

UNOHAC

United Nations Office for Humanitarian Assistance

System/User Manual

UNOHAC

The Office for Humanitarian Assistance Coordination (UNOHAC) in Mozambique was established as part of the UN operations in Mozambique (ONUMOZ) to increase the overall effectiveness of the emergency and peacekeeping operations. By incorporating a broad-based coordinating function, it was hoped that humanitarian assistance activities could be directed from a firm information base.

As a first objective, UNOHAC in Mozambique set about developing procedures and tools for information gathering, sharing, and dissemination.

The primary document resulting from this objective is the Consolidated Humanitarian Assistance Programme. This programme identifies sectors in need of assistance, i.e., agriculture, health, education. Needs within these sectors are detailed by activity, and each activity has a price tag attached to it.

In Mozambique, the programme document has been used to make a rational appeal for donor funds to match specific needs. As funds have been pledged or committed, UNOHAC has been able to provide donors and potential donors with up-to-date information on remaining needs, identify areas of over or under funding, and track the actual obligation of funds.

The methodology applied in the formation of the Consolidated Humanitarian Assistance Programme can be used at any stage of the continuum - from natural or man-made disaster, through rehabilitation and reconstruction to development.

An integrated database system, SHAMAN: System for Humanitarian Assistance Management, was developed to manage the mass of information in the Consolidated Programme, to keep it dynamically updated, and to produce reports in publishable form at any time. The database was expanded from the basic data, i.e., needs and contributions, to include other information useful for coordination of humanitarian assistance projects. For example, SHAMAN includes data on

all humanitarian assistance activities being implemented in the country by various agencies, population data, and incidents impacting humanitarian assistance activities.

Because SHAMAN proved to be useful to UNOHAC in Mozambique, it was decided to turn SHAMAN from a Mozambique-centered database into a generalized database customizable for any country.

SHAMAN is a powerful and comprehensive integrated database management system. It can be used as a planning and management tool, and as an implementing - monitoring tool in connection with:

- disaster response and mitigation.
- rehabilitation in the wake of natural or man-made disasters.
- reconstruction planning.
- long-term development programming.

The principles of the CHAP can be applied anywhere - humanitarian assistance appeals, planning, operations, and development. SHAMAN is a convenient and tested tool for planning and managing humanitarian assistance and related activities.

Maputo, Mozambique
January, 1994

How to Install and Run SHAMAN

If you want instant gratification, don't like to read a manual or have only 5 minutes, these instructions are for you.

1. Ensure that there is a line in the `CONFIG.SYS` file that reads:

```
FILES=171
```

and that the *largest executable program size* is at least 550K. This may be ascertained at the DOS prompt by typing `\DOS\MEM`. DOS version 6.x is recommended. If there is not enough memory, use DOS's MemMaker to optimize DOS's use of memory.

2. Re-boot the computer.
3. Insert the SHAMAN Program diskette in the A: Drive.
4. Type A: <ENTER>
5. Type INSTALL <ENTER>

SHAMAN will construct a number of sub-directories off the C: drive and decompress SHAMAN files into them. The program will then attempt to start and will present the user with the LogOn Screen asking for a user name and password. Accept the user name <SHAMAN> and type in the password <shaman>. SHAMAN will next construct index files for all SHAMAN tables and support files.

SHAMAN's initial installation contains complete data on Mozambique. It can be used to experiment with the program. When the main menubar is shown on screen, use the arrow keys to navigate from one choice to another. Press <ENTER> to select a choice. Repeated <ESC> will eventually exit SHAMAN.

To re-enter SHAMAN type: `CD\CLIPPERS\ARTFUL\SHAMAN`

About This Manual

This 4-part manual provides full information for understanding, using and maintaining SHAMAN.

The manual explains how to use SHAMAN to manage your humanitarian assistance resources. Every step, from inputting data to producing meaningful reports in varied formats is described. Information for managers, novice users, and experienced programmers is included.

The material is organized in four main parts:

1. SHAMAN Overview
2. Using SHAMAN
3. Technical Reference
4. Appendices

Part 1 is especially useful for managers wanting to assess how they can best use SHAMAN. It explains SHAMAN concepts, its database modules, its output in the form of reports or maps, how to customize SHAMAN to suit your situation, and technical requirements for using SHAMAN.

Part 2 provides the user with all information needed to access and use SHAMAN. Clear instructions and examples are given for every SHAMAN operation.

Part 3 is a technical reference for the system administrator. It includes instructions for system installation, system customization, and system maintenance.

Part 4, Appendices, includes all program code, data dictionary, authority tables, and sample reports, maps, and forms.

PART I

SHAMAN Overview

Introduction

About Part I

Part I of the SHAMAN manual provides an overview of what SHAMAN is and how it can be used to manage a humanitarian assistance program.

Managers can get a broad understanding of the SHAMAN system, to decide whether the database is suitable for their needs, to determine what equipment and staff they would need to use the system, and how they can customize SHAMAN.

MIS staff can use this section for an introduction to SHAMAN before they turn to the technical details.

Part I is divided into 4 chapters:

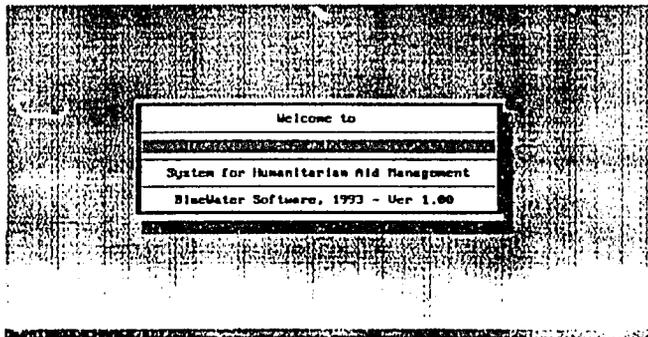

Chapter 1: About SHAMAN - What is the SHAMAN system?

Chapter 2: SHAMAN's Database - What database modules does SHAMAN have?

Chapter 3: Customizing SHAMAN - How can I customize SHAMAN for my situation?

Chapter 4: Technical Specifications - What equipment and staff do I need to use SHAMAN?

Figure I:1 - SHAMAN opening screen

Chapter 1

About SHAMAN

*SHAMAN is a database system
for humanitarian assistance
management*

SHAMAN: System for Humanitarian Assistance Management is a powerful database management tool. The database:

- relates financial data to humanitarian assistance projects.
- gives instant access to country-wide information on government and non-government humanitarian assistance activities.
- provides the ability to produce customized reports in the form of text or maps.

SHAMAN was developed for use in situations where humanitarian assistance is being provided by a variety of donors, governments and private organizations. A coordinating body can effectively use SHAMAN to maintain a dynamically updated information database on all aspects of humanitarian assistance and produce a wide variety of reports for dissemination to the donor community and all involved agencies. An organization could also use SHAMAN to focus on humanitarian assistance projects within the framework of its own operations.

SHAMAN can be used as a planning and management tool, but also as an implementing/monitoring tool at any stage of humanitarian assistance, from emergency to development.

SHAMAN Concepts

*SHAMAN relates financial
data to humanitarian
assistance needs and
current projects*

SHAMAN was designed with two main factors in mind:

- the relationship of humanitarian assistance needs and activities to funding.
- management's need for easily accessible, up-to-the minute reports in varied formats.

The heart of the SHAMAN system is the Consolidated Humanitarian Assistance Programme.

This programme contains data on:

- humanitarian assistance needs,
- all funding committed and obligated,
- designated sectoral activities,
- donors and implementers.

Extensive text on activity objectives, target populations, and background is contained within each sectoral activity record.

The Consolidated Humanitarian Assistance Programme is easily updated to provide management with up-to-the-minute information.

Other, interrelated modules provide important, supplementary information. Included are:

- information on the humanitarian assistance activities of various agencies -- Who's Doing What, Where?
- country resources, such as health and education facilities,
- population data, both current and historic, from various sources,
- incidents affecting humanitarian aid distribution.

The strength of SHAMAN is in its report generating capabilities. A suite of commonly-needed reports is accessible within the system. Up-to-date reports can be produced in a few minutes. Further reports can be developed and incorporated as needed.

With the addition of mapping software, visual reports in the form of maps or graphs can also be produced from SHAMAN data. For management, this view of data can provide new insights.

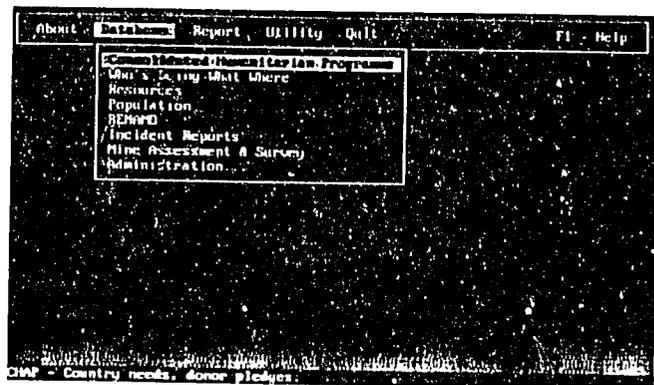

Up-to-date reports and maps can be generated quickly and easily. With the addition of Geographic Information Systems software, SHAMAN data can be output visually in the form of maps and graphs.

SHAMAN Architecture

SHAMAN uses data-driven technology to provide a flexible, modular system.

SHAMAN is composed of a series of interrelated modules that are easily accessed from a pull-down menu system.

Figure 1:2 - Main menu screen with pulldown database modules menu.

Design features include:

- Dictionary-based, data-driven technology.
- Open system architecture.
- Easily maintainable and modifiable modules.
- Powerful ad hoc query capability.
- Full-screen entry and editing of records.
- Extensive on-line help.
- Ability to generate new reports as needed or access standard reports from within the system.
- Ability to incorporate data with geographic information systems and output maps and graphs.

What you Need to Know

SHAMAN is a complex system with a simple and friendly user interface. Only basic computer skills are needed to use SHAMAN effectively.

SHAMAN is a complex system with a simple and friendly user interface. For data entry, only basic keyboard and mouse skills are needed. Any reasonably-competent data entry clerk should be able to master the system with a few hours of use. Maintenance of the system requires a knowledgeable programmer, while modifications require an intimate knowledge of software used in SHAMAN system development.

SHAMAN Reports and Maps

A powerful report generator is incorporated in the SHAMAN system.

- R&R Report Writer® provides the ability to produce reports in varied text formats.

A built in suite of reports gives management immediate access to current information. Further reports can be designed and incorporated as needed.

- Reports can be output quickly in a standard format or in publishable quality.

The addition of MapInfo® (Geographic Information Systems software) allows SHAMAN data to be output visually in the form of maps and graphs.

- Information presented on country or regional maps allows analysis on levels not possible from textual data. See Part IV, Appendix E for examples.

Chapter 2

SHAMAN's Database

SHAMAN's database consists of a number of integrated modules, each easily accessible from the main SHAMAN menu.

Each SHAMAN database module appears to the user to be a stand-alone segment, but in fact the parts are tightly integrated, sharing files (tables) with other modules. For example, the location table, shared by nearly all database modules, is the authority table for spellings in use for districts, towns, etc. This ensures that location names remain consistent across all modules, allowing valid comparisons, reporting, and mapping.

NOTE: Each database module contains a core set of files. The fact that some of these files are shared is transparent to the user, but integral to the design of SHAMAN. Any poorly-conceived system modification or maintenance can have a crippling ripple effect across the system.

Listed in this chapter are all standard SHAMAN database modules, including a general description, the data input and the reports output. Detailed information on the file structures and contents may be found in Part IV of this manual.

Consolidated Humanitarian Assistance Programme

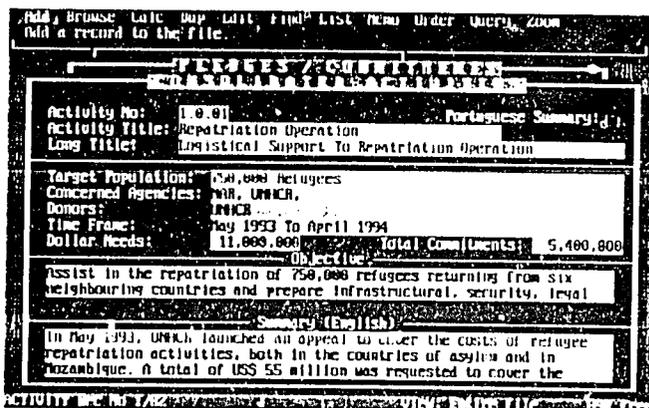

The Consolidated Humanitarian Assistance Programme is the primary database module of SHAMAN. It allows tracking of donor contributions, matching them against sectoral needs to identify areas of over or under-commitment.

The Consolidated Humanitarian Assistance Programme database module is the heart of the SHAMAN system. It contains records of all identified humanitarian assistance needs, donor pledges, and the \$ needs attached to each activity. It matches donor contributions against sectoral needs to identify areas of over or under-commitment.

- Constantly updated, it allows an instant look at any activity to see current \$ needs matched against total commitments to date.
- Memo fields allow full descriptions of activities and objectives.
- A powerful report generator outputs Humanitarian Programme information in publishable form.

A regularly published Consolidated Programme report is a powerful tool for soliciting donations, monitoring funding and activities, and responding to management, agency, and donor information needs.

Figure I:3 - Consolidated Humanitarian Assistance Programme data-entry Screen

Data include:

- pledges and commitments from donors, government and non-government organizations, and implementing agencies.
- location, number and type of beneficiaries.
- \$ needs and amounts committed.

Standard Reports include:

- Consolidated Humanitarian Programme
- Contributions by Donor
- Contributions by Activity
- Contributions by Amount
- Contributions by Sector
- Financial Summary
- Donor Pledge Report Form
- Needs Summary
- Pledges/Activities

A regularly published Consolidated Programme report is a powerful tool for soliciting donations

Who's Doing What Where?

The Who's Doing What Where Module provides information on the activities and responsible personnel of all of the humanitarian assistance agencies working in-country.

The Who's Doing What Where? module documents the humanitarian assistance activities being implemented by agencies active in the country.

It lists all of the humanitarian assistance agencies working in-country and provides broad information on agency activities and projects. Included are all sub-offices, addresses, phone and FAX numbers, number of personnel and contact numbers, activities and their locations.

This module can be very useful to all concerned agencies for coordination of always limited resources.

Data include:

- agency names, addresses and contact names and numbers.
- agency activities.
- agency active districts.

Standard Reports include:

- Who-What-Where/Agency/Province/District
- Who-What-Where/ Province/ District/ Agency/Activity
- Who-What-Where Form (DeskJet)
- Who-What-Where Form (LaserJet)

Resources

The Resources module

holds data on a wide variety of country sectoral resources, such as Health,

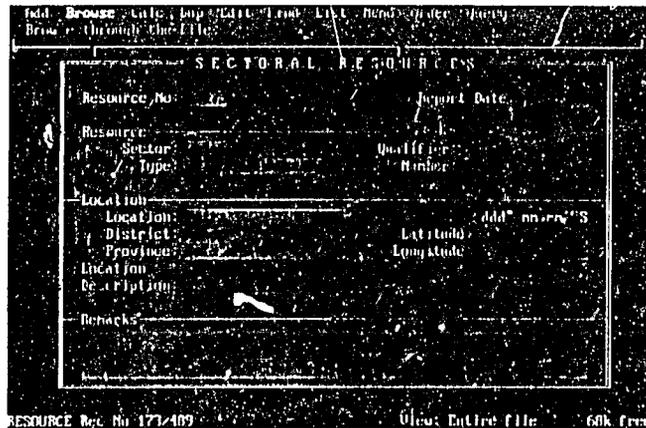

Education, Water

The Resources module contains information on a country's resources in various sectors, e.g., health, education, water. Careful analysis of information needs before customizing this file can make it useful in a variety of situations. For example, it may be useful to know the number of schools in a district, the number of classrooms in each, and their exact location. This information can then be compared to population density, number of teachers, etc. and used as an indicator of the need for rebuilding or augmentation of sectoral needs.

Any type of quantifiable data concerning sectoral items can be input into the database. In the health sector, it can include information on numbers of hospitals or health centers, the number of beds per hospital, and the exact locations. In the water sector it might be useful to know the number of hand-dug wells.

Reports from data in this module are useful planning documents. Addition of mapping software can make this a powerful analysis tool.

Figure 1:4 - Resources module data-entry screen.

Data include:

- information about resource sector - e.g. education, health, water;
- resource type, number, and location.

Output:

- Customized reports and thematic maps.

Population

Population figures from varied sources can be compared by district or country in the Population module

The Population module holds population figures by district from various sources. It includes figures on the number of persons currently receiving humanitarian assistance benefits.

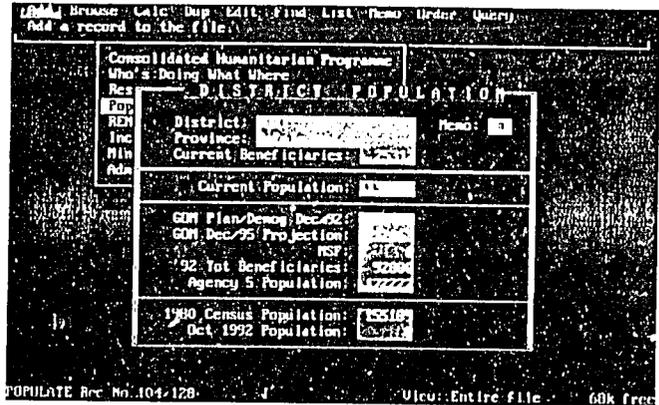

The source field names for population figures are customized at setup.

There are fields for up to five population estimates from government or non-government agencies and two fields for the latest government census figures.

Comparison of population estimates from varied sources can be done at a glance. Overall population can be summed up quickly and output to reports.

Information provided by this module is especially valuable for thematic mapping in the resource sector.

Figure 1:5 - Population module data-entry screen.

Data include:

- Actual and projected population figures by districts

Output:

- Customized reports and thematic maps.

Partisan Dispatches

Dispatches of food and non-food items to disrupted areas can be monitored using the Partisan module

Partisan is used here in the sense of any opposition group, for example, RENAMO in Mozambique, the SPLA in Sudan, or UNITA in Angola. The file/module name can be customized as appropriate.

One result of disruptive conditions, such as civil war, is an information-gap on resources and conditions in disrupted areas. An agency or coordinating body can monitor food and non-food dispatches to these areas using this module.

Dispatches may be tracked or output by agency, by province, by district, by date, by commodity, and by amount.

Data include:

- dispatches of food and non-food items to disrupted areas by various agencies.

Standard Reports include:

- PARTISAN by Province District
- PARTISAN Dispatches by Agency/District/Category.
- PARTISAN Dispatches by Month/District/Category

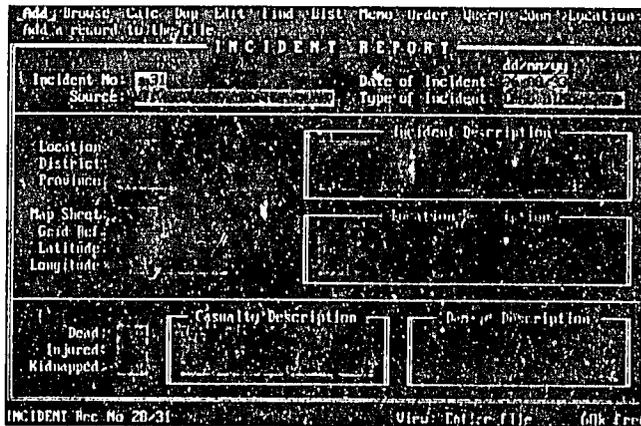

Incident Reports

Reports of incidents impacting humanitarian assistance, such as accident, theft, or land mines, can be tracked and related to identify problem areas.

