0.1 ha surface area were used for the Cycle II experiments.

MATERIALS AND METHODS

This work was conducted according to the CRSP Second Work Plan insofar as possible (PD/A CRSP 1984). Departures from the standard protocol are listed in Appendix A.

For the shrimp experiment, eighteen 0.1-ha ponds were stocked with *P. monodon* postlarvae at a density of 4 animals/m², during both the dry season (December 1984 - April 1985) and the rainy season (August - December 1985). Six ponds were allocated to each of three depth treatments, with target depths of 1.5, 1.0, and 0.5 m. Three ponds in each of these treatments were mixed by water circulation devices during daylight hours (0600-1700 hours), while the other three were not mixed.

The ponds were prepared by drying, liming, and applying chicken manure at a rate of 2 t/ha. They were then filled slowly to promote the growth of lab-lab. Beginning in the second month, ponds were fed pelleted feed at a rate of 10% of the estimated shrimp weight/day; this rate was reduced to 8% for the third month and 4% for the fourth and final month. Initially, about 50% of the pond water was exchanged twice per month at high tides. Later in the experiment, additional water exchange and emergency aeration were occasionally used to alleviate low levels of dissolved oxygen.

In addition to the water quality measurements specified in the Second Work Plan, salinity was monitored daily (by refractometer) and shrimp weight was sampled weekly.

In the tilapia experiments, 21 ponds of 0.05 ha area and approximately 0.6 m depth were stocked at a density of 1 fish/m² (500/pond) for the first trial (November 1984 - April 1985), and at a density of 1.2 fish/m² (600/pond) for the second trial (October 1985 - March 1986). Fingerlings were obtained from another freshwater facility and acclimated to 27 ppt salinity for several days before stocking. Mean stocking weights

ranged from 7.9 to 9.2 g/fish in the first trial and from 43.3 to 47.2 g/fish in the second trial.

The tilapia ponds were prepared like the shrimp ponds. Seven treatments (three ponds each) were used in the experiments. The treatments were as follows:

Treatment	Inputs	Rate/mo.	Application frequency (times/week)
I	Chicken manure only	57.6 kg/ha	three
II	16-20-0 only	12.5 kg/ha	one
III	Feeds only (20% crude protein)	6% of fish biomass	six
IV	Chicken manure + 16-10-0	57.6 kg/ha	three
V	Chicken manure + feeds (20% crude protein)	57.6 kg/ha 6% of fish biomass	three six
VI	Chicken manure + 16-20-0 + feeds (20% crude protein)	57.6 kg/ha 12.5 kg/ha 6% of fish biomass	three one six
VII	No input		

The feeding rate for the first month of culture was based on the average weight of the fish in all ponds at day zero. The amount of feed was adjusted monthly after each sampling. The feed was composed of rice bran, ipil-ipil (*Leucaena leucocephala*) leaf meal, corn meal, fishmeal, soybean meal, vegetable oil, vitamin premix, and shrimp head meal.

The SYSTAT package (Wilkinson 1984) was used for all statistical analysis. Water quality data were averaged monthly corresponding to intervals between sampling dates. A two-way ANOVA factorial analysis with replication per sampling was done on the water quality parameters. A stepwise multiple regression analysis was done to determine which of the variables best predicted the average size of shrimp per sampling (i.e., the growth of shrimp). All the water quality variables listed in Table 2 were initially entered in the model (alpha levels set at $p = 0.15$).

Analyses of growth and harvest data for the dry season are not presented here because a large number of finfish intruders in the ponds made it difficult to assess treatment effects on *P. monodon* alone. During the wet season, the ponds were treated with an ichthyocide (teaseed cake) which held intruders at negligible levels. A two-way factorial ANOVA was done on the wet season harvest data.

RESULTS AND DISCUSSION

Weather--both experiments

Rainfall during the dry season experiment (November 1984 - April 1985) ranged from 0 to 4.0 cm/d, with a mean of 0.38 cm/d. For the period covering the rainy season experiments (June - December 1985), the range was from 0 to 4.8 cm/d, with a mean of 0.27 cm/d. The dry and wet seasons are compared in Figure 1. The high rainfall in November 1984 greatly increased the dry season mean and upper limit, while the low value for December 1985 decreased the wet season mean and lower limit.

The two seasons are most clearly distinct with respect to solar radiation (Figure 2). Cloud cover caused low monthly means during the entire wet season. Monthly wind speed and temperature means are illustrated in Figures 3, 4, and 5.

Tilapia experiment

Water and soil analyses

Two physical parameters that were significantly different among treatments were temperature and Secchi disk visibility. Temperature increased in the treatments that received added inputs regardless of their type (Table 1). Soils in ponds with inputs, particularly chicken manure and feeds, behaved like soils amended with organic-matter, in which heat was liberated and temperature increased (National Research Council 1976, Watanabe 1984).

Secchi disk visibility was significantly lower ($P < 0.01$) (Table 1) in treatments with inputs and highest in the treatment without input (Table 1). The lowest visibility readings were in the treatment with feed, indicating that feed served not only as fish food but also as a source of nutrients for phytoplankton.

