SLIP COVERS FOR FURNITURE

I. P. No. 67301

S. I. C. 2392

Industry Profiles are intended to promote the development of private industry in the developing countries by assembling economic and technical information in a professional analysis to support basic decisions in the establishment of small or medium-scale plants in a specific industry. The information contained in a profile is selected and organized for the guidance of the entrepreneur in the less developed country.

Industry Profiles contain basic information on market aspects, production rates, capital requirements, materials and supplies, utilities, manpower operating costs and sales revenues. Work-flow diagrams and, in some instances, machinery layouts are included along with references to sources of technical information, professional services, patents, materials and equipment.

The profiles adopt as a benchmark, productivity rates and costs which could be anticipated under conditions prevailing in the United States. Anticipated profits are before taxes. Since conditions vary widely from country to country, the entrepreneur using this profile must make suitable adjustments to conditions prevailing in his country. This profile should help in reaching correct assumptions.

PRODUCT DESCRIPTION

Slip covers for upholstered furniture designed to fit standard sizes and shapes of furniture and cushions.

A. GENERAL EVALUATION OF PROSPECTS

The fixed investment required for this plant is small, especially in comparison with the amount of labor required and the annual sales volume. Twenty-two people are employed yet only two skilled workers are needed. Slip covers are in demand wherever upholstered furniture is used. The prospects for this industry in any country depends upon the type of furniture in general use by the population. If upholstered furniture is commonly used in living rooms, prospects for this plant should be good.

B. MARKET ASPECTS1. USERS

Homes, hotels, apartments, clubs; wherever upholstered furniture is used.

2. SALES CHANNELS AND EXTENT OF MARKET

Sales would be made direct to furniture stores. The market for this product depends entirely on the amount and kind of furniture used within the country. Slip covers are used only on upholstered furniture and, for this reason, a survey should be made to determine the potential sales. This product is well packaged and the value is relatively high in relation to the cost of transporting it. The domestic market should be nationwide. Competition could be encountered from small shops that hand-fit slip covers. But the cost of hand-fitted slip covers is so much higher than the ready-made product that such competition would be able to secure only a small percentage of the market. This plant should have no difficulty competing against imported products and some export sales might be made to neighboring countries that do not have a slip cover manufacturing plant of this type.

3. RATE OF PROFIT

It should be emphasized that the information under "Production Requirements" on the next page illustrates typical U.S. cost relationships of the various factors entering into the manufacture in the United States of a specified product. It is generally recognized that profits before taxes of manufacturers in the United States may be appreciably lower than normally would be the case in a developing country. While certain imported capital items and specialized technical services may be higher in cost in developing countries, certain other significant production costs such as semi-skilled and unskilled labor, materials and supplies obtained locally may be significantly lower. Factors vitally affecting industrial products costs and profit margins such as degree of competition, size of market, availability of labor, availability of risk capital, relative financial risk, level of industry taxes, and general economic and political stability have widely differing interrelationships and impact on the selling price and profit margin of a manufactured product in a developing country as compared with the United States. Planned operations and production limits would, of necessity, have to be adapted to cost and profit conditions existing in a particular developing country as a first step in determining whether a more intensive survey of the manufacturing possibilities for a particular product and industry is warranted.

4. SELECTED GROSS PROFIT ITEMS

(See supporting data on page 3)

The annual gross sales revenue is estimated at \$260,000.

The total fixed investment, plus working capital, is estimated at \$77,900.

The annual gross profit, before taxes, is estimated at \$19,000.

Based on these figures, the profit on gross sales, before taxes, amounts to about 7.3%.

(A gross profit on sales, before taxes, of 7.3%, while reflecting U.S. experience, should not be considered normal for a developing country where profit margins may be considerably higher in industry and trade.)

The annual profit on the total capital requirements, before taxes, is estimated at about 24.3%.

5. COST PER MAN EMPLOYED

Eighteen direct and six indirect workers, or a total of twenty-four workers, are employed.

The total fixed capital investment is estimated at \$31,000.

Based on these figures, the fixed investment per man employed amounts to about \$1,300.

12

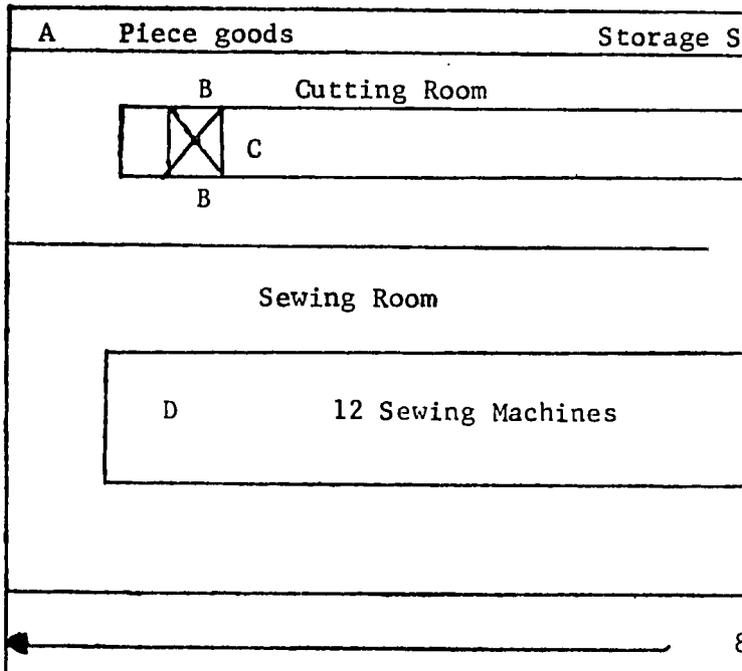

C. PRODUCTION REQUIREMENTS - SLIP COVERS FOR FURNITURE
ANNUAL CAPACITY - ONE SHIFT OPERATION : 20,000 UNITS
NOTE: COSTS AND OPERATING DATA ARE BASED ON UNITED STATES PRICES AND PRACTICES**

I.P. No. 67301

VII. PROFESSIONAL ENGINEERING SERVICES

The services of professional engineers are desirable in the design of industrial plants even though the proposed plant may be small.

A correct design is one which provides the greatest economy in the investment of funds and establishes the basis of operation that will be most profitable in the beginning and will also be capable of expansion without expensive alteration.

The addresses of professional engineers who specialize in Industrial Design, some of whom may be willing to undertake such work on low cost projects overseas, can be secured by reference to the published cards in various engineering magazines.

They may also be reached through their national organizations, one of which is the:

National Society of Professional Engineers
2029 K Street, N. W.
Washington, D. C. 20006

Manufacturers of industrial equipment employ engineers familiar with the design and installation of their specialized products. These manufacturers are usually willing to give prospective customers the benefit of technical advice by those engineers in determining the suitability of their equipment in any proposed project. The equipment manufacturer also knows, and can recommend, professional engineers in private practice who are willing and able to provide appropriate consulting services.

PRE-INVESTMENT FEASIBILITY STUDY SUGGESTED

The foregoing information must be necessarily presented in concise form. Before an investment is made in a plant a feasibility study is suggested. The investor, for his planning, should have more information dealing with the specific locality contemplated. For obvious reasons, such information cannot be included in *Industry Profiles*. Such a study, therefore, should explore local factors and conditions, including costs, sources of raw materials and supplies, availability of utilities and fuel, manpower, transportation, etc.

The investor will need reasonably accurate information on Government and legal requirements, banking and financing, potential demand, competition, construction services, and manpower training requirements. Further, he should consider developing plans for management and production controls, operating procedures, and sales promotion.

ORDERING INSTRUCTIONS

The price of *Industry Profiles* is a minimum of \$3.00 for from one to five "Profiles." The purchaser may select up to five of any "Profiles" available.

Complete sets of the 250 *Industry Profiles* published in 1966, I. P. No. 66001 through I. P. No. 66250 consecutively, may be purchased for \$125.00 per set. Complete sets of the 150 *Industry Profiles* to be published in 1967, I. P. No. 67251 through I. P. No. 67400 consecutively, may be purchased for \$75.00 per set. The latter "Profiles" will automatically be shipped to full set purchasers upon release.

Address orders to: U.S. Department of Commerce
Clearinghouse for Federal Scientific and
Technical Information, 410.12
Springfield, Virginia 22151

Prepayment is required. Make check or money order payable to National Bureau of Standards—CFSTI. Clearinghouse deposit account holders may charge purchases to their accounts.

GENERAL INFORMATION

An *Index of Industry Profiles* is available on request from the agency for International Development, AA/PRR, Washington, D. C. 20523.

This *Industry Profile* was prepared for the U. S. Agency for International Development by International Development Services Inc., Washington, D. C.

INDUSTRY PROFILES

BRASS TABLE LAMPS

I. P. No. 67302

S. I. C. 3642

Industry Profiles are intended to promote the development of private industry in the developing countries by assembling economic and technical information in a professional analysis to support basic decisions in the establishment of small or medium-scale plants in a specific industry. The information contained in a profile is selected and organized for the guidance of the entrepreneur in the less developed country.

Industry Profiles contain basic information on market aspects, production rates, capital requirements, materials and supplies, utilities, manpower operating costs and sales revenues. Work-flow diagrams and, in some instances, machinery layouts are included along with references to sources of technical information, professional services, patents, materials and equipment.

The profiles adopt as a benchmark, productivity rates and costs which could be anticipated under conditions prevailing in the United States. Anticipated profits are before taxes. Since conditions vary widely from country to country, the entrepreneur using this profile must make suitable adjustments to conditions prevailing in his country. This profile should help in reaching correct assumptions.

BRASS TABLE LAMPS

I. P. No. 67702
S. I. C. 3642
DECEMBER 1967

PRODUCT DESCRIPTION

Brass table lamps complete with shades.

A. GENERAL EVALUATION OF PROSPECTS

The factory selling price of this lamp is fairly high per unit. Since table lamps suitable for use in the average home can usually be purchased for about half this price, this brass table lamp can be considered a luxury item in most countries. While the capital requirements are low in comparison with the sales volume, the estimated profits, before taxes, are also low for a luxury item; therefore, the market for this product should be carefully investigated before embarking on this venture. If electric power is not available in the interior, sales will be possible only in the metropolitan areas.

B. MARKET ASPECTS

1. USERS

Principally homes. Some might be used in business offices and hotels.

2. SALES CHANNELS AND METHODS

This plant would sell direct to furniture stores, department stores and electrical appliance stores. The market for this product will depend upon the per capita income of the population and the availability of electric power in the rural areas. Since this is a luxury item, an accurate estimate of sales potential cannot be made without a survey to determine its marketing possibilities. Keen competition will probably be encountered from lower-priced, similar items. Transportation costs should be minor when compared with the selling price of these lamps. The geographical extent of the domestic market will be controlled by the sales price and the availability of electric power. This plant should not expect to compete in the export market except for possible sales to gift shops that cater to tourists.

3. RATE OF PROFIT

It should be emphasized that the information under "Production Requirements" on the next page illustrates typical U. S. cost relationships of the various factors entering into the manufacture in the United States of a specified product. It is generally recognized that profits before taxes of manufacturers in the United States may be appreciably lower than normally would be the case in a developing country. While certain imported capital items and specialized technical services may be higher in cost in developing countries certain other significant production costs such as semi-skilled and unskilled labor, materials and supplies obtained locally may be significantly lower. Factors vitally affecting industrial products costs and profit margins such as degree of competition, size of market, availability of labor, availability of risk capital, relative financial risk, level of industry taxes, and general economic and political stability have widely differing interrelationships and impact on the selling price and profit margin of a manufactured product in a developing country as compared with the United States. Planned operations and production limits would, of necessity, have to be adapted to cost and profit conditions existing in a particular developing country as a first step in determining whether a more intensive survey of the manufacturing possibilities for a particular product and industry is warranted.

4. SELECTED GROSS PROFIT ITEMS

(See supporting data on page 3)

The annual gross sales revenue is estimated at \$576,000.

The total fixed investment, plus working capital, is estimated at \$168,000.

The annual gross profit, before taxes, is estimated at \$58,000.

Using these figures, the profit on gross sales, before taxes, amounts to about 10.1%.

(A gross profit on sales, before taxes, of 10.1%, while reflecting U. S. experience, should not be considered normal for a developing country where profit margins may be considerably higher in industry and trade.)

The annual profit on the total capital requirements, before taxes, is estimated at about 34.5%.

5. COST PER MAN EMPLOYED

Seventeen direct and seven indirect workers, or a total of twenty-four workers, are employed. The total fixed capital investment is estimated at \$73,000.

Based on these figures, the fixed investment per man employed would amount to about \$ 3,040.

76

C. PRODUCTION REQUIREMENTS - BRASS TABLE LAMPS
ANNUAL CAPACITY - ONE SHIFT OPERATION: 48,000 LAMPS
NOTE: COSTS AND OPERATING DATA ARE BASED ON UNITED STATES PRICES AND PRACTICES**

I.P. No. 67302

GENERAL INFORMATION

An *Index of Industry Profiles* is available on request from the agency for International Development, AA/PRR, Washington, D. C. 20523.

This *Industry Profile* was prepared for the U. S. Agency for International Development by International Development Services Inc., Washington, D. C.

INDUSTRY PROFILES

TILE ROOFING, CLAY

I. P. No. 67303

S. I. C. 3259

Industry Profiles are intended to promote the development of private industry in the developing countries by assembling economic and technical information in a professional analysis to support basic decisions in the establishment of small or medium-scale plants in a specific industry. The information contained in a profile is selected and organized for the guidance of the entrepreneur in the less developed country.

Industry Profiles contain basic information on market aspects, production rates, capital requirements, materials and supplies, utilities, manpower operating costs and sales revenues. Work-flow diagrams and, in some instances, machinery layouts are included along with references to sources of technical information, professional services, patents, materials and equipment.

The profiles adopt as a benchmark, productivity rates and costs which could be anticipated under conditions prevailing in the United States. Anticipated profits are before taxes. Since conditions vary widely from country to country, the entrepreneur using this profile must make suitable adjustments to conditions prevailing in his country. This profile should help in reaching correct assumptions.

PRODUCT DESCRIPTION

Roofing tile, half round, color of red clay, made by soft mud method.

A. GENERAL EVALUATION OF PROSPECTS

Local sources of good clay and sand material situated near the potential market are essential for this industry. The location of clay and sand relatively close together is not uncommon and the production of roofing tile has long been practiced in many countries. Where roofing tile is commonly used, plants of this type may already be in existence. A new plant would, therefore, be required only to meet increased demand or to replace small and technically backward plants. Roofing tile presents an attractive appearance and is not expensive compared with other roofing. Since the capital investment for this plant is moderate in comparison with the gross sales, prospects for this industry should be good in many countries.

B. MARKET ASPECTS1. USERS

Building and public works contractors; individuals for minor jobs.

2. SALES CHANNELS AND EXTENT OF MARKET

Direct sales to large building contractors and to building materials supply houses. In view of the variety of materials that can be used for roofing and the variation in the amount of building construction from country to country, it is not considered practical to determine the market potential for support of this plant in terms of population. In countries where clay roofing tile is commonly used, other plants will undoubtedly exist. A modern plant should be able to compete effectively with small producers. Where roofing tile is not commonly used, the sales appeal of this new product would be a major consideration. A comprehensive survey should be made before investing in this plant. Transport costs of roofing tile are too high to make it economically feasible to ship nationwide. The market area will depend on good, paved highways, inland waterways and low freight rates. Under ordinary conditions, delivery by truck over a radius of more than fifty miles would not be profitable. Roofing tiles, because of their weight, are seldom, if ever, exported.

3. RATE OF PROFIT

It should be emphasized that the information under "Production Requirements" on the next page illustrates typical U.S. cost relationships of the various factors entering into the manufacture in the United States of a specified product. It is generally recognized that profits before taxes of manufacturers in the United States may be appreciably lower than normally would be the case in a developing country. While certain imported capital items and specialized technical services may be higher in cost in developing countries, certain other significant production costs such as semi-skilled and unskilled labor, materials and supplies obtained locally may be significantly lower. Factors vitally affecting industrial products costs and profit margins such as degree of competition, size of market, availability of labor, availability of risk capital, relative financial risk, level of industry taxes, and general economic and political stability have widely differing interrelationships and impact on the selling price and profit margin of a manufactured product in a developing country as compared with the United States. Planned operations and production limits would, of necessity, have to be adapted to cost and profit conditions existing in a particular developing country as a first step in determining whether a more intensive survey of the manufacturing possibilities for a particular product and industry is warranted.

4. SELECTED GROSS PROFIT ITEMS

(See supporting data on page 3)

The annual gross sales revenue is estimated at \$235,000

The total fixed investment, plus working capital, is estimated at \$272,200.

The annual gross profit, before taxes, is estimated at \$26,000.

Using these figures, the profit on gross sales, before taxes, amounts to about 11.1%.

(A gross profit on sales, before taxes, of 11.1%, while reflecting U. S. experience, should not be considered normal for a developing country where profit margins may be considerably higher in industry and trade.)

The annual profit on the total capital requirements, before taxes, is estimated at about 9.6%.

5. COST PER MAN EMPLOYED

Twenty direct and five indirect workers, or a total of twenty-five workers, are employed.

The total fixed capital investment is estimated at \$230,000.

Based on these figures, the fixed investment per man employed would amount to \$9,200.