The Incident Report module provides a means to track incidents affecting humanitarian assistance activities, e.g theft of food aid, vehicle accidents, harassment, or land mines, and relate clusters of incidents to specific locations or activities.

With the addition of mapping software this module becomes a powerful analytical tool to determine any incident patterns or problem locations.

Figure I:6 - Incident Report module data-entry screen. Note the need for text editing procedures.

Mine Assessment and Survey

Information on mined roads or other suspected mine locations, and the progress of de-mining operations, can facilitate safe delivery of humanitarian assistance and reintegration of populations scattered by warfare

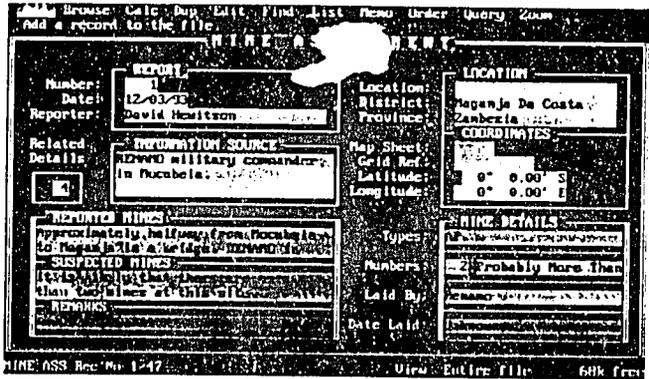

The Mine Assessment and Survey module provides a means to track mine locations as they are reported, found, and removed. It can be used by de-mining teams and is also a valuable source of information for humanitarian assistance agencies working in areas mined or suspected to be mined. With the addition of mapping software, known dangerous areas can be quickly identified.

The 2-phase mine assessment and survey operation involves:

1. an initial qualitative assessment of danger areas with teams reporting on types, probable numbers and suspected locations of mines.
2. a detailed survey of actual mines and types found, along with records of their disposal.

This module details and interrelates both phases.

Figure I:7 - Mine Assessment and Survey module data-entry screen.

Data include:

- Mines reported and their locations.
- Mines found and their disposal

Standard Reports include:

- Mine Assessment & Survey

Administration

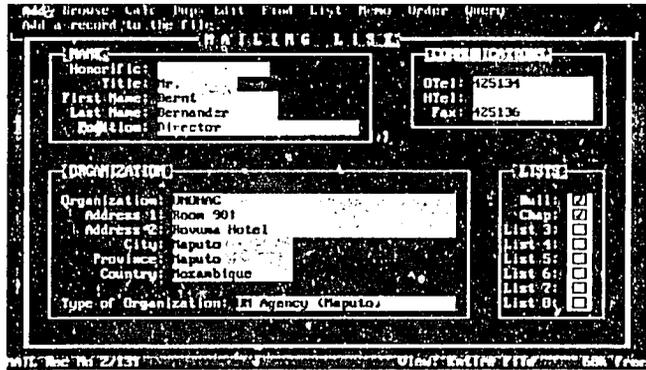

Dissemination of information is made easy by maintenance of a customized mailing list capable of producing mailing labels specific to a particular document.

The present version of SHAMAN contains one administration module consisting of a mailing list that allows up to eight document types to be entered. SHAMAN prints out labels for the specified mailing, mak-

ing dissemination of notices, monthly bulletins, or other publications quick and easy

The administration module can be modified to add files useful to an organization, e.g., a personnel file.

Figure 1:7 - Administration Mailing List module data-entry screen.

Data include:

- Names, addresses, honorifics, phone and FAX numbers, type of organization, and what mailing list(s) each individual or group is on (up to eight categories).

Standard Reports include:

- Mailing Labels - Bulletin

Chapter 3

Customizing SHAMAN

SHAMAN can be customized to meet your humanitarian assistance management needs.

SHAMAN can be customized to suit the humanitarian assistance program management needs in various countries and of various agencies. SHAMAN was developed for a coordinating agency, UNOHAC, and will be most adaptable to the needs of such a body. However, the structure is such that it can be set up for other development, monitoring and reporting needs.

For successful customization, management must analyze its program to determine the basic data categories and information needs. A suggested approach is outlined below.

Some organizations might choose to use only part of the SHAMAN system. For example, it is quite possible to use only the Consolidated Humanitarian Assistance portion of the database. A mine assessment and survey team might want to use only the Mine Assessment module and customize only the related main and support files.

In any case, basic analysis must be done, preferably in cooperation with a competent computer database specialist, to ensure that needs mesh with technical constraints.

Analysis Phase

1. Preparing the Consolidated Humanitarian Assistance Programme

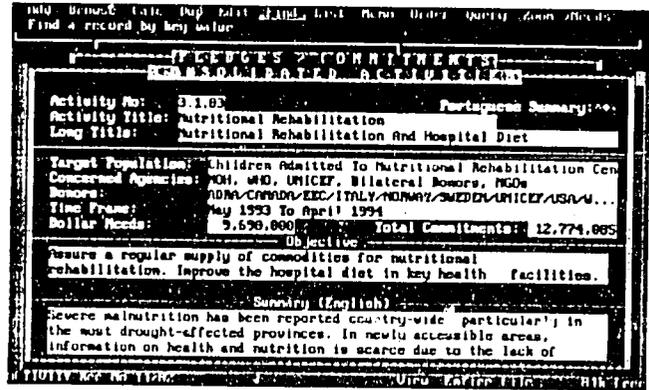

Careful analysis of the total humanitarian assistance needs is a crucial first step.

The categories, sectors, and activities encompassed by the Programme must be determined. In SHAMAN's 3-tiered system, one category will have multiple sectors; sectors will have multiple activities.

Activity Table Example

In the following example, the category 3 (Emergency Relief), has 4 related sectors, and 9 related activities. One sector (Relief Food Aid) with one of its activities (Nutritional Rehabilitation) is shown.

Figure I:8 - Activity File data screen for Activity Number 3.1.03

- 3 represents the Category - Emergency Relief
- .1 represents the Sector - Relief of Food Aid
- .03 represents the Activity - Nutritional Rehabilitation

The UNOHAC Consolidated Programme Activity file can be used as a model

Careful analysis of the Consolidated Programme before setting up SHAMAN is crucial for the smooth operation of the database. Any changes in the basic Programme will have a ripple effect across the system. However, accompanying text can be edited at any time as the Programme matures. New activities can be incorporated as well. Deleting former activities is problematic and should be avoided if at all possible.

Attach \$ amounts to each activity need.

The 3-tiered Programme information will be customized as SHAMAN's Activity Title File.

The Consolidated Programme Activity file used by UNOHAC in Mozambique is reproduced in Part IV, Appendix C of this manual. It is a good model on which to base your Consolidated Humanitarian Assistance Programme.

2. Determine Needs

The second task is to attach \$ needs to the activities identified in Phase 1. Each 4-digit Activity will have one or more needs records. For example, the 3.1.03 has two needs records:

Figure I:9 - Browse screen for Activity Number 3.1.03 Needs records.

Actno	Title	Amount
3.1.03		2500000
3.1.03	Commodities for therapeutic feeding	7190000

Changing the \$ amounts of the needs later is a simple editing task.

3. Determine Resource Sectors and Types

Decide which resources you want to track

The Resource file has an associated support file (RES_TYPE) that controls the resource sector and resource type information. Analysis must be done on these two items before entering any resource data.

For example, assume that sector resources under Health, Education, and Water are to be tracked.

Under the sector heading of Health you may want to track health posts and hospitals. Two records will be entered into the Resource Type file as follows:

Sector	Type
Health	HEALTH POST CENTER
Health	HOSPITAL

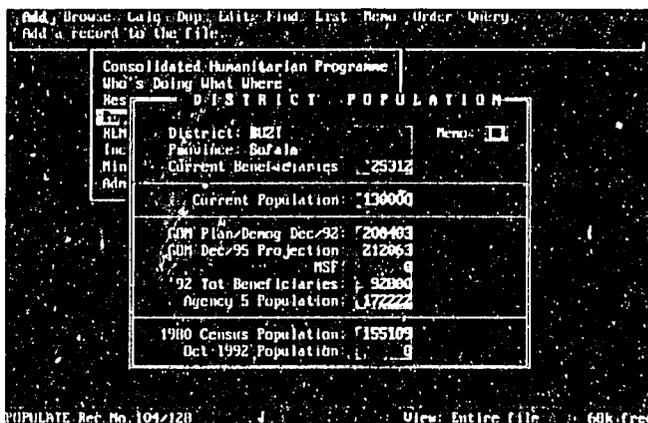

Perform this analysis for all sectors to be tracked.

4. Determine Population Data Sources

Choose up to 7 sources for population data

The Population module allows comparison of population data from various sources by district. You must decide on categories/time periods useful to your organization, and the sources of the data.

Figure 1:10 - Population File data screen for one district showing bottom 7 modifiable categories of population data collection.

For example, you may wish to track MSF-generated data on district population figures. A natural choice, of course, would be the country's own census figures and projected population figures by district.

5. Determine Publications for Mailing List

SHAMAN allows up to eight publications to be included in the Mailing List module.

Choose publications that are distributed regularly to any group of recipients and enter them into the list.

For example:

Consolidated Humanitarian Assistance Programme
Bulletin
Monthly Report
Incident Report

6. Determine Report Needs

*Determining report needs is
an ongoing activity*

This is an ongoing area for analysis. Standard reports are included in SHAMAN modules. However, management may have requirements for other reports from time to time. These reporting needs should be communicated to the system administrator. Virtually any report from SHAMAN data can be produced using R&R Report Writer.

The remainder of the customization phase is technical. Given the in-

Customization Phase

formation base determined above, the SHAMAN system administrator can proceed with customizing the database fields, authority tables, etc. There will also be other routine customization requirements, such as country-specific field names.

General instructions and suggestions can be found in Part III, Chapter 2, Customizing SHAMAN. Directions for using the Utility modules needed are in Part II, Chapter 4, SHAMAN Utility.

Chapter 4

Technical Specifications

*SHAMAN is a responsive,
modifiable and easily
maintainable system.*

SHAMAN is a turnkey system that uses hierarchical pulldown menus, extensive online help screens for the operators and ad hoc query capabilities. The programs are written in CLIPPER (a dBASE compiler) and ARTEFUL II (a third-party database-engine) and delivered in the form of executable files. The basic system is operable by anyone with a few hours training.

Reports are initially prepared by using Concentric Systems' R&R Report Writer[®] for Clipper. Memory swapping is seamlessly performed by OVERLAY() or Blinker[®].

SHAMAN is a *data-driven* program, i.e., much of its behavior is modified at runtime and is not predetermined by hard-coded data. Most of these data are kept in support files that are user modifiable while other data are in a data dictionary file which is itself modifiable at runtime. This makes for a more responsive, modifiable and easily maintainable system than is possible otherwise.

Operating System Requirements

Hardware:

SHAMAN is a mission-critical application. For best results, it requires powerful hardware.

For efficient operation, the system should *minimally* be installed on an IBM-compatible 33mhz, 80386 computer with a hard disk greater than 100mb and 2mb or more of RAM. However, it is recommended that a 33mhz, 80486 DX machine with hard disk greater than 200 mb and 8mb of ram be used as a server in a peer to peer Local Area Network. Lantastic[®] version 5 has been successfully used in this regard.

Peripherals:

Two other pieces of hardware are necessary to ensure the continued running of the computer: a voltage stabilizer and an Uninterruptable Power Source (UPS). The voltage stabilizer should have electronic stabilization for small fluctuations in voltage plus a servo-motor control to handle large fluctuations.

The STAC ST-500 has been successfully tested. It is placed in front of a UPS, i.e., it is connected directly to the mains. The ST-500 not only stabilizes the voltage, it also converts from 220 to 110 or vice versa and has output plugs for both voltages.

A UPS should be chosen with a capacity of running at least 500 watts for 15 to 30 minutes.

Computer Support Requirements

A capable data administrator will have a good knowledge of software programs used by SHAMAN and a basic knowledge of hardware maintenance.

SHAMAN is a *mission-critical* application designed specifically for humanitarian assistance program management. It was designed and tested in the field. SHAMAN is said to be mission-critical because it directly influences the effectiveness of program operations. As such, the system needs continuous availability, operational reliability, data integrity and security.

The above can only be supplied by a computer-literate data administrator with a good working knowledge of Clipper, DOS, and the other software packages that are part of SHAMAN. The person also needs a basic knowledge of computer hardware functioning and maintenance. He/she should be capable, for example, of swapping a faulty floppy disk drive or removing a non-functioning hard disk to ship out for repairs. The Data Administrator should direct all data entry and devise and implement procedures for data verification. He/She should be responsible for report generation and be able to design new reports on demand from management.

SHAMAN data entry can be handled by any reasonably competent data-entry clerk with a working knowledge of English.

Many validation routines are incorporated into SHAMAN. For example, in many fields, SHAMAN will not allow entry of data unless validated by authority files. However, SHAMAN data includes extensive text files and other qualitative data that depends on the integrity of data input. It is important that the data administrator understand the need for rigorous validation of data entry.

SHAMAN data entry can be handled by any reasonably competent data-entry clerk with a working knowledge of English. If SHAMAN data is enhanced with the addition of mapping software, it would be useful to have someone on staff with some familiarity with GIS systems.

Information Support Requirements

The effectiveness of SHAMAN as a tool for data manipulation and dissemination depends heavily on the methods used for data collection and verification. SHAMAN data will most likely be gathered from many agencies and by several agents. Standardization of data collection forms or formats is recommended as part of the customization phase.

The effectiveness of SHAMAN depends on the methods used for data collection and verification.

The forms have to be a compromise between what is easy for data collection and what is easy for data entry. For ease and accuracy of data entry there should be a relationship between the data collection form and the data entry screen. Sample forms can be found in Appendix E.

SHAMAN's associated reporting and mapping capabilities are powerful. It's worth taking extra time in analyzing data collection methods and forms to take full advantage of these capabilities.

PART II

Using SHAMAN

Introduction

About Using SHAMAN

SHAMAN: System for Humanitarian Assistance Management, is a robust and comprehensive database management system designed to meet complex humanitarian assistance coordination needs. It was initially designed for UNOHAC: United Nations Office for Humanitarian Assistance Coordination in Mozambique, but can be customized for particular countries and situations.

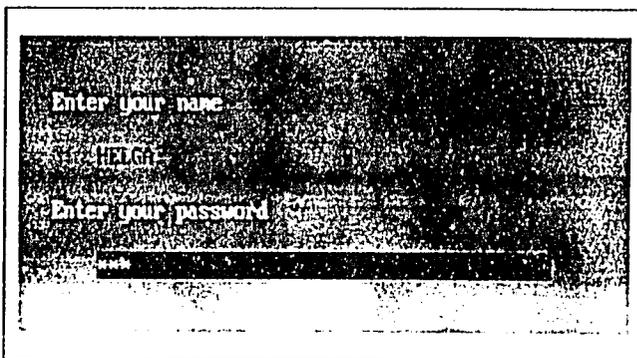

Although easy to use, SHAMAN is an extremely sophisticated and comprehensive database program. Because all the work is done "behind the scenes", the non-specialist user has a powerful tool at his/her disposal without having to know all the technical details.

SHAMAN is designed for the non-computer expert. A new user can learn to maneuver through SHAMAN and become proficient in entering data and producing reports in a few sessions. There is little or no danger of corrupting files or crashing the system through beginner errors.

A log-on system protects SHAMAN data by limiting access. Three levels of access are permitted: Novice, Expert, and System Administrator.

- A Novice user can look at the data but cannot change it.
- An Expert user can enter and edit data in most fields. He/She is locked out of the Data Dictionary and System File and any other files designated by the System Administrator.
- The System Administrator has access to all files and can modify any part of the SHAMAN system.

Figure II:1 - SHAMAN LogOn screen.

SHAMAN is composed of many interrelated modules. Some comprise several related tables for data entry; others serve as support units. To the general user, these interrelationships are transparent. The support units contain files which the system administrator uses initially when customizing SHAMAN, and subsequently for SHAMAN maintenance.

Part II of the SHAMAN manual is written for the user and provides full instructions for using Shaman's pulldown menus and doing full-screen maintenance.

Chapter 1: SHAMAN Menus and Maintenance Tools This chapter gives information on how to access and navigate SHAMAN menus and explains specific terms and skills needed for full-screen maintenance of SHAMAN files.

Chapter 2: SHAMAN Database Use this chapter to get information on SHAMAN database modules and for step-by-step instructions for entering data.

Chapter 3: SHAMAN Report Use this chapter to get instructions for producing standard, integrated SHAMAN reports.

Chapter 4: SHAMAN Utility This chapter gives detailed explanations on the use and maintenance of SHAMAN System, Support, Utility, and External files and functions.

Chapter 5: Generating Reports Use this chapter for general instructions and needed references for using R&R Report Writer® to generate SHAMAN reports.

Chapter 6: Generating Maps Use this chapter for general instructions and needed references for using MapInfo® to generate SHAMAN maps.

Chapter 1

SHAMAN Menus and Maintenance Tools

This chapter gives instructions for navigating SHAMAN menus, and explains the skills needed to do full-screen maintenance.

It is divided into five parts:

- Useful Terms
- Navigating SHAMAN Menus
- SHAMAN Action Menu
- Using SHAMAN Action Tools
- Using On-Line Help

Useful Terms

Access To call up a menu, an action, a screen, a record, a picklist, etc., by pressing the appropriate key(s).

Browse To scroll through multiple records to view or select for further action.

Checkbox A box in which a \checkmark can be toggled on and off.

Child Record A record that is dependent on a parent record, e.g., in the Who What Where module, a What record is dependent on its parent Who record.

Default A set value which appears automatically in a field. It can be overwritten.

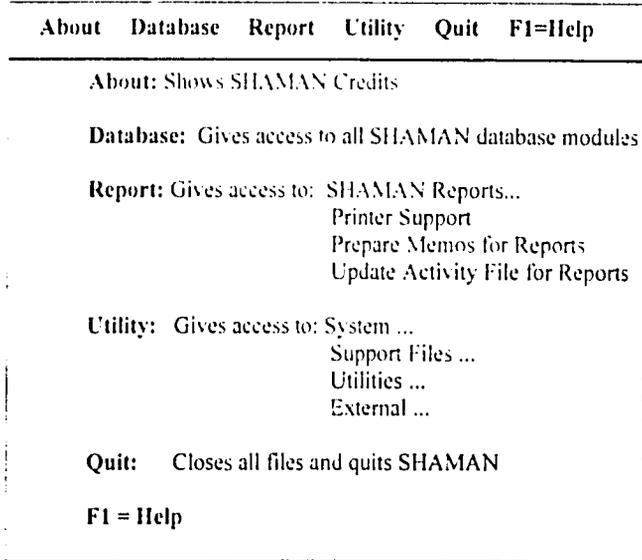

Dialogue Box A message that pops up on screen asking you to perform some action, e.g., "Press any key to continue."