Table 2 presents the means of selected water chemical parameters. The treatments with feed had significantly ($P < 0.01$) lower mean dissolved oxygen contents than those without. The feed, chicken manure, and 16-20-0 treatments resulted in the lowest dissolved oxygen concentrations among all treatments, indicating higher dissolved oxygen consumption by feeds and chicken manure and higher oxygen levels in the chicken manure only, 16-20-0 only, and no-input treatments. Tamse (1983) observed that the morning and afternoon oxygen saturation levels of manured ponds decreased two days after the start of application. Non-manured ponds, however, had higher levels of oxygen saturation. Feeds and chicken manure--organic matter inputs--consumed large quantities of oxygen upon decomposition (Matida, unpublished data).

The nitrate concentrations in the ponds receiving chicken manure were significantly higher than in those not receiving chicken manure ($P < 0.05$). Nitrites, however, were significantly higher in treatments I, V, and VI, which also received chicken manure. Available phosphorus was highest in the treatments with chicken manure (0.24%). Thus, the addition of either or both contributes to the phosphorus in the water. N, P, and S are the main constituents of organic compounds and these are liberated from organic materials as a result of microbial activity (Flaig 1984).

Soil phosphorus differed significantly among the treatments ($P < 0.05$), and was highest in treatment V, where chicken manure and feed may have contributed to its accumulation. The P content of chicken manure resulted in higher P content of the pond soil although the total P in the soil contributed very little P to the water. The concentration of available P in the water was only about 0.8% of the total P in the soil (Tables 2 and 3). In general, higher available P in the water was observed where total P in the soil was high.

The organic matter content of the sediments was significantly different among the treatments ($P < 0.01$). In the first run, the highest percentage of organic matter in the sediment was observed in Treatment I (chicken manure only) while the lowest was in the treatment without inputs. In the second run, the highest organic matter contents were observed in the treatments with feed. There were indications that organic matter influenced dry pH; that is, dry pH values decreased as the percentage of organic matter increased. It is possible that the increase in the acidity of the sediment resulted when organic matter decomposed under anaerobic conditions, releasing organic acids (Watanabe 1984).

No significant differences were observed among primary productivity, zooplankton and phytoplankton populations, and lab-lab biomass. However, a highly significant difference in chlorophyll *a* concentrations was seen among the treatments. A direct relationship was observed between primary productivity or the amount of carbon produced and chlorophyll *a* concentrations. The same observation was made by Fortes (1973) in his studies of chlorophyll in the waters of selected manmade ponds in Alabama. The treatments with combinations of chicken manure, feed, and/or 16-20-0 had the highest primary production in both the first and second runs. Similarly, the concentrations of chlorophyll *a* in the water were highest in the treatments with the combination of chicken manure, feed, and/or 16-20-0. No clear relationship was observed between plankton and lab-lab biomass, although the highest densities of zooplankton were observed in combination treatment of chicken manure, feed, and/or 16-20-0. Although no trend in the effect of the different treatments on zooplankton, phytoplankton, and lab-lab biomass was established, it was very clear that the different inputs increased the various parameters because the treatment without inputs consistently gave the lowest values.

Survival, growth, and yield

The average weights attained by the tilapia were highest in the treatments that received feed, either alone or in combination with other inputs. The sizes of the fish at harvest from the treatments that received feed were not significantly different ($P > 0.05$) (87.1–189.4 g and 83–203.4 g for the first and second runs, respectively), but were significantly different from the treatments without feed ($P < 0.01$). Table 4 shows that available P was highest in treatments V and VI. Chlorophyll *a* concentrations and zooplankton abundance were also higher in these treatments than in the treatments without feed. However, nitrite concentrations in the treatments that received feed-fertilizer combinations were high, although not at levels (0.5 mg/l) toxic to the fish (Boyd 1979). Feeds served not only as food but also as nutrient sources similar to fertilizers. Boyd (1982) computed the amount of N and P added into fishponds as feed and concluded that nutrients from feed supplied on a continuous basis are more effective in promoting plankton growth than nutrients from fertilizer applied at two- to four-week intervals.

The average weight gains for Nile tilapia were 0.52–1.26 g/d and 0.56–1.04 g/d for the first and second runs, respectively. The average gain in the treatments that received feed, either alone or in combination with organic and/or inorganic fertilizer, was significantly greater ($P < 0.01$) than in the other treatments. This slow growth could have been due to poor quality of the tilapia stock which was shown by electrophoretic analysis to be 37% admixed with *Oreochromis mossambicus* alleles. Further, despite low fish densities in the ponds due to high mortality, the daily weight gain was low. The combination of chicken manure and 16-20-0 did not significantly improve the daily weight gain, which was 32-37% greater than the daily weight gain of the fish in the treatment with no input. Tang (1979) estimated that fish production can be increased by at least six times by fertilization alone and 18 times by the addition of feeds. The results of these trials did not approach previous estimates, but showed that fertilization, feeding, and feeding plus fertilization increased yields by 14.5 to 40%; 48 to 69%, and 50 to 71%, respectively.