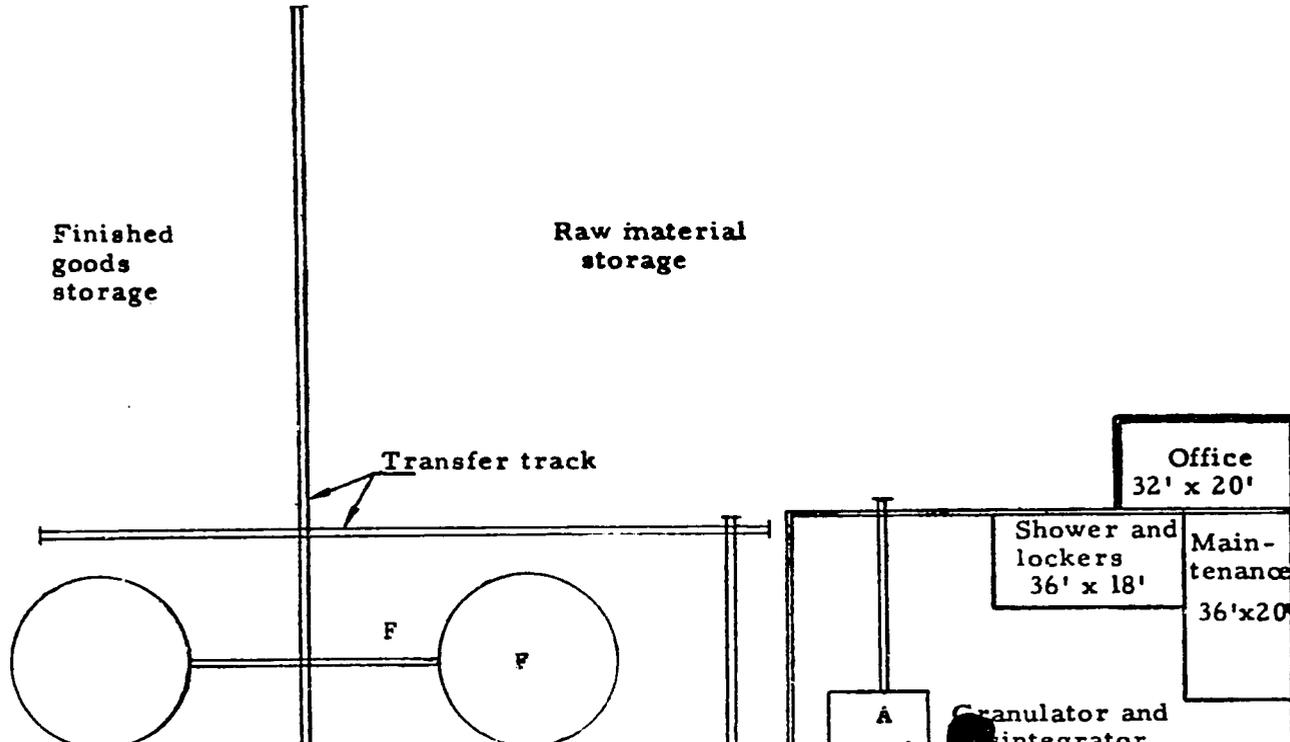

C. PRODUCTION REQUIREMENTS - TILE ROOFING, CLAY

ORDERING INSTRUCTIONS

The price of *Industry Profiles* is a minimum of \$3.00 for from one to five "Profiles." The purchaser may select up to five of any "Profiles" available.

Complete sets of the 250 *Industry Profiles* published in 1966, I. P. No. 66001 through I. P. No. 66250 consecutively, may be purchased for \$125.00 per set. Complete sets of the 150 *Industry Profiles* to be published in 1967, I. P. No. 67251 through I. P. No. 67400 consecutively, may be purchased for \$75.00 per set. The latter "Profiles" will automatically be shipped to full set purchasers upon release.

Address orders to: U.S. Department of Commerce
Clearinghouse for Federal Scientific and
Technical Information, 410.12
Springfield, Virginia 22151

Prepayment is required. Make check or money order payable to National Bureau of Standards—CFSTI. Clearinghouse deposit account holders may charge purchases to their accounts.

GENERAL INFORMATION

An *Index of Industry Profiles* is available on request from the agency for International Development, AA/PRR, Washington, D. C. 20523.

This *Industry Profile* was prepared for the U. S. Agency for International Development by International Development Services Inc., Washington, D. C.

INDUSTRY PROFILES

CANNED FISH

I. P. No. 67304

S. I. C. 2031

Industry Profiles are intended to promote the development of private industry in the developing countries by assembling economic and technical information in a professional analysis to support basic decisions in the establishment of small or medium-scale plants in a specific industry. The information contained in a profile is selected and organized for the guidance of the entrepreneur in the less developed country.

Industry Profiles contain basic information on market aspects, production rates, capital requirements, materials and supplies, utilities, manpower operating costs and sales revenues. Work-flow diagrams and, in some instances, machinery layouts are included along with references to sources of technical information, professional services, patents, materials and equipment.

The profiles adopt as a benchmark, productivity rates and costs which could be anticipated under conditions prevailing in the United States. Anticipated profits are before taxes. Since conditions vary widely from country to country, the entrepreneur using this profile must make suitable adjustments to conditions prevailing in his country. This profile should help in reaching correct assumptions.

CANNED FISH

I.P. No. 67304
S.I.C. 2031
DECEMBER 1967

PRODUCT DESCRIPTION

Canned fish in 1/2-pound and 1-pound cans.

A. GENERAL EVALUATION OF PROSPECTS

The prospects for this industry depend to a large extent upon an adequate supply of fish for at least 75 consecutive days each year at reasonable prices. The fixed investment is modest in relation to the annual sales revenue and the number of men employed. This plant could be used to can many types of fish and, with some alterations, could also be used to can vegetables.

B. MARKET ASPECTS

1. USERS

Homes, restaurants, hotels, institutions, military installations, wherever food is served.

2. SALES CHANNELS AND EXTENT OF MARKET

Sales would be made to wholesalers for distribution to retail stores and direct to military installations and other large users. The market required to support this industry will depend, to some extent, upon the per capita income and the other types of food available such as poultry and meat. The product is well packaged and the value is high in relation to transportation costs. The domestic market would be nationwide. Competition can be expected in areas where fresh fish is in plentiful supply. Plants similar to this one that are already in existence within the country will also furnish competition. If this plant is well managed and efficiently operated, it should have no difficulty in exporting any surplus production not consumed locally.

3. RATE OF PROFIT

It should be emphasized that the information under "Production Requirements" on the next page illustrates typical U.S. cost relationships of the various factors entering into the manufacture in the United States of a specified product. It is generally recognized that profits before taxes of manufacturers in the United States may be appreciably lower than normally would be the case in a developing country. While certain imported capital items and specialized technical services may be higher in cost in developing countries, certain other significant production costs such as semi-skilled and unskilled labor, materials and supplies obtained locally may be significantly lower. Factors vitally affecting industrial production costs and profit margins such as degree of competition, size of market, availability of labor, availability of risk capital, relative financial risk, level of industry taxes, and general economic and political stability have widely differing interrelationships and impact on the selling price and profit margin of a manufactured product in a developing country as compared with the United States. Planned operations and production limits would, of necessity, have to be adapted to cost and profit conditions existing in a particular developing country as a first step in determining whether a more intensive survey of the manufacturing possibilities for a particular product and industry is warranted.

4. SELECTED GROSS PROFIT ITEMS

The annual gross sales revenue is estimated at \$700,000.

The total fixed investment, plus working capital, is estimated at \$416,500.

The annual gross profit, before taxes, is estimated at \$65,000.

Based on these figures, the profit on gross sales, before taxes, amounts to about 9.3%.

(A gross profit on sales, before taxes, of 9.3%, while reflecting U.S. experience, should not be considered normal for a developing country where profit margins may be considerably higher in industry and trade.)

The annual profit on the total capital requirements, before taxes, would amount to about 15.7%.

5. COST PER MAN EMPLOYED

One hundred and twenty direct workers and eleven indirect workers, or a total of one hundred and thirty-one workers, are employed.

The total fixed-capital investment is estimated at \$314,000.

Based on these figures, the fixed investment per man employed would amount to about \$2,400.

C. PRODUCTION REQUIREMENTS - CANNED FISH
ANNUAL CAPACITY - THREE SHIFT OPERATION, 75 DAYS:
2,000,000 CANS

I.P. No. 67304
S.I.C. 2031

NOTE: COSTS AND OPERATING DATA ARE BASED ON UNITED STATES PRICES AND PRACTICES**

<u>1. CAPITAL REQUIREMENTS</u>		<u>Cost</u>
<u>a. Fixed Capital</u>		
Land - 5 acres		
Building - one-story, 100' x 100'		
12,000 square feet refrigerated.		
Equipment, furniture & fixtures		
Prodn. tools & equipment		
Other tools & equipment		
Furniture & fixtures		
Transportation equipment		
Total fixed capital		\$ 314,000
<u>Principal items:</u>		
Wash		
Scald		
Trays		
Racks		
Process tables		
Can sterilizer		
Can filler		
Can closer		
Retorts		
Packer & sealer		
Fork lift truck		
<u>b. Working Capital (30 days)</u>		
Direct materials		
Direct labor		
Manufacturing overhead		
Administrative costs		
Sales costs		
Freight-out, discounts, bad debts & allowances		
Sales revenue		
Training costs		
Total working capital		\$ 102,500
<u>c. Total Capital Requirements</u>		\$ 416,500

<u>2. MATERIALS AND SUPPLIES</u>		
<u>a. Direct Materials</u>	<u>Annual Requirements</u>	<u>Annual Cost</u>
Fish	2,500,000 lbs	
Soybean oil	250,000 lbs.	
Salt	15,000 lbs.	
Cans, cartons and labels		
Total direct materials		\$ 391,000
<u>b. Supplies</u>		
Lubricants & hand tools		
Gas, oil and maintenance of truck		
Maintenance & spare parts		
Office supplies		
Total supplies		\$ 6,000
<u>c. Availability of materials & supplies</u>		
Fish must be available at plant site.		
All other materials should be available locally. All are available in world markets.		

<u>3. POWER, FUEL AND WATER</u>		<u>Annual Cost</u>
Electric Power - 100 H.P. connected load		
Fuel - Bunker C oil		
Water - for production, sanitation and fire protection. Must be potable		\$ 11,500

<u>4. DEPRECIATION</u>	<u>Yrs. life</u>	<u>Amount</u>
Building	20	
Prodn. tools & equipment	10	
Other tools & equipment	10	
Furniture & fixtures	10	
Transportation equipment	4	
Total depreciation		\$ 24,700

<u>5. MANPOWER</u>	<u>Number</u>	<u>Annual Cost</u>
<u>a. Indirect labor</u>		
Manager	1	
Supervisor	3	
Office	2	
Inspectors	3	
Maintenance	1	
Truck Driver	1	
Total indirect labor	11	\$ 46,000

<u>b. Direct Labor</u>		
Skilled workers	9	
Semi-skilled workers	9	
Unskilled workers	102	
Total direct labor	120	\$ 99,000

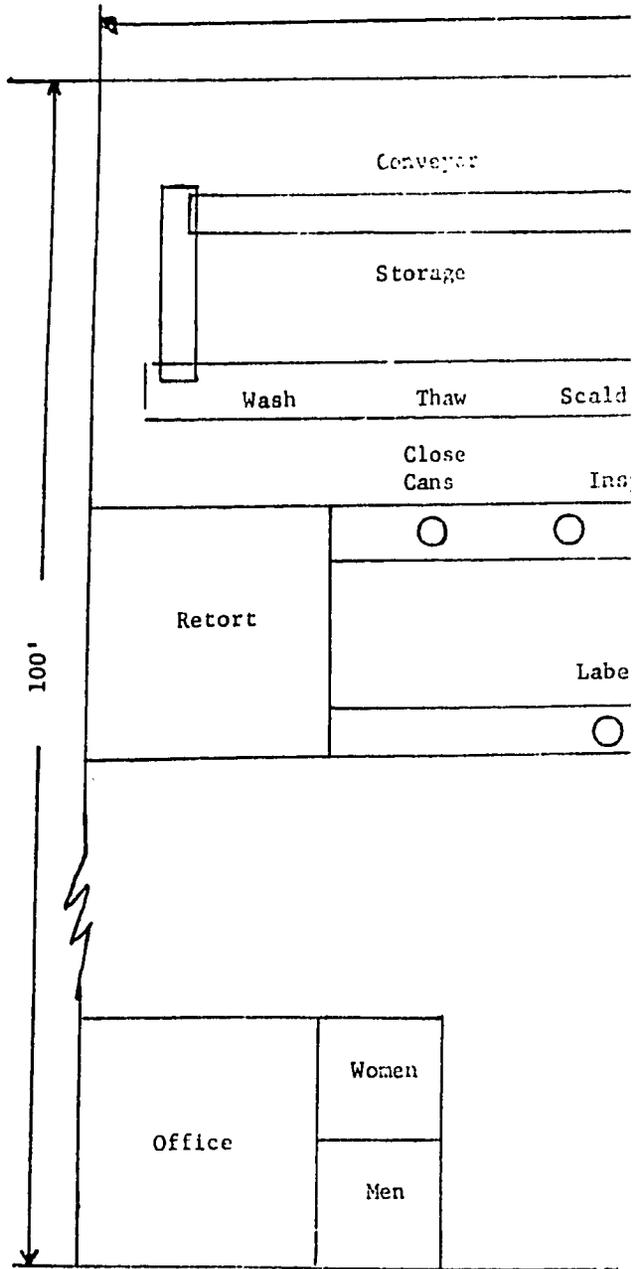

c. Training needs
Manager, supervisors, must be fully experienced. They, with the help of the skilled workers should be able to train other workers and reach full production in two weeks.

<u>6. TRANSPORTATION</u>	
<u>a. Own transport equipment</u>	
Truck.	
<u>b. External transport facilities</u>	
Plant should be located close to source of the fish supply. About 1,400 tons of fish are shipped per year. Good highways and railroad if possible.	

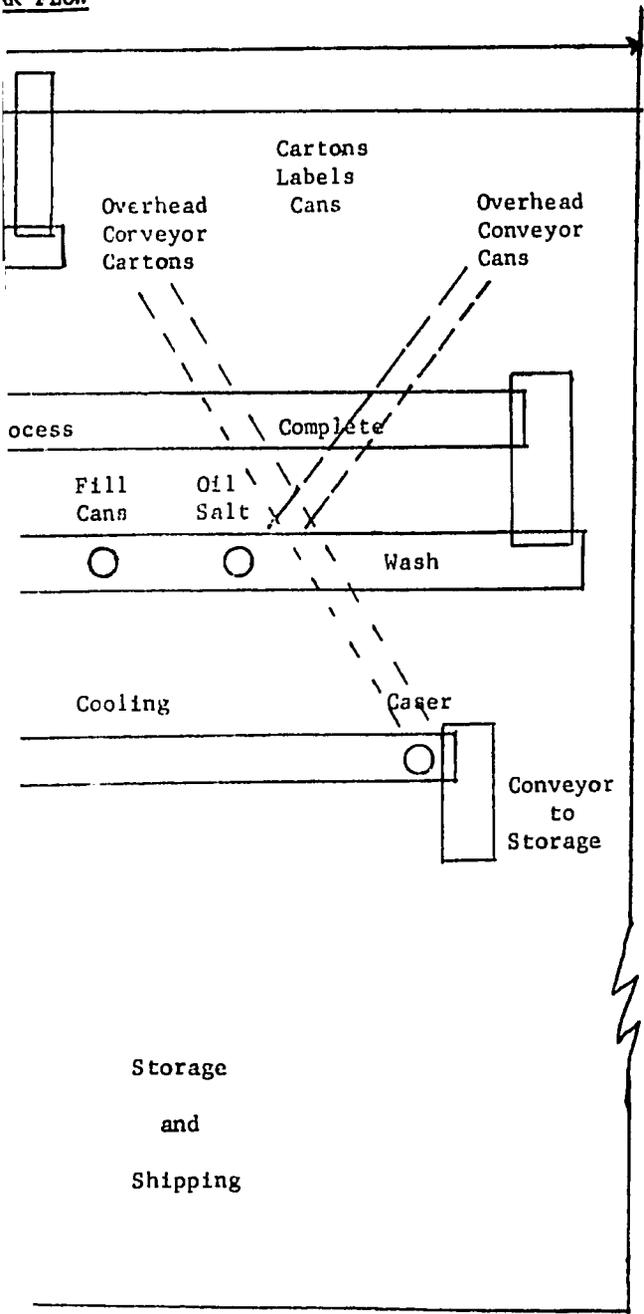

<u>7. TOTAL ANNUAL COSTS AND SALES</u>	
<u>REVENUE</u>	
Direct materials	\$ 391,000
Direct labor	99,000
Manufacturing overhead*	88,200
Total manufacturing cost	\$578,200
Interest on loans	
Insurance	
Legal	
Audit	
Contingencies	
Total administrative cost	\$ 26,800
Sales expense	\$ 18,000
Freight-out, travel discounts	
Allowances & bad debts	\$ 12,000
Total annual costs	\$635,000
Annual Gross Profit	\$ 65,000
<u>ANNUAL SALES REVENUE</u>	\$700,000

*Includes Supplies, Power, Fuel, Water, Depreciation and Indirect labor (2b-3-4-5a)
**It was not found practical to show individual item costs because of wide variations in price and other factors, consequently only representative totals are used.

VII. PROFESSIONAL ENGINEERING SERVICES

The services of professional engineers are desirable in the design of industrial plants even though the proposed plant may be small.

A correct design is one which provides the greatest economy in the investment of funds and establishes the basis of operation that will be most profitable in the beginning and will also be capable of expansion without expensive alteration.

The addresses of professional engineers who specialize in Industrial Design, some of whom may be willing to undertake such work on low cost projects overseas, can be secured by reference to the published cards in various engineering magazines.

They may also be reached through their national organizations, one of which is the :

National Society of Professional Engineers
2029 K Street, N. W.
Washington, D. C. 20006

Manufacturers of industrial equipment employ engineers familiar with the design and installation of their specialized products. These manufacturers are usually willing to give prospective customers the benefit of technical advice by those engineers in determining the suitability of their equipment in any proposed project. The equipment manufacturer also knows, and can recommend, professional engineers in private practice who are willing and able to provide appropriate consulting services.

PRE-INVESTMENT FEASIBILITY STUDY SUGGESTED

The foregoing information must be necessarily presented in concise form. Before an investment is made in a plant a feasibility study is suggested. The investor, for his planning, should have more information dealing with the specific locality contemplated. For obvious reasons, such information cannot be included in *Industry Profiles*. Such a study, therefore, should explore local factors and conditions, including costs, sources of raw materials and supplies, availability of utilities and fuel, manpower, transportation, etc.

The investor will need reasonably accurate information on Government and legal requirements, banking and financing, potential demand, competition, construction services, and manpower training requirements. Further, he should consider developing plans for management and production controls, operating procedures, and sales promotion.

ORDERING INSTRUCTIONS

The price of *Industry Profiles* is a minimum of \$3.00 for from one to five "*Profiles*." The purchaser may select up to five of any "*Profiles*" available.

Complete sets of the 250 *Industry Profiles* published in 1966, I. P. No. 66001 through I. P. No. 66250 consecutively, may be purchased for \$125.00 per set. Complete sets of the 150 *Industry Profiles* to be published in 1967, I. P. No. 67251 through I. P. No. 67400 consecutively, may be purchased for \$75.00 per set. The latter "*Profiles*" will automatically be shipped to full set purchasers upon release.