Dropfield A short list of the acceptable values (names or numbers) which can be called up from a field. Values are usually hard-coded in. Dropfields in SHAMAN are identified by a down arrow beside the field.

- Field** A single unit of information in a database record, e.g., an Activity Number.
- Full-screen Maintenance** The ability to do maintenance on records by having them appear one record per screen.
- Light Bar** A movable bar or block of light used to highlight a menu item or field.
- Maintenance** Performing any action on a record, e.g., add, edit, duplicate, etc.
- Menu Bar** The top of the SHAMAN screen containing menu choices listed horizontally.
- Module** An organized grouping of related data.
- Parent Record** A record that has dependent children, e.g., a Who record has a related What record. This is its child record.
- Picklist** A menu (list) of acceptable values (names or numbers) which pops up or can be called up from a field to select a choice. Usually from an authority table and may have more than one column.
- Pull-down Menu** A secondary menu that appears onscreen when you access a menu.
- Pop-up Box** A box containing information or values that pops up on screen, either automatically or through direct access.
- Screen Prompt** A dialogue box or message that pops up on screen to give you information.
- Scroll** Move the Light Bar horizontally or vertically through the menu bar or the SHAMAN screen using the arrow keys.
- Select** Scroll to highlight your choice and press <ENTER>.
- Support File** Often a file used as an authority table for spellings, values, etc.
- Table** A DBF (database) file of records (rows) containing loosely related fields (columns).
- Utility** A peripheral routine that helps you perform some task, e.g., backup files.
- Value** A name or number entered into a field.
- Zoom** Move from the record in view to a related record of another table.

Navigating SHAMAN Menus

All SHAMAN records and actions are accessed through pulldown menus. The opening SHAMAN menu gives the user the following choices:

To select a menu item:

- use the left or right arrow keys to highlight an option and press <ENTER>

OR: Enter the first letter of your choice, e.g., <D> for Database.

A second level of options appears in a pulldown menu:

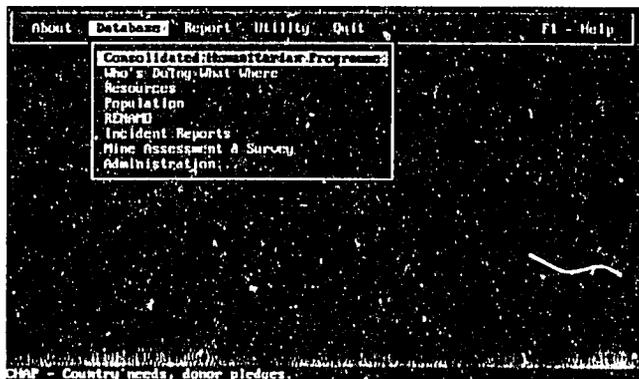

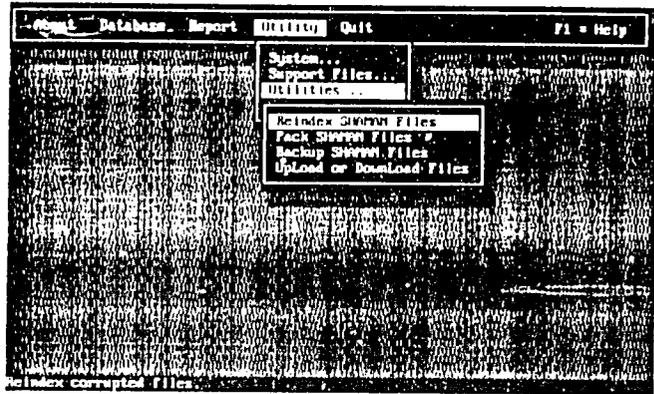

Figure II:2 - Database pulldown menu.

The extension "... " indicates a second level of pulldown menu choice:

Figure II:3 - Utility menu showing a second pulldown level.

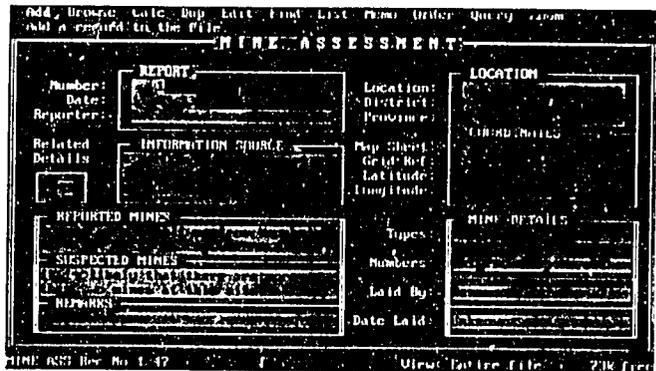

To select a pulldown menu item:

- use the up or down arrow keys to highlight an option and press <ENTER>.

The menu bar across the top of the screen changes to give a choice of actions.

Figure II:4 - Mine Assessment screen showing top action menu bar.

Action Menu

SHAMAN's action menu (full-screen maintenance menu) gives the user the following choices:

Add Browse Calc Dup Edit Find List Memo Order Query Zoom	
Add	Add a new record
Browse	Browse records in the table in use.
Calc	Count: Count the number of records in the table in use. Sum: Sums up all numeric fields in the table in use.
Dup	Add a new record starting with a duplicate of the record in view.
Edit	Edit all Fields: Edit all fields in the record in view. Edit Non_Key Fields: Edit non-key fields specific to the record in view.
Find	Search for specific records in the table in use or in a related table.
List	Select a report related to the table in use.
Memo	Add, view or edit notes on the current record.
Order	Select the order in which to view the table in use.
Query	Query the table in use or a related table.
Zoom	Move to a related table.

The action menu bar will include only the choices applicable to the table in view. For example, Zoom will appear in the menu bar only if it is possible to move to a related table.

To select a menu item:

- use the left or right arrow keys to highlight an option and press <ENTER>

OR: Enter the first letter of your choice, e.g., <A> for Add.

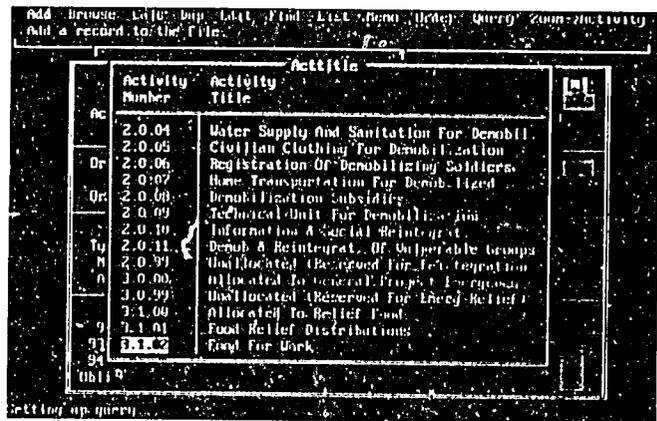

Using SHAMAN Action Tools

Add

Choosing Add brings up a new, empty record of the table in use, with the cursor on the first field. Entry of data is straightforward, with the following safeguards and assists in place:

- Usually, a new record comes up with *new* inserted in the first field. SHAMAN fills in this field with a prime identifier when the record is saved.
- Date convention: Dates must be entered in the British convention of dd/mm/yy, e.g., 27/09/94
- Picklists: SHAMAN provides picklists for fields where data must match information in authority tables. This safeguard ensures that standard spellings, acronyms, etc. are used. If an unacceptable value is typed in, a picklist pops up. Scroll the list to select the correct value and press <ENTER>. The correct value will be entered in the field.

Figure II:5 - Activity No. picklist from Activity Title file.

Alternatively, the user can go directly to the picklist by pressing <ENTER> on the empty field. This option makes data entry quick and easy.

To call up a picklist on a field with data already in it, type in any letter and press <ENTER>. Because the value is now unacceptable, the picklist will pop up.

Fields provided with picklists can be identified onscreen. As the field is highlighted, an outline box is drawn around it. Normally, picklisted fields cannot be left empty. In a few exceptions, a screen prompt will appear instead of an outline box. Type in any letter and press <ENTER> to access the picklist. Otherwise, press

<ENTER> to move to the next field.

- Dropfields: A few screens contain dropfields. (Dropfields differ from picklists in that the choices are hard coded and cannot be changed in the Support Utility). Dropfields are identified by a down arrow next to the field. To access the choices in a dropfield, press <SPACEBAR>.
- Checkboxes: Some screens contain checkboxes. Use <SPACEBAR> to toggle the v on and off.
- Checkboxes are also used to show that a memo exists for a record. The v is toggled on by SHAMAN when a memo is entered.
- Saving records: SHAMAN uses a screen prompt to remind the user to save a record.

OR: Save the record with a <Ctrl W> command.

- Deleting records: If you've made an error, or don't wish to save an entry, press <ESC> to go back to the previous record. To delete a record once it has been saved, press <DELETE>. A screen prompt will pop up for you to confirm your choice.

Browse

The *Browse* option is available for a quick overview of records. In *Browse* mode the user can view multiple records but cannot change them.

Figure II: 6 - Browse screen from the Who module, showing Agency addresses.

Alt Calc Dup Edit Find List Memo Order Query Zoom-Shift
Browse through the file.

Who No	Agency	Address
00103	ACTIUN NORD-SUD	AV. V. LENIN 191 CP 4331
00104	HELIVETAS	AV. AHMED SEKOU TOURE 637 CP 135
00105	HELIVETAS	
00106	MISSAO CONTRA LEPRO	CP 130
00107	CARE	AV. EDUARDO MONDLANE 7600
00100	CARE	AV. MARTIRES DE NOVA 596
00109	MSF (SPAIN)	AV. EDUARDO MONDLANE 677 CP. 677
00110	OXFAM	AV. EDUARDO MONDLANE
00111	ITALIAN COOPERATION	CAMPUS BASE
00112	AMRU	FACIN PAU 75
00113	ADCOA	PC ALEXANDRE HERCULANO 270A
00114	KULINA	AV. KARL MARX 1452
00115	OXFAM	AV. PATRICIO LUMUMBA 770
00116	GAA	

- To view records, scroll vertically or horizontally.
- To access a record for full screen maintenance, scroll to highlight the record and press <ENTER>.
- To change the order of the records being viewed, select *Order* before you *Browse*.

- To return to the original record screen press <ESC>.

Calc

The *Calc* function is especially useful when used in conjunction with a sub-set of data selected with *Query*.

Calc: Count quickly counts the number of records in the sub-set of records selected.

Figure II-7 - Calc/Sum screen showing total district population figures.

TOTALS	
Pop 1	12302894
Pop 2	0
Curr Pop	1401000
Curr Benef	344429
Agency 1 pop	15594417
Agency 2 pop	17665781
Agency 3 pop	0
Agency 4 pop	3659100
Agency 5 pop	2694537

Oct 1992 Population:

POPULATE Rec No 89/128 View: Entire file 60k free

Calc: Sum sums up any numeric fields in the table in use.

Dup

Choose *Dup* when adding multiple records in which most of the information is the same. Press <ENTER> on fields holding duplicate data; overwrite data in others.

Edit

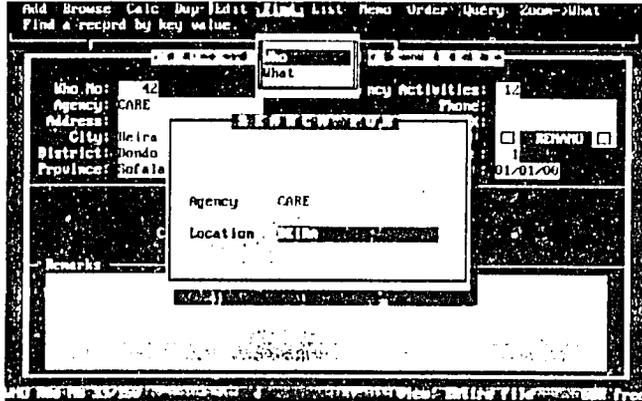

SHAMAN allows two levels of editing, *Key Fields* and *Non_Key Fields*.

- For normal editing of a record, choose *Edit Non_Key Field*. This option allows the user to edit non-key fields specific to that record.
- *Key Fields* are rarely edited. Any changes to key fields will affect any child records. USE WITH CAUTION.
- To edit memo fields, choose *Memo* from the action menu.

Find

Find allows the user to search for specific records in the table in view or in a related table. Popup boxes step the user through the *Find* function.

Figure II:8 - Find pulldown menu and dialog box allowing Find on Agency/Location for WHO file.

List

The List menu option lists all reports related to the table in view. Reports can be output to screen, printer, or another file. Popup boxes step the user through the List function.

- See Reports, Part II, Chapter 3.

Memo

SHAMAN allows virtually unlimited text to be included in its memo fields. Choose *Memo* and enter text as needed.

Some records contain memos but they do not appear onscreen. In these cases a \surd in an onscreen checkbox indicates a memo. Access by selecting *Memo*.

Some memos appear in the record onscreen, under Remarks or other named memo field, e.g., Objective or information source. The entire memo text may not appear onscreen. It can be accessed by selecting *Memo*.

Some records contain more than one memo field. A pulldown menu under the *Memo* option identifies these choices.

Edit a memo by selecting *Memo* while the related record is in view.

Order

Order allows the user to change the order in which records in a table appear. It is especially useful when using *Browse* to be able to view records in a chosen order.

Query

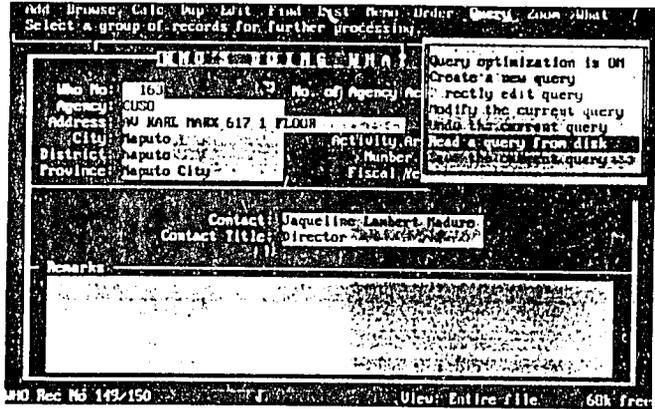

Query allows the user to select a sub-set of the data in the current or related tables. Subsequent operations, such as *Browse*, or *Calc*, will include only that sub-set. The message View Filtered by query will

appear in the lower right screen.

Query is especially useful to get quick answers to ad hoc enquiries when a formal report is not required.

A number of options appear in a pull-down menu when the *Query* option is selected.

Figure II:9 - Query pull-down menu showing Query options.

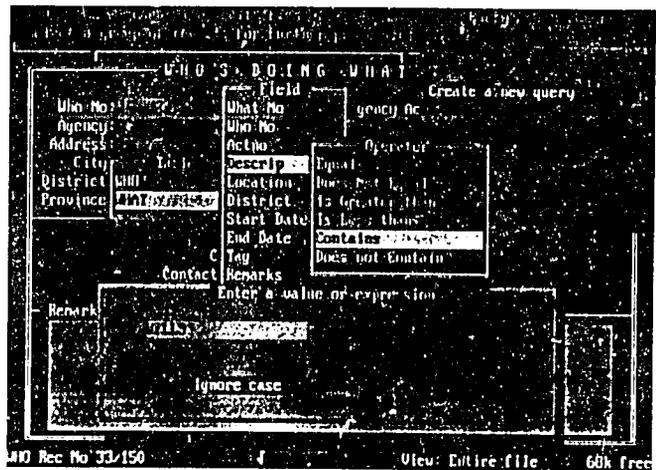

- *Query optimization is ON* generally gives the user a faster response time. However, it must be turned off for any queries on numeric fields.

To toggle between on and off, hit <ENTER> while *Query Optimization* is highlighted.

- Selecting *Create a new query* pops open a series of windows which step the user through making the query.

Figure II:10 - A Query on the WHAT file asking for all records where the field Description contains the word "WELLS".

- *Directly edit query* takes the user into a programmer's view of the query. A normal user will not use this option.
- *Modify the current query* reopens the *Create a new query* window.
- *Undo the current query* removes the query filter. The message *View: Entire File* returns to the lower right screen.
- *Read a query from disk* pops up a list of any previously saved queries related to the table in view.
- *Save the current query* allows the user to save frequently used queries, accessing them later with the *Read a query from disk* command.

Zoom

Choose *Zoom* to move from the record in view to one in a related table. You can then do full-screen maintenance on records in the related table.

To "UnZoom" press <ESC>. You'll be taken back to the original screen.

Using On-Line Help

The SHAMAN manual can be accessed on-line by pressing <Shift><F1>. This action will take you into Expert Help, where help on any subject in the SHAMAN manual can be called up.

If you need help to use On-Line Help, press <F1> when in Expert Help.

Chapter 2

Database Modules

Shaman's database is made up of a number of interrelated modules:

- Consolidated Humanitarian Assistance Program
- Who's Doing What Where?
- Resources
- Population
- Partisan Dispatches
- Incident Reports
- Mine Assessment and Survey
- Administration

In this chapter, each database module is described and illustrated.

These modules appear to the user to be stand-alone units, but in fact the parts are tightly integrated, sharing files (tables) with other modules. For example, the `Location` table is shared by nearly all modules, acting as an authority table for spellings in use for towns, districts, etc. This standardization ensures that valid comparisons and reporting can be done when drawing information from different segments of the database.

In this chapter, each database module is described and illustrated. Data entry tips provide full instructions for data entry in main files. Support files are addressed in Chapter 4, *Utility*. A glossary of terms specific to the humanitarian assistance data being entered is included below. It will be especially useful for entry of the crucial CHAP data.

Glossary of Humanitarian Assistance Terms

Activity Specific action required to respond to a defined need within a given sector, e.g., "Supply of Agricultural Tools." (See "Category" and "Sector").

Carryover Funds committed within one time frame (i.e., 92/93) which only become available in another (i.e., 93/94).

Category A common programming focus for a set of related sectors, e.g., "Restoration of Essential Services." (See "Sector" and "Activity").

Channel The organization disbursing funds to an implementing agency.

Commitment A firm programme intention on the part of the donor.

Contribution Funds in kind or in cash, made available by a donor for a specific purpose.

Disbursement The actual transfer of funds from the donor to the channel or implementing agency.

Donation The funds that are committed by a donor.

Donor The organization which is the source of the funds and has the decision-making power to direct the resources to the country.

Implementing Agency The organization carrying out the activity.

Obligated Funds Funds in which a signed contract between donor and implementor for a specific activity has been finalized.

Pledge Funds promised by a donor for a country.

Sector A set of related activities which have a common programming focus, e.g., "Agriculture." (See "Category" and "Activity").

Consolidated Humanitarian Assistance Programme (CHAP) Module

The CHAP module is the heart of the SHAMAN database. It contains records of all humanitarian assistance requirements identified in a country, pledges made by donors, and \$ amounts needed to meet these requirements. Reports generated from CHAP data become the primary humanitarian assistance coordination documents.