Harvest, growth, and water and soil quality data are listed in Appendix B. A major problem during both grow-out periods was disease. Survival during the first trial was between 11.4 and 20.1% and during the second trial it ranged from 28.8 to 47.2%. It is hypothesized that the high incidence of disease was related to culture under saline conditions. Because of poor survival it is difficult to confidently draw conclusions concerning the effects of feeds and fertilizers in tilapia production in brackishwater ponds. Average fish size and production were significantly higher in all treatments with feeds than in those without feeds, however. It is concluded that strains of tilapia should be screened to determine which are most appropriate for grow-out in brackishwater ponds.

Shrimp experiment

Water analyses

Most water quality values changed significantly during the grow-out period, with the exception of un-ionized ammonia concentrations (Table 5), which were unaffected by the depth or circulation treatments. It is possible that ammonia nitrogen is readily metabolized in brackishwater ponds and therefore rarely attains high concentrations. Seasonal weather changes are most probably the reason for changes in pond temperature and salinity during the grow-out period. Changes in productivity and nutrient concentrations with time were perhaps due to increased feed loading during the grow-out period. These changes are reflected in increases in Secchi disk depth, dissolved oxygen, chlorophyll concentration, phytoplankton, zooplankton, nitrates, nitrites, and reactive phosphorus.

Most of the water quality parameters monitored were significantly affected by the depth treatments (Table 5). Those variables related to productivity (Secchi disk depth, morning and afternoon oxygen concentrations, chlorophyll α , phytoplankton, and zooplankton). Nutrient concentrations (nitrites, nitrates, and reactive phosphorous) were significantly higher in the shallower ponds. This is undoubtedly due to smaller volumes of water in the shallow ponds, because all ponds received equal quantities of feed. Cole and Boyd (1986) have shown that average concentrations of water quality parameters such as chlorophyll α , nitrite nitrogen, and chemical oxygen demand increase with increasing feeding rates. A similar relationship is expected when equal amounts of feed are applied to ponds with decreasing water volumes. In these experiments the shallow ponds also proved to be less stable environments with regard to diurnal temperature fluctuations. They had significantly higher afternoon temperatures and significantly lower morning temperatures than the deeper ponds (Table 5).

There were few significant treatment effects due to circulation. However, daytime circulation did appear to lower the surface temperature of the pond. There were significantly lower afternoon temperatures during the dry season and significantly lower morning temperatures during the wet season in circulation ponds. Daytime circulation also appeared to increase primary productivity, because chlorophyll α concentrations were higher in circulated ponds during the wet season. This increase in primary productivity due to circulation was also evidenced by higher dissolved oxygen concentrations in the afternoons. Daytime circulation also substantially decreased thermal and oxygen stratification in ponds throughout the diurnal cycle.

Depth, survival, growth, and yield

In both trials, the average individual shrimp size was significantly higher in deeper ponds than in shallower ponds (Table 5). Depth was retained as a significant indicator of shrimp growth during the wet season by the stepwise regression procedure (Table 6). Salinity was also retained in the model, which shows its importance to the growth of *P. monodon*. Other water quality parameters retained in the model included productivity (morning and evening dissolved oxygen and phytoplankton densities)

and feeding rate (ammonia and nitrates), which reflected their influences on shrimp growth.

The effects of water depth on both size and survival of *P. monodon* were significant (Table 7). These dependent variables were, however, inversely related. Size was greater but survival was lower in deep ponds. A regression of size versus survival was significant ($y = 125.3 - 1.8x$; probability > regression F ratio = 0.002). This inverse relationship explains the lack of significant treatment effects on total production (i.e., the deeper ponds had larger but fewer shrimp while the shallower ponds had smaller but more numerous shrimp). An analysis of covariance of size of shrimp versus the depth treatments, with survival as the covariate, showed no significant depth effects on size of shrimp ($p = 0.477$).

It is difficult to evaluate the effects of water depth on the growth of *P. monodon* in view of the inverse relation of size and survival during the wet season grow-out period. It is possible that survival is dependent on water depth and that shallow ponds would be expected to have higher survival, given approximately equal feeding rates in all ponds. If this is so, and if size is inversely and causally related to survival, then it may not be necessary to use deep ponds to obtain a particular yield level. It is also possible, however, that the survival patterns observed during the wet season trial are due to some factor unrelated directly to the depth treatments.

Growth, harvest, soil, and water quality data are presented in Appendix B. Water circulation positively influenced primary productivity, decreased the surface temperature, and reduced stratification of temperature and dissolved oxygen. Water depth significantly affected almost all water quality parameters, and deeper ponds had shrimp of significantly greater average size. There were no significant treatment effects on shrimp production, due to an inverse relation of survival and average size. It is concluded that water depth and circulation profoundly affect the water quality of brackishwater shrimp ponds, but that these effects in shrimp production are not apparent at the stocking density used in this experiment. Further tests at higher stocking densities are necessary to establish the causality of water depth, survival, and average size of shrimp.