Clearinghouse for Federal Scientific and
Technical Information, 410.12
Springfield, Virginia 22151

Prepayment is required. Make check or money order payable to National Bureau of Standards—CFSTI. Clearinghouse deposit account holders may charge purchases to their accounts.

GENERAL INFORMATION

An *Index of Industry Profiles* is available on request from the agency for International Development, AA/PRR, Washington, D. C. 20523.

This *Industry Profile* was prepared for the U. S. Agency for International Development by International Development Services Inc., Washington, D. C.

INDUSTRY PROFILES

CATTLE FEED FROM MANIOC PULP

I. P. No. 67305

S. I. C. 2042

Industry Profiles are intended to promote the development of private industry in the developing countries by assembling economic and technical information in a professional analysis to support basic decisions in the establishment of small or medium-scale plants in a specific industry. The information contained in a profile is selected and organized for the guidance of the entrepreneur in the less developed country.

Industry Profiles contain basic information on market aspects, production rates, capital requirements, materials and supplies, utilities, manpower operating costs and sales revenues. Work-flow diagrams and, in some instances, machinery layouts are included along with references to sources of technical information, professional services, patents, materials and equipment.

The profiles adopt as a benchmark, productivity rates and costs which could be anticipated under conditions prevailing in the United States. Anticipated profits are before taxes. Since conditions vary widely from country to country, the entrepreneur using this profile must make suitable adjustments to conditions prevailing in his country. This profile should help in reaching correct assumptions.

PRODUCT DESCRIPTION

Cattle and poultry feed made from manioc (cassava) pulp, mixed with other feed ingredients and sold in 100 pound paper bags.

A. GENERAL EVALUATION OF PROSPECTS

The prospects for this industry will depend on an adequate supply of manioc pulp and on a potential sales of 1,450 tons annually. The pulp supply must be sufficient to operate the plant 24 hours a day, 250 days a year. The addition of facilities to manufacture manioc pulp would substantially increase the margin of profit and assure an adequate supply of pulp.

B. MARKET ASPECTS

1. USERS

Stock farms, poultry farms, feeding places where animals are conditioned for slaughter and areas where specialized feeding of animals is done.

2. SALES CHANNELS AND EXTENT OF MARKET

There is a great flexibility in the use of this product and no exact estimate can be given of the number of animals required to absorb the plant's production. Much depends on the composition of animals' other food intake. The plant's production could feed about 3,000 steers and approximately the same number of dairy cattle. Used for poultry feed, the plant's output could maintain about 30,000 laying hens or about 250,000 pullets during the fattening season. Sales would be made to wholesalers and possibly to large users. Active sales promotion among users is necessary, especially if the product is new in the market. The only domestic competition would come from a similar manufacturing plant in the area but unless costs are high, competition should be met without difficulty. This is a common world-wide export but little difficulty should be experienced in selling any surplus feed providing high quality is maintained and shipping and tariff costs are not prohibitive. The potential domestic market in countries of moderate size and with reasonably good transport systems is nationwide. Keep delivery costs as low as possible.

3. RATE OF PROFIT

It should be emphasized that the information under "Production Requirements" on the next page illustrates typical U.S. cost relationships of the various factors entering into the manufacture in the United States of a specified product. It is generally recognized that profits before taxes of manufacturers in the United States may be appreciably lower than normally would be the case in a developing country. While certain imported capital items and specialized technical services may be higher in cost in developing countries, certain other significant production costs such as semi-skilled and unskilled labor, materials and supplies obtained locally may be significantly lower. Factors vitally affecting industrial production costs and profit margins such as degree of competition, size of market, availability of labor, availability of risk capital, relative financial risk, level of industry taxes, and general economic and political stability have widely differing interrelationships and impact on the selling price and profit margin of a manufactured product in a developing country as compared with the United States. Planned operations and production limits would, of necessity, have to be adapted to cost and profit conditions existing in a particular developing country as a first step in determining whether a more intensive survey of the manufacturing possibilities for a particular product and industry is warranted.

4. SELECTED GROSS PROFIT ITEMS

The annual gross sales revenue is estimated at \$130,000.

The total fixed investment, plus working capital, is estimated at \$81,500.

The annual gross profit, before taxes, is estimated at \$9,000.

Based on these figures, the profit on gross sales, before taxes, amounts to about 6.9%.

(A gross profit on sales, before taxes, of 6.9%, while reflecting U.S. experience, should not be considered normal for a developing country where profit margins may be considerably higher in industry and trade.)

The annual profit on the total capital requirements, before taxes, would amount to about 11.0%.

5. COST PER MAN EMPLOYED

Seven direct workers and three indirect workers, or a total of ten workers, are employed.

The total fixed capital investment is estimated at \$ 59,000.

Based on these figures, the fixed investment per man employed would amount to \$5,900.

They may also be reached through their national organizations, one of which is the:

National Society of Professional Engineers
2029 K Street, N. W.
Washington, D. C. 20006

Manufacturers of industrial equipment employ engineers familiar with the design and installation of their specialized products. These manufacturers are usually willing to give prospective customers the benefit of technical advice by those engineers in determining the suitability of their equipment in any proposed project. The equipment manufacturer also knows, and can recommend, professional engineers in private practice who are willing and able to provide appropriate consulting services.

PRE-INVESTMENT FEASIBILITY STUDY SUGGESTED

The foregoing information must be necessarily presented in concise form. Before an investment is made in a plant a feasibility study is suggested. The investor, for his planning, should have more information dealing with the specific locality contemplated. For obvious reasons, such information cannot be included in *Industry Profiles*. Such a study, therefore, should explore local factors and conditions, including costs, sources of raw materials and supplies, availability of utilities and fuel, manpower, transportation, etc.

The investor will need reasonably accurate information on Government and legal requirements, banking and financing, potential demand, competition, construction services, and manpower training requirements. Further, he should consider developing plans for management and production controls, operating procedures, and sales promotion.

ORDERING INSTRUCTIONS

The price of *Industry Profiles* is a minimum of \$3.00 for from one to five "*Profiles*." The purchaser may select up to five of any "*Profiles*" available.

Complete sets of the 250 *Industry Profiles* published in 1966, I. P. No. 66001 through I. P. No. 66250 consecutively, may be purchased for \$125.00 per set. Complete sets of the 150 *Industry Profiles* to be published in 1967, I. P. No. 67251 through I. P. No. 67400 consecutively, may be purchased for \$75.00 per set. The latter "*Profiles*" will automatically be shipped to full set purchasers upon release.

Address orders to: U.S. Department of Commerce
Clearinghouse for Federal Scientific and
Technical Information, 410.12
Springfield, Virginia 22151

Prepayment is required. Make check or money order payable to National Bureau of Standards—CFSTI. Clearinghouse deposit account holders may charge purchases to their accounts.

GENERAL INFORMATION

An *Index of Industry Profiles* is available on request from the agency for International Development, AA/PRR, Washington, D. C. 20523.

This *Industry Profile* was prepared for the U. S. Agency for International Development by International Development Services Inc., Washington, D. C.

INDUSTRY PROFILES

LAUNDRY BAGS

I. P. No. 67306

S. I. C. 5087

Industry Profiles are intended to promote the development of private industry in the developing countries by assembling economic and technical information in a professional analysis to support basic decisions in the establishment of small or medium-scale plants in a specific industry. The information contained in a profile is selected and organized for the guidance of the entrepreneur in the less developed country.

Industry Profiles contain basic information on market aspects, production rates, capital requirements, materials and supplies, utilities, manpower operating costs and sales revenues. Work-flow diagrams and, in some instances, machinery layouts are included along with references to sources of technical information, professional services, patents, materials and equipment.

The profiles adopt as a benchmark, productivity rates and costs which could be anticipated under conditions prevailing in the United States. Anticipated profits are before taxes. Since conditions vary widely from country to country, the entrepreneur using this profile must make suitable adjustments to conditions prevailing in his country. This profile should help in reaching correct assumptions.

PRODUCT DESCRIPTION

Laundry bags with cord and eyelet made from duck in two sizes, 26" x 26" for individual use in private homes and 30" x 48" for commercial laundries, hotels, institutions, military establishments, rooming houses, etc.

A. GENERAL EVALUATION OF PROSPECTS

The capital requirements for this industry are moderate. The manufacturing operations are relatively simple and do not demand a highly skilled work force. All direct materials and supplies should normally be available locally. The use of laundry bags in rural areas might be limited in some countries. Sales, for the most part will be concentrated in populous, urban areas.

B. MARKET ASPECTS1. USERS

Principal users of this product are commercial laundries. Hotels, apartment and rooming houses might be reached by merchandising through a hotel supply company or other similar outlet. Large institutions, hospitals, and the military may buy in big quantities direct.

2. SALES CHANNELS AND EXTENT OF MARKET

Sales would be made direct to laundries and other large volume users, direct to stores for sales to individuals for home use and to hotel supply companies or other similar outlets. Laundry bags are light and well packaged and can be shipped at moderate cost anywhere through out the country although most sales will be concentrated in urban areas. Competition might be encountered from small family-owned and operated factories. But if this plant is well managed, quality and lower costs should prevail. No competition from imported products should be encountered since laundry bags seldom are found in the international market place.

3. RATE OF PROFIT

It should be emphasized that the information under "Production Requirements" on the next page illustrates typical U. S. cost relationships of the various factors entering into the manufacture in the United States of a specified product. It is generally recognized that profits before taxes of manufacturers in the United States may be appreciably lower than normally would be the case in a developing country. While certain imported capital items and specialized technical services may be higher in cost in developing countries, certain other significant production costs such as semi-skilled and unskilled labor, materials and supplies obtained locally may be significantly lower. Factors vitally affecting industrial production costs and profit margins such as degree of competition, size of market, availability of labor, availability of risk capital, relative financial risk, level of industry taxes, and general economic and political stability have widely differing interrelationships and impact on the selling price and profit margin of a manufactured product in a developing country as compared with the United States. Planned operations and production limits would, of necessity, have to be adapted to cost and profit conditions existing in a particular developing country as a first step in determining whether a more intensive survey of the manufacturing possibilities for a particular product and industry is warranted.

4. SELECTED GROSS PROFIT ITEMS

(See supporting data on page 3)

The annual gross sales revenue is estimated at \$240,000.

The total fixed investment, plus working capital, is estimated at \$76,000.

The annual gross profit, before taxes, is estimated at \$18,000.

Based on these figures, the profit on gross sales, before taxes, amounts to 7.5%.

(A gross profit on sales, before taxes, of 7.5%, while reflecting U.S. experience, should not be considered normal for a developing country where profit margins may be considerably higher in industry and trade.)

The annual profit on the total capital requirements, before taxes, would amount to about 23.7%.

5. COST PER MAN EMPLOYED

Sixteen direct workers and six indirect workers, or a total of twenty-two workers are employed. The total fixed capital investment is estimated at \$57,000.

Based on these figures, the fixed investment per man employed would amount to about \$2,600.

C. PRODUCTION REQUIREMENTS - LAUNDRY BAGS

I.P. No. 67306

ANNUAL CAPACITY - ONE SHIFT OPERATION : 110,000 BAGS

VII. PROFESSIONAL ENGINEERING SERVICES

The services of professional engineers are desirable in the design of industrial plants even though the proposed plant may be small.

A correct design is one which provides the greatest economy in the investment of funds and establishes the basis of operation that will be most profitable in the beginning and will also be capable of expansion without expensive alteration.

The addresses of professional engineers who specialize in Industrial Design, some of whom may be willing to undertake such work on low cost projects overseas, can be secured by reference to the published cards in various engineering magazines.

They may also be reached through their national organizations, one of which is the :

National Society of Professional Engineers
2029 K Street, N. W.
Washington, D.C. 20006

Manufacturers of industrial equipment employ engineers familiar with the design and installation of their specialized products. These manufacturers are usually willing to give prospective customers the benefit of technical advice by those engineers in determining the suitability of their equipment in any proposed project. The equipment manufacturer also knows, and can recommend, professional engineers in private practice who are willing and able to provide appropriate consulting services.

PRE-INVESTMENT FEASIBILITY STUDY SUGGESTED

The foregoing information must be necessarily presented in concise form. Before an investment is made in a plant a feasibility study is suggested. The investor, for his planning, should have more information dealing with the specific locality contemplated. For obvious reasons, such information cannot be included in *Industry Profiles*. Such a study, therefore, should explore local factors and conditions, including costs, sources of raw materials and supplies, availability of utilities and fuel, manpower, transportation, etc.

The investor will need reasonably accurate information on Government and legal requirements, banking and financing, potential demand, competition, construction services, and manpower training requirements. Further, he should consider developing plans for management and production controls, operating procedures, and sales promotion.

ORDERING INSTRUCTIONS

The price of *Industry Profiles* is a minimum of \$3.00 for from one to five "*Profiles*." The purchaser may select up to five of any "*Profiles*" available.

Complete sets of the 250 *Industry Profiles* published in 1966, I. P. No. 66001 through I. P. No. 66250 consecutively, may be purchased for \$125.00 per set. Complete sets of the 150 *Industry Profiles* to be published in 1967, I. P. No. 67251 through I. P. No. 67400 consecutively, may be purchased for \$75.00 per set. The latter "*Profiles*" will automatically be shipped to full set purchasers upon release.

Address orders to: U.S. Department of Commerce
Clearinghouse for Federal Scientific and
Technical Information, 410.12
Springfield, Virginia 22151

Prepayment is required. Make check or money order payable to National Bureau of Standards—CFSTI. Clearinghouse deposit account holders may charge purchases to their accounts.

GENERAL INFORMATION

An *Index of Industry Profiles* is available on request from the agency for International Development, AA/PRR, Washington, D. C. 20523.

This *Industry Profile* was prepared for the U. S. Agency for International Development by International Development Services Inc., Washington, D. C.

INDUSTRY PROFILES

PORTABLE SAWMILL

I. P. No. 67307

S. I. C. 2421

Industry Profiles are intended to promote the development of private industry in the developing countries by assembling economic and technical information in a professional analysis to support basic decisions in the establishment of small or medium-scale plants in a specific industry. The information contained in a profile is selected and organized for the guidance of the entrepreneur in the less developed country.

Industry Profiles contain basic information on market aspects, production rates, capital requirements, materials and supplies, utilities, manpower operating costs and sales revenues. Work-flow diagrams and, in some instances, machinery layouts are included along with references to sources of technical information, professional services, patents, materials and equipment.

The profiles adopt as a benchmark, productivity rates and costs which could be anticipated under conditions prevailing in the United States. Anticipated profits are before taxes. Since conditions vary widely from country to country, the entrepreneur using this profile must make suitable adjustments to conditions prevailing in his country. This profile should help in reaching correct assumptions.

PORTABLE SAWMILL

PRODUCT DESCRIPTION

Portable sawmill with diesel power unit on a truck that is also used to transport the portable sawmill from one location to another.

A. GENERAL EVALUATION OF PROSPECTS

The prospects for this industry depend to a great extent upon the availability of logs. The mill could operate under a contract of so much per thousand per board foot of lumber or it could buy and saw the logs and sell the lumber. On either basis, under normal conditions, the mill should show a profit if an adequate supply of logs is available.

B. MARKET ASPECTS

1. USERS

Lumber from sawmills is usually further processed before being sold to industry or to others for construction purposes.

2. SALES CHANNELS AND EXTENT OF MARKET

Sales are usually made directly to fabricating plants for further processing before use. The market required to support this portable sawmill depends primarily on the amount of industry within the country which requires lumber and the amount of construction and building that takes place annually. A sales survey should be made to determine the potential for this plant. Since lumber is used in both industry and construction, the geographical extent of the market would be nationwide. A portable sawmill of this type could not compete with a large sawmill located where large amounts of timber are available. But, where it can operate some distance away from permanent sawmills and where logs can be purchased at reasonable prices, competition could be met. Because of the high cost of importing lumber, this plant would also be able to meet competition from imported products. The output of this plant is too small to consider entering international markets.

3. RATE OF PROFIT

It should be emphasized that the information under "Production Requirements" on the next page illustrates typical U.S. cost relationships of the various factors entering into the manufacture in the United States of a specified product. It is generally recognized that profits before taxes of manufacturers in the United States may be appreciably lower than normally would be the case in a developing country. While certain imported capital items and specialized technical services may be higher in cost in developing countries, certain other significant production costs such as semi-skilled and unskilled labor, materials and supplies obtained locally may be significantly lower. Factors vitally affecting industrial products costs and profit margins such as degree of competition, size of market, availability of labor, availability of risk capital, relative financial risk, level of industry taxes, and general economic and political stability have widely differing interrelationships and impact on the selling price and profit margin of a manufactured product in a developing country as compared with the United States. Planned operations and production limits would, of necessity, have to be adapted to cost and profit conditions existing in a particular developing country as a first step in determining whether a more intensive survey of the manufacturing possibilities for a particular product and industry is warranted.

4. SELECTED GROSS PROFIT ITEMS

(See supporting data on page 3)

The annual gross sales revenue is estimated at \$265,000.

The total fixed investment, plus working capital, is estimated at \$67,300.

The annual gross profit, before taxes, is estimated at \$21,000.

Using these figures, the profit on gross sales, before taxes, amounts to about 8.0%.

(A gross profit on sales, before taxes, of 8.0%, while reflecting U.S. experience, should not be considered normal for a developing country where profit margins may be considerably higher in industry and trade.)

The annual profit on the total capital requirements, before taxes, is estimated at 31.2%.

5. COST PER MAN EMPLOYED

Six direct and three indirect workers, or a total of nine workers, are employed.

The total fixed capital investment is estimated at \$21,000.

Based on these figures, the fixed investment per man employed would amount to about \$2,325.

INDUSTRY PROFILES

ALUMINUM FOUNDRY

I. P. No. 67308

S. I. C. 3361

Industry Profiles are intended to promote the development of private industry in the developing countries by assembling economic and technical information in a professional analysis to support basic decisions in the establishment of small or medium-scale plants in a specific industry. The information contained in a profile is selected and organized for the guidance of the entrepreneur in the less developed country.

Industry Profiles contain basic information on market aspects, production rates, capital requirements, materials and supplies, utilities, manpower operating costs and sales revenues. Work-flow diagrams and, in some instances, machinery layouts are included along with references to sources of technical information, professional services, patents, materials and equipment.