*The Consolidated
Humanitarian Assistance
Programme is the heart of
the SHAMAN database
system.*

NOTE: Clean data collection and entry is critical; rigorous validation procedures must be implemented.

The CHAP module contains two main files:

Activity File
Pledge File

and uses four support files:

Activity Title File
Needs File
Donor File
Agency File

The text in the Activity file amplifies the objective of the activity and summarizes the related situation. It can be of any length, but it is

suggested that for clarity of presentation it be limited to fit a one-page per activity format. (See Appendix D: Sample Reports, CHAP).

NOTE Analyzing and setting up the Activity Title File and the Needs File is a crucial first step in using the CHAP module. How well that is done dictates the usefulness of the CHAP.

Activity File

The Activity file contains the key data on CHAP activities. Activity numbers and titles are determined during the customizing phase. Creating Authority Files for these all-important tables is done at setup by the system administrator in consultation with senior management.

Initially, the Activity file requires extensive data and text entry. As the CHAP matures and needs are refined, text may need to be edited. However, the basic categories, sectors, and activity numbers and titles must remain the same. The child Pledge records, other database modules, and integrated SHAMAN reports are all dependent on the Activity file.

Figure II:11 - Activity file screen.

The screenshot shows a terminal window with a menu bar at the top: Add, Browse, Calc, Dup, Edit, Find, List, Menu, Order, Query, Zoom, Needs. Below the menu bar is the text "Add a record to the file." The main area is titled "PLEDGES / COMMITMENTS CONSOLIDATED ACTIVITIES". The form contains the following fields:

- Activity No.: 01.01
- Activity Title: Food Relief Distributions
- Long Title: Food Relief Distributions
- Target Population: 1.8 Million Displaced, Affected and Returned Popula
- Concerned Agencies: UNHCR, ICRC, UNRWA, UNICEF, UNDP, UNFPA, UNWOMEN, UNCTAD, UNCTAD/UNEP, UNCTAD/WHO, UNCTAD/WHO/UNEP, UNCTAD/WHO/UNEP/UNICEF, UNCTAD/WHO/UNEP/UNICEF/UNDP, UNCTAD/WHO/UNEP/UNICEF/UNDP/UNFPA, UNCTAD/WHO/UNEP/UNICEF/UNDP/UNFPA/UNWOMEN, UNCTAD/WHO/UNEP/UNICEF/UNDP/UNFPA/UNWOMEN/UNCTAD, UNCTAD/WHO/UNEP/UNICEF/UNDP/UNFPA/UNWOMEN/UNCTAD/UNCTAD
- Donors: UNCTAD/WHO/UNEP/UNICEF/UNDP/UNFPA/UNWOMEN/UNCTAD/UNCTAD
- Time Frame: 1991-1992
- Dollar Needs: 10000000
- Total Commitments: 10000000

At the bottom of the screen, it says "ACTIVITY Rec No: 12/92" and "View: Entire file 60k free".

Note: The Activity file must initially be set up from the *Support ...* module. Select *Utility*, then *Support ...*, then *Activity File Maintenance*. (The Activity Title File must be set up first).

Once the Activity file has been set up, Activity records can be accessed by Zooming from the related Pledge records.

Data entry tips:

- A picklist can be called up from the Activity No. field.
- The Activity Title and Long Title are filled in by SHAMAN when the Activity No. is entered.

- Concerned Agencies are generally implementing agencies. There is often more than one.
- Donors, Dollar Needs, and Total Commitments are information fields only. Information is updated dynamically by SHAMAN.
- To enter the main text select *Memo* and then *Objectives* and *Summary*.

To enter a summary in another language select *Memo* and *Other Lang*. If another language summary is entered, a \times will appear in the check-box.

(The field title for the [Other language] Summary is changed in the defaults file. For example, in Mozambique the field title is customized as "Portuguese Summary".)

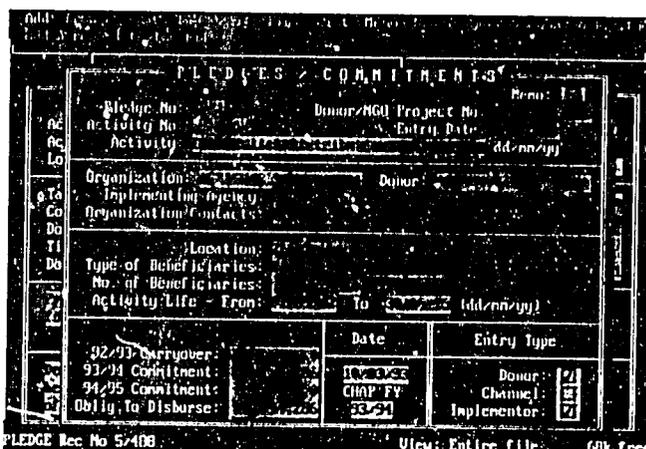

NOTE In most cases, SHAMAN will be used in countries where national data entry staff have English as a second language. Careful editing of the lengthy text in this file is recommended.

- *Zoom -> Needs* is useful to get a quick view of \$ breakdown of Needs. Any modifications should be made by the system administrator in the Needs Support file.

Pledge File

Pledge records are child records of their parent records in the Activity file. There may be several child records for each parent record, i.e., several pledges for each activity.

Figure II:12 - Pledge file screen.

Data entry tips:

- The default for Entry Date is the current date. Overwrite if necessary.

- Picklists can be called up from the Activity No., Organization, and Donor fields.
- The Activity title is filled in by SHAMAN.
- The Organization, Donor and Implementing Agency fields cannot be left blank.
- The default value for Implementing Agency is "To be determined." If agency is known, overwrite.
- More than one Location can be entered. As a convention, using the first 3 letters of a location + allows a number of locations to be entered in the field, e.g., "Tet Gaz Map" is entered as the abbreviated provinces of Tete, Gaza, and Maputo.
- The CHAP FY (fiscal year) is entered by SHAMAN. It must be changed in the Defaults file at fiscal year end.

■ **Note** The UN Humanitarian Assistance fiscal year runs from 1 May to 30 April

- Under Entry Type, one or more choices must be checked. Use <SPACEBAR> to toggle the on or off.
- A Donor is the source of the funds, a Channel is a middleman administering the funds, and an Implementor is the organization carrying out the activity. For example, the EEC contributes \$200,000 for Water Supply and Sanitation to UNHCR. UNHCR disburses the money to CARE for a well-drilling project. The EEC is the Donor, UNHCR is the Channel, and CARE is the implementor. However, if UNHCR commits the money to their own water projects, they are the implementor. An organization can fit more than one category, depending how the money is used, e.g., UNHCR could fit all three categories if they committed money from their own funds, used part of it for their own projects and gave some to CARE.

■ **NOTE:** Because the data for the Pledge file come from varied sources and can be incomplete or ambiguous, verification is often necessary. It is recommended that one person be responsible for verification and standardization of data.

Who's Doing What Where Module

The Who's Doing What Where Module documents the humanitarian assistance activities currently being implemented by agencies active in the field. It is useful for coordination of always limited resources.

The Who What Where Module contains two main files:

Who File
What File

and uses three support files:

Location File
Agency File
Activity Title File

Who File

The Who file holds basic information on humanitarian assistance agencies active in the country. These agency records are the parent records for all related What records. An agency should have one Who record for each field office it maintains.

Figure II:13 - Who file screen.

The screenshot displays the 'Who' file screen for agency 'SCT (UK)'. The interface includes a menu bar at the top with options: Add, Browse, Calc, Dup, Edit, Find, List, Memo, Order, Query, Zoom, What, and Browse Through the file. The main data fields are as follows:

Who No: 60	No. of Agency Activities: 27
Agency: SCT (UK)	Phone: 84-2122258
Address: PRINCEA, DOS, TRABALHADORES	FAX: 84-2122258
City: Quilimay	Activity Areas: GDU <input type="checkbox"/> RERARD <input type="checkbox"/>
District: Nicoya (Nic)	Number of Staff: 56
Province: Carabala	Fiscal Year Start: 01/01/93

Below the data fields, there is a 'Contact' section with the following information:

Contact: Stacy Hall
Contact Title: Program Manager

A 'Remarks' section is visible at the bottom, containing a large area of noise or a corrupted image.

At the bottom of the screen, the status bar shows: 'Who Rec. No 57/150' and 'View: Entire File 60k Green'.

Data entry tips:

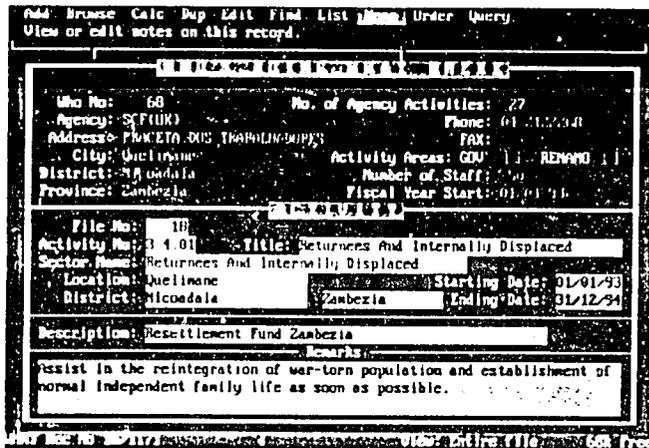

- Picklists can be called up from the Agency and City fields.
- The No. of Activities will be filled in by SHAMAN as child What records are entered.
- District and Province are filled in by SHAMAN when City is entered.
- District is not necessary for address purposes, but useful for information.
- In Activity Areas use <SPACEBAR> to toggle on or off.
- Select *Memo* to enter any remarks.
- Select *Zoom -> What* to enter child records in the related What file.

What File

Each Who record can have one or more dependent What records. The What File holds these child records. Each What record documents an

activity coordinated by the related Who agency.

Figure II:14 - Child What file record overlaid on Who screen.

Data entry tips:

- Parent record information appears in the top of each child record.
- Picklists can be called up from the Activity No., Location, and District fields.
- The Location field can be left blank. To access the picklist, press any key + <ENTER>.
- In the Activity No. picklist, choose the Activity No. that most closely matches the activity described. For example, if an agency describes their activity as "supply of hoes and shovels", choose *4.1.03 Agricultural Tools*. If the agency describes their activity as "agricultural support", choose the broader sectoral number *4.1 Agriculture*.
- The actual Agency's description of their activity, e.g. "supply of hoes and shovels," should be entered in the Description field.
- Select *Memo* to enter any remarks.

Note: Data collection in a standardized format is essential if this module is to be useful. A suggested data-collection form can be found under *List*.

Resources Module

The Resources module contains information on a country's resources in various sectors, e.g., health, education, water. Reports from data in this module are useful planning documents. The addition of mapping software makes this an even more powerful analytical tool.

The Resources module contains one main file:

Resources File

and uses two support files:

Location File

Resource Type File

Resources File

The Resources file holds information on the sector, the type and number of resources, and their location. Careful analysis of information needs before customizing this file can make it useful in a variety of situations.

Figure II:15 - Resources file screen.

The screenshot displays the 'SECTORIAL RESOURCES' form. At the top, there is a menu bar with options: Add, Browse, Calc, Dup, Edit, Find, List, Memo, Order, Query. Below the menu, the form is titled 'SECTORIAL RESOURCES'. It contains the following fields and values:

- Resource No.: 173
- Report Date: 25/03/93
- Sector: Water
- Type: Well & Borehole
- Qualifier: Number of Boreholes
- Number: 1
- Location:
 - District: Danda
 - Province: 3077
 - Latitude: 77° 57' 00" S
 - Longitude: 77° 57' 00" E
- Description: Water supply for...
- Remarks: A

At the bottom of the screen, there is a status bar that reads: 'RESOURCE Rec No: 173-109' and 'View: Entire file: 681 from'.

Data entry tips:

- The default for Report Date is the current date. Overwrite with Report Date if available.
- Picklists can be called up from Sector, Type, Location, and District fields.
- The Location field can be left blank. To access the picklist, press any key + <ENTER>.
- Province is filled in by SHAMAN.
- The Qualifier field is used to describe the resource being counted. It can be used in various ways. For example, if the Resource Sector is Health and the Resource Type is Hospitals, the Qualifier could be "Number of Beds," or it might be the type of hospital, e.g., "Provincial Hospital."
- The Number must be greater than 0.
- Location Description helps to physically locate resources within

Data entry tips:

- The default for Date of Entry is the current date. Overwrite with date of incident or incident report if available.
- Picklists can be called up from Type of Incident, Location, and District fields.
- Location may be left blank. To access the picklist, press any key + <ENTER>.
- Province is filled in by SHAMAN.
- Location Description helps locate the incident within an area, e.g., "Near the bridge approximately half way between Mocubela and Maganja."
- The Latitude and Longitude can be filled in to pinpoint the incident location. This is especially useful if mapping software is being used in conjunction with SHAMAN data and also for pinpointing Mine incidents. If Lat. Long. is not entered, SHAMAN will select the coordinates of the nearest town or district seat in any reports or maps.
- Enter Latitude and Longitude as degrees and decimal minutes, e.g., a latitude of 20° 10' 30" is entered into the field as "20 10.5 S."
- Select *Memo -> Incident Description* to describe the basic incident.
- Fill in other memo fields as appropriate.
- *Zoom -> Location* if you need to enter a location that does not appear on the picklist.

Note: Check the picklist carefully before entering a new location to ensure you are not just using an alternate spelling. Your entry will become part of the Location Authority File.

Population Module

The Population file holds population figures by district from various sources. It includes figures on the number of persons currently receiving humanitarian assistance benefits.

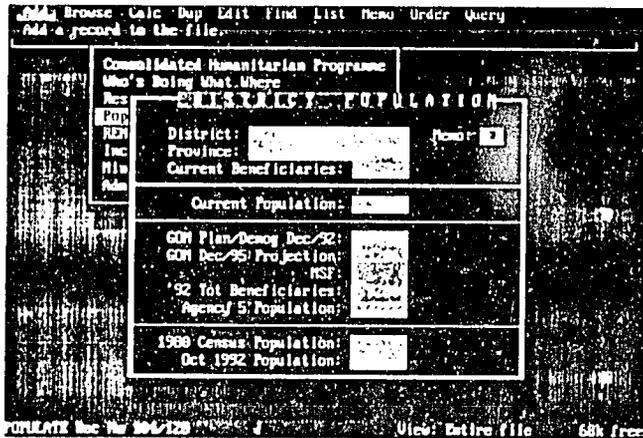

The Population module contains one main file: Population File

and uses one support file: Location File

The source field names for population figures are customized at setup. There are 5 fields for population estimates from government or non-

government agencies and 2 fields for the latest government census figures.

Figure II:17 - District Population file screen.

Note - Analyze population source fields carefully before setup. They cannot be changed later without changing all dependent R&R Reports.

Population File

Data Entry Tips:

- A picklist can be called up from District.
- The Province is entered by SHAMAN when the record is saved.
- Enter population figures as appropriate.

Partisan Module

The Partisan module holds information on dispatches of food and non-food items to areas under Partisan control.

The Partisan module contains one main file:

Partisan File

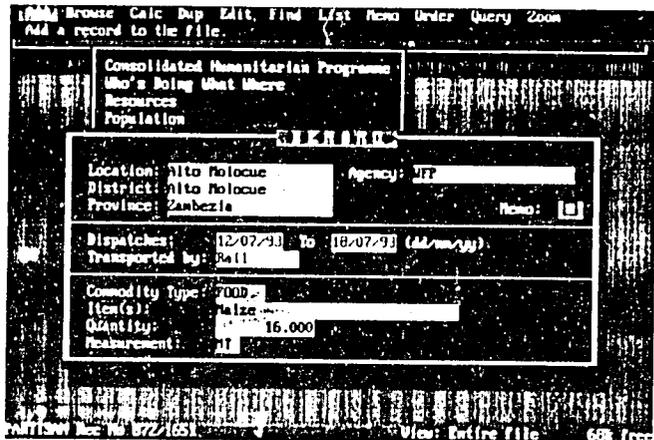

and uses three support files:

Location File
Agency File
Mode of Transport File

The fields name of the Partisan group is customized at setup, e.g. "RENAMO" in Mozambique, or "SPLA" in Sudan.

Partisan File

Figure II:18 - Partisan file screen.

Data Entry Tips:

- Picklists can be called up from Location, Agency, and Transported By fields.
- District and Province are entered by SHAMAN when Location is filled in.
- Dispatches is set up to record dispatches between any two dates.

Note There is an important difference between dispatches and deliveries. Especially in war-torn situations the actual delivery amounts may not be known

- The default for Transported By is TRUCK. To accept, press <ENTER>. To change, type <X> and press <ENTER> to access picklist.
- Commodity Type and Measurement are dropfields.
- The default for Commodity Type is FOOD. To accept, press <ENTER>. To change, press <SPACEBAR> to access list. (R&S = Relief and Survival).
- Item is the type of commodity, e.g., "maize", or "plastic sheets."
- The Number must be greater than 0.
- The default for Measurement is MT (metric tons). To accept, press <ENTER>. To change, press <SPACEBAR> to access list.

Mine Assessment and Survey Module

The Mine Assessment and Survey module provides a means to track mine locations as they are reported, found, and removed. It can be used by de-mining teams and is also a valuable source of information for humanitarian assistance agencies working in areas mined or suspected to be mined. With the addition of mapping software, known dangerous areas can be quickly identified.

The Mine Assessment module contains two main files:

Mine Assessment File
Mines File

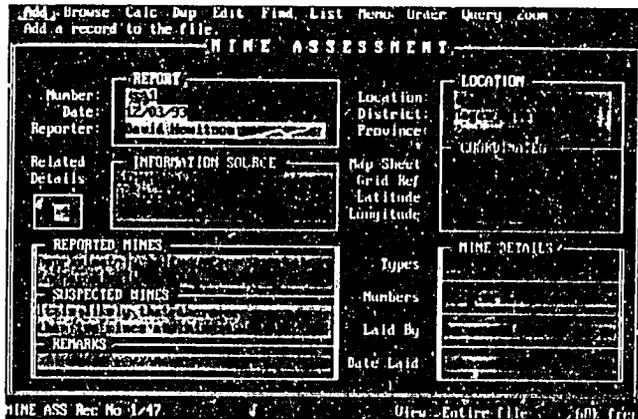

and uses the following support files:

Location File
Mine Types File

Mine Assessment File

The Mine Assessment file contains records of mines reported or found. Information can be general or specific. Memo fields allow extensive text.

Figure II-10 - Mine Assessment and Survey file screen.

Data entry tips:

- The default for Date is the current date. Overwrite with report-date if available.
- Reporter can be a named individual or title, e.g. UNOHAC Rep., Nampula.
- Picklists can be called up from Location and District fields.
- Location may be left blank. To access the picklist, press any key + ENTER.