Circulation	0.076	0.335	0.658
Depth x Circ.	0.125	0.047*	0.597

Figure 1. Average rainfall per month during the dry and wet season trials of the shrimp core experiment. Cycle II, Nov. 1984 - Dec. 1985.

Figure 2. Average solar radiation per month during the dry and wet season trials of the shrimp core experiment. Cycle II, Nov. 1984 - Dec. 1985.

Figure 3. Average wind speed per month during the dry and wet season trials of the shrimp core experiment. Cycle II, Nov. 1984 - Dec. 1985.

Figure 4. Average minimum air temperature per month during the dry and wet season trials of the shrimp core experiment. Cycle II, Nov. 1984 - Dec. 1985.

Figure 5. Average maximum air temperature per month during the dry and wet season trials of the shrimp core experiment. Cycle II, Nov. 1984 - Dec. 1985.

APPENDIX A

Departures from Protocol

During Cycle II all data collection procedures followed the protocol outlined in the CRSP Second Work Plan (PD/A CRSP 1984), with the following exceptions:

DAILY MEASUREMENTS

Solar radiation

Sample time procedure: Weekdays only (Monday through Friday) except holidays and absences; hourly readings, on at 0800 hours and off at 1700 hours.

Analytical method: LI-COR Model LI-550 used.

Rainfall

Sample time procedure: Read mornings, Monday through Friday, except holidays and absences.

Analytical method: Only one rain gauge available.

Wind speed

Sample time procedure: Weekdays only (Monday through Friday) except holidays and absences; between 0800 and 0900 hours.

Analytical method: Florite Bacarrach Wind Speedometer used.

Air temperature, maximum and minimum

Sample time procedure: Read Monday-Friday except holidays and absences around 0800 hours.

Analytical method: Only one maximum-minimum thermometer used.

Pond depth

Analytical method: Read to nearest 1 cm (not to nearest 0.5 cm).

BIWEEKLY AND WEEKLY MEASUREMENTS

Dissolved oxygen

Sample point procedure: Reading taken from both upwind and downwind ponds off catwalk near dike (not at center). There were three pond depth treatment, each with different sampling depths: 1.4-m deep ponds--25 cm off bottom, mid-depth, and 25 cm from top; 1.0-m deep ponds--25 cm off bottom and 25 cm from top; 0.5-m deep ponds--mid-depth. During the first month, all measurements were taken at mid-depth.

Sample time procedure: Mondays, Wednesdays, and Fridays at dawn and dusk.

Pond temperature extremes

Sample point procedure: Same as for dissolved oxygen.

Sample time procedure: Daily, weekdays.

Pond temperature

Sample point procedure: Same as for dissolved oxygen.

Sample time procedure: Monday, Wednesday, and Friday.

pH

Sample point procedure: Same as for dissolved oxygen.
Sample time procedure: Monday, Wednesday, and Friday.

Secchi disk visibility

Sample point procedure: Taken only on one side of pond--upwind side.
Sample time procedure: Monday through Friday except holidays.

Chlorophyll a, b, and c

Sample time procedure: Twice per month.

MONTHLY MEASUREMENTS

Required measurements:

Ammonia

Sample time procedure: Twice per month.
Analytical method: Followed Strickland and Parsons (1972).

Nitrate

Sample time procedure: Twice per month.
Analytical method: Silicate method.

Total dissolved orthophosphate

Sample time procedure: Twice per month.

Fish/Shrimp group weight

Analytical method: 10% for tilapia, 2.5% for shrimp.

Fish/Shrimp mean weight

Analytical method: 10% for tilapia, 1.25% for shrimp.

Fish/Shrimp mean length

Analytical method: 10% for tilapia, 1.25% for shrimp.

Recommended measurements:

Primary productivity

Analytical method: Three-point methods used; DO meter.

Phytoplankton composition

Sample time procedure: Twice per month.
Timetable for sampling and analysis: Samples were preserved in formalin and analyzed at leisure.

Zooplankton composition

Sample time procedure: Twice per month.
Timetable for sampling and analysis: Samples were preserved in formalin and analyzed at leisure.

Benthos composition

Analytical method: Only lablab biomass measured.

Units of Measurement and Abbreviations Used in the Appendix Tables

Daily Weather Measurements:

SOLAR1 (solar radiation).....	E/m ² /d
SOLAR2 (solar radiation).....	cal/cm ² /d
RAIN (rainfall).....	cm/d
WIND (wind speed).....	km/hr
ATEMPMAX (max air temperature).....	°C
ATEMPMIN (min air temperature).....	°C
EVAP (evaporation).....	mm/d

Daily Pond Measurements:

DEPTH.....	m
INFLOW.....	m ³ /hr
OVERFLOW.....	Y/N
"nil".....	<i>Oreochromis niloticus</i>

Weekly and Twice-Weekly Measurements:

All DO (dissolved oxygen).....	mg/L
All TEMP (temperature).....	°C
ALKA (alkalinity).....	mg/L (as CaCO ₃)
HARD (total hardness).....	mg/L (as CaCO ₃)
All N (Kjeldahl, NO ₂ , NO ₃ , Total).....	mg/L
All P (Total, Ortho-PO ₄).....	mg/L
SECCHI DISK.....	cm
CHLOROPHYLL a, b, or c.....	mg/m ³