The profiles adopt as a benchmark, productivity rates and costs which could be anticipated under conditions prevailing in the United States. Anticipated profits are before taxes. Since conditions vary widely from country to country, the entrepreneur using this profile must make suitable adjustments to conditions prevailing in his country. This profile should help in reaching correct assumptions.

PRODUCT DESCRIPTION

Small aluminum foundry. Other non-ferrous metals may be cast on a small-scale basis.

A. GENERAL EVALUATION OF PROSPECTS

This plant employs only two people - - the owner and a skilled worker. They would cast novelties for gift shops, small aluminum toys and do repair work of all kinds for individuals or private industry. Any non-ferrous article that has been broken could, by using the broken pieces as a pattern, be reproduced in this foundry. This plant could also produce non-ferrous parts for small industries. A plant of this kind can be a valuable asset to the economy and industrial development of an emerging nation.

B. MARKET ASPECTS1. USERS

Small industries needing non-ferrous castings as components. Repair work can also be done for individuals. Artistic castings and novelties for gift shops will also use the services of this plant. The market for the kind of work depends essentially upon the volume of business done by gift shops, upon the needs of other small industries and upon the amount of repair work of non-ferrous articles required within the country. It is not practical to estimate sales potential on the basis of population. The value of this product is high in relation to its weight and transportation costs should be low. The geographical extent of the market should be nationwide. This plant should have a considerable degree of protection against imports since it produces a high quality product and because of the convenience of the service. Competition from substitutes should be insignificant. These products are seldom exported and this plant is too small to consider entering the export market.

3. RATE OF PROFIT

It should be emphasized that the information under "Production Requirements" on the next page illustrates typical U.S. cost relationships of the various factors entering into the manufacture in the United States of a specified product. It is generally recognized that profits before taxes of manufacturers in the United States may be appreciably lower than normally would be the case in a developing country. While certain imported capital items and specialized technical services may be higher in cost in developing countries, certain other significant production costs such as semi-skilled and unskilled labor, materials and supplies obtained locally may be significantly lower. Factors vitally affecting industrial products costs and profit margins such as degree of competition, size of market, availability of labor, availability of risk capital, relative financial risk, level of industry taxes, and general economic and political stability have widely differing interrelationships and impact on the selling price and profit margin of a manufactured product in a developing country as compared with the United States. Planned operations and production limits would, of necessity, have to be adapted to cost and profit conditions existing in a particular developing country as a first step in determining whether a more intensive survey of the manufacturing possibilities for a particular product and industry is warranted.

4. SELECTED GROSS PROFIT ITEMS

(See supporting data on page 3)

The annual gross sales revenue is estimated at \$45,000.

The total fixed investment, plus working capital, is estimated at \$18,400.

The annual gross profit, before taxes, is estimated at \$5,000.

Based on these figures, the profit on gross sales, before taxes, amounts to about 11.1%.

(A gross profit on sales, before taxes, of 11.1%, while reflecting U.S. experience, should not be considered normal for a developing country where profit margins may be considerably higher in industry and trade.)

The annual profit on the total capital requirements, before taxes, would amount to about 27.2%.

5. COST PER MAN EMPLOYED

One direct worker and one indirect worker or a total of two workers, are employed.

The total fixed capital investment is estimated at \$11,000.

Based on these figures, the fixed investment per man employed would amount to \$5,500.

C. PRODUCTION REQUIREMENTS - ALUMINUM FOUNDRY

I. P. No. 67308

ANNUAL CAPACITY - ONE SHIFT OPERATION: \$45,000 SALES

S.I.C. 3361

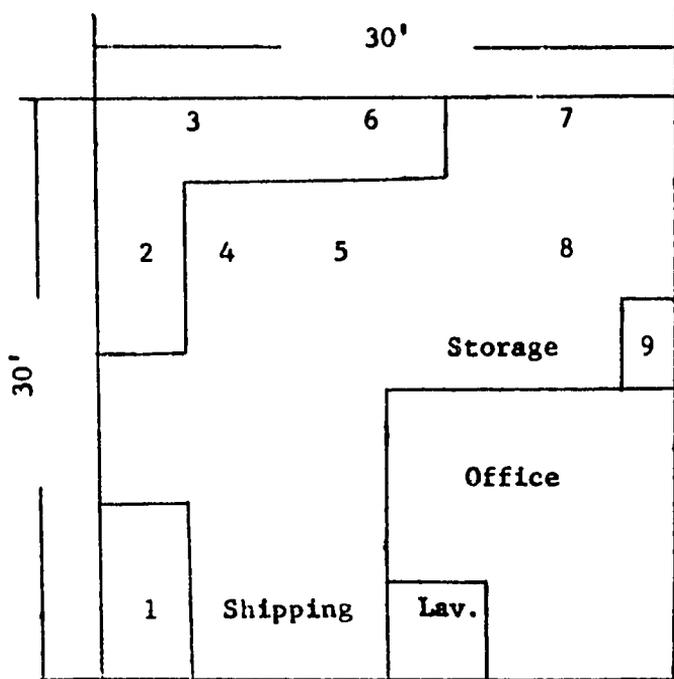

NOTE: COSTS AND OPERATING DATA ARE BASED ON UNITED STATES PRICES AND PRACTICES**

1. CAPITAL REQUIREMENTS			3. POWER, FUEL AND WATER		
a. Fixed Capital		Cost			Annual Cost
Land - 10,000 sq. ft.			Electric Power - 1 H.P.		
Building - one story 30' x 30'			Fuel - oil for furnace and core oven		
Equipment, furniture & fixtures			Water - sanitation and fire protection		\$ 1,070

VII. PROFESSIONAL ENGINEERING SERVICES

The services of professional engineers are desirable in the design of industrial plants even though the proposed plant may be small.

A correct design is one which provides the greatest economy in the investment of funds and establishes the basis of operation that will be most profitable in the beginning and will also be capable of expansion without expensive alteration.

The addresses of professional engineers who specialize in Industrial Design, some of whom may be willing to undertake such work on low cost projects overseas, can be secured by reference to the published cards in various engineering magazines.

They may also be reached through their national organizations, one of which is the:

National Society of Professional Engineers
2029 K Street, N.W.
Washington, D.C. 20006

Manufacturers of industrial equipment employ engineers familiar with the design and installation of their specialized products. These manufacturers are usually willing to give prospective customers the benefit of technical advice by those engineers in determining the suitability of their equipment in any proposed project. The equipment manufacturer also knows, and can recommend, professional engineers in private practice who are willing and able to provide appropriate consulting services.

PRE-INVESTMENT FEASIBILITY STUDY SUGGESTED

The foregoing information must be necessarily presented in concise form. Before an investment is made in a plant a feasibility study is suggested. The investor, for his planning, should have more information dealing with the specific locality contemplated. For obvious reasons, such information cannot be included in *Industry Profiles*. Such a study, therefore, should explore local factors and conditions, including costs, sources of raw materials and supplies, availability of utilities and fuel, manpower, transportation, etc.

The investor will need reasonably accurate information on Government and legal requirements, banking and financing, potential demand, competition, construction services, and manpower training requirements. Further, he should consider developing plans for management and production controls, operating procedures, and sales promotion.

ORDERING INSTRUCTIONS

The price of *Industry Profiles* is a minimum of \$3.00 for from one to five "*Profiles*." The purchaser may select up to five of any "*Profiles*" available.

Complete sets of the 250 *Industry Profiles* published in 1966, I. P. No. 66001 through I. P. No. 66250 consecutively, may be purchased for \$125.00 per set. Complete sets of the 150 *Industry Profiles* to be published in 1967, I. P. No. 67251 through I. P. No. 67400 consecutively, may be purchased for \$75.00 per set. The latter "*Profiles*" will automatically be shipped to full set purchasers upon release.

Address orders to: U.S. Department of Commerce
Clearinghouse for Federal Scientific and
Technical Information, 410.12
Springfield, Virginia 22151

Prepayment is required. Make check or money order payable to National Bureau of Standards—CFSTI. Clearinghouse deposit account holders may charge purchases to their accounts.

GENERAL INFORMATION

An *Index of Industry Profiles* is available on request from the agency for International Development, AA/PRR, Washington, D. C. 20523.

This *Industry Profile* was prepared for the U. S. Agency for International Development by International Development Services Inc., Washington, D. C.

INDUSTRY PROFILES

FOUNDRY PATTERN MAKING

I. P. No. 67309

S. I. C. 3565

Industry Profiles are intended to promote the development of private industry in the developing countries by assembling economic and technical information in a professional analysis to support basic decisions in the establishment of small or medium-scale plants in a specific industry. The information contained in a profile is selected and organized for the guidance of the entrepreneur in the less developed country.

Industry Profiles contain basic information on market aspects, production rates, capital requirements, materials and supplies, utilities, manpower operating costs and sales revenues. Work-flow diagrams and, in some instances, machinery layouts are included along with references to sources of technical information, professional services, patents, materials and equipment.

The profiles adopt as a benchmark, productivity rates and costs which could be anticipated under conditions prevailing in the United States. Anticipated profits are before taxes. Since conditions vary widely from country to country, the entrepreneur using this profile must make suitable adjustments to conditions prevailing in his country. This profile should help in reaching correct assumptions.

25

FOUNDRY PATTERN MAKING

PRODUCT DESCRIPTION

Wood patterns for use in both ferrous and non-ferrous foundries.

A. GENERAL EVALUATION OF PROSPECTS

The prospects for this industry depend upon the amount of other industries within the country requiring pattern marking. Many industries buy their own patterns so that they can procure foundry work at any foundry by merely furnishing the patterns. The sales of these products, therefore, would derive from both foundries and industries that use castings. The plant described in this profile is small and can easily be expanded should business warrant. Where an adequate potential sales volume in foundry patterns exists, this industry should prove a good investment.

B. MARKET ASPECTS

1. USERS

Foundries and industries that use castings.

2. SALES CHANNELS AND EXTENT OF MARKET

Sales would be made direct to users. The market for this industry depends upon the number of foundries using castings. A sales survey should be made to determine the dollar value of patterns purchased locally by foundries and industry each year. Patterns should be distributed nationally. They are not usually found in the export market. The only competition that can be expected, therefore, is from other plants of this or larger capacity within the same country. A great deal of skill is required in pattern making which puts quality of product in first place as a competitive factor.

3. RATE OF PROFIT

It should be emphasized that the information under "Production Requirements" on the next page illustrates typical U.S. cost relationships of the various factors entering into the manufacture in the United States of a specified product. It is generally recognized that profits before taxes of manufacturers in the United States may be appreciably lower than normally would be the case in a developing country. While certain imported capital items and specialized technical services may be higher in cost in developing countries, certain other significant production costs such as semi-skilled and unskilled labor, materials and supplies obtained locally may be significantly lower. Factors vitally affecting industrial production costs and profit margins such as degree of competition, size of market, availability of labor, availability of risk capital, relative financial risk, level of industry taxes, and general economic and political stability have widely differing interrelationships and impact on the selling price and profit margin of a manufactured product in a developing country as compared with the United States. Planned operations and production limits would, of necessity, have to be adapted to cost and profit conditions existing in a particular developing country as a first step in determining whether a more intensive survey of the manufacturing possibilities for a particular product and industry is warranted.

4. SELECTED GROSS PROFIT ITEMS

(See supporting data on page 3)

The annual gross sales revenue is estimated at \$84,000.

The total fixed investment, plus working capital, is estimated at \$60,000.

The annual gross profit, before taxes, is estimated at \$13,000.

Based on these figures, the profit on gross sales, before taxes, amounts to about 15.5%.

(A gross profit on sales, before taxes, of 15.5%, while reflecting U.S. experience, should not be considered normal for a developing country, where profit margins may be considerably higher in industry and trade.)

The annual profit on the total capital requirements, before taxes, would amount to about 21.7%.

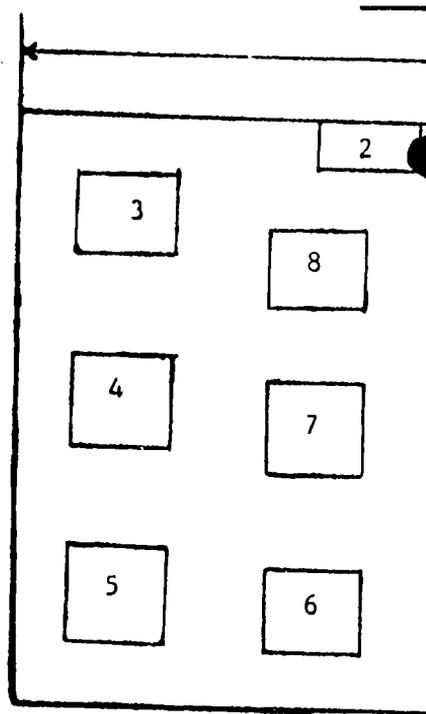

5. COST PER MAN EMPLOYED

Three direct workers and three indirect workers, or a total of six workers, are employed.

The total fixed capital investment is estimated at \$33,000.

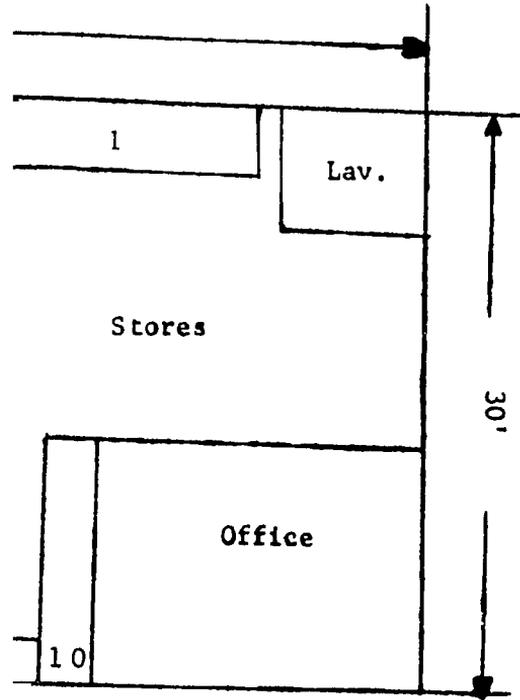

Based on these figures, the fixed investment per man employed would amount to \$5,500.

92

INDUSTRY PROFILES

JIGS AND FIXTURES

I. P. No. 67310

S. I. C. 3544

Industry Profiles are intended to promote the development of private industry in the developing countries by assembling economic and technical information in a professional analysis to support basic decisions in the establishment of small or medium-scale plants in a specific industry. The information contained in a profile is selected and organized for the guidance of the entrepreneur in the less developed country.

Industry Profiles contain basic information on market aspects, production rates, capital requirements, materials and supplies, utilities, manpower operating costs and sales revenues. Work-flow diagrams and, in some instances, machinery layouts are included along with references to sources of technical information, professional services, patents, materials and equipment.

The profiles adopt as a benchmark, productivity rates and costs which could be anticipated under conditions prevailing in the United States. Anticipated profits are before taxes. Since conditions vary widely from country to country, the entrepreneur using this profile must make suitable adjustments to conditions prevailing in his country. This profile should help in reaching correct assumptions.

PRODUCT DESCRIPTION

Design and production of jigs and fixtures for metal working industries. Plant could also perform die sinking.

A. GENERAL EVALUATION OF PROSPECTS

Prospects for this industry depend largely upon the number of small industries within a country needing jigs, fixtures and small dies for precision work. Large plants usually have their own tool room. The fixed investment for this plant is modest in comparison with the gross sales and the annual gross profits.

B. MARKET ASPECTS1. USERS

Small industries that do not have their own tool room.

2. SALES CHANNELS AND EXTENT OF MARKET

Sales would be made direct to small plants and industries. The market needed to support this plant depends entirely upon the needs of small industries without their own tool-making facilities. This plant could do production work on a contract basis for small industries as well as produce jigs and fixtures. When making a feasibility survey for this plant, this should be taken into consideration. The extent of the domestic market will include all areas where small industries exist. Jigs and fixtures are small and well packaged and the transportation cost in relation to the value of the finished product is low. A large number of machine tools are required to manufacture jigs and fixtures and only large plants of the kind described in this profile could produce any form of competition. Jigs and fixtures are not usually exported although this plant might make some sales in neighboring countries not enjoying this plant's capabilities.

3. RATE OF PROFIT

It should be emphasized that the information under "Production Requirements" on the next page illustrates typical U.S. cost relationships of the various factors entering into the manufacture in the United States of a specified product. It is generally recognized that profits before taxes of manufacturers in the United States may be appreciably lower than normally would be the case in a developing country. While certain imported capital items and specialized technical services may be higher in cost in developing countries, certain other significant production costs such as semi-skilled and unskilled labor, materials and supplies obtained locally may be significantly lower. Factors vitally affecting industrial products costs and profit margins such as degree of competition, size of market, availability of labor, availability of risk capital, relative financial risk, level of industry taxes, and general economic and political stability have widely differing interrelationships and impact on the selling price and profit margin of a manufactured product in a developing country as compared with the United States. Planned operations and production limits would, of necessity, have to be adapted to cost and profit conditions existing in a particular developing country as a first step in determining whether a more intensive survey of the manufacturing possibilities for a particular product and industry is warranted.

4. SELECTED GROSS PROFIT ITEMS

(See supporting data on page 3)

The annual gross sales revenue is estimated at \$200,000.

The total fixed investment, plus working capital, is estimated at \$173,700.

The annual gross profit, before taxes, is estimated at \$30,000.

Using these figures, the profit on gross sales, before taxes, amounts to about 15%.

(A gross profit on sales, before taxes, of 15%, while reflecting U.S. experience, should not be considered normal for a developing country where profit margins may be considerably higher in industry and trade.)

The annual profit on the total capital requirements, before taxes, is estimated at 17.3%.

5. COST PER MAN EMPLOYED

Nine direct and five indirect workers, or a total of fourteen workers, are employed.

The total fixed capital investment is estimated at \$141,000.

Based on these figures, the fixed investment per man employed would amount to about \$10,070.

VII. PROFESSIONAL ENGINEERING SERVICES

The services of professional engineers are desirable in the design of industrial plants even though the proposed plant may be small.

A correct design is one which provides the greatest economy in the investment of funds and establishes the basis of operation that will be most profitable in the beginning and will also be capable of expansion without expensive alteration.

The addresses of professional engineers who specialize in Industrial Design, some of whom may be willing to undertake such work on low cost projects overseas, can be secured by referring to the published cards in various engineering magazines.