- Province is filled in by SHAMAN when record is saved.
- Number of Related Details is filled in by SHAMAN as child records are entered.
- The Latitude and Longitude can be filled in to pinpoint the mine location. This is especially useful if mapping software is being used in conjunction with SHAMAN data and also for pinpointing mine locations. If Lat. Long. is not entered, SHAMAN will select the coordinates of the nearest town or district seat in any reports or maps.
- Enter Latitude and Longitude as degrees and decimal minutes, e.g., a latitude of 20° 10' 30" is entered into the field as "20 10.5 S."
- Mine Details are general at this level. More than one Type can be entered, e.g., "anti-tank, anti-personnel" or "AT, AP."
- Number is approximate. A qualifying note can be added, e.g., "unknown," or, "I seen; probably more."
- Access text fields by selecting *Memo* and then relevant field: *Source, Reported, Suspected, or Remarks.*
- *Zoom -> Mines* for child records of the Mine Assessment records.
- *Zoom -> Location* if you need to enter a location that does not appear on the picklist.

Note: Check the picklist carefully before entering a new location to ensure you are not just using an alternate spelling. Your entry will become part of the Location Authority File.

- *Zoom -> Mine types* to enter new types of mines found or reported.

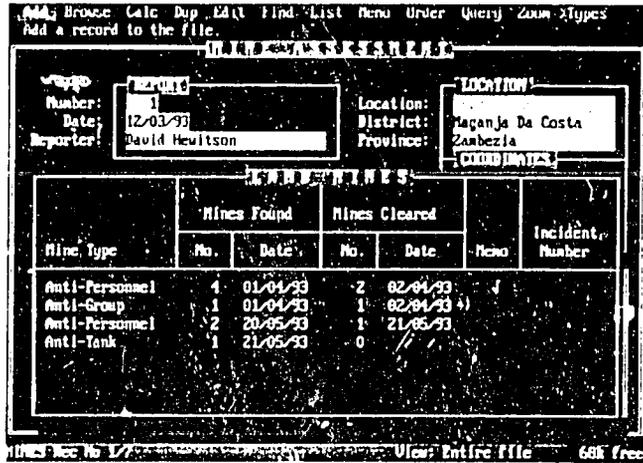

Note: Browse the Mine Type file before entering a new mine type to ensure you are not just using a variant. Your entry will become part of the Mine Types Authority File.

Mines File

The Mines file is the only module in SHAMAN in which more than one record appears on a screen. All data related to one Mine Assessment record are immediately accessible to the user in a browse-like screen.

The Mines records provide specific information on the actual mines found and cleared in the area reported in the assessment.

Figure II:20 - Child Mines file record overlaid on Mine Assessment screen.

Data entry tips:

- Append a new record line by selecting *Add*.
- Edit old records by selecting *Edit*. Then scroll to highlight the record line and press <ENTER>.
- A picklist can be called up from Mine Type.
- Some Mines records will relate to incidents reported in the Incident file. However SHAMAN does not relate the records automatically. To look for a related Incident Report number, *Zoom -> Incident* and use *Find* or *Browse* to locate the
- *Zoom -> Mine types* to enter new types of mines found.

Note: Browse the Mine types file before entering a new Mine Type to ensure you are not just using a variant. Your entry will become part of the Mine Type Authority File.

Administration Module

The administration module can be modified to add files useful to an organization, such as a Personnel File. This version of SHAMAN contains one file, a mailing list, that makes it easy to disseminate SHAMAN reports or other publications, notices, etc. The module allows up to eight document types to be entered. Names and addresses of individuals and organizations are entered once. Mailing labels specific to the document to be sent are produced as needed.

The Administration module contains one main file: Mailing Labels and uses one support file: Classify File.

Mailing List File

Figure II:21 - Mailing List file screen.

```

(MMA) Browse Calc Dup Edit Find List #New Order Query
Add a record to the file.
MAILING LIST
-----
PERSON
Honorific:
Title: Dr.
First Name: Bernard
Last Name: Berman
Position: Director
-----
COMMUNICATIONS
Phone: 12514
Htel:
Fax: 12515
-----
ORGANIZATION
Organization: HRC
Address 1: Room 901
Address 2: Aouma Hotel
City: Naputo
Province: Naputo
Country: Azanbique
Type of Organization: M Agency (Naputo)
-----

List 1: 
List 2: 
List 3: 
List 4: 
List 5: 
List 6: 
List 7: 
List 8: 
-----
Alt key: 2/151  View: Entire  11%  687/1000

```

Data entry tips:

- The upper Name fields can be left blank, and only the Organization name and address filled in.
- Picklists can be called up from Honorific and Title. Press any key and <ENTER> to access, or leave blank by pressing <ENTER>.
- The default on Title is Mr. Press <ENTER> to accept, <SPACEBAR> to override with another choice.
- A picklist can be called up from Type of Organization.
- Under Lists, scroll the list of documents to highlight your choice. Use <SPACEBAR> to toggle the on or off. Any number of the documents listed can be selected.
- Mailing labels for a particular document will be produced only for those records containing a in the relevant checkbox.

Chapter 3

SHAMAN Report

The pulldown menu under Report gives access to:

- Reports
- Printer Support
- Prepare Memos for Reports
- Update Activity File for Reports

Reports

SHAMAN reports are created using R&R Report Writer® and these report "shells" are then integrated into SHAMAN using the Report Manager Utility. Most standard reports are listed in a pulldown menu under *Reports*. The list will change as further reports are developed and integrated into SHAMAN.

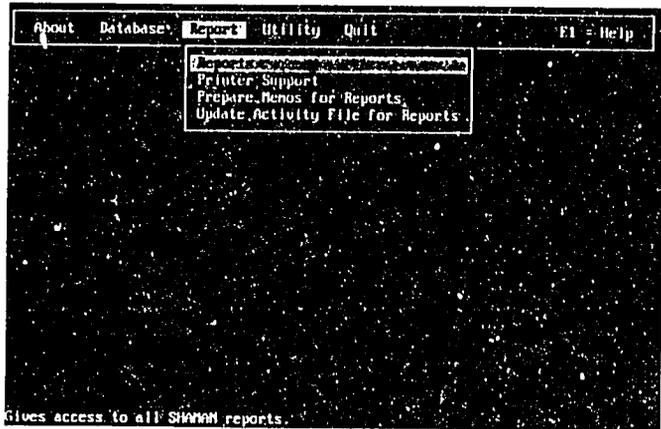

Figure II:22 - Pulldown Report menu.

Reports can be accessed from this menu and output to the screen, the printer, or another file. (The same reports can be accessed under the *List* menu when working with files. Only the reports related to the file being used appear in its List).

To select and output a report:

- 1 Scroll to highlight the report and press <ENTER>. A Report Settings menu will pop up with "Go! Print the Report" highlighted.
- 2 Press <ENTER> to output the report as designated in the Report Manager. (Most SHAMAN reports are set to output to screen. The output setting can be changed in the Report Manager Utility).

OR: to override the designated setting, change Destination (Screen, Printer, or File), set Scope and Copies as required. Then select "Go! Print the Report".

Note: It is easy to output a report to printer from the Reports menu choice, but the report will be put out for a generic printer. For higher quality printing on a specific printer, e.g. an HP LaserJet, shell out to R&R Report Writer® under *Utility -> External*.

See also Prepare Memos for Reports and Update Activity File for Reports below.

Printer Support

Printer Support is configured for either a generic printer or laser printer at system setup. The Printer Support option is rarely needed by normal users of SHAMAN. One possible use is to enhance the appearance of a <Print Screen> by changing the number of dots per inch. The system administrator may need to use it from time to time, especially if a non-standard printer is being used.

Note: This option is not used to change the printing characteristics of Reports.

Prepare Memos for Reports

Use the Prepare Memos for Reports option before shelling out to R&R Report Writer® to print a report that contains memos, e.g. the CHAP. This option strips out the soft carriage returns which otherwise print as box symbols in R&R. SHAMAN does this automatically for reports output to printer from within SHAMAN. (See Reports above).

Shell out to R&R Report Writer under *Utility -> External*.

Update Activity File for Reports

Use the Update Activity File for Reports option before shelling out to R&R Report Writer® to print any report that will use the donor field in the Activity file, e.g., the CHAP. This option takes all donor information from the Pledge files and updates the donor field in the Activity file. SHAMAN does this automatically for reports output to printer from within SHAMAN. (See Reports above).

Shell out to R&R Report Writer under *Utility -> External*.

Chapter 4

Utility

The SHAMAN Utility menu is divided into four sections:

- System
- Support Files
- Utilities
- External

Novice users are locked out of most of these modules. Only the system administrator should have access to the data dictionary and other modules which directly affect SHAMAN's operation.

System

System modules relate directly to administration of the SHAMAN program.

Choose *System* to access:

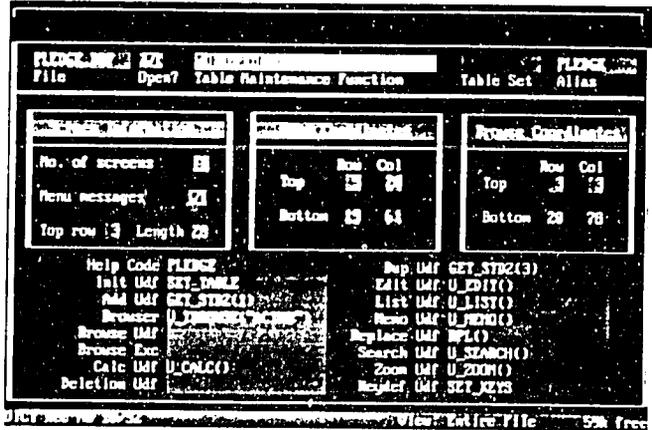

- SHAMAN Data Dictionary
- Help Index
- Query Manager
- System Administrator
- Report Manager

SHAMAN Data Dictionary

The Data Dictionary is the manager of the SHAMAN program. It tracks information about all files, indexes, relations, and commands in SHAMAN.

WARNING Only the system administrator has access to the Data Dictionary. Complete instructions for its use and maintenance can be found in the Artful Tivo User's Guide. This is definitely not an area for novice programmers.

Figure II:23 - Data Dictionary screen showing Pledge file record.

Use the Data Dictionary to:

- Add a new main table or edit an existing main table.
 - Add a new index or change a table's index.
 - Add or change a table's relationships to other files.
 - Add or change a table's Zooms to other files.
- 1 To see any dictionary record, move the light bar to it and press <ENTER>. There are several dictionary record screens. <PgUp> and <PgDn> move you through them.
 - 2 To add a dictionary record (table) press <INSERT>.
 - 3 To delete a file press .

Help Index

The Help Index lists and gives access to all the context-sensitive Help screens in SHAMAN.

Use the Help Index to:

- Get a quick overview of what Help exists.
- Read through the Help files.
- Edit the Help screen.
- Edit the Help Key, the Read Variable and the Coordinates of current Help record.

To Edit the Help Screen:

1. Scroll to the Help record you want and press <ENTER>.
 2. Edit the text and press <Ctrl-W> to save changes.
- The system administrator can also edit Help screens as they are called up. It may be useful to add some extra Help from time to time for specific problems or to provide Mission-specific examples.

To Edit the Help Key, the Read Variable and the Coordinates:

1. Scroll to the Help record you want and press `· F2 ·`.
2. Edit selected fields and press `· Ctrl-W ·` to save changes.
 - Normally, this editing only involves the name of the Help screen and rarely, the Help Key.

Query Manager

The Query Manager allows direct access to the Saved Queries table. The existing queries can then be edited directly in the file.

This function would normally be used only to delete queries if the number of queries saved to disk became unmanageable.

Use the Query Manager table to:

- Delete a Query saved to disk.
- Modify a Query.
- Change the name of a Query.

To delete a Query:

1. Select *Query Manager*.
2. Select the Query you want to delete. This can be done using the *Browse* or *Find* actions or the Arrow keys.
3. Press ``.

To modify a Query:

1. Select *Query Manager*.
2. Select the Query as above.
3. Press *Memo*. The Query can then be modified in the Memo box.

To change the name of a Query:

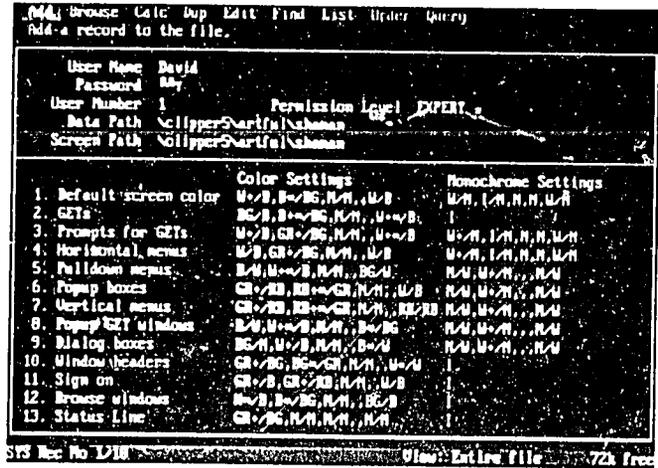

1. Select the Query as above.
2. Select *Edit* and then *Edit all Fields*.
3. Change the name of the Query in the Query Name field.

System Manager

The System Manager allows the user to change colors and passwords.

- To change colors, select *System Manager*. Then select *Edit Non_key Fields*.
- To add or change passwords, select *System Manager*. Then select *Edit* and *Edit Key Fields*.

Figure II-24 - System Manager screen used to change user passwords, levels and colors.

Report Manager

The Report Manager utility allows externally created reports from R&R Report Writers to be integrated into SHAMAN. It creates a path between SHAMAN and the Report Libraries. The Reports can then be accessed under the Report or List menu choices.

To add a new report to SHAMAN:

1. Select *Report Manager* and go to Screen 1.
2. Enter the name of the report and the commonly-required settings for query, index, scope, copy, and destination.

These values become the default settings, allowing the user to quickly access the report under *Report* or *List* and select "Go! Print the Report." The values can be temporarily overwritten within the Reports/List menu if needed.

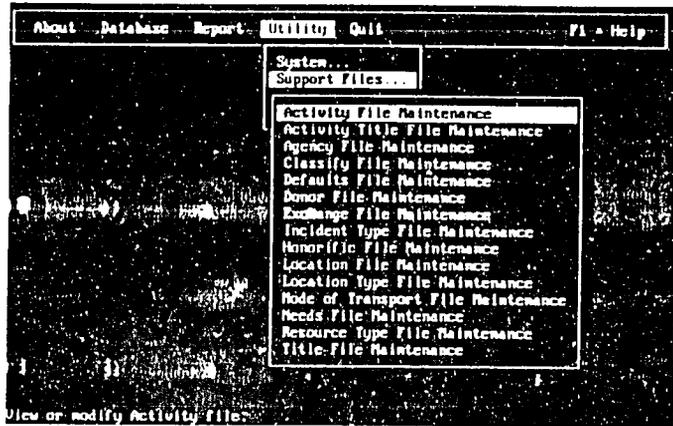

3. Go to Screen 2 with <PgDn>.
4. Enter Expert Control Settings for Type of Report, its Library and other technical information.
 - Field level help is available by pressing <F1>, but for full information, refer to the Artful Two User's Guide.

Support Files

Support files are the authority files used by SHAMAN. Support files can be related to more than one database module. They ensure use of standard names, spellings, acronyms, etc. Only names from a related support file will appear in a field's picklist. For example, the picklist for Agency will contain only the list of agencies entered into the Agency file.

Careful analysis and ongoing maintenance of the Support files is crucial for the smooth running of SHAMAN. Much of the initial work is done at system setup.

Figure II:25 - Support Files pulldown menu.

Use Support File Maintenance to:

- Customize SHAMAN
- Add or modify items in a support file.
- Get information on a support file.

At setup, SHAMAN's authority files must be customized for a particular country or situation. This will include Donors, Activity Name and Numbers, and some field names. Support Files Maintenance is used to create these authority files.

From time to time, modifications need to be made. For example:

The CHAP FY (fiscal year) is in SHAMAN as a default value. To change the value at the start of a new fiscal year, go to *Utility -> Support Files -> Defaults File Maintenance* and enter the new fiscal year.

Or:

If a new donor pledges funds, the Donor field in the Pledge file will not accept the new donor name until it is entered into the Donor authority file. Go to *Utility -> Support Files -> Donor File Maintenance* to add the new Donor name.

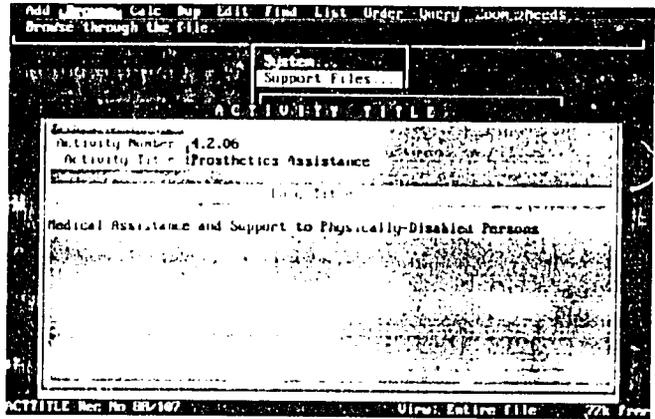

Note: Ensure that any additions are not simply variants of a name already in an authority table. Browsing the relevant file using the Support Files maintenance option is an easy way to check.

Activity Title File Maintenance

The Activity Title file is the first file to be customized when setting up SHAMAN and is vital to the operation of the SHAMAN system. It

could be considered as a table of contents to the CHAP. The number identifies the category, the sector, and the activity. The title describes the activity in a short and long form.

Figure II:26 - Activity Title file maintenance screen.

In Activity No. 4.2.06:

- 4 represents the category Restoration of Essential Services
- .2 represents the sector Health
- .06 represents the Activity Prosthetics Assistance

'Prosthetics Assistance' is the short title. The long title for the activity is 'Medical Assistance and Support to Physically Disabled Persons.'

The short and long titles may be the same.

Two Activity numbers are reserved for general area activities. The number ".00" represents a general allocation. For example, in Activity No. 4.2.00, ".00" would represent money slated by a donor for the Health sector without specifying an activity.

The number ".99" represents donor unallocated, but UNOHAC reserved funds. For example, in Activity No. 4.2.99, the ".99" would represent unallocated funds reserved by UNOHAC for the Health sector.

These numbers are intended only as a "catch all" for funds that have not yet been allocated to specific activities or which are designated by the donor for use anywhere within a program, sector, or activity. They show up in the financial summary report, but not in the activity summary report.

Note The Activity Title file cannot be modified after setup without serious consequences for the integrity of SHAMAN. It is possible to add a new activity to a sector, or even a new sector to a category, as long as they are not inserted into a run of existing numbers. However, changing numbers or titles, or even shifting them will affect every related file and report.

Agency File Maintenance

The Agency file contains Agency names, type of agency, short and long descriptions, e.g., Agency Title: CIDA; Long title: Canadian International Development Agency; Type: BIL. (Bilateral).

Customize the file to include all the agencies active in a country or area, or only a specific list. New agencies can be added as needed.

Classify File Maintenance

The Classify file is the authority table for mailing list classifications. Use it to classify the individual mailing list record as to type of organization represented. For example, DON, Donor; NGO, Non-government organization; EMB, Embassy. This allows one to print out a mailing list of just Donors or just NGOs.