Diurnal Measurements:

All DO (dissolved oxygen).....	mg/L
All TEMP (temperature).....	°C

Fish/Shrimp Stocking, Sampling, and Harvesting:

"STK".....	stocking
"SAM".....	sampling
"HAR".....	harvesting
"nil".....	<i>Oreochromis niloticus</i>
POP. WEIGHT.....	kg
SAMPLE LENGTH.....	cm
REPROD. WEIGHT.....	kg

Plankton and Benthos:

NET (PRIMARY) PRODUCTION.....	mg C/m ³ /d
GROSS (PRIMARY) PRODUCTION.....	mg C/m ³ /d

Water Quality Characteristics:

ALKALIN (alkalinity).....	mg/L (as CaCO ₃)
HARDNESS	mg/L (as CaCO ₃)
All N (NH ₃ , NO ₂ , NO ₃ , NO ₂ +NO ₃).....	mg/L
All P (Total, Ortho-P)	mg/L
Cl.....	mg/L
SALT.....	ppt
SO ₄	mg/L
BORON	mg/L
CALCIUM.....	mg/L
COPPER.....	mg/L
IRON.....	mg/L
MAGNESIUM	mg/L
POTASSIUM.....	mg/L
SODIUM.....	mg/L
ZINC.....	mg/L

Pond Soil Characteristics:

CLAY.....	%
SILT	%
SAND.....	%
ORGANIC MATTER	%
SOIL-P.....	ppm
SOIL Ca	meq/100g
SOIL Mg.....	meq/100g
SOIL K	ppm
SOIL Na.....	meq/100g
SOIL N.....	%
SOIL NH ₄	ppm
SOIL NO ₃	ppm
SOIL CEC.....	meq/100g
SOIL SALT	mmhos/cm
SOIL Al.....	ppm

Table 3. Miscellaneous Observations Including Fish Health. Iloilo, Philippines.
Cycle II, Dry Season

DAY	MONTH	YEAR	POND#	OBSERVATIONS
3	12	1984	B02	Pond water is very clear.
3	12	1984	B03	Visibility was bottom.
3	12	1984	B08	Abundant growth of lablab was observed.
10	12	1984	B01	Jelly fish were found floating on the pond.
11	12	1984	A41	Pond water was very clear.
11	12	1984	A46	Pond water was very clear.
14	12	1984	B18	Sea urchin were found and removed.
19	12	1984	B15	Prawn juveniles were pouched.
19	12	1984	B16	Prawn juveniles were pouched.
19	12	1984	B20	Pouching of prawn juveniles was discovered at noon.
20	12	1984	B14	Sea urchin were again found and removed.
20	12	1984	B18	Sea urchin were removed.
2	1	1985	A29	Growth of lablab was luxurious.
2	1	1985	A31	Abundant growth of lablab was observed.
2	1	1985	A37	Abundant growth of lablab was observed.
2	1	1985	A41	Growth of pond algae was abundant.
3	1	1985	B19	Sea urchin were also found present in this pond.
7	1	1985	A32	Fishes were not found eating the feeds.
7	1	1985	A33	Fishes were not found eating the feeds.
7	1	1985	A35	Fishes were not found eating the feeds.
7	1	1985	A36	Fishes were not found eating the feeds.
7	1	1985	A37	Fishes were not found eating the feeds.
7	1	1985	A41	Fishes were not found eating the feeds.
7	1	1985	A43	Fishes were not found eating the feeds.
7	1	1985	A48	Fishes were not found eating the feeds.
7	1	1985	A49	Fishes were not found eating the feeds.
9	1	1985	B01	First stock sampling, prawn samples were mostly found clinging on coconut palm leaves
9	1	1985	B14	Prawn were of larger sizes and collecting of samples took only a short time.
10	1	1985	A29	Growth of lablab was still abundant.
10	1	1985	A31	Growth of lablab was abundant.
10	1	1985	A32	Fishes were found eating the feeds after the pond was flooded.
10	1	1985	A48	Fishes were found eating the feeds after the pond was flooded.
17	1	1985	A29	Water depth was very low.
20	1	1985	A30	Fish samples were hard to catch.
21	1	1985	A29	Abundant growth of lablab was observed.
23	1	1985	A29	Pond was overdrained.
23	1	1985	A30	The pond was overdrained.
23	1	1985	A31	The pond was overdrained.
23	1	1985	A32	The pond was overdrained.
23	1	1985	A33	The pond was overdrained.
23	1	1985	A34	The pond was overdrained.
23	1	1985	A35	The pond was overdrained.
23	1	1985	A42	Fish samples were hard to collect.
26	1	1985	B13	Mortalities were found floating near the pond gate.
5	2	1985	B01	Samples were gathered from both the coconut palm leaves and the feeding trays.