They may also be reached through their national organizations, one of which is the:

National Society of Professional Engineers
2029 K Street, N.W.
Washington, D.C. 20006

Manufacturers of industrial equipment employ engineers familiar with the design and installation of their specialized products. These manufacturers are usually willing to give prospective customers the benefit of technical advice by those engineers in determining the suitability of their equipment in any proposed project. The equipment manufacturer also knows, and can recommend, professional engineers in private practice who are willing and able to provide appropriate consulting services.

PRE-INVESTMENT FEASIBILITY STUDY SUGGESTED

The foregoing information must be necessarily presented in concise form. Before an investment is made in a plant a feasibility study is suggested. The investor, for his planning, should have more information dealing with the specific locality contemplated. For obvious reasons, such information cannot be included in *Industry Profiles*. Such a study, therefore, should explore local factors and conditions, including costs, sources of raw materials and supplies, availability of utilities and fuel, manpower, transportation, etc.

The investor will need reasonably accurate information on Government and legal requirements, banking and financing, potential demand, competition, construction services, and manpower training requirements. Further, he should consider developing plans for management and production controls, operating procedures, and sales promotion.

ORDERING INSTRUCTIONS

The price of *Industry Profiles* is a minimum of \$3.00 for from one to five "*Profiles*." The purchaser may select up to five of any "*Profiles*" available.

Complete sets of the 250 *Industry Profiles* published in 1966, I. P. No. 66001 through I. P. No. 66250 consecutively, may be purchased for \$125.00 per set. Complete sets of the 150 *Industry Profiles* to be published in 1967, I. P. No. 67251 through I. P. No. 67400 consecutively, may be purchased for \$75.00 per set. The latter "*Profiles*" will automatically be shipped to full set purchasers upon release.

Address orders to: U.S. Department of Commerce
Clearinghouse for Federal Scientific and
Technical Information, 410.12
Springfield, Virginia 22151

Prepayment is required. Make check or money order payable to National Bureau of Standards—CFSTI. Clearinghouse deposit account holders may charge purchases to their accounts.

GENERAL INFORMATION

An *Index of Industry Profiles* is available on request from the agency for International Development, AA/PRR, Washington, D. C. 20523.

This *Industry Profile* was prepared for the U. S. Agency for International Development by International Development Services Inc., Washington, D. C.

INDUSTRY PROFILES

PROCESSED SEA FOOD

I P. No. 67311

S I. C. 2036

Industry Profiles are intended to promote the development of private industry in the developing countries by assembling economic and technical information in a professional analysis to support basic decisions in the establishment of small or medium-scale plants in a specific industry. The information contained in a profile is selected and organized for the guidance of the entrepreneur in the less developed country.

Industry Profiles contain basic information on market aspects, production rates, capital requirements, materials and supplies, utilities, manpower operating costs and sales revenues. Work-flow diagrams and, in some instances, machinery layouts are included along with references to sources of technical information, professional services, patents, materials and equipment.

The profiles adopt as a benchmark, productivity rates and costs which could be anticipated under conditions prevailing in the United States. Anticipated profits are before taxes. Since conditions vary widely from country to country, the entrepreneur using this profile must make suitable adjustments to conditions prevailing in his country. This profile should help in reaching correct assumptions.

PROCESSED SEAFOOD

PRODUCT DESCRIPTION

Frozen breaded or frozen fried fish, shrimp, frozen lobster tails. The product mix can be adapted to the varieties available and to the market demand.

A. GENERAL EVALUATION OF PROSPECTS

The plant requires a fairly large capital investment, a highly skilled management and ten skilled workers, although most of the laborers need not be highly skilled. There must, of course, be an adequate supply of suitable fish. There is a growing demand for processed seafood and wherever a continuous and adequate supply of seafood is available for processing the year around, this industry should represent a good investment, providing highly skilled management is employed.

B. MARKET ASPECTS

1. USERS

Households and where food is served.

2. SALES CHANNELS AND EXTENT OF MARKET

Sales will generally be made to wholesale food distributors and, in some cases, direct to large consumers. The market needed for this plant will depend on a sufficiently high per capita income and the acceptability of seafood in the ordinary diet of the population. Where the average income is high enough to permit most people to buy these products and where seafood is usual in the eating habits, an adequate market for the production of this plant should be found. Since this plant requires a fairly large investment, the only domestic competition would arise from the fresh fish industries. As a rule, however, in tropical countries, fresh fish are not shipped long distances. The extent of the domestic market for this product will depend upon the existence of refrigeration equipment including refrigerated transportation and customer-owned refrigeration facilities. Where such refrigeration is available, the extent of the domestic market would be nationwide. The ability of this plant to export surplus production will depend on the type and quality of the products, the refrigeration facilities available and the ability of management to control costs.

3. RATE OF PROFIT

It should be emphasized that the information under "Production Requirements" on the next page illustrates typical U.S. cost relationships of the various factors entering into the manufacture in the United States of a specified product. It is generally recognized that profits before taxes of manufacturers in the United States may be appreciably lower than normally would be the case in a developing country. While certain imported capital items and specialized technical services may be higher in cost in developing countries, certain other significant production costs such as semi-skilled and unskilled labor, materials and supplies obtained locally may be significantly lower. Factors vitally affecting industrial products costs and profit margins such as degree of competition, size of market, availability of labor, availability of risk capital, relative financial risk, level of industry taxes, and general economic and political stability have widely differing interrelationships and impact on the selling price and profit margin of a manufactured product in a developing country as compared with the United States. Planned operations and production limits would, of necessity, have to be adapted to cost and profit conditions existing in a particular developing country as a first step in determining whether a more intensive survey of the manufacturing possibilities for a particular product and industry is warranted.

4. SELECTED GROSS PROFIT ITEMS

(See supporting data on page 3)

The annual gross sales revenue is estimated at \$1,150,000

The total fixed investment, plus working capital, is estimated at \$640,600.

The annual gross profit, before taxes, is estimated at \$104,000.

Based on these figures, the profit on gross sales, before taxes, amounts to about 9.0%.

(A gross profit on sales, before taxes, of 9.0%, while reflecting U. S. experience, should not be considered normal for a developing country where profit margins may be considerably higher in industry and trade.)

The annual profit on the total capital requirements, before taxes, would amount to about 16.0%.

5. COST PER MAN EMPLOYED

Seventy-three direct workers and eleven indirect workers, or a total of eighty-four workers, are employed. The total fixed capital investment is estimated at \$450,000.

Based on these figures, the fixed investment per man employed would amount to \$5,357.

C. PRODUCTION REQUIREMENTS - PROCESSED SEAFOOD
ANNUAL CAPACITY - ONE SHIFT OPERATION: 2,400,000

I.P. No. 67311
 S.I.C. 2036

NOTE : COSTS AND OPERATING DATA ARE BASED ON UNITED STATES PRICES AND PRACTICES**

1. CAPITAL REQUIREMENTS		Cost
a. Fixed Capital		
Land - one acre at pier		
Building - one story, 90' x 125'		
Equipment, furniture & fixtures		
Prodn. tools & equipment		
Other tools & equipment		
Furniture & fixtures		
Transportation equipment		
Total fixed capital		\$450,000
Principal Items :		
Platform scales	Cooling Tunnel	
Flight elevator	Semi-automatic piston filler	
Washer		
Preparation conveyor	Heat sealer	
Washing and Drying conveyor	Cooling tank	
Battering machine	Shrimp peeler and deveiner	
Plate freezer	Compressor	
Sizer	Steam generator	
Batter mixer	Laboratory equipment	
Truck		
Steam jacketed kettles		
Band saws		
Fryer		
b. Working Capital (30 days)		
Direct materials		
Direct labor		
Manufacturing overhead		
Administrative costs		
Sales costs		
Freight-out, discounts, bad debts & allowances		
Sales revenue		
Training costs		
Total working capital		\$190,600
c. Total Capital Requirements		\$640,600

2. MATERIALS AND SUPPLIES		
	Annual Requirements	Annual Cost
a. Direct Materials		
Fish and shrimp		
Batter and breading mix		
Hydrogenated fat		
Wax paper overwrap		
Cartons and shipping cases		
Total direct materials		\$500,000
b. Supplies		
Lubricants & hand tools		
Cutting tools & abrasives		
Maintenance & spare parts		
Office supplies		
Cleaning & sanitizing chemicals		
rubber gloves and aprons		
Gas, oil and maintenance of truck		
Total supplies		\$ 6,400
c. Availability of materials & supplies		
Fresh fish must be available at pier.		
All supplies should be available locally.		
All are available in world markets.		

3. POWER, FUEL AND WATER		Annual Cost
Electric Power - 175 H. P. connected load		
Fuel - Bunker C oil		
Water - must be potable		\$ 7,000

4. DEPRECIATION	Yrs. life	Amount
Building	20	
Prodn. tools & equipment	10	
Other tools & equipment	10	
Furniture & fixtures	10	
Transportation equipment	4	
Total depreciation		\$ 38,600

5. MANPOWER		Number	Annual Cost
a. Indirect labor			
Manager	1		
Supervisors	2		
Office	3		
Inspectors	2		
Maintenance	2		
Truck Driver	1		
Total indirect labor	11		\$ 14,000

b. Direct labor			
Skilled workers	10		
Semi-skilled workers	13		
Unskilled workers	50		
Total direct labor	73		\$ 305,000

c. Training needs
 The manager, 2 supervisors and 2 inspectors must be fully experienced. They with the help of the skilled workers should be able to train all workers and reach full production in 30 days.

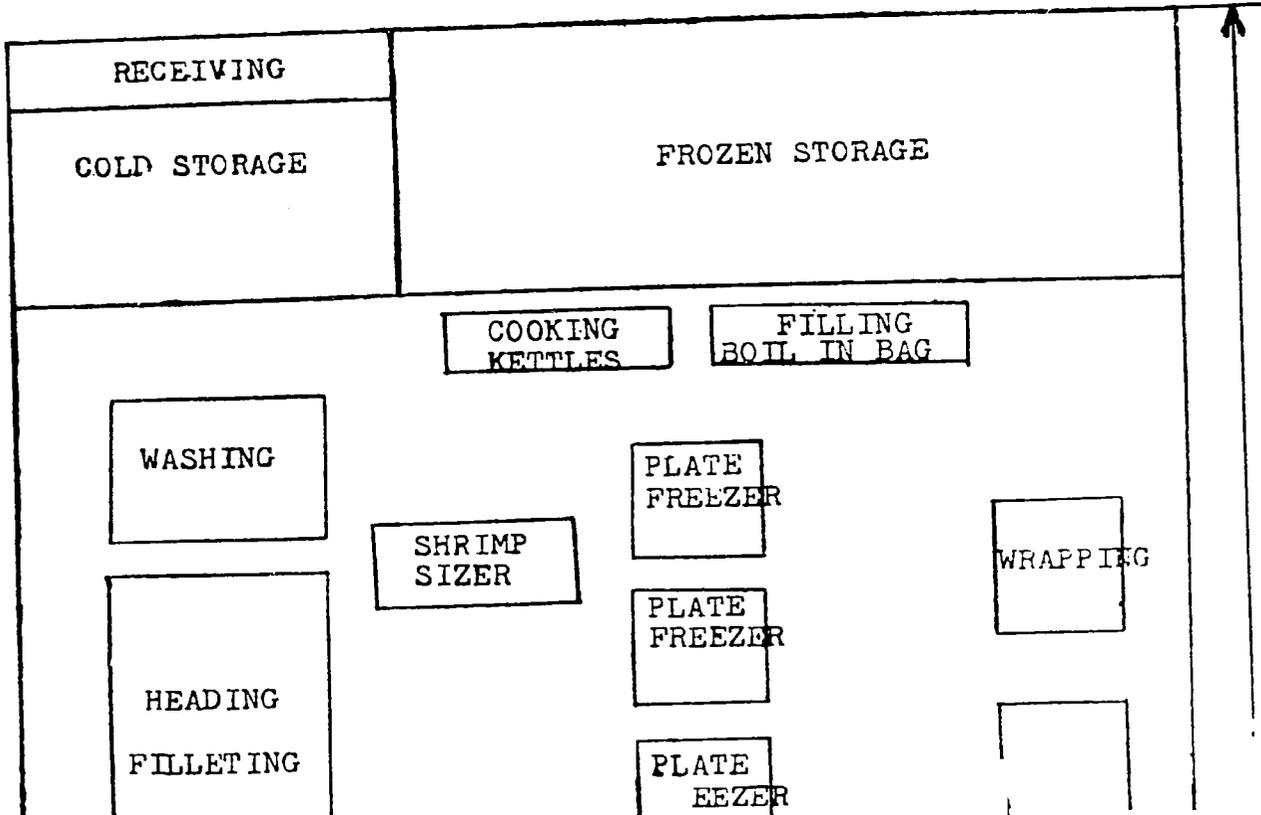

6. TRANSPORTATION	
a. Own transport equipment	
Truck - refrigerated	
b. External transport facilities	
Daily shipments of processed fish will amount to about 5 tons per day.	
Good highways.	

7. TOTAL ANNUAL COSTS AND SALES	
REVENUE	
Direct materials	\$500,000
Direct labor	305,000
Manufacturing overhead*	126,000
Total manufacturing cost	\$ 931,000
Interest on loans	
Insurance	
Legal	
Audit	
Contingencies	
Total administrative cost	\$ 65,000
Sales expense	\$ 37,000
Freight-out, travel discounts	
Allowances & bad debts	\$ 13,000
Total annual costs	\$1,046,000
Annual Gross Profit	\$ 104,000
ANNUAL SALES REVENUE	\$1,150,000

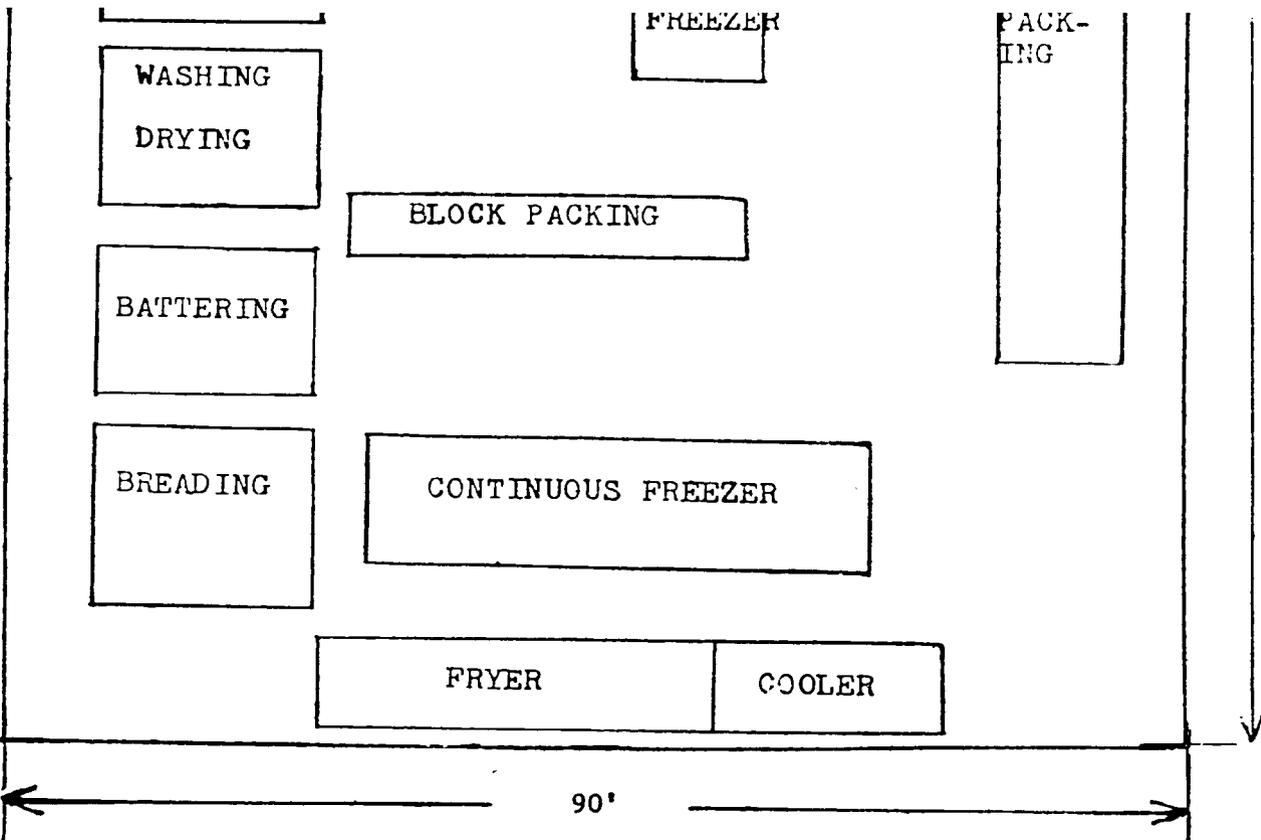

*Includes Supplies, Power, Fuel, Water, Depreciation and Indirect labor (2b-3-4-5a)
 **It was not found practical to show individual item costs because of wide variations in price and other factors, consequently only representative totals are used.

INDUSTRY PROFILES

CANNED DEHYDRATED ONIONS

I. P. No. 67312

S. I. C. 2034

Industry Profiles are intended to promote the development of private industry in the developing countries by assembling economic and technical information in a professional analysis to support basic decisions in the establishment of small or medium-scale plants in a specific industry. The information contained in a profile is selected and organized for the guidance of the entrepreneur in the less developed country.

Industry Profiles contain basic information on market aspects, production rates, capital requirements, materials and supplies, utilities, manpower operating costs and sales revenues. Work-flow diagrams and, in some instances, machinery layouts are included along with references to sources of technical information, professional services, patents, materials and equipment.

The profiles adopt as a benchmark, productivity rates and costs which could be anticipated under conditions prevailing in the United States. Anticipated profits are before taxes. Since conditions vary widely from country to country, the entrepreneur using this profile must make suitable adjustments to conditions prevailing in his country. This profile should help in reaching correct assumptions.

PRODUCT DESCRIPTION

Dehydrated onions in No. 10 cans (canners' designation 306-700, i.e. 6 3/16" in diameter and 7" in height.)

A. GENERAL EVALUATION OF PROSPECTS

An assured adequate supply of suitable, locally-grown onions is essential. The plant would operate 24 hours a day for about 130 days a year. Therefore, a supply of seasonal workers would be required. The capital requirements for this plant are moderately high. The demand for this product is increasing. If a high standard of product quality is maintained, there should be no difficulty in finding market outlets. However, a feasibility study of this project should be made covering source of material, labor, market, and all other important factors.