Defaults File Maintenance

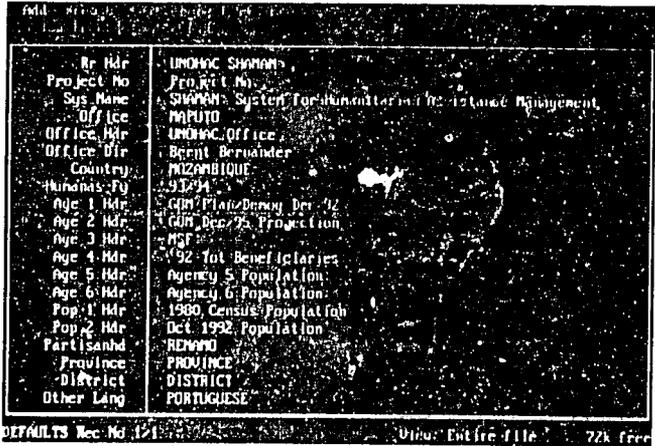

Defaults File Maintenance is the utility used to customize SHAMAN at setup and to modify SHAMAN default settings as required.

The Defaults file holds information customized for particular field names, and in some cases, field contents.

For example, one country might use the term Province, another might use State. The field name can be changed using Edit in *Defaults File Maintenance*.

The Defaults file includes standard names used in R&R Report fields, e.g., Country Header.

Figure II:27 - Defaults file maintenance screen, page 1.

There are many Default settings. Use <PgDn> to access the second screen.

Donor File Maintenance

The Donor file contains a code name and a description for each Donor, e.g., "USAID," "United States Agency for International Development."

New Donor names can be added as required.

Honorific File Maintenance

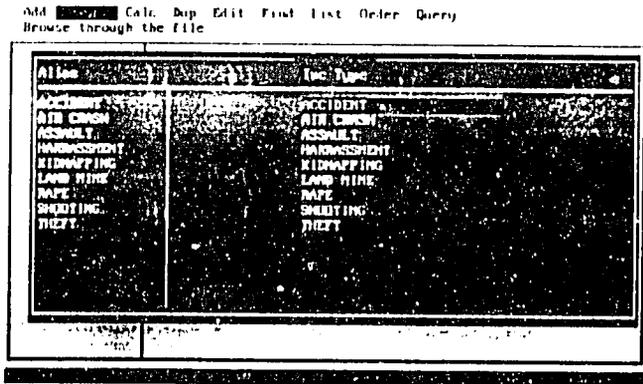

The Honorific file contains special titles used to address government officials, or other dignitaries, e.g., "Her Excellency."

Customize as required for your mailing list.

Incident Type File Maintenance

The Incident Type file contains short and long descriptions of incident types, e.g., theft, harassment, land mine. In most cases, the short and long names will be the same.

Figure II:28 - Browse screen for Incident Type file.

Location File Maintenance

The Location file contains the Location Name, District, Province, Type of place, Latitude, Longitude, and Location Remarks.

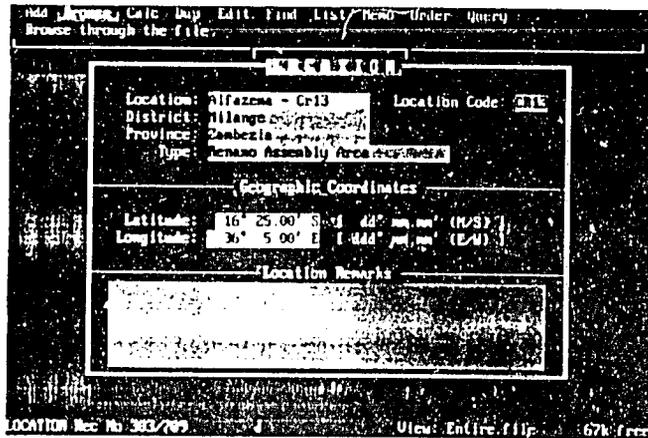

In some countries, deciding on standard spelling of place names is difficult, e.g., when transliterating from a foreign alphabet to a Roman alphabet. It is imperative that only one name be used for a single place.

Latitude and Longitude must be entered for any location to be pinpointed on a map when using mapping software.

Note: In some modules latitude and longitude can also be entered into records e.g. location of land mines. These specific latitude and longitude entries do not become part of the Location file.

- Enter latitude and longitude as degrees and decimal minutes, e.g., a latitude of 20° 10' 30" is entered into the field as "20 10.5 S."

Figure II:29 - Location file maintenance screen.

Using a Location Code is useful if you need to break the location type information down farther. For example, in Mozambique, Assembly Areas for Demobilization were designated as NR01, NG12, etc. The CR13 in the above illustration stands for Central RENAMO #13.

Note For ease of use and because all locations needed cannot be foreseen at set-up, some modules allow the user to Zoom -> Location to enter a new location. It is recommended that the system administrator review these new entries from time to time to ensure use of standardized spellings, etc.

Location Type File Maintenance

The Location Type file contains short and long descriptions of location types, e.g., AA, Assembly Area; DS, District Seat; PC, Provincial Capital.

Mine Type File Maintenance

The Mine Type file contains the names and descriptions of mine types, e.g., UXO, Unexploded ordinance; Anti-tank, Anti-tank; AP:Ru T-46, Anti-personnel - Russian T 46; IED, Improvised Explosive Device.

New mine types can also be entered directly from the Mines file by using *Zoom -> Mine Type*.

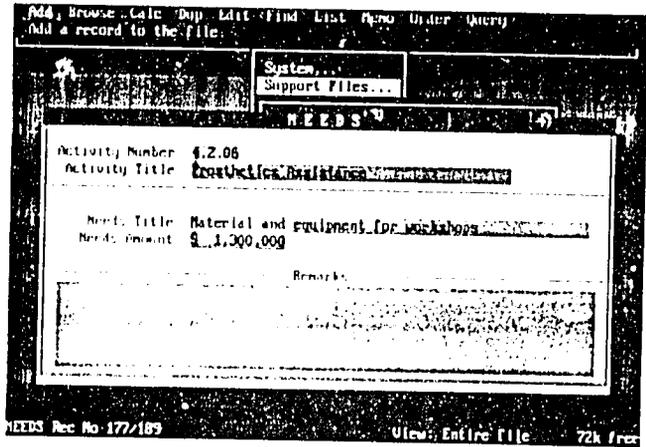

Mode of Transport File Maintenance

The Mode of Transport File contains the name and code letter for types of in-country transport used for moving commodities, e.g. Truck, T.

Needs File Maintenance

The Needs file is closely related to the Activity Title file. There can be more than one child Needs record for each parent Activity Title record. The Needs file contains the Activity Number and Title, along with the Needs amount in US\$.

Figure II:30 - Needs file maintenance screen.

Setting up the Needs file is an important part of initial SHAMAN customization. New records can be added as required.

Resource Type File Maintenance

The Resource Type file contains the names of resource types, e.g., wells, schools, their sectors, e.g., water, education, and any remarks.

Determining which resource sectors and types will be tracked is part of the customization process. Additions can be made if required.

Title File Maintenance

The Title file contains name titles, e.g., Mr., Mrs., Sr., used in the title field of the Mailing List.

Utilities

Choose Utilities to perform these actions on SHAMAN files:

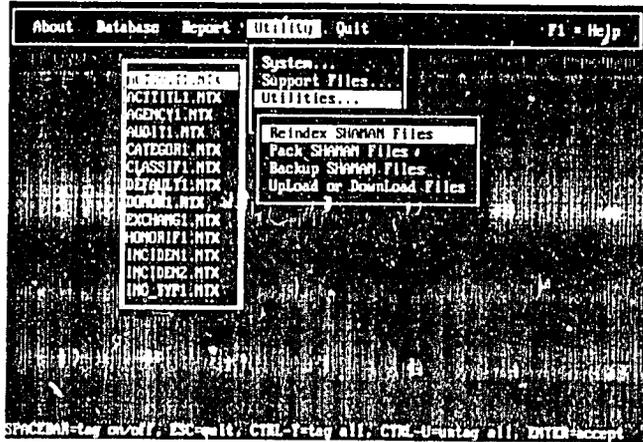

- Reindex SHAMAN Files
- Pack SHAMAN Files
- Backup SHAMAN Files
- Reindex SHAMAN Files

Reindex SHAMAN Files

The Reindex SHAMAN Files utility reindexes corrupted files. If

there seems to be a problem finding information that you know is in the file, there may be a problem with the index. Try the solution of reindexing the file.

Figure II:31 - Reindex utility showing index picklist.

To Reindex a file:

1. Scroll the list of files and use <SPACEBAR> to tag each file that you want reindexed.

- To tag all the files press <Ctrl-T>.
- To untag all files press <Ctrl-U>.

2. After tagging, press <ENTER>.

- A dialog box will appear with choices to continue [OK] or cancel [Cancel] all reindexing.

3. Scroll to your choice and press <ENTER>.

Pack SHAMAN Files

Packing a file physically removes any records that have been deleted (before packing, deleted records are still in the file even though you can't see them). Packing helps to make the file shorter and will also reindex at the same time.

WARNING: It may take a long time to pack, especially if the file is big. There is danger of file corruption if the procedure is interrupted for any reason. Use with care.

To Pack selected files:

1. Scroll the list of files and use <SPACEBAR> to tag each file that you want packed.

- To tag all files press <Ctrl-T>.

- To untag all files press <Ctrl-U>.
2. After tagging press <ENTER>.
- A dialog box will appear with choices to either continue [OK] or cancel [Cancel] all packing operations.
3. Scroll to your choice and press <ENTER>.

Backup SHAMAN Files

SHAMAN Backup procedures are fast and simple. Files are first compressed using PKZIP. You are then stepped through the backup process with onscreen choices.

To Backup files:

1. Scroll to "Backup all SHAMAN Files" and press <ENTER>. A series of screens will pop up to do the following:

Screen 1: Select backup drive (Normally choose your 3 1/2" floppy drive).

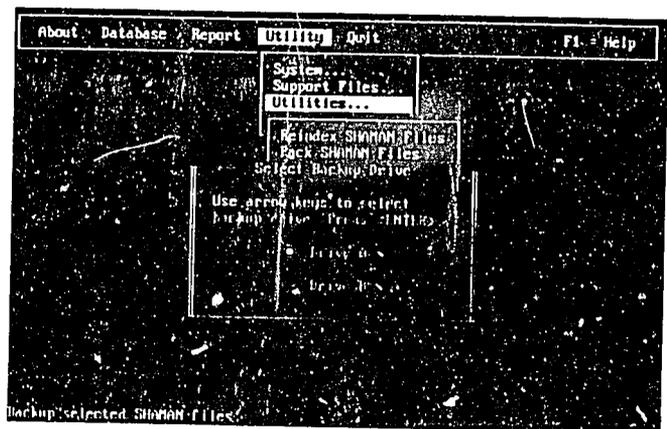

Figure II:32 - Screen 1 of SHAMAN Backup utility.

Screen 2: Compress files with PKZIP and Continue (Press <F1> for information on PKZIP).

Screen 3: Delete old version of SHAMAN.ZIP (Normally OK).

Screen 4: Insert Backup disk (Use high density 1.44mb. 3 1/2" disk).

Screen 5: Delete old SHAMAN.ZIP file on disk if it exists (Normally OK).

Screen 6: Compare size of file and size of free space on disk (If enough space, continue).

Screen 7: Confirm OK to continue.

Screen 8: Confirms successful copy.

To Restore All SHAMAN Files from Backup Disk:

1. Place SHAMAN Backup disk in A: or B: drive and press <ENTER>. If you accept OK, ALL files will be replaced including data files.

To Restore a single file:

If, for example, you want to restore the Location files.

1. Exit SHAMAN to DOS.
2. From DOS type: PKUNZIP A:SHAMAN.ZIP LOCATION.*

External

External allows direct access to:

DOS
R&R Report Writer®

DOS Gateway

DOS Gateway allows quick entry to DOS without exiting SHAMAN. To shell out to DOS:

1. Select DOS Gateway from the Utility Menu..
2. Perform any activity in DOS.
3. To return to SHAMAN, type EXIT on the DOS Command line and press <ENTER>.

WARNING: Use DOS Gateway with caution. The SHAMAN files are open and can be corrupted.

R&R Report Writer

R&R Report Writer® allows quick entry to R&R Report Writer® without exiting SHAMAN. To shell out to R&R Report Writer®:

1. Select R&R Report Writer® from the Utility Menu.
2. Perform any activity in R&R Report Writer®.
3. To return to SHAMAN, type EXIT on the DOS Command line and press <ENTER>.

Chapter 5

Generating Reports

SHAMAN makes it simple to produce up-to-the-minute reports with a few keystrokes. A suite of commonly called-for reports is incorporated into each module. They can be called up on screen, printed, or exported to a text file. These reports are designed using R&R Report Writer®, integrated into SHAMAN, and then generated as needed. New reports can be designed and integrated as required. For information on incorporating and accessing reports, see Part II, Chapter 3, Reports.

This section provides general information on generating new reports, and needed references for the use of R&R Report Writer®.

Generating New SHAMAN Reports

Follow R&R directions for full instructions. The program includes extensive On-line Help accessible with <F1>. See also Using R&R Report Writer® below.

All SHAMAN reports are kept in a SHAMAN report library:

SHAMAN.RP1 or SHAMAN.RP5 (Windows version)

An existing "SHAMAN Report Skeleton" can be used as a starter for your new report. It already contains Headings, Titles and Boxes which you can then fill in.

Using R&R Report Writer®

Go to R&R Report Writer® (DOS xBase edition) by shelling out from SHAMAN under *Utility -> External* or from DOS. Access R&R Report Writer® for Windows by exiting SHAMAN and entering Windows.

Concentric System's R&R Report Writer® is a powerful report writing program that can be mastered by any reasonably experienced computer user. It has the ability to relate and sort data from many different tables with ease.

SHAMAN makes it simple to produce up-to-the-minute reports with a few keystrokes. New reports can be designed with R&R Report Writer® and integrated into the system as required.

"In order to create a report, you select the database file(s) to use. Then you create a report definition that tells R&R how to present the data from the selected files.

This report definition includes a report layout that you design on your screen by typing text where you want it to appear and indicating where data from your files should appear or print. As you create the layout, you can move text and data freely around the report screen.

At any point in designing a report, you can print the report, preview it on your screen, modify it, and save the report output in a disk file. When you've completed the report definition, you can also save the definition so that you can run or modify the report at any time." R&R Report Writer User's Guide, p. 23

For complete information on the use of R&R, see:

R&R Report Writer User's Guide, Concentric Data Systems, Inc., Westborough, MA, 1990.

R&R Report Writer® for Windows

To easily integrate lines, boxes and graphics into your reports, use R&R Report Writer® for Windows.

Using R&R Report Writer® for Windows rather than the DOS version of R&R has a number of advantages:

- Graphics and shading can be incorporated
- The drawing of lines and boxes is much easier.
- You have generally better control over most aspects.

The only disadvantage in using R&R Report Writer® for Windows is that reports cannot be printed in SHAMAN. The user must first exit SHAMAN and access Windows.

R&R Report Writer® for Windows documentation includes three printed manuals and a context-sensitive on-line help facility. The published references supplied with the program include:

Getting Started - Installation instructions and a quick tour of essential R&R skills.

Using R&R - Comprehensive command and procedures explanations.

Developing Applications - Using R&R reports in Windows applications (for system developers).

All three manuals © 1993 by Concentric Data Systems, Inc.

Chapter 6

Generating Maps

Geographical Information Systems (GIS) are computer-based systems used to store and manipulate geographic information, outputting data in the form of maps or graphs.

SHAMAN uses MapInfo®, a flexible GIS, to provides the user with the ability to present a variety of geographically relevant data in the form of country, regional or district maps. This visual presentation of data is a powerful tool for analysis and synthesis.

This section provides information on outputting SHAMAN data in the form of maps, and needed references for using MapInfo®.

Producing SHAMAN Maps

SHAMAN uses MapInfo®, a flexible GIS, to provides the user with the ability to present a variety of geographically relevant data in the form of country, regional or district maps.

Before using MapInfo® you will need digitized base maps of the country you are working in, preferably in a scale of 1:2,000,000 or better, with overlays for provincial or district boundaries or their equivalent, roads, rivers, and towns and cities at various political levels.

As GIS systems become more popular, access to base maps and overlays is increasing. In Mozambique, the World Bank was the first to provide digitized maps of the country in the scale of 1:2,000,000.

An inexpensive 12" by 12" digitizing tablet is a useful tool for making overlays to go with your base maps.

To generate a map from SHAMAN data exit SHAMAN and go to Windows and MapInfo®.

Using MapInfo®

MapInfo® documentation gives complete instructions (see below) for relating SHAMAN .dbf files to base maps. As an example, suppose you wish to produce a map showing food dispatches in metric tons by District. The Partisan file is opened in MapInfo® as a .dbf file. Choose "File", "Open", then "File Format:", "dBASE DBF" and "File

Name:" "partisan.dbf". Then each dispatch record is geocoded (related) to the district to which the food was sent by choosing "Table", "Geocode" from the MapInfo® menu bar. Consult the MapInfo® manuals for detailed information.

MapInfo documentation includes three printed manuals and a context-sensitive on-line help facility. The published references supplied with the program include:

Getting Started - all the information needed to start using MapInfo, including a comprehensive tutorial

MapInfo User's Guide - an overview of MapInfo's key concepts

MapInfo Reference - a detailed, alphabetic listing of MapInfo Commands

All three manuals © 1985-92 by Mapping Information Systems Corporation.

PART III

Technical Reference

Introduction

About Technical Reference

Part III of this manual contains technical information needed to install, customize, and maintain the SHAMAN system. It is divided into two chapters:

Chapter 1, Programmer Maintenance Information, includes a technical description of the SHAMAN system, and all the routines needed to install SHAMAN and keep it running smoothly.

Chapter 2, Customizing SHAMAN, gives a suggested order and general instructions for customizing SHAMAN.

Chapter 1

Programmer Maintenance Information

Description of the SHAMAN System

*Much of SHAMAN's
simplicity and power
comes from functions from
Artful II, a relational
engine that drives Clipper*

SHAMAN has 10 major related DBFs and 21 indexes plus another 23 support DBFs with 27 indexes for a total of 81 open files. It is constructed with one main program source file (SHAMAN.PRG) plus additional source files (SHA_FUN.PRG, SHA_UTL.PRG, SHA_MAS.PRG, SHA_MIG.PRG, ACTTITLE.PRG AND NEEDS.PRG). Together they comprising less than 7000 lines of source code. Yet SHAMAN has the capabilities of relational find, relational query, reports, dictionary management, and system configuration, in addition to adding, editing, duplicating and deleting records, and a user-configurable help system. How is it possible? With functions from Artful II, a relational engine that drives Clipper 5. If you'd like to see the source code for SHAMAN, call up SHAMAN.PRG or the other PRG files with your favorite ASCII word processor.

SHAMAN.PRG is the main program. It sets up arrays of prompts, messages and function names, opens the dictionary, and calls DO_IT(). It also contains the data screen code for all the major table forms. These functions are called by an Artful Function THE_USUAL(), which in turn is called from the front-end menu DO_IT().