**Table 3. Miscellaneous Observations Including Fish Health. Iloilo, Philippines.
Cycle II, Dry Season**

DAY	MONTH	YEAR	POND#	OBSERVATIONS
5	2	1985	B02	Small sized samples were found to abound the coconut palm leaves while bigger sized ones were taken from the feeding trays.
5	2	1985	B09	Samples were also taken from both the feeding trays and the coconut palm leaves.
5	2	1985	B13	collecting of samples took a longer time.
5	2	1985	B19	Frawn samples were of larger size and found to abound the feeding trays.
5	2	1985	B20	Sampling took a longer time and few samples were collected hence sampling was repeated at night.
18	2	1985	B01	Salinity decreased; no feed was left on the feeding trays.
18	2	1985	B02	Salinity decreased; water was brownish in color and no feeds were left on the feeding trays.
18	2	1985	B03	Feeding trays were found empty and the water salinity decreased.
18	2	1985	B04	Prawns were found on feeding trays; salinity decreased.
18	2	1985	B05	Bigger prawns were found on the feeding trays near the gate where water was pumped and smaller ones were present on the other trays.
18	2	1985	B06	Small leaks were found on the sides of the dike going to the diversion canal.
18	2	1985	B07	Abundant growth of natural food was observed and no feeds were found left on feeding trays.
18	2	1985	B08	Lablab were found floating on the pond.
18	2	1985	B10	Feeds were found on feeding trays and no prawn was seen on the trays.
18	2	1985	B19	Pond water has a very dark brown color.
20	2	1985	B10	A very big leak was found on the north side near the gate.
4	3	1985	B01	Sampling was done at around 1700 to 0200H.
4	3	1985	B02	Shrimp samples were found to frequent the feeding trays.
4	3	1985	B14	Samples were easier to collect than the previous month.
4	3	1985	B18	Shrimps found on feeding trays were bigger at night than at daytime.
6	3	1985	B05	Several tilapia fingerlings were found eating on feeding trays.
6	3	1985	B07	Tilapia fingerlings were also found eating the natural food floating on the pond.
6	3	1985	B16	Feeds inside the feeding trays were found eaten by some tilapia fingerlings.
6	3	1985	B20	Several tilapia fingerlings were found swimming near the pond gate.
14	3	1985	B15	Fry of tilapia were also found floating and eating on the feeding trays.
14	3	1985	B16	Several tilapia were caught on the feeding trays.
14	3	1985	B26	Tilapia fingerlings were found and removed on the feeding trays.
20	3	1985	A30	Lesions were dominant on female tilapia.
20	3	1985	A37	Few lesions were found.
20	3	1985	A43	Some of the fishes with severe lesions were taken for analysis.
21	3	1985	B16	Fish competitors were removed using cast net.
21	3	1985	B19	Fish competitors were caught using cast net.
21	3	1985	B20	Tilapia fingerlings were caught on feeding trays and also by cast net.
28	3	1985	B03	Pond water had a rusty brown color.
2	4	1985	A33	Sea urchin were found near the pond gate.
3	4	1985	B05	Sample mean weight decreased.
8	4	1985	A41	Plankton bloom occurred.
17	4	1985	B01	Salinity dropped due to very heavy rainfall.
17	4	1985	B02	Salinity dropped due to very heavy rainfall.
17	4	1985	B03	Salinity dropped due to a very heavy rainfall.
17	4	1985	B04	Salinity dropped due a very heavy rainfall.
17	4	1985	B05	Salinity dropped due to a very heavy rainfall.
17	4	1985	B06	Salinity dropped due to a very heavy rainfall.
17	4	1985	B07	Salinity dropped due to a very heavy rainfall.
17	4	1985	B08	Salinity dropped due to a very heavy rainfall.
17	4	1985	B09	Salinity dropped due to heavy rainfall.

Table 3. Miscellaneous Observations Including Fish Health. Iloilo, Philippines.
Cycle II, Dry Season

DAY	MONTH	YEAR	POND#	OBSERVATIONS
17	4	1985	B10	Salinity dropped due to heavy rainfall.
17	4	1985	B11	A heavy rain occurred causing the sudden drop of salinity.
17	4	1985	B13	Salinity dropped due to a very heavy rainfall.
17	4	1985	B14	Salinity dropped, pond water has a very dark brown color.
17	4	1985	B15	Salinity dropped caused by a sudden and heavy rainfall.
17	4	1985	B16	Salinity dropped due to very heavy rainfall.
17	4	1985	B18	Salinity dropped due to a very heavy rain.
17	4	1985	B19	Color of pond water improved; salinity dropped.
17	4	1985	B20	Salinity dropped due to a very heavy rainfall.
2	5	1985	B15	Prawn were surfacing at around 0430 to 0600H; D O level was very low.
2	5	1985	B18	Surfacing of prawn occurred.
3	5	1985	B15	Prawn were surfacing again.
4	5	1985	B13	Prawn were surfacing but no mortality was found.
5	5	1985	B13	Prawn were still surfacing at early morning.
20	12	1985	A35	Visibility was poor.