B. MARKET ASPECTS1. USERS

Households and wherever food is served.

2. SALES CHANNELS AND METHODS

Sales would be made to wholesalers and direct to large retailers, military installations and other large consumers. There are many factors to be considered in arriving at the market needed to support this factory. In tropical and semi tropical countries where onions could be grown the year around, sales would naturally be adversely affected. The cost of dehydrated onions might prohibit their use where the per capita income is low and the supply of raw fresh onions ample. The use of onions in the diet varies from country to country. Therefore, a survey of market potential is mandatory. Dehydrated onions are light and well packaged, presenting no transportation problem, so the domestic market should be nationwide. This is a distinctive product with no direct substitutes and it cannot be produced without a sizeable investment. Therefore, no domestic competition should be expected unless it comes from other plants producing the same product. Dehydrated onions are exported worldwide. But a plant of this size might be at a disadvantage in competing in world markets with mass product.

3. RATE OF PROFIT

It should be emphasized that the information under "Production Requirements" on the next page illustrates typical U. S. cost relationships of the various factors entering into the manufacture in the United States of a specified product. It is generally recognized that profits before taxes of manufacturers in the United States may be appreciably lower than normally would be the case in a developing country. While certain imported capital items and specialized technical services may be higher in cost in developing countries certain other significant production costs such as semi-skilled and unskilled labor, materials and supplies obtained locally may be significantly lower. Factors vitally affecting industrial products costs and profit margins such as degree of competition, size of market, availability of labor, availability of risk capital, relative financial risk, level of industry taxes, and general economic and political stability have widely differing interrelationships and impact on the selling price and profit margin of a manufactured product in a developing country as compared with the United States. Planned operations and production limits would, of necessity, have to be adapted to cost and profit conditions existing in a particular developing country as a first step in determining whether a more intensive survey of the manufacturing possibilities for a particular product and industry is warranted.

4. SELECTED GROSS PROFIT ITEMS

(See supporting data on page 3)

The annual gross sales revenue is estimated at \$600,000.

The total fixed investment, plus working capital, is estimated at \$580,100.

The annual gross profit, before taxes, is estimated at \$50,000.

Based on these figures, the profit on gross sales, before taxes, amounts to about 8.3%.

(A gross profit on sales, before taxes, of 8.3%, while reflecting U. S. experience, should not be considered normal for a developing country where profit margins may be considerably higher in industry and trade.)

The annual profit on the total capital requirements, before taxes, would amount to about 8.6%.

5. COST PER MAN EMPLOYED

Forty-nine direct workers and ten indirect workers, or a total of fifty-nine workers are employed.

The total fixed capital investment is estimated at \$480,000.

Based on these figures, the fixed investment per man employed would amount to about \$8,135.

C. PRODUCTION REQUIREMENTS - CANNED DEHYDRATED ONIONS
ANNUAL CAPACITY - THREE SHIFT OPERATION, 130 DAYS:
520,000 CANS

VII. PROFESSIONAL ENGINEERING SERVICES

The services of professional engineers are desirable in the design of industrial plants even though the proposed plant may be small.

A correct design is one which provides the greatest economy in the investment of funds and establishes the basis of operation that will be most profitable in the beginning and will also be capable of expansion without expensive alteration.

The addresses of professional engineers who specialize in the Industrial Design, some of whom may be willing to undertake such work on low cost projects overseas, can be secured by reference to the published cards in various engineering magazines.

They may also be reached through their national organizations, one of which is the:

National Society of Professional Engineers
2029 K Street, N. W.
Washington, D. C. 20006

Manufacturers of industrial equipment employ engineers familiar with the design and installation of their specialized products. These manufacturers are usually willing to give prospective customers the benefit of technical advice by those engineers in determining the suitability of their equipment in any proposed project. The equipment manufacturer also knows, and can recommend, professional engineers in private practice who are willing and able to provide appropriate consulting services.

PRE-INVESTMENT FEASIBILITY STUDY SUGGESTED

The foregoing information must be necessarily presented in concise form. Before an investment is made in a plant a feasibility study is suggested. The investor, for his planning, should have more information dealing with the specific locality contemplated. For obvious reasons, such information cannot be included in *Industry Profiles*. Such a study, therefore, should explore local factors and conditions, including costs, sources of raw materials and supplies, availability of utilities and fuel, manpower, transportation, etc.

The investor will need reasonably accurate information on Government and legal requirements, banking and financing, potential demand, competition, construction services, and manpower training requirements. Further, he should consider developing plans for management and production controls, operating procedures, and sales promotion.

ORDERING INSTRUCTIONS

The price of *Industry Profiles* is a minimum of \$3.00 for from one to five "*Profiles*." The purchaser may select up to five of any "*Profiles*" available.

Complete sets of the 250 *Industry Profiles* published in 1966, I. P. No. 66001 through I. P. No. 66250 consecutively, may be purchased for \$125.00 per set. Complete sets of the 150 *Industry Profiles* to be published in 1967, I. P. No. 67251 through I. P. No. 67400 consecutively, may be purchased for \$75.00 per set. The latter "*Profiles*" will automatically be shipped to full set purchasers upon release.

Address orders to: U.S. Department of Commerce
Clearinghouse for Federal Scientific and
Technical Information, 410.12
Springfield, Virginia 22151

Prepayment is required. Make check or money order payable to National Bureau of Standards—CFSTI. Clearinghouse deposit account holders may charge purchases to their accounts.

GENERAL INFORMATION

An *Index of Industry Profiles* is available on request from the agency for International Development, AA/PRR, Washington, D. C. 20523.

This *Industry Profile* was prepared for the U. S. Agency for International Development by International Development Services Inc., Washington, D. C.

INDUSTRY PROFILES

GLUCOSE FROM CASSAVA STARCH

I. P. No. 67313

S. I. C. 2041

Industry Profiles are intended to promote the development of private industry in the developing countries by assembling economic and technical information in a professional analysis to support basic decisions in the establishment of small or medium-scale plants in a specific industry. The information contained in a profile is selected and organized for the guidance of the entrepreneur in the less developed country.

Industry Profiles contain basic information on market aspects, production rates, capital requirements, materials and supplies, utilities, manpower operating costs and sales revenues. Work-flow diagrams and, in some instances, machinery layouts are included along with references to sources of technical information, professional services, patents, materials and equipment.

The profiles adopt as a benchmark, productivity rates and costs which could be anticipated under conditions prevailing in the United States. Anticipated profits are before taxes. Since conditions vary widely from country to country, the entrepreneur using this profile must make suitable adjustments to conditions prevailing in his country. This profile should help in reaching correct assumptions.

PRODUCT DESCRIPTION

Glucose sold in bulk, shipped in tank cars or tank trucks.

A. GENERAL EVALUATION OF PROSPECTS

The prospects for this industry will depend on the adequate supply of wet cassava starch. This supply must be sufficient for the plant to operate 24 hours per day, 250 days per year. Glucose is used in a wide variety of food and other industries. The fixed capital investment is fairly moderate. Only three skilled workers are required. If the raw materials and sales potential are available, this industry should represent a good investment.

B. MARKET ASPECTS

1. USERS

Industries including manufacture of foodstuffs, medical preparations, tanning and finishing of leather, rayon manufacture and moisture conditioning of tobacco.

2. SALES CHANNELS AND EXTENT OF MARKET

Sales would be made in bulk directly to industries. The market depends upon the utilization of the product by a variety of local industries. The plant should undertake nationwide distribution since bulk shipment to widely dispersed industries is a comparatively low-cost method of transportation. Since the investment required to produce this product prohibits competition from small factories, the only domestic competition encountered would arise from other plants of relative size producing the same product. If raw material is available locally and the plant is well managed, efficiently operated and turns out a high-quality product, there should be little difficulty in competing with imported products. This plant could also consider entering the worldwide market for glucose if shipping and tariff costs are not inordinately high.

3. RATE OF PROFIT

It should be emphasized that the information under "Production Requirements" on the next page illustrates typical U.S. cost relationships of the various factors entering into the manufacture in the United States of a specified product. It is generally recognized that profits before taxes of manufacturers in the United States may be appreciably lower than normally would be the case in a developing country. While certain imported capital items and specialized technical services may be higher in cost in developing countries, certain other significant production costs such as semi-skilled and unskilled labor, materials and supplies obtained locally may be significantly lower. Factors vitally affecting industrial products costs and profit margins such as degree of competition, size of market, availability of labor, availability of risk capital, relative financial risk, level of industry taxes, and general economic and political stability have widely differing interrelationships and impact on the selling price and profit margin of a manufactured product in a developing country as compared with the United States. Planned operations and production limits would, of necessity, have to be adapted to cost and profit conditions existing in a particular developing country as a first step in determining whether a more intensive survey of the manufacturing possibilities for a particular product and industry is warranted.

4. SELECTED GROSS PROFIT ITEMS

(See supporting data on page 3)

The annual gross sales revenue is estimated at \$360,000.

The total fixed investment, plus working capital, is estimated at \$370,200.

The annual gross profit, before taxes, is estimated at \$48,000.

Using these figures, the profit on gross sales, before taxes, amounts to about 13.3%.

(A gross profit on sales, before taxes, of 13.3%, while reflecting U.S. experience, should not be considered normal for a developing country where profit margins may be considerably higher in industry and trade.)

The annual profit on the total capital requirements, before taxes, is estimated at 13%.

5. COST PER MAN EMPLOYED

Fifteen direct and six indirect workers, or a total of twenty-one workers, are employed.

The total fixed capital investment is estimated at \$312,000.

Based on these figures, the fixed investment per man employed would amount to about \$14,860.

C. PRODUCTION REQUIREMENTS - GLUCOSE FROM CASSAVA STARCH I.P. No. 67313

PRE-INVESTMENT FEASIBILITY STUDY SUGGESTED

The foregoing information must be necessarily presented in concise form. Before an investment is made in a plant a feasibility study is suggested. The investor, for his planning, should have more information dealing with the specific locality contemplated. For obvious reasons, such information cannot be included in *Industry Profiles*. Such a study, therefore, should explore local factors and conditions, including costs, sources of raw materials and supplies, availability of utilities and fuel, manpower, transportation, etc.

The investor will need reasonably accurate information on Government and legal requirements, banking and financing, potential demand, competition, construction services, and manpower training requirements. Further, he should consider developing plans for management and production controls, operating procedures, and sales promotion.

ORDERING INSTRUCTIONS

The price of *Industry Profiles* is a minimum of \$3.00 for from one to five "*Profiles*." The purchaser may select up to five of any "*Profiles*" available.

Complete sets of the 250 *Industry Profiles* published in 1966, I. P. No. 66001 through I. P. No. 66250 consecutively, may be purchased for \$125.00 per set. Complete sets of the 150 *Industry Profiles* to be published in 1967, I. P. No. 67251 through I. P. No. 67400 consecutively, may be purchased for \$75.00 per set. The latter "*Profiles*" will automatically be shipped to full set purchasers upon release.

Address orders to: U.S. Department of Commerce
Clearinghouse for Federal Scientific and
Technical Information, 410.12
Springfield, Virginia 22151

Prepayment is required. Make check or money order payable to National Bureau of Standards—CFSTI. Clearinghouse deposit account holders may charge purchases to their accounts.

GENERAL INFORMATION

An *Index of Industry Profiles* is available on request from the agency for International Development, AA/PRR, Washington, D. C. 20523.

This *Industry Profile* was prepared for the U. S. Agency for International Development by International Development Services Inc., Washington, D. C.

INDUSTRY PROFILES

HIGH ALUMINA REFRACTORY BRICK AND CEMENT

I. P. No. 67314

S. I. C. 3297

Industry Profiles are intended to promote the development of private industry in the developing countries by assembling economic and technical information in a professional analysis to support basic decisions in the establishment of small or medium-scale plants in a specific industry. The information contained in a profile is selected and organized for the guidance of the entrepreneur in the less developed country.

Industry Profiles contain basic information on market aspects, production rates, capital requirements, materials and supplies, utilities, manpower operating costs and sales revenues. Work-flow diagrams and, in some instances, machinery layouts are included along with references to sources of technical information, professional services, patents, materials and equipment.

The profiles adopt as a benchmark, productivity rates and costs which could be anticipated under conditions prevailing in the United States. Anticipated profits are before taxes. Since conditions vary widely from country to country, the entrepreneur using this profile must make suitable adjustments to conditions prevailing in his country. This profile should help in reaching correct assumptions.

PRODUCT DESCRIPTION

High alumina refractory brick and cement of not over 70 percent aluminum oxide. The bricks will be 9" x 4 1/2" x 3" straight or their equivalent in arches, wedges, feather wedges, keys and other special shapes

A. GENERAL EVALUATION OF PROSPECTS

These products are used principally by industry. Therefore, the prospects for this business depend upon the number of industries within the country that require high alumina brick and cement. It is also important that raw materials be available locally.

B. MARKET ASPECTS

1. USERS

Industries are the principal users of these products.

2. SALES CHANNELS AND EXTENT OF MARKET

Sales would be made direct to industry and the market for these products depends entirely on industrial requirements. Therefore, a market survey of industry will determine the annual potential sales volume. These products are packaged well and the sales price permits nationwide distribution. Sales, of course, will probably center in urban industrial areas. This plant cannot be operated successfully on a small-volume basis. Only another plant of this size and capacity could offer any domestic competition. If the principal raw materials are available locally at reasonable cost and the plant is efficiently operated, this factory should have no difficulty competing against imported products. Some export sales to neighboring countries not having a plant of this size are feasible.

3. RATE OF PROFIT

It should be emphasized that the information under "Production Requirements" on the next page illustrates typical U.S. cost relationships of the various factors entering into the manufacture in the United States of a specified product. It is generally recognized that profits before taxes of manufacturers in the United States may be appreciably lower than normally would be the case in a developing country. While certain imported capital items and specialized technical services may be higher in cost in developing countries, certain other significant production costs such as semi-skilled and unskilled labor, materials and supplies obtained locally may be significantly lower. Factors vitally affecting industrial products costs and profit margins such as degree of competition, size of market, availability of labor, availability of risk capital, relative financial risk, level of industry taxes, and general economic and political stability have widely differing interrelationships and impact on the selling price and profit margin of a manufactured product in a developing country as compared with the United States. Planned operations and production limits would, of necessity, have to be adapted to cost and profit conditions existing in a particular developing country as a first step in determining whether a more intensive survey of the manufacturing possibilities for a particular product and industry is warranted.

4. SELECTED GROSS PROFIT ITEMS

(See supporting data on page 3)

The annual gross sales revenue is estimated at \$600,000.

The total fixed investment, plus working capital, is estimated at \$846,000.

The annual gross profit, before taxes, is estimated at \$90,000.

Using these figures, the profit on gross sales, before taxes, amounts to 15%.

(A gross profit on sales, before taxes, of 15%, while reflecting U.S. experience, should not be considered normal for a developing country where profit margins may be considerably higher in industry and trade.)

The annual profit on the total capital requirements, before taxes, is estimated at 10.6%.

5. COST PER MAN EMPLOYED

Seventeen direct and eight indirect workers, or a total of twenty-five workers, are employed. The total fixed capital investment is estimated at \$750,000.

Based on these figures, the fixed investment per man employed would amount to \$30,000.

C. PRODUCTION REQUIREMENTS - HIGH ALUMINA REFRACTORY BRICK AND CEMENT

I.P. No. 67314
S.I.C. 3297

Lists manufacturers and suppliers of raw materials and equipment to the ceramics industry.

VII. PROFESSIONAL ENGINEERING SERVICES

The services of professional engineers are desirable in the design of industrial plants even though the proposed plant may be small.

A correct design is one which provides the greatest economy in the investment of funds and establishes the basis of operation that will be most profitable in the beginning and will also be capable of expansion without expensive alteration.

The addresses of professional engineers who specialize in Industrial Design, some of whom may be willing to undertake such work on low cost projects overseas, can be secured by reference to the published cards in various engineering magazines.

They may also be reached through their national organizations, one of which is the:

National Society of Professional Engineers
2029 K Street, N. W.
Washington, D. C. 20006

Manufacturers of industrial equipment employ engineers familiar with the design and installation of their specialized products. These manufacturers are usually willing to give prospective customers the benefit of technical advice by those engineers in determining the suitability of their equipment in any proposed project. The equipment manufacturer also knows, and can recommend, professional engineers in private practice who are willing and able to provide appropriate consulting services.

PRE-INVESTMENT FEASIBILITY STUDY SUGGESTED

The foregoing information must be necessarily presented in concise form. Before an investment is made in a plant a feasibility study is suggested. The investor, for his planning, should have more information dealing with the specific locality contemplated. For obvious reasons, such information cannot be included in *Industry Profiles*. Such a study, therefore, should explore local factors and conditions, including costs, sources of raw materials and supplies, availability of utilities and fuel, manpower, transportation, etc.

The investor will need reasonably accurate information on Government and legal requirements, banking and financing, potential demand, competition, construction services, and manpower training requirements. Further, he should consider developing plans for management and production controls, operating procedures, and sales promotion.

INDUSTRY PROFILES

POTATO CHIPS

I. P. No. 67315

S. I. C. 2099

Industry Profiles are intended to promote the development of private industry in the developing countries by assembling economic and technical information in a professional analysis to support basic decisions in the establishment of small or medium-scale plants in a specific industry. The information contained in a profile is selected and organized for the guidance of the entrepreneur in the less developed country.

Industry Profiles contain basic information on market aspects, production rates, capital requirements, materials and supplies, utilities, manpower operating costs and sales revenues. Work-flow diagrams and, in some instances, machinery layouts are included along with references to sources of technical information, professional services, patents, materials and equipment.

The profiles adopt as a benchmark, productivity rates and costs which could be anticipated under conditions prevailing in the United States. Anticipated profits are before taxes. Since conditions vary widely from country to country, the entrepreneur using this profile must make suitable adjustments to conditions prevailing in his country. This profile should help in reaching correct assumptions.

PRODUCT DESCRIPTION

Potato chips packaged in glassine bags and friction sealed cans.

A. GENERAL EVALUATION OF PROSPECTS

This product will sell to the people in the upper income brackets in any country. However, in many countries where rice, for example, is the staple food and, in many cases, about the only food that the lower income people have to eat, potato chips will be a luxury seldom enjoyed.