*An Artful metafunction,
The_Usual(), does most of
the work*

Many of the options in "Utilities" are library functions, and most of the file maintenance for "Support" is accomplished by a library module which can paint screens and administer SAYs and GETs for any table if you're in a hurry. Explore all the menu options. The most powerful here is the Application Dictionary - the first option in the Utilities pulldown under SYSTEM. [Be careful using it.] It is not user-bulletproof. It is not recommended that you make changes to SHAMAN's dictionary until you are a very comfortable using Clipper/Artful.

The light bar menu at the top has been created by THE_USUAL()

from the dictionary. The only entries we had to make in the DICT record for RELATIONS were filename, alias, whether to open the file, and the index key information (if we wanted to set relations, we'd have to do that too, but no relations are set here). All other fields in DICT were defaulted to call- to ArtfulLib functions.

The program code that manipulates the PLEDGE file is an example of a call to THE_USUAL(), the ArtfulLib metafunction which is doing most of the work here. There are four functions associated with the PLEDGE file:

PLE_SCREEN() Paints the screen background for the PLEDGE file.

PLE_SAY() Displays one PLEDGE record.

PLE_KEY() Edits the current or a new PLEDGE record.

PLE_EDIT() Edits the non-key PLEDGE fields.

All the logic and control is from THE_USUAL() itself, and the functions it calls. You'll find the call to THE_USUAL() in SHAMAN.PRG, as a text string in the UDFs() array [THE_USUAL('PLEDGE')]. It was called by macro expansion from DO_IT(), the outer control function for SHAMAN. For example, when you select "Find", the relational find mechanism in THE_USUAL() creates, from the dictionary's relations fields, a menu of the files you can meaningfully search from this module. Once you've selected a file, it constructs a menu of available index keys. Then it gets your input, and looks for the object you specified in the file you specified. "Query" is also running solely from library calls and the dictionary. You'll notice that the Query pulldown shows some selections in different colors than others, to distinguish those that can be called. "Modify", "Undo" and "Save" can only be selected after a query has been set.

Setting the Runtime Environment

For smooth operation, SHAMAN should have as much of DOS's 640K of memory available as possible

For smooth operation, SHAMAN should have as much of DOS's 640K of memory available as possible. It should also have 3 or more mb of expanded memory and many megabytes of extra hard disk space. In addition there are a number of environmental variables that must be set. Follow the directions below.

Operating System

Install DOS 6.0 as the operating system. It is more efficient and makes better use of memory than previous DOS versions.

Disk Space

Run CHKDSK /L at the dot prompt to see how much hard disk space

Three or more megabytes of extended/expanded memory will improve indexing and general system performance.

Ensure that enough file handles are included in the CONFIG.SYS file.

is free. If less than 2 or 3 megabytes are free use a hard disk manager such as XTPRO or File Manager under Windows to delete unnecessary files. Clipper 5.01's VMM (Virtual Memory Manager) works best with several megabytes of disk space available. A disk expander utility (Stacker 2.1 has been successfully used) is recommended for increasing usable hard disk space.

Expanded Memory

Expanded memory is quite helpful in getting the most from the system. Three or more megabytes are recommended as the indexing performance under Clipper 5.01 will be greatly improved. If the computer has only extended memory, a memory manager such as QEMM 386 by Quarterdeck can be used to convert some of the extended memory to expanded memory.

CONFIG.SYS

Assuming the computer used is some flavor of 80486 with 3 or more megabytes of extended memory, the following lines should be in the CONFIG.SYS file in the root directory (C:\):

```
DEVICE=C:\DOS\HIMEM.SYS
DOS=HIGH,UMB
DEVICEHIGH=C:\DOS\EMM386.EXE 2048 RAM
DEVICEHIGH=C:\DOS\RAMDRIVE.SYS 1024/E
SHELL=C:\DOS\COMMAND.COM C:\DOS\ /E:2048 /P
FILES=171
BUFFERS=30
```

The most important thing here is that the Files=171 line be included in the Config.Sys file. In DOS 6.x, MakeMem can be run to optimize use of RAM. Disk-caching should also be used to increase the performance of SHAMAN.

AUTOEXEC.BAT

Again assuming an 80486, the following lines should be included in the AUTOEXEC.BAT file in the root directory.

```
C:\NG\EH -U -D
SET CLIPPER=F171
```

System Installation

Ensure that you have installed the minimal hardware configuration and followed the above instructions for Setting the Runtime Environment. You are now ready to install SHAMAN.

The initial SHAMAN installation is quite easy. Insert the SHAMAN program disk in the A: Drive and type "A: <ENTER>" followed by "INSTALL <ENTER>". An executable version of PKUNZIP will

automatically unzip all the compressed SHAMAN files, make necessary sub-directories off the c: drive to put them into and attempt to start SHAMAN.

*Initial SHAMAN
installation is quite easy*

If the CONFIG.SYS file has been previously modified (and the computer restarted) to have the line FILES=171, SHAMAN will present the opening user name and password dialog box. Typing "SHAMAN" for the user name and "shaman" for the password will allow initial entry into the system. SHAMAN will automatically construct index files for all the files it opens. This index file construction is usually only done once when the index files are initially absent. This is also one method of reindexing the whole system if problems are encountered with running SHAMAN. Simply delete all the files with a .NTX extension and reopen SHAMAN.

*Experiment with existing
SHAMAN data files to
become familiar with the
system.*

For full access to all of SHAMAN's modules, enter the system with the user name "DAVID" and password "may". This allows the system administrator to enter the System Administration module in the "Utility", "System" section and then change the passwords and user names to suit the current installation. The system administrator should make him/herself *user number 1* with a secure password. The user named "SHAMAN" is *user number 3* and has the user level of which allows read-only access to most modules.

After the files have been successfully installed, the system administrator should experiment with navigating SHAMAN and performing data entry in various modules until he/she is comfortable with using SHAMAN's many function. Then the system needs to be customized for the country or location using the system. Instructions on customization may be found in Part I, Chapter 3 and Part II, Chapter 4.

The basic SHAMAN system is supplied in the form of an executable

System Maintenance

file SHAMAN.EXE. It is already compiled and linked. The following instructions, therefore are only necessary in the case of a program modification where SHAMAN.PRG or the other *.PRG have been changed.

How to Compile the SHAMAN Program

The current version of SHAMAN was compiled with Clipper® 5.01 using Artful II® version 2.7 and linked with Blinker® 2.1. Before any compiling or linking of SHAMAN can be done, Clipper 5.01, Blinker 2.1 or greater and Artful II version 2.7 must be installed following manufacturers recommended installation procedures.

To make a modified version of SHAMAN, the following programs need to be compiled: SHAMAN.PRG, SHA_FUN.PRG,

SHA_UTL.PRG, SHA_MAS.PRG, SHA_MIG.PRG, ACTTITLE.PRG and NEEDS.PRG. Compile them with the following series of commands from DOS while in the subdirectory C:\CLIPPER5\ARTFUL\SHAMAN:

First ensure that the following files are in the subdirectory C:\CLIPPER5\ARTFUL\SHAMAN:

```
DZ_SINON.CH
DZ_CONFIG.CH
DZ_LOGON.CH
AA_DUST1.CH
```

These are header files needed by the preprocessor to compile SHAMAN files.

Then type the following commands:

```
SETAA
SETAPP SHAMAN
CLIPPER SHAMAN /n/l/w
CLIPPER SHA_FUN /n/l/w
CLIPPER SHA_UTL /n/l/w
CLIPPER SHA_MAS /n/l/w
CLIPPER SHA_MIG /n/l/w
CLIPPER ACTTITLE /n/l/w
CLIPPER NEEDS /n/l/w
```

SHAMAN.OBJ, SHA_FUN.OBJ, SHA_UTL.OBJ, SHA_MAS.OBJ, SHA_MIG.OBJ, ACTTITLE.OBJ, and NEEDS.OBJ should have been successfully created by the compiler.

How to Link the SHAMAN Programs

SHAMAN was originally linked using Blinker 2.0. It could be linked with Clipper's RTLINK or with another compatible linker, but for best results (no surprises) Blinker is recommended. The following object files must be in the C:\CLIPPER5\ARTFUL\SHAMAN subdirectory:

```
SHAMAN.OBJ
SHA_FUN.OBJ
SHA_UTL.OBJ
SHA_MAS.OBJ
SHA_MIG.OBJ
ACTTITLE.OBJ
NEEDS.OBJ
```

In addition SHAMANB.LNK must be in the same subdirectory. It is an ASCII file with the following lines:

```
blinker incremental off
output shaman.exe
fi SHAMAN
```

```
fi sha_fun
fi sha_utl
fi sha_mig
fi sha_mas
fi needs
fi acttitle
lib clipper
lib shamanb
lib artful
lib artfulc
lib overcl
lib pckernel
lib pcfncs
```

The lines that start with "fi" list all the object files that will be linked while the "lib" lines tell the linker what libraries to look in for the compiled functions needed by the program object code modules. The order specified is important. The library modules with extensions of LIB are found in the subdirectory C:\CLIPPER5\ARTFUL\LIB or C:\CLIPPER5\LIB.

The actual linking is accomplished with the following command:

```
BLINKER @SHAMANB
```

RTLINK is the linker that came with Clipper 5.01 and is located in the subdirectory C:\CLIPPER5\BIN. Bli.iker should be in the same subdirectory.

How to make a program disk

The program PKZIP.EXE and ZIP2EXE.EXE should be installed in a subdirectory named C:\ZIP. An updated program disk can be easily made by going to the subdirectory C:\CLIPPER5\ARTFUL\SHAMAN\PROG. Type MAKEPROG <ENTER>. A self-expanding file containing all the compressed SHAMAN files will be made. It is named SHA_PROG.EXE. Copy this file and the INSTALL.BAT file to a new floppy and you now have the whole SHAMAN system, including data, on a single diskette ready to install on another computer or to use to update a previously-installed SHAMAN system.

DPD (Designer PullDown MenuMaker)

DPD (Designer PullDown MenuMaker) is the Artful II program used to construct the SHAMAN main menu. It can be used to modify the behavior of the system. The files involved are SHAM_MNU.DBF, SHAM_MNU.DBT and SHAM_MNI.NTX. Directions for the use of Artful II's DPD are found in the Artful II manual.

WinGen (Windows Screen Designer and Generator)

WinGen (Window Generator) is the Artful II program used to construct the NEEDS and ACTTITLE SHAMAN full-screen maintenance screens. It allows the user to design all aspects of a module screen and then generate the code necessary to run the module. Directions for the use of Artful II's WinGen are found in the Artful II manual.

System Integrity

Initial setup and ongoing maintenance of SHAMAN's support files is important for system integrity.

SHAMAN's support files, combined with picklists which act as authority tables for specific fields, provide verification for much of the data entry. Initial setup and ongoing maintenance of these support files is important for system integrity. Additions may have to be made from time to time. For example, a new donor or a new location may have to be added. The system administrator needs to review these authority tables regularly to ensure that no alternate spellings or acronyms have been added.

In addition, data entry verification procedures need to be set up and followed rigorously. It is a good idea to have one person checking another's data entry by checking a printout of the data against the data collection forms.

A daily log of each data entry clerk's activities should be kept, logging in what files were modified by adding or editing. SHAMAN's audit file keeps a record of every change made in SHAMAN.

Data entry and verification procedures must be set up and followed rigorously. Text editing is also very important.

Data entry is likely to be done by national staff having English as a second language. This means that the extensive text in the various memo fields needs to be edited by a native English speaker. This is especially important in the CHAP, as the important descriptive text fields become part of widely-disseminated documents. However, language errors cause any report to lose force.

Troubleshooting

File Handles

Often when things don't work, or SHAMAN is unable to index its files when it first starts up, the system does not have enough file handles. Make sure there is a line in the CONFIG.SYS file that says "FILES=171".

Memory Management

If SHAMAN ceases to work for no apparent reason, or you get an error message that says something about memory, it may mean that someone has added a new TSR program that is using up valuable DOS

memory. Ensure with memory management software that there are at least 570K of usable RAM available for the system.

Use of SHARE in a Network Environment

If the DOS program, SHARE is loaded, make sure that the /L parameter is set up to the number of file handles, e.g.,

```
SHARE /F:20000 /L:171
```

See the DOS manual for a more detailed explanation of SHARE and its use.

Index File Corruption

If you suddenly start finding that you can't find records that you know are in the system, or other strange related behavior occurs, it probably means that some indexes have been corrupted.

The Utilities menu contains a reindex function in which individual indexes can be reindexed

OR: you can cause indexing of all SHAMAN files by deleting all of them from the DOS prompt with the command `DEL *.NTX`.

Memo File (.DBT) Bloat

Memo file bloat will most often occur with the ACTIVITY.DBT file. If you notice the file size increasing to much more than 500K, it means that extensive editing of activity memo fields has caused undue file bloat. This can be corrected by using the Clipper utility DBU:

1. Call up the Activity file in DBU.
2. Copy the Activity file to another file of any temporary name, e.g., ACT_TEMP.
3. Ensure that the new file has all the Activity file information in it.
4. Delete the original ACTIVITY.DBT file.
5. Rename the temporary ACT_TEMP.DBT file ACTIVITY.DBT.

The ACTIVITY.DBT file should now be considerably smaller than it was.

Chapter 2

Customizing SHAMAN

SHAMAN can be customized to meet country-specific and agency/program-specific needs. See Part I, Chapter 3, for general information on the analysis phase of customizing SHAMAN. See Part II, Chapter 4 for instructions on using the support modules needed to customize SHAMAN.

This chapter gives general instructions for customizing the various files. By following the suggested order, you should have SHAMAN up and running quickly.

Defaults File

The file as received already has data in all the default fields. Most of these defaults are headers which appear as field names on SHAMAN screens. For example, "District" and "Province" are headers that appear in many screens. They reflect subdivisions used in many but not all countries. You may need to change them to "County" and "State", or some other political subdivision.

The Defaults table, accessed under the Utility menu is organized in order of the categories:

- General Defaults
- Population File Defaults
- Partisan File Defaults
- Pledge File defaults
- Mailing List defaults

The Defaults file fields for each of these categories are listed below along with example data from Mozambique and a general description:

General Defaults

Field	Contents	Description
Project_No	Project No.	Project No. (if used)
RR_Hdr	UNOHAC SHAMAN	R&R Reports - Header
Sys_Name	SHAMAN: System for Humanitarian Assistance Management	SystemName
Office	MAPUTO	Office Default
Office_Hdr	UNOHAC Office	Office Header (used in R&R reports)
Office_Dir	Bernt Bernander	Office Director Name
Country	MOZAMBIQUE	Country where SHAMAN in use
Humanas_FY	93/94	Humanitarian Aid Fiscal Year
District	District	District level Header
Province	Province	Province level Header

■ Note: These general defaults appear in many files.

Population File Defaults

Field	Contents	Description
Age_1_Hdr	GOM Plan/Demog Dec/92:	Headers for agencies whose population figures are being used.
Age_2_Hdr	GOM Dec/95 Projection:	
Age_3_Hdr	MSF:	
Age_4_Hdr	'92 Tot Beneficiaries:	
Age_5_Hdr	Agency 5 Population:	
Age_6_Hdr	Agency 6 Population:	
Pop_1_Hdr	1980 Census Population	
Pop_2_Hdr	Oct 1992 Population	

■ Note: See the Population File module screen to understand these defaults.

Partisan File Defaults

Field	Contents	Description
PartisanHd	RENAMO	Name used by partisan group.

■ Note: See the Partisan File module screen to understand these defaults.

Pledge File Defaults

Field	Contents	Description
OtherLang	Portuguese	Language used for other-language summary.
CarryOv_Hd	92-93 Carryover	Last year carryover.
Cur_Com_Hd	93-94 Commitment	Current year commitment.
Nex_Com_Hd	94-95 Commitment	Next year commitment.
Disburs_Hd	Oblig.To Disburse	Obligated \$ amount.
CHAP_FY	93-94	Fiscal Year.

Note: See the CHAP module screen to understand these defaults

Mailing List Defaults

Field	Contents	Description
Mail_List1	Bull	Names of publications or documents being distributed or mailed.
Mail_List2	CHAP	
Mail_List3	LIST 3	
Mail_List4	LIST 4	
Mail_List5	LIST 5	
Mail_List6	LIST 6	
Mail_List7	LIST 7	
Mail_List8	LIST 8	

Note: See the Mail File module screen to understand these defaults.

The specifications for each of these fields (how many characters are allowed) can be found in the data dictionary.

The files listed below should have data entered in the suggested order. Instructions and sample screens can be found in Part II, Chapter 4.

Activity Title File

Information for this mission critical table is decided during the analysis phase. It includes the Activity Number, and long and short titles.

Note: The Activity Title file cannot be modified after setup without serious consequences for the integrity of SHAMAN. It is possible to add a new activity to a sector, or even a new sector to a category, as long as they are not inserted into a run of existing numbers. However, changing numbers or titles, or even shifting them will affect every related file and report.

Needs File

The Needs file is closely related to the Activity Title file. Each Activity Title record has one or more child Needs records. A Needs record duplicates the Activity Number of its parent record, and contains a specific Needs title and the needed amount in US\$.

Setting up the Needs file is an important part of initial SHAMAN customization. New records can be added as required.

Note The Needs file is one of the files that would be seriously affected by any change made in the Activity Title file. All Needs records would have to be altered accordingly.

Activity File

The Activity file is the main database file of SHAMAN. It contains one record for every humanitarian assistance program activity. It must be customized with the data and text decided upon during the analysis phase.

The SHAMAN system is dependent on this database file (no pledge records can be entered without a related activity record). To initialize the system, the Activity file records are entered under the Utility -> Support Files -> Activity File menu choice.

Donor

Many of the donors in the list supplied will remain the same. Add or delete as required.

Agency

Many of the agencies in the list supplied will remain the same. Add delete as required.

Location Type

Some location types may remain the same, e.g., "DS, District Seat." Others will need to be added or deleted.

Location

Begin by entering all the main cities, towns, and villages of known humanitarian assistance activities, ensuring that you choose a standard spelling. Other locations can be added as needed, in some cases by zooming from the data-entry screen.

Note. Because locations can be added from data-entry screens, it is important to review this authority file regularly to prevent duplication through non-standard spelling

Resource Type

The resource sectors and types to be tracked are determined during the analysis phase.

Incident Type

The standard list in the file should be sufficient.

Mine Type

The standard list in the file should be sufficient to start. Others can be entered by zooming from the data entry screen.

Mode of Transport

The standard list in the file should be sufficient.