Table 3. Miscellaneous Observations Including Fish Health. Iloilo, Philippines. Cycle II, Wet Season

DAY	MONTH	YEAR	POND#	OBSERVATIONS
13	9	1985	B01	Sampling took only a few minutes.
13	9	1985	B02	Sizes of prawn were several times bigger.
13	9	1985	B03	Samples were found mostly on the coconut palm leaves.
13	9	1985	B04	Bigger shrimp were no longer found on the coconut palm leaves.
13	9	1985	B11	Shrimp samples were smaller thus sampling took a longer time than in other ponds.
13	9	1985	B20	Samples were easy to collect.
17	9	1985	B04	Pond water was very clear; prawn can be seen crawling on the pond floor.
25	9	1985	B05	Several tilapia fingerlings were found eating on feeding trays.
25	9	1985	B07	Several tilapia fingerlings were found eating on feeding trays.
30	9	1985	B15	Prawns were surfacing.
3	10	1985	A29	Initial sampling was done a month after the fish were stocked in the pond.
3	10	1985	A30	Initial sampling was done a month after the fish were stocked in the pond.
3	10	1985	A31	Initial sampling was done a month after the fish were stocked in the pond.
3	10	1985	A32	Initial sampling was done a month after the fish were stocked in the pond.
3	10	1985	A33	Initial sampling was done a month after the fish were stocked in the pond.
3	10	1985	A34	Initial sampling was done a month after the fish were stocked in the pond.
3	10	1985	A35	Initial sampling was done a month after the fish were stocked in the pond.
3	10	1985	A36	Initial sampling was done a month after the fish were stocked in the pond.
3	10	1985	A37	Initial sampling was done a month after the fish were stocked in the pond.
3	10	1985	A38	Initial sampling was done a month after the fish were stocked in the pond.
3	10	1985	A39	Initial sampling was done a month after the fish were stocked in the pond.
3	10	1985	A40	Initial sampling was done a month after the fish were stocked in the pond.
3	10	1985	A41	Initial sampling was done a month after the fish were stocked in the pond.
3	10	1985	A42	Initial sampling was done a month after the fish were stocked in the pond.
3	10	1985	A43	Initial sampling was done a month after the fish were stocked in the pond.
3	10	1985	A44	Initial sampling was done a month after the fish were stocked in the pond.
3	10	1985	A45	Initial sampling was done a month after the fish were stocked in the pond.
3	10	1985	A46	Initial sampling was done a month after the fish were stocked in the pond.
3	10	1985	A47	Initial sampling was done a month after the fish were stocked in the pond.
3	10	1985	A48	Initial sampling was done a month after the fish were stocked in the pond.
3	10	1985	A49	Initial sampling was done a month after the fish were stocked in the pond.
7	10	1985	B03	Pond water was very clear.
9	10	1985	B16	Shrimps were surfacing.
15	10	1985	A20	Gobies were the most number of species eradicated.
15	10	1985	B01	Tea seed cake was applied, gobies were the most species killed.
15	10	1985	B02	Tea seed cake application.
15	10	1985	B03	Tea seed cake application, gobies were the hardest species affected.
15	10	1985	B04	Application of tea seed cake. Several tilapia fingerlings were eradicated.
15	10	1985	B06	Application of tea seed cake, less competitors were found.
15	10	1985	B07	Several fish competitors were killed.
15	10	1985	B08	Fish competitors were found surfacing thirty minutes after tea seed cake was applied.
15	10	1985	B09	Sea bass was found after tea seed cake was applied.
15	10	1985	B10	Large sizes of tilapia were taken an hour after the application of tea seed cake.
15	10	1985	B11	Less fish competitors were found.
15	10	1985	B15	Application of tea seed cake, gobies were the last to be affected.

Table 3. Miscellaneous Observations Including Fish Health. Iloilo, Philippines.
Cycle II, Wet Season