B. MARKET ASPECTS1. USERS

This product is used in homes, hotels, restaurants, bars, clubs and wherever food is sold or served.

2. SALES CHANNELS AND EXTENT OF MARKET

Sales are usually made to retail stores and, in some cases, direct to large users. In many countries, this product would be considered a luxury item by a large percentage of the population. The market will vary, therefore, according to the income levels. This product is light and well packaged. Since it is used by practically everyone in the domestic market - providing it is an affordable expense - the market would be nationwide. A relatively large investment is required in order to produce potato chips. For this reason, domestic competition - if any - will come from other plants within the country with the same production capability. There should be no competition from imported potato chips since these are seldom found in the world trade market. However, small export sales to friendly, neighboring countries might be expected.

3. RATE OF PROFIT

It should be emphasized that the information under "Production Requirements" on the next page illustrates typical U. S. cost relationships of the various factors entering into the manufacture in the United States of a specified product. It is generally recognized that profits before taxes of manufacturers in the United States may be appreciably lower than normally would be the case in a developing country. While certain imported capital items and specialized technical services may be higher in cost in developing countries, certain other significant production costs such as semi-skilled and unskilled labor, materials and supplies obtained locally may be significantly lower. Factors vitally affecting industrial products costs and profit margins such as degree of competition, size of market, availability of labor, availability of risk capital, relative financial risk, level of industry taxes, and general economic and political stability have widely differing interrelationships and impact on the selling price and profit margin of a manufactured product in a developing country as compared with the United States. Planned operations and production limits would, of necessity, have to be adapted to cost and profit conditions existing in a particular developing country as a first step in determining whether a more intensive survey of the manufacturing possibilities for a particular product and industry is warranted.

4. SELECTED GROSS PROFIT ITEMS

(See supporting data on page 3)

The annual gross sales revenue is estimated at \$260,000.

The total fixed investment, plus working capital, is estimated at \$272,000.

The annual gross profit, before taxes, is estimated at \$24,000.

Using these figures, the profit on gross sales, before taxes, amounts to about 9.2%.

(A gross profit on sales, before taxes, of 9.2%, while reflecting U.S. experience, should not be considered normal for a developing country where profit margins may be considerably higher in industry and trade.)

The annual profit on total capital requirements, before taxes, is estimated at 8.8%.

5. COST PER MAN EMPLOYED

Twelve direct and six indirect workers, or a total of eighteen workers, are employed.

The total fixed capital investment is estimated at \$228,600.

Based on these figures, the fixed investment per man employed would amount to \$12,700.

C. PRODUCTION REQUIREMENTS - POTATO CHIPS

VII. PROFESSIONAL ENGINEERING SERVICES

The services of professional engineers are desirable in the design of industrial plants even though the proposed plant may be small.

A correct design is one which provides the greatest economy in the investment of funds and establishes the basis of operation that will be most profitable in the beginning and will also be capable of expansion without expensive alteration.

The addresses of professional engineers who specialize in Industrial Design, some of whom may be willing to undertake such work on low cost projects overseas, can be secured by reference to the published cards in various engineering magazines.

They may also be reached through their national organizations, one of which is the:

National Society of Professional Engineers
2029 K Street, N.W.
Washington, D.C. 20006

Manufacturers of industrial equipment employ engineers familiar with the design and installation of their specialized products. These manufacturers are usually willing to give prospective customers the benefit of technical advice by those engineers in determining the suitability of their equipment in any proposed project. The equipment manufacturer also knows, and can recommend, professional engineers in private practice who are willing and able to provide appropriate consulting services.

PRE-INVESTMENT FEASIBILITY STUDY SUGGESTED

The foregoing information must be necessarily presented in concise form. Before an investment is made in a plant a feasibility study is suggested. The investor, for his planning, should have more information dealing with the specific locality contemplated. For obvious reasons, such information cannot be included in *Industry Profiles*. Such a study, therefore, should explore local factors and conditions, including costs, sources of raw materials and supplies, availability of utilities and fuel, manpower, transportation, etc.

The investor will need reasonably accurate information on Government and legal requirements, banking and financing, potential demand, competition, construction services, and manpower training requirements. Further, he should consider developing plans for management and production controls, operating procedures, and sales promotion.

ORDERING INSTRUCTIONS

The price of *Industry Profiles* is a minimum of \$3.00 for from one to five "*Profiles*." The purchaser may select up to five of any "*Profiles*" available.

Complete sets of the 250 *Industry Profiles* published in 1966, I. P. No. 66001 through I. P. No. 66250 consecutively, may be purchased for \$125.00 per set. Complete sets of the 150 *Industry Profiles* to be published in 1967, I. P. No. 67251 through I. P. No. 67400 consecutively, may be purchased for \$75.00 per set. The latter "*Profiles*" will automatically be shipped to full set purchasers upon release.

Address orders to: U.S. Department of Commerce
Clearinghouse for Federal Scientific and
Technical Information, 410.12
Springfield, Virginia 22151

Prepayment is required. Make check or money order payable to National Bureau of Standards—CFSTI. Clearinghouse deposit account holders may charge purchases to their accounts.

GENERAL INFORMATION

An *Index of Industry Profiles* is available on request from the agency for International Development, AA/PRR, Washington, D. C. 20523.

This *Industry Profile* was prepared for the U. S. Agency for International Development by International Development Services Inc., Washington, D. C.

INDUSTRY PROFILES

SHEET STEEL, HOT ROLLED

I. P. No. 67316

S. I. C. 3316

Industry Profiles are intended to promote the development of private industry in the developing countries by assembling economic and technical information in a professional analysis to support basic decisions in the establishment of small or medium-scale plants in a specific industry. The information contained in a profile is selected and organized for the guidance of the entrepreneur in the less developed country.

Industry Profiles contain basic information on market aspects, production rates, capital requirements, materials and supplies, utilities, manpower operating costs and sales revenues. Work-flow diagrams and, in some instances, machinery layouts are included along with references to sources of technical information, professional services, patents, materials and equipment.

The profiles adopt as a benchmark, productivity rates and costs which could be anticipated under conditions prevailing in the United States. Anticipated profits are before taxes. Since conditions vary widely from country to country, the entrepreneur using this profile must make suitable adjustments to conditions prevailing in his country. This profile should help in reaching correct assumptions.

PRODUCT DESCRIPTION

Sheet steel, 15 to 25 gauge, 48" wide, for the manufacture of lightweight fixtures.

A. GENERAL EVALUATION OF PROSPECTS

For the tonnage involved in the production of steel by the plant described in this profile, it would be uneconomical to manufacture slab or billet steel for rolling. This plant requires a very substantial capital investment. Its economic feasibility depends entirely upon the existence of other industries within the country which use hot rolled sheet steel and upon the availability of steel slabs delivered at reasonable cost.

B. MARKET ASPECTS

1. USERS

The principal users of hot rolled sheet steel are fabricators who make their products by means of stamping and forming.

2. SALES CHANNELS AND EXTENT OF MARKET

Sales will be made principally direct to industries; some may be made to metal merchants. The market for hot rolled sheet steel depends on the existence or development of industries needing this type of steel for their fabrication work and upon export sales to neighboring countries that do not have a sheet steel plant. A comprehensive survey should be undertaken to determine the market potential. This product is easily transported and if good transportation facilities exist throughout the country, nationwide distribution of the product should be made. Competition in the domestic market can be expected from foreign suppliers presently serving the area particularly if their operations are fully integrated because they will enjoy a distinct price advantage. This plant could not compete in the international market against mass producers.

3. RATE OF PROFIT

It should be emphasized that the information under "Production Requirements" on the next page illustrates typical U.S. cost relationships of the various factors entering into the manufacture in the United States of a specified product. It is generally recognized that profits before taxes of manufacturers in the United States may be appreciably lower than normally would be the case in a developing country. While certain imported capital items and specialized technical services may be higher in cost in developing countries, certain other significant production costs such as semi-skilled and unskilled labor, materials and supplies obtained locally may be significantly lower. Factors vitally affecting industrial products costs and profit margins such as degree of competition, size of market, availability of labor, availability of risk capital, relative financial risk, level of industry taxes, and general economic and political stability have widely differing interrelationships and impact on the selling price and profit margin of a manufactured product in a developing country as compared with the United States. Planned operations and production limits would, of necessity, have to be adapted to cost and profit conditions existing in a particular developing country as a first step in determining whether a more intensive survey of the manufacturing possibilities for a particular product and industry is warranted.

4. SELECTED GROSS PROFIT ITEMS

(See page 3 for supporting data)

The annual gross sales revenue is estimated at \$6,500,000.

The total fixed investment, plus working capital, is estimated at \$1,908,700.

The annual gross profit, before taxes, is estimated at \$757,000.

Based on these figures, the profit on gross sales, before taxes, amounts to about 11.6%.

(A gross profit on sales, before taxes, of 11.6%, while reflecting U.S. experience, should not be considered normal for a developing country where profit margins may be considerably higher in industry and trade.)

The annual profit on the total capital requirements, before taxes, would amount to about 39.4%.

5. COST PER MAN EMPLOYED

Fifty direct workers and fourteen indirect workers, or a total of sixty-four workers, are employed.

The total fixed capital investment is estimated at \$1,395,000.

Based on these figures, the fixed investment per man employed would amount to about \$21,800.

C. PRODUCTION REQUIREMENTS SHEET STEEL, HOT ROLLED

I.P. No. 67316

ANNUAL CAPACITY - TWO SHIFT OPERATION : 50,000 TONS

S.I.C. 3316

NOTE : COSTS AND OPERATING DATA ARE BASED ON UNITED STATES PRICES AND PRACTICES**

1. CAPITAL REQUIREMENTS

a. Fixed Capital	<u>Cost</u>
Land - 10 acres	
Building - one story 60' x 180'	
Equipment, furniture & fixtures	
Prodn. tools & equipment	
Other tools & equipment	
Furniture & fixtures	
Transportation equipment	
Total fixed capital	\$1,395,000
Principal Items :	
Slab heating furnace	Air compressor
Hot rolled steel mill	Transfer tables
Crop shear	and hydraulic
Coilers	system
Hoists	10 ton stake truck
Conveyors	
Lift trucks	
Strapping tables	
Oil storage tank	
Pump	
Piping and valves	
b. Working Capital (15 days)	
Direct materials	
Direct labor	
Manufacturing overhead	
Administrative costs	
Sales costs	
Freight-out, discounts, bad debts & allowances	
Sales revenue	
Training costs	
Total working capital	\$ 513,700
c. Total Capital Requirements	\$1,908,700

2. MATERIALS AND SUPPLIES

a. Direct Materials	<u>Annual Requirements</u>	<u>Annual Cost</u>
Steel slabs	50,500 tons	
Less amount earned from sale of scrap		
Packaging material		
Total direct materials		\$4,883,000
b. Supplies		
Lubricants & hand tools		
Cutting tools & abrasives		
Maintenance & spare parts		
Office supplies		
Gas, oil and maintenance of truck		
Total supplies		\$ 50,000
c. Availability of materials & supplies		
Steel slabs may have to be imported. All available in world markets.		

3. POWER, FUEL AND WATER

a. Electric Power - 1,800,000 KWH	<u>Annual Cost</u>
connected load	
Fuel - 1,250,000 gal. Bunker C oil	
Water - about 48,000,000 gals.	
	\$128,000

4. DEPRECIATION	<u>Yrs. life</u>	<u>Amount</u>
Building	20	
Prodn. tools & equipment	10	
Other tools & equipment	10	
Furniture & fixtures	10	
Transportation equipment	4	
Total depreciation		\$135,200

5. MANPOWER

	<u>Number</u>	<u>Annual Cost</u>
a. Indirect Labor		
Manager	1	
Supervisors	2	
Office	5	
Maintenance	4	
Truck driver	2	
Total indirect labor	14	\$ 87,000

b. Direct Labor		
Skilled workers	8	
Semi-skilled workers	16	
Unskilled workers	26	
Total direct labor	50	\$256,000

c. Training Needs
 Manager and supervisor should have years of experience. They, with 8 skilled workers, should be able to train all workers and reach full production in 30 days.

6. TRANSPORTATION

a. Own transport equipment.
 one 10 ton stake truck

b. External transport facilities.
 In and out shipments amount to about 400 tons per working day. Plant should be located on railroad siding and good highways.

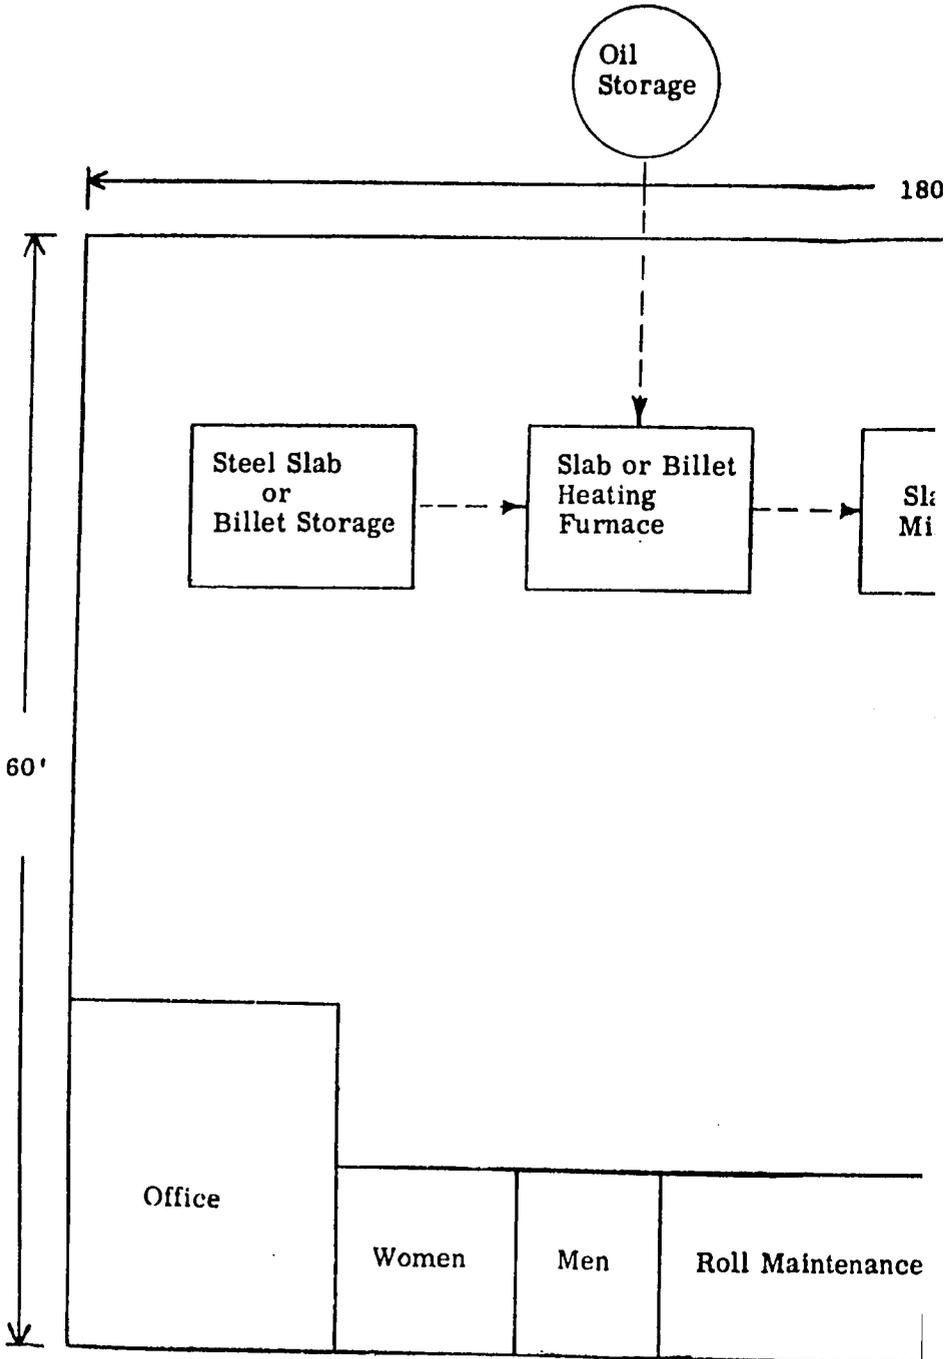

7. TOTAL ANNUAL COSTS AND SALES

REVENUE	
Direct materials	\$4,883,000
Direct labor	256,000
Manufacturing overhead*	401,000
Total manufacturing cost	\$5,540,000
Interest on loans	
Insurance	
Legal	
Audit	
Contingencies	
Total administrative cost	131,000
Sales expense	36,000
Freight-out, travel discounts	
Allowances & bad debts	36,000
Total annual costs	\$5,743,000
Annual Gross Profit	\$ 757,000
ANNUAL SALES REVENUE	\$6,500,000

*Includes Supplies, Power, Fuel, Water, Depreciation and Indirect Labor (2b-3-4-5a)

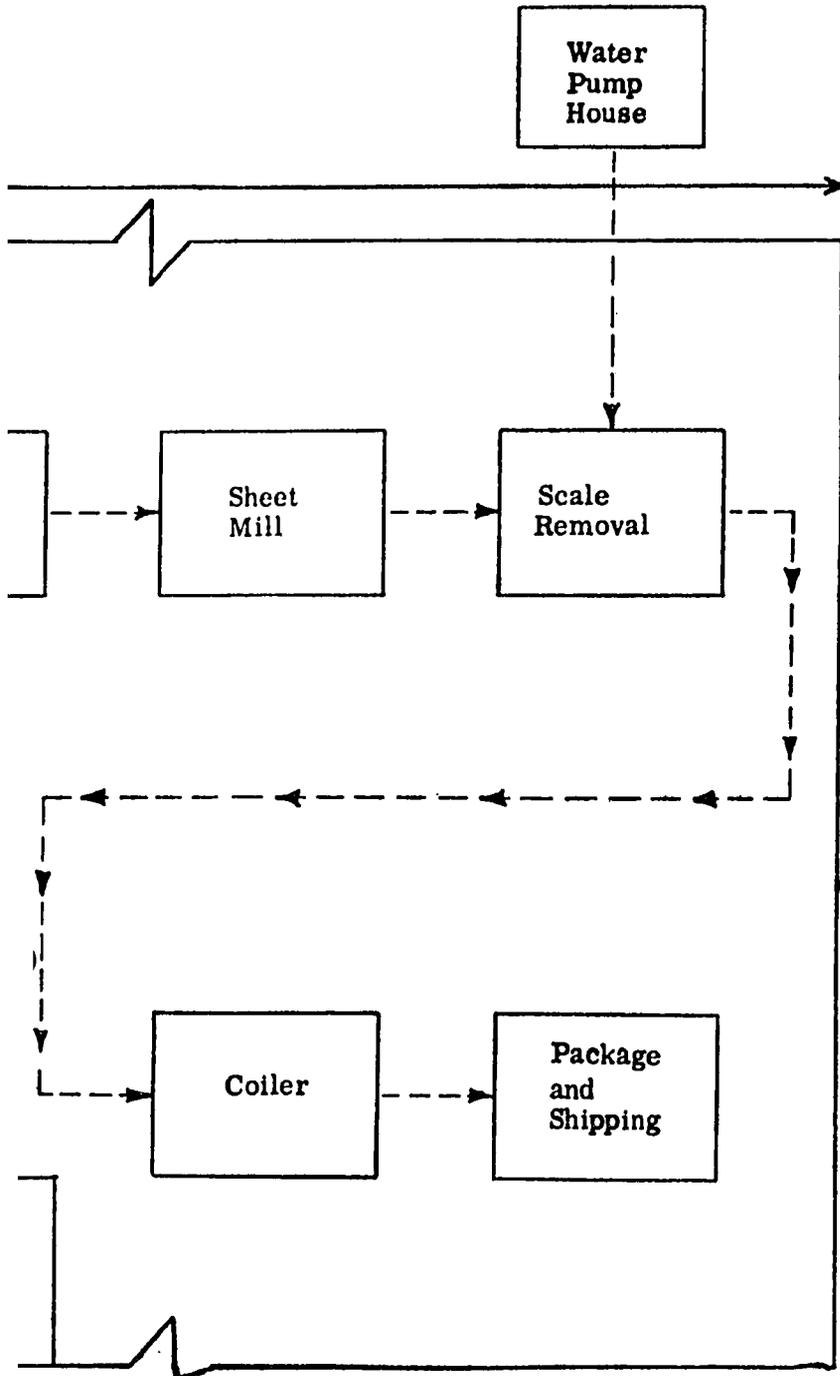

**It was not found practical to show individual item costs because of wide variations in price and other factors consequently only representative totals are used.