                 Att_Fld()

Purpose:         Form for The_Usual()
Table:          ACTTITLE
Written by:     Artful WinGen
Date:          Dec 12, 1993
Template:       WINUSUAL.ATM
Compile with:   /l/n/w
Link with:     Artful Two v2 75 or later.
Test:          Make with MM <progName> /b/n/w/dDEBUG

```

```

Functions
Att_Test():     Tester
Att_Scr():      Paint screen for ACTTITLE
Att_Say():      Say current record of ACTTITLE
Att_Key():      Execute Gets for ACTTITLE
Att_Fld():      Required for The_Usual()

```

NOTE:

If your form references other tables,
add Db_Open() calls for them to Att_Test()

To incorporate this file in your application...

- Set Id_Char to <Att> in the DICT record for the ACTTITLE table.
- Set DICT->Udf_Init to <SET_TABLE>, or to the name of your custom menu udf for The_Usual().
- Add the name of this file to your application .CLP file.

*/

Program	D2_HFILL.PRG
System	ARTFUL.LIB for Clipper 5.0
Functions	HELP_FILL(), HF_UDF()
Purpose	Validation routine to scroll a lookup table in a window, returning True if the user selects a record, else False. This traps the user in the GET until a legit entry is made.
Conventions	Pass the first parameter by reference (@) if you want to update it inside the user function
Syntax	HELP_FILL(@_menuvar, @_alias, fld_array [, udf [, condition: [, tr [, tc [, br [, bc [, headarray: [, key_no [, real_key [, fld_ptr: [, disp_order]]]]]]]]])
Parameters	
xVariable	item to validate
cAlias	lookup table
fld_array	of fields to display in window
udf	useful for displaying multiple fields after help_fill
condition	used to set filter to... - optional
tr ... bc	coordinates of window - optional
headarray	list header in display box instead of using variable names - optional
key_no	if passed, index order for SEEK, else current one
real_key	useful where GET object != actual index key, optional
fld_ptr	field to return, default 2
disp_ordr	if passed, index order for help window, else current one
Example	declare fld_array(2) fld_array(1) = "COMPANY" fld_array(2) = "ACCOUNT_NO" @ 10,10 SAY "ENTER BRANCH" GET m_branch PICT "9999" ; VALID HELP_FILL(@m_branch, "CUST", fld_array)
Assumes	All data is legitimate; lookup table is open
Side Effects	Crashes on bad data
Returns	.T. if target exists, else .F.
ARTFUL Calls	GET/SET_KEYS, AFLLENGTH, CENTRE, GET/SET_FILTER, SYSCOLOR, FILTR_TYPE, PUSH/POP_SCR, BOXER, STAT_LINE, IS_DATA
Authors	Arthur Fuller, Peter Brawley
Copyright	Artful Applications, Inc. 1986 - 1990
Modified	David W. Zimmerly
3/08/92	1. Filter changed to take effect BEFORE initial search
18/09/92	2. nOrder changed to accept type Block as well as a numeric.
19/09/92	3. Parameter added for shadow box - set .T.

Program	DZ_DELETE.PRG
System	ARTFUL.LIB for Clipper 5.0
Function	SHA_DEL()
Purpose	Special processing originally for WFP FACTS delete fnct
Conventions	
Syntax	SHA_DEL - should be in the dictionary entry
Parameters	
cDelUdf	Optional code block/udf to execute after a delete/recall
lProcFlag	Dummy parameter to detect whether RPL() was called with a hot key - if so, Clipper will pass this parameter.
Parameters	
Example	SHA_DEL
Assumes	File is open, and the first index of any child file is indexed on a key from the parent file.
Side Effects	Deletes or recalls current record.
Returns	.T.
ARTFUL Calls	STAT_LINE, VERIFY, DICT_FIND, STRINT, POP_MSG, SEEK_REL,
Authors	Arthur Fuller, Peter Brawley, Jonathan Liem
	Modified 22/8/92 by David W. Zimmerly
Copyright	Artful Applications, Inc. 1986, 1987, 1988, 1989 BlueWater Software 1992

Notes:

Guards against deleting a parent while children exist, but assumes the context of THE_USUAL(), i.e. if there are child tables, their names are in THE_USUAL()'s arrays.

DEL_STATUS is a dictionary numeric field with 3 possible values:

- 0 - do not allow deletion if any children exist
- 1 - if children exist and user confirms, delete children too
- 2 - delete parent, do not delete child records
- 3 - no deletions allowed under any circumstances

When there are grandkids, set DEL_STATUS = 0 to prevent orphaning of the grandkid records.

Status 2 is for those situations in which the Zoom is actually a zoom to a parent rather than a zoom to a child.

<_del_udf> is executed after the delete/recall for apps that require custom processing of deleted/recalled records. Note that only the name of the udf is passed (ie. no parentheses), because DUST_1 appends a parameter controlling whether a delete or recall just took place to the udf call.

NAMPULA

District	Location	Date	Reported by: UNOHAC REP NAMPULA
MECONTA	7 DE ABRIL	17/05/93	Map Sheet: 44 Grid Reference: Latitude: Longitude: ' 39 7' E

Remarks: Road between 7 de Abril and Muesia is believed to be mined.

District	Location	Date	Reported by: UNOHAC REP NAMPULA
MECONTA	CORRANE	17/05/93	Map Sheet: 44 Grid Reference: Latitude: Longitude: ' 39 6' E

Remarks: Mined areas are within the residential area of Corrane and close to the maternity section of the hospital.

District	Location	Date	Reported by: UNOHAC REP NAMPULA
MECONTA	CORRANE	17/05/93	Map Sheet: 44 Grid Reference: Latitude: Longitude: ' 39 6' E

Remarks: The road between Mecua and Corrane is believed to be mined.

District	Location	Date	Reported by: DAVID HEWITSON
MECONTA	MECUA	20/05/93	Map Sheet: Grid Reference: Latitude: Longitude: ' 39.3' E

Source: Local inhabitants

Reported Mines: Close to the road heading south through the village is a group of concrete buildings, three or four on either side of the road, approximately five metres from the road. It is reported that there are mines close to the buildings on the sides away from the road.

Suspected Mines: Local people are now clearing the buildings ready for use. They are confident that there are no mines between the buildings and the road. There may well be more casualties. These buildings should not be approached.

Remarks: In approximately 1985 FRELIMO forces left the town, which was then occupied by RENAMO. When they in turn left, they laid mines around the buildings to prevent their re-use. At least one casualty has been suffered close to these buildings (January, 1993).

[see sketch map]

Even though some ground has been cleared, without casualty so far, there is no guarantee that mining only took place on the far side of the buildings, away from the road. The supposed reason for the mining was denial of the use of the buildings. It is therefore likely that mines were placed between the buildings and the road.

District	Location	Date	Reported by: UNOHAC REP NAMPULA
MECONTA	MECUA	17/05/93	Map Sheet: 44 Grid Reference: Latitude: Longitude: ' 39.4' E

Remarks: The road between Mecua and Corrane is believed to be mined.

Note: the section of road is defined by the positions in report numbers 30 and 31.

BEST AVAILABLE COPY

District	Location	Date	Reported by: UNCHAC REP NAMPULA
ILHA DE MOZAMBIQUE	MUTOMONHO	14/05/93	Map Sheet: Grid Reference: Latitude: Longitude: 340.5' E

Remarks: Suspected zone close to the entrance to the Lunga area.

MANICA

District	Location	Date	Reported by: ENRIQUE PORTILLO
MANICA	MAVONDE	17/08/93	Map Sheet: Grid Reference: Latitude: Longitude:

Source: RENAMO.

Reported Mines: Small mine field identified and marked by 1 RENAMO.

Remarks: There is a small mine field around the middle of Mavonde.

NAMPULA

District	Location	Date	Reported by: AAA
ANSOCHÉ		24/05/93	Map Sheet: Grid Reference: Latitude: Longitude:

Source: Local NGO; AAA

Reported Mines: The southern bank of the river Metomode running east from Namaponda and the river running east from Mutucute.

District	Location	Date	Reported by: AAA
MALEMA		24/05/93	Map Sheet: Grid Reference: Latitude: Longitude: 37.4' E

Source: Local NGO; AAA

Reported Mines: River bank where the road north from Macalia meets the river Lurio reported mined.

Suspected Mines: See Remarks.

Remarks: The river Lurio formed a barrier between Colonial and FRELIMO forces during the war of independence. All areas around the western borders of Nampula province should be suspect.

District	Location	Date	Reported by: AAA
MALEMA	MALEMA	24/05/93	Map Sheet: Grid Reference: Latitude: Longitude:

Source: Local NGO; AAA

Reported Mines: The road between Malema and Nacathe, 2/3 of the way to Mutuali, is reported to be mined.

Remarks: This is the main road leading west from Nampula towards Niassa and Malawi beyond. It is believed that the first 10km west of Malema are safe. There are also bridges down along this road.

Activity: 3.1.03	Nutritional Rehabilitation and Hospital Diet
Target Population:	Children admitted to nutritional rehabilitation centres and hospital patients
Concerned Agencies:	MOH, WHO, UNICEF, Bilateral Donors, NGOs
Time Frame:	May 1993 to April 1994
Objective:	Assure a regular supply of commodities for nutritional rehabilitation. Improve the hospital diet in key health facilities.

Summary

Severe malnutrition has been reported country-wide, particularly in the most drought-affected provinces. In newly accessible areas, information on health and nutrition is scarce due to the lack of basic health services. Some missions report instances of serious malnutrition; this is confirmed by the poor condition of people moving to accommodation centres.

Nutritional rehabilitation, targeting malnourished children, is carried out by the Ministry of Health and NGOs using a mixture of milk, oil and sugar. The need for commodities for therapeutic feeding is increasing and new nutritional rehabilitation centres are being established wherever there are trained personnel.

With the improvement of accessibility and communication, provincial stockpiles of milk, oil and sugar must be created, within the framework of enhanced support to provincial health authorities (4.2.03). The commodities will be delivered to peripheral health units according to prevailing nutritional conditions, the capacity of the health network, and logistics. District hospitals have limited funds for recurring costs, so that food for in-patients is generally insufficient. Chronic patients have special requirements which cannot be met by the current hospital diet. With the expected expansion of the health network these difficulties are likely to worsen. Basic needs for improving the hospital diet include maize, pulses, oil, sugar and milk.

FINANCIAL SUMMARY - US\$	
Commodities for hospital diet	2,500,000
Commodities for therapeutic feeding	7,190,000
Total Needs	9,690,000
Donors: AUSA, GERMANY, JAPAN, ITALY, USA, EEC, NATCOM/UNICEF, WFP, NORWAY, DANIDA, WFP, UNICEF, EEC	
Carryover 92/93	1,959,684
Commitments	12,774,085
Total Available and Committed	14,733,769
of which 9,356,469 obligated to disburse	64 %
Unmet Needs	(5,043,769)

Activity: 3.2.01	Road, Rail and Sea Transport
Target Population:	1.8 million displaced, affected and returned populations in all provinces
Concerned Agencies:	WFP, UNHCR, Bilateral Donors, NGOs, DPCCN
Time Frame:	May 1993 to April 1994
Objective:	Guarantee regular, timely and adequate delivery of relief assistance to beneficiaries.

Summary

For the coming marketing year, in view of the large amounts of relief assistance required for distribution and the territorial extension of relief activities, transport logistics remains a major challenge. The opening up of new areas and the expected influx of refugees from neighbouring countries require special efforts. Due to the scale, complexity and urgency of aid operations, NGO's and UNILOG are complementing and assisting Government efforts. In the past, internal transport of relief assistance was often determined by the prevailing security situation and the availability of military escorts to accompany food convoys.

Since the signature of the peace accord the situation has improved but logistics remains a vital concern for the continuous provision of relief assistance. The provision of ITSH funding (Internal Transport, Shipping and Handling), is essential if food commodities are to be moved by road, rail and sea to needy areas, and to allow for the contracting of private transporters. NGOs have been working on distribution in Renamo areas and returnee districts to distribute part of the total of 336,000 tons planned for distribution during the 12-month period. DPCCN will assume responsibility for 40% of deliveries, NGOs-30%, and WFP/UNILOG-30%.

FINANCIAL SUMMARY - US\$	
Road, rail and sea transport	41,576,769
Total Needs	41,576,769
Donors: WFP/USA/DAA/EEC/GERMANY/SWEDEN/UK-SOUTH AFRICA	
Carryover 92/93	6,047,059

Activity: 3.2.02 **Airlift Operations**

Target Population: Affected populations in inaccessible areas

Concerned Agencies: WFP, UNHCR, Bilateral Donors, NGOs, DPCCN

Time Frame: May 1993 to April 1994

Objective: Provide basic relief aid to areas not accessible by other means.

Summary

There is a continued need for airlift operations to various destinations not accessible by any other means, pending the initiation of demining activities and the rehabilitation and reconstruction of many access routes. Airlift operations significantly decreased since May as roads, particularly in Sofala to Inhaminga and Caia, opened up.

With the onset of the rainy season, when secondary and tertiary roads become impassable, some of the accessible locations will, once again, become isolated. During this period, airlifts will constitute the only alternative for delivery of basic supplies. For this purpose, it is estimated that approximately 5,000 mt of relief food commodities will still have to be airlifted between May 1993 and April 1994, at a total estimated cost of USD 2.5 million.

FINANCIAL SUMMARY - US\$	
Airlift operations	2,500,000

Activity: 3.2.03	Maintenance and Storage
Target Population:	1.8 million displaced, affected and returned populations in all provinces
Concerned Agencies:	WFP, UNHCR, Bilateral Donors, NGOs, DPCCN
Time Frame:	May 1993 to April 1994
Objective:	Provide spare parts, lubricants and fuel for the DPCCN fleet. Fund additional storage capacity for relief food aid.

Summary

DPCCN remains a major operator for the transportation of relief supplies, despite the increasing involvement of the major private sector, of UNILOG, and of the NGO's. However, the average age of the DPCCN fleet will be over six years. An adequate supply of spare parts becomes even more important as the trucks continue to age. Part of the requirements in spares, fuel and lubricants will be met through ITSH funds, but for those contributions not accompanied by these funds, additional funding has to be made available.

The same reasoning applies to storage costs. In the past, DPCCN was able to make use of relatively adequate storage facilities at low cost. Presently, a large part of the warehouses being used are being returned to their owners. Additional capacity has to be found in locations previously not accessible since the quantity of relief aid is significant. Some tent-type warehouses and roofing materials will also be required.

FINANCIAL SUMMARY - US\$	
Fuel and lubricants	768,000
Spares	600,000
Storage	2,000,000
Total Needs	3,368,000

Activity: 3.3.01	Internal Transportation of Displaced Vulnerable Groups
Target Population:	Estimated 250,000 persons within Mozambique
Concerned Agencies:	CENE, Social Welfare, NAR, Bilateral Donors, IOM
Time Frame:	August 1993 to July 1994
Objective:	Provide transport assistance to vulnerable groups among the internally displaced.

Summary

An estimated 4 million internally displaced people will re-settle within Mozambique as a result of the peace process. Of these, many are very far from their home villages and will be unable to reach their destinations unassisted. Some of the aged, sick, handicapped, and those weakened by hunger will also be unable to walk far, or afford to pay for public transportation.

The International Organization for Migration (IOM) has identified a number of partners in each province and has researched where these vulnerable groups are. The registration process is now well underway. Liaison is taking place with communities to involve them in the selection and planning processes. Names of those selected are listed, along with their desired time of return, eligibility category, point of origin, destination, and if they will plant. Numbers are kept centrally by place of origin and destination. By the end of October 1993, this project will already assist 7,000 vulnerable persons to reach their destinations, mainly with IOM-organized transport.

The transport system uses the available mix of transport in each province, contracting a basic fleet and hiring other small transporters as needed. An estimated 12,500 are being given a self-resettlement grant. For 237,500 travelling by organized transport, food rations for resettlement are being issued at the journey's beginning, and food or a travel subsidy is being provided en route. The transport of large groups to a single area at one time is being avoided, in preference for gradual arrivals. Local authorities, national agencies and NGOs are informed of cases requiring special assistance, and of the schedule for arrivals.

FINANCIAL SUMMARY - US\$	
Office costs	1,024,000
Operational costs	5,225,000
Staff	1,145,468
Total Needs	7,394,468

of which 707,692 obligated to disburse	34 %
Unmet Needs	5,286,776

BEST AVAILABLE COPY

Activity: 3.4.01	Relief and Survival Items for Returnees and Internally Displaced
Target Population:	Eligible beneficiaries among returnees and internally displaced.
Concerned Agencies:	DPCCN, NAR, UNHCR, DHA, NGOs
Time Frame:	May 1993 to April 1994
Objective:	Provide essential survival and relief items to the most needy people.

Summary

It is estimated that 300,000 internally displaced Mozambicans will require distributions of relief and survival items from the Consolidated Humanitarian Assistance Programme. Each family of five members will receive one set of clothing (one extra length of cloth for women), an average of 2.5 blankets, one cooking set, and 6 kilogrammes of soap (500 grammes per month). The total cost of this package per family will be USD 69.50.

Some returnees will also be targeted. Those returning from neighbouring countries received assistance while in the countries of asylum and it is expected that they will travel with these items when they return to their areas of origin. However, those refugees who were not in camps will be treated as displaced persons. Within Mozambique UNHCR will distribute plastic sheeting to returnees who for various reasons, are unable to roof their houses, as well as buckets for carrying water. For vulnerable groups such as pregnant women, the aged and others, some tents will be distributed until homes can be built.

To date, most of the support for relief and survival items has been provided by NGOs - both national and international - to those internally displaced families living in areas which were inaccessible during the war years. These areas and these families are priorities. UNOHAC coordinates distribution of items to Renamo areas, and since May 1993 several agencies have distributed items to these areas.

FINANCIAL SUMMARY - US\$	
Logistics and storage	1,146,750
Purchase of relief and survival items	4,587,000
Purchase of water jars, tents and plastic sheeting	2,000,000
Total Needs	7,733,750
Donors: UNHCR/DHA/SCF(UK)/FHI//EEC/GERMANY/SOUTH AFRICA/DENMARK WORLD VISION/CHINA	
Carryover 92/93	809,892
Commitments	2,965,431
Total Available and Committed of which 1,748,652 obligated to disburse	3,775,323 46 %
Unmet Needs	3,958,427

BEST AVAILABLE COPY

Activity: 3.4.02	Emergency Stockpile Project
Target Population:	Eligible beneficiaries among returnees, internally displaced and victims of natural disasters
Concerned Agencies:	CENE, DPCCN, DHA, NGOs
Time Frame:	May 1993 to April 1994
Objective:	Respond quickly to the unforeseen emergency situation for the most needy people.

Summary

The stockpile warehouses in Maputo, Beira and Quelimane enable the stockpile project to provide and distribute, on short notice: clothing, blankets, cooking utensils, soap, shelter, a water supply, and tools for sanitation. These go to the most needy people not otherwise assisted. In case of emergency the stockpile can provide these relief items for distribution through NGOs. To shorten the delivery time to the districts and reduce the internal transport costs, the construction of 6 new equipped, prefabricated warehouses is planned (Quelimane for 100,000 people, Inhambane, Chimoio, Tete, Morrumbala and Nampula for 50,000 people each). Survival and relief items should also be provided for Maputo (50,000) and Beira (100,000 people).

This project started 5 years ago and is operating smoothly. The stockpile has been particularly important in ensuring distribution to previously inaccessible areas, particularly Renamo zones. Its continuation on an expanded basis is essential to respond to the needs of the most vulnerable families.

FINANCIAL SUMMARY - US\$	
Logistics and distribution	2,077,500
New equipped warehouses	595,000
Purchase of relief items	8,310,000
Technical assistance and operation costs	828,800
Total Needs	11,811,300
Donors: DHA/SWEDEN/EEC	
Carryover 92/93	0
Commitments	3,064,222
Total Available and Committed	3,064,222
of which 1,264,222 obligated to disburse	41 %
Unmet Needs	8,747,078