DAY	MONTH	YEAR	POND#	OBSERVATIONS
15	10	1985	B14	Chanos chanos were the first species to die after tea seed cake was applied.
15	10	1985	B15	Application of tea seed cake.
15	10	1985	B16	Application of tea seed cake.
15	10	1985	B18	Application of tea seed cake.
15	10	1985	B19	Several fish competitors were found and eradicated.
17	10	1985	A32	Tilapia were found eating the feeds after the ponds were just flooded.
17	10	1985	A33	Tilapia were found eating the feeds after the pond was flooded.
17	10	1985	A35	Tilapia were found eating the feeds after the pond was just flooded.
17	10	1985	A36	Tilapia were found eating the feeds after the pond was just flooded.
17	10	1985	A37	Tilapia were found eating the feeds after the pond was flooded.
17	10	1985	A38	Tilapia were found eating the feed after the pond was flooded.
17	10	1985	A39	Tilapia were found eating the feeds after the pond was flooded.
17	10	1985	A44	Tilapia were found eating the feeds after the pond was flooded.
17	10	1985	A48	Tilapia were found eating the feeds after the pond was flooded.
23	10	1985	A44	A big leak was found in the dike going to the diversion canal.
23	10	1985	B01	Salinity reading stratifies.
23	10	1985	B02	Salinity reading stratifies.
23	10	1985	B03	Salinity reading stratifies.
23	10	1985	B04	Salinity reading stratifies.
23	10	1985	B05	Salinity reading stratifies.
23	10	1985	B06	Salinity reading stratifies.
23	10	1985	B07	Salinity reading stratifies.
23	10	1985	B08	Salinity reading stratifies.
23	10	1985	B09	Salinity reading stratifies.
23	10	1985	B10	Salinity reading stratifies.
23	10	1985	B11	Salinity reading stratifies.
25	10	1985	B14	Surfacing of prawns occurred.
25	10	1985	B15	Surfacing of prawn occurred.
25	10	1985	B16	Surfacing of prawn occurred.
25	10	1985	B18	Surfacing of prawn occurred, no mortality was found.
25	10	1985	B19	Surfacing of prawn occurred.
25	10	1985	B20	Surfacing of prawn occurred.
26	10	1985	B14	Surfacing still occur.
26	10	1985	B15	Surfacing still occur.
26	10	1985	B16	Surfacing still occur.
26	10	1985	B19	Surfacing still occur.
26	10	1985	B17	Surfacing still occur.
26	10	1985	B20	Shrimp started surfacing at around 0500H.
27	10	1985	B14	Shrimps continued to surface at early morning.
27	10	1985	B15	Shrimp continued to surface at early morning.
27	10	1985	B16	Shrimps were again surfacing at early morning.
27	10	1985	B18	Less number of shrimps were found surfacing.
27	10	1985	B19	Shrimps were surfacing but no mortalities were monitored.
27	10	1985	B20	Shrimps were surfacing and were found near the dikes.
28	10	1985	A32	Surfacing occurred.
28	10	1985	B14	Shrimps are found going against the incoming water.

**Table 3. Miscellaneous Observations Including Fish Health. Iloilo, Philippines.
Cycle II, Wet Season**

DAY	MONTH	YEAR	POND#	OBSERVATIONS
28	10	1985	B15	Surfacing continued, flow through system was adapted.
28	10	1985	B16	Surfacing continued, continuous change of water was done.
28	10	1985	B18	Continued surfacing, continuous changing of pond water was done.
28	10	1985	B19	Surfacing continued, pond water was continuously changed.
28	10	1985	B20	Less shrimps were found surfacing, no mortality was monitored.
29	10	1985	B16	Surfacing continued, no mortality was monitored.
29	10	1985	B20	Surfacing continued, no mortality was monitored.
30	10	1985	A36	Several mortalities occurred while the fishes were sampled.
30	10	1985	A44	Hundred percent of the fish samples died.
30	10	1985	B13	Surfacing again occurred, pond was flooded.
30	10	1985	B15	Surfacing occurred again, no mortality was monitored.
31	10	1985	B13	Surfacing continued.
6	11	1985	B13	Surfacing still occurred.
6	11	1985	B14	Shrimps were again surfacing.
6	11	1985	B15	Shrimps were again surfacing.
6	11	1985	B16	Few shrimps were found surfacing.
6	11	1985	B18	Shrimps were found surfacing and flocked to the sides of the pond.
6	11	1985	B19	Plenty of shrimps were found surfacing and on the sides of the pond.
6	11	1985	B20	Shrimps were found surfacing again.
8	11	1985	B03	Surfacing occurred, pond water has a rusty brown color.
9	11	1985	A36	Surfacing occurred.
9	11	1985	A37	Surfacing occurred.
9	11	1985	B13	Stocks in B13 were still surfacing.
10	11	1985	B03	Pond water had a rusty brown color.
10	11	1985	B04	Shrimps were surfacing until around 0900H.
10	11	1985	B09	Surfacing occurred, several mortalities were monitored.
10	11	1985	B13	Stocks in continued to surface and several mortalities were collected.
10	11	1985	B15	Stocks were still surfacing.
10	11	1985	B16	Surfacing still occurred.
10	11	1985	B20	Prawn were surfacing, no mortalities were monitored.
11	11	1985	A37	Tilapia were surfacing, DO reading was zero.
11	11	1985	B02	Mortalities were found and the stock continued to surface.
11	11	1985	B04	Surfacing continued.
18	11	1985	B14	Shrimps were again found surfacing, feeding was only half of the ration.
18	11	1985	B15	Surfacing continued, feeding was half of the ration.
18	11	1985	B18	Feeding was adjusted to half of the ration for the shrimps were still surfacing.
20	11	1985	A37	Tilapia were surfacing again.
7	12	1985	B01	Stock were still surfacing.
7	12	1985	B02	Surfacing occurred.
7	12	1985	B03	Surfacing occurred.
7	12	1985	B04	Surfacing occurred.
7	12	1985	B16	Surfacing occurred again.
7	12	1985	B19	Stock were again found surfacing, feed was reduced.
3	2	1986	A32	Fishes were surfacing, several small bubbles were found on the water surface.
18	2	1986	A37	Fishes were surfacing again.
19	2	1986	A39	Surfacing occurred.