GENERAL INFORMATION

An *Index of Industry Profiles* is available on request from the agency for International Development, AA/PRR, Washington, D. C. 20523.

This *Industry Profile* was prepared for the U. S. Agency for International Development by International Development Services Inc., Washington, D. C.

INDUSTRY PROFILES

STARCH, OIL, AND FEED FROM SORGHUM GRAIN

I. P. No. 67317

S. I. C. 2041

Industry Profiles are intended to promote the development of private industry in the developing countries by assembling economic and technical information in a professional analysis to support basic decisions in the establishment of small or medium-scale plants in a specific industry. The information contained in a profile is selected and organized for the guidance of the entrepreneur in the less developed country.

Industry Profiles contain basic information on market aspects, production rates, capital requirements, materials and supplies, utilities, manpower operating costs and sales revenues. Work-flow diagrams and, in some instances, machinery layouts are included along with references to sources of technical information, professional services, patents, materials and equipment.

The profiles adopt as a benchmark, productivity rates and costs which could be anticipated under conditions prevailing in the United States. Anticipated profits are before taxes. Since conditions vary widely from country to country, the entrepreneur using this profile must make suitable adjustments to conditions prevailing in his country. This profile should help in reaching correct assumptions.

PRODUCT DESCRIPTION

Oil, starch and cattle feed produced from sorghum grain. The oil is sold in bulk. The starch and cattle feed are sold in 100-pound bags.

A. GENERAL EVALUATION OF PROSPECTS

This plant requires a substantial capital investment. The manufacturing processes are largely mechanical. Therefore, not much skilled labor is required. Good management and supervision are needed, however, to control the production costs. These products are fairly standardized and will have to be sold at market prices over which the individual producer has little control. The prospects for this industry, therefore, depend upon the the availability of a regular supply of sorghum grain at reasonable prices and upon the control of operating costs of which labor is an important element.

B. MARKET ASPECTS1. USERS

- (a) Oil: Vegetable oil refineries, food and other industries.
- (b) Starch: Food and other industries.
- (c) Feed: Livestock raisers.

2. SALES CHANNELS AND EXTENT OF MARKET

The oil and starch would be sold mainly to other industries using these products and, possibly, to exporters. The feed would be sold to wholesale feed merchants. Markets for these products are likely to be dispersed and varied in character, depending to a great extent on the use of the products by industries and on livestock feeding methods. In estimating the market, all three products must be considered as a unit since a market must exist for all in order to earn a profit. A comprehensive feasibility survey including a careful market investigation must be conducted. These products are more or less standardized. Producers must sell at prevailing market prices. The marketing problem, therefore, lies not in finding buyers but in producing at an attractive price while earning an adequate margin of profit. Bulk transport facilities are necessary for the shipment of the oil and, to the extent that these are available, the domestic market would be nationwide.

3. RATE OF PROFIT

It should be emphasized that the information under "Production Requirements" on the next page illustrates typical U. S. cost relationships of the various factors entering into the manufacture in the United States of a specified product. It is generally recognized that profits before taxes of manufacturers in the United States may be appreciably lower than normally would be the case in a developing country. While certain imported capital items and specialized technical services may be higher in cost in developing countries, certain other significant production costs such as semi-skilled and unskilled labor, materials and supplies obtained locally may be significantly lower. Factors vitally affecting industrial products costs and profit margins such as degree of competition, size of market, availability of labor, availability of risk capital, relative financial risk, level of industry taxes, and general economic and political stability have widely differing interrelationships and impact on the selling price and profit margin of a manufactured product in a developing country as compared with the United States. Planned operations and production limits would, of necessity, have to be adapted to cost and profit conditions existing in a particular developing country as a first step in determining whether a more intensive survey of the manufacturing possibilities for a particular product and industry is warranted.

4. SELECTED GROSS PROFIT ITEMS

(See supporting data on page 3)

The annual gross sales revenue is estimated at \$1,330,000.

The total fixed investment, plus working capital, is estimated at \$1,055,200.

The annual gross profit, before taxes, is estimated at \$180,000.

Using these figures, the profit on gross sales, before taxes, amounts to 13.5%.

(A gross profit on sales, before taxes, of 13.5%, while reflecting U.S. experience, should not be considered normal for a developing country where profit margins may be considerably higher in industry and trade.)

The annual profit on the total capital requirements, before taxes, is estimated at about 17.1%.

5. COST PER MAN EMPLOYED

Fifty-four direct and eleven indirect workers, or a total of sixty-five workers, are employed.

The total fixed capital investment is estimated at \$741,000.

Based on these figures, the fixed investment per man employed would amount to \$11,400.

VII. PROFESSIONAL ENGINEERING SERVICES

The services of professional engineers are desirable in the design of industrial plants even though the proposed plant may be small.

A correct design is one which provides the greatest economy in the investment of funds and establishes the basis of operation that will be most profitable in the beginning and will also be capable of expansion without expensive alteration.

The addresses of professional engineers who specialize in Industrial Design, some of whom may be willing to undertake such work on low cost projects overseas, can be secured by reference to the published cards in various engineering magazines.

They may also be reached through their national organizations, one of which is the :

National Society of Professional Engineers
2029 K Street, N.W.
Washington, D.C. 20006

Manufacturers of industrial equipment employ engineers familiar with the design and installation of their specialized products. These manufacturers are usually willing to give prospective customers the benefit of technical advice by those engineers in determining the suitability of their equipment in any proposed project. The equipment manufacturer also knows, and can recommend, professional engineers in private practice who are willing and able to provide appropriate consulting services.

145

PRE-INVESTMENT FEASIBILITY STUDY SUGGESTED

The foregoing information must be necessarily presented in concise form. Before an investment is made in a plant a feasibility study is suggested. The investor, for his planning, should have more information dealing with the specific locality contemplated. For obvious reasons, such information cannot be included in *Industry Profiles*. Such a study, therefore, should explore local factors and conditions, including costs, sources of raw materials and supplies, availability of utilities and fuel, manpower, transportation, etc.

The investor will need reasonably accurate information on Government and legal requirements, banking and financing, potential demand, competition, construction services, and manpower training requirements. Further, he should consider developing plans for management and production controls, operating procedures, and sales promotion.

ORDERING INSTRUCTIONS

The price of *Industry Profiles* is a minimum of \$3.00 for from one to five "*Profiles*." The purchaser may select up to five of any "*Profiles*" available.

Complete sets of the 250 *Industry Profiles* published in 1966, I. P. No. 66001 through I. P. No. 66250 consecutively, may be purchased for \$125.00 per set. Complete sets of the 150 *Industry Profiles* to be published in 1967, I. P. No. 67251 through I. P. No. 67400 consecutively, may be purchased for \$75.00 per set. The latter "*Profiles*" will automatically be shipped to full set purchasers upon release.

Address orders to: U.S. Department of Commerce
Clearinghouse for Federal Scientific and
Technical Information, 410.12
Springfield, Virginia 22151

Prepayment is required. Make check or money order payable to National Bureau of Standards—CFSTI. Clearinghouse deposit account holders may charge purchases to their accounts.

GENERAL INFORMATION

An *Index of Industry Profiles* is available on request from the agency for International Development, AA/PRR, Washington, D. C. 20523.

This *Industry Profile* was prepared for the U. S. Agency for International Development by International Development Services Inc., Washington, D. C.

INDUSTRY PROFILES

FISH OIL AND FISH MEAL PLANT—EVAPORATION PROCESS (20 tons)

I. P. No. 67318

S. I. C. 2095

Industry Profiles are intended to promote the development of private industry in the developing countries by assembling economic and technical information in a professional analysis to support basic decisions in the establishment of small or medium-scale plants in a specific industry. The information contained in a profile is selected and organized for the guidance of the entrepreneur in the less developed country.

Industry Profiles contain basic information on market aspects, production rates, capital requirements, materials and supplies, utilities, manpower operating costs and sales revenues. Work-flow diagrams and, in some instances, machinery layouts are included along with references to sources of technical information, professional services, patents, materials and equipment.

The profiles adopt as a benchmark, productivity rates and costs which could be anticipated under conditions prevailing in the United States. Anticipated profits are before taxes. Since conditions vary widely from country to country, the entrepreneur using this profile must make suitable adjustments to conditions prevailing in his country. This profile should help in reaching correct assumptions.

PRODUCT DESCRIPTION

Fish oil and fish meal derived from inedible fish and fish wastes using an evaporating process.

(Explanatory Note: The production requirements given on page three of this profile and their related references were compiled on the premise that 20 tons of raw fish would be processed per hour in an operation of eight hours duration. Production requirements and cost figures for the processing of forty tons of raw fish per hour are set forth in another profile (I. P. No. 67377, S. I. C. 2095).

A. GENERAL EVALUATION OF PROSPECTS

The availability of the principal raw material for this product and the constantly increasing demand for fish meal and fish oil for a growing number of uses makes prospects for this industry particularly good in almost any country. Another favorable aspect of this industry is that production of palm fats and other liquid oils is not keeping pace with the increased demand. These factors, together with the export potential of this plant, provide excellent prospects for investors in this industry. This plant processes 20 tons of raw fish per hour.

B. MARKET ASPECTS

1. USERS

Manufacturers of margarine, animal feeds, fungicide sprays, soap, fertilizer, paints, lubricating oil, lower grade cooking fats and shortening.

2. SALES CHANNELS AND EXTENT OF MARKET

Sales are generally made to large dealers in fish meal and fish oil who have representatives in all countries. Local sales are usually made directly to local industries and to wholesalers of animal feeds. Oil is shipped in drums and in tank cars. The production volume of this plant should be consumed in the domestic market easily since its products are found as components of a great number of other products. There is a nationwide market for these items in any country that has increased or is increasing its livestock production, soil productivity or is improving or increasing the protein content of the people's diet. There should be no difficulty in exporting any percentage of the output not sold locally. Fish oil and meal are easily transported.

3. RATE OF PROFIT

It should be emphasized that the information under "Production Requirements" on the next page illustrates typical U. S. cost relationships of the various factors entering into the manufacture in the United States of a specified product. It is generally recognized that profits before taxes of manufacturers in the United States may be appreciably lower than normally would be the case in a developing country. While certain imported capital items and specialized technical services may be higher in cost in developing countries, certain other significant production costs such as semi-skilled and unskilled labor, materials and supplies obtained locally may be significantly lower. Factors vitally affecting industrial products costs and profit margins such as degree of competition, size of market, availability of labor, availability of risk capital, relative financial risk, level of industry taxes, and general economic and political stability have widely differing interrelationships and impact on the selling price and profit margin of a manufactured product in a developing country as compared with the United States. Planned operations and production limits would, of necessity, have to be adapted to cost and profit conditions existing in a particular developing country as a first step in determining whether a more intensive survey of the manufacturing possibilities for a particular product and industry is warranted.

4. SELECTED GROSS PROFIT ITEMS

(See supporting data on page 3)

The annual gross sales revenue is estimated at \$1,600,000.

The total fixed investment, plus working capital, is estimated at \$812,000.

The annual gross profit, before taxes, is estimated at \$160,000.

Based on these figures, the profit on gross sales, before taxes, amounts to 10.0%.

(A gross profit on sales, before taxes, of 10.0%, while reflecting U. S. experience, should not be considered normal for a developing country where profit margins may be considerably higher in industry and trade.)

The annual profit on the total capital requirements, before taxes, would amount to about 19.8%.

5. COST PER MAN EMPLOYED

Eight direct workers and six indirect workers, or a total of fourteen workers, are employed.

The total fixed capital investment is estimated at \$555,000.

Based on these figures, the fixed investment per man employed would amount to about \$39,650.

ANNUAL CAPACITY - ONE SHIFT OPERATION: 8,000 TONS MEAL; 4,000 TONS OIL

NOTE: COSTS AND OPERATING DATA ARE BASED ON UNITED STATES PRICES AND PRACTICES**

VII. PROFESSIONAL ENGINEERING SERVICES

The services of professional engineers are desirable in the design of industrial plants even though the proposed plant may be small.

A correct design is one which provides the greatest economy in the investment of funds and establishes the basis of operation that will be most profitable in the beginning and will also be capable of expansion without expensive alteration.

The addresses of professional engineers who specialize in Industrial Design, some of whom may be willing to undertake such work on low cost projects overseas, can be secured by reference to the published cards in various engineering magazines.

They may also be reached through their national organizations, one of which is the :

National Society of Professional Engineers
2029 K Street, N. W.
Washington, D. C. 20006

Manufacturers of industrial equipment employ engineers familiar with the design and installation of their specialized products. These manufacturers are usually willing to give prospective customers the benefit of technical advice by those engineers in determining the suitability of their equipment in any proposed project. The equipment manufacturer also knows, and can recommend, professional engineers in private practice who are willing and able to provide appropriate consulting services.

PRE-INVESTMENT FEASIBILITY STUDY SUGGESTED

The foregoing information must be necessarily presented in concise form. Before an investment is made in a plant a feasibility study is suggested. The investor, for his planning, should have more information dealing with the specific locality contemplated. For obvious reasons, such information cannot be included in *Industry Profiles*. Such a study, therefore, should explore local factors and conditions, including costs, sources of raw materials and supplies, availability of utilities and fuel, manpower, transportation, etc.

The investor will need reasonably accurate information on Government and legal requirements, banking and financing, potential demand, competition, construction services, and manpower training requirements. Further, he should consider developing plans for management and production controls, operating procedures, and sales promotion.

ORDERING INSTRUCTIONS

The price of *Industry Profiles* is a minimum of \$3.00 for from one to five "*Profiles*." The purchaser may select up to five of any "*Profiles*" available.

Complete sets of the 250 *Industry Profiles* published in 1966, I. P. No. 66001 through I. P. No. 66250 consecutively, may be purchased for \$125.00 per set. Complete sets of the 150 *Industry Profiles* to be published in 1967, I. P. No. 67251 through I. P. No. 67400 consecutively, may be purchased for \$75.00 per set. The latter "*Profiles*" will automatically be shipped to full set purchasers upon release.

Address orders to: U.S. Department of Commerce
Clearinghouse for Federal Scientific and
Technical Information, 410.12
Springfield, Virginia 22151

Prepayment is required. Make check or money order payable to National Bureau of Standards—CFSTI. Clearinghouse deposit account holders may charge purchases to their accounts.

GENERAL INFORMATION

An *Index of Industry Profiles* is available on request from the agency for International Development, AA/PRR, Washington, D. C. 20523.

This *Industry Profile* was prepared for the U. S. Agency for International Development by International Development Services Inc., Washington, D. C.

INDUSTRY PROFILES

BOTTLED MILK

I. P. No. 67319

S. I. C. 2026

Industry Profiles are intended to promote the development of private industry in the developing countries by assembling economic and technical information in a professional analysis to support basic decisions in the establishment of small or medium-scale plants in a specific industry. The information contained in a profile is selected and organized for the guidance of the entrepreneur in the less developed country.

Industry Profiles contain basic information on market aspects, production rates, capital requirements, materials and supplies, utilities, manpower operating costs and sales revenues. Work-flow diagrams and, in some instances, machinery layouts are included along with references to sources of technical information, professional services, patents, materials and equipment.

The profiles adopt as a benchmark, productivity rates and costs which could be anticipated under conditions prevailing in the United States. Anticipated profits are before taxes. Since conditions vary widely from country to country, the entrepreneur using this profile must make suitable adjustments to conditions prevailing in his country. This profile should help in reaching correct assumptions.

PRODUCT DESCRIPTION

Milk is purchased from dairy farmers, pasteurized, bottled and delivered to the customer.

A. GENERAL EVALUATION OF PROSPECTS

The prospects for this industry depend on two factors: (1) that a good supply of milk is available locally all year round, at reasonable prices; and (2) that the output of this plant can be sold locally all year round. These and other factors should be determined by conducting a comprehensive survey.

B. MARKET ASPECTS1. USERS

Anywhere that food is served.

2. SALES CHANNELS AND EXTENT OF MARKET

About 75 to 80 percent of the output of this plant would be delivered to users. The balance would be delivered to retail stores for sale to consumers. Milk, a highly perishable product, must be kept under proper refrigeration at all times. Therefore, it must be chilled during delivery by truck to the consumer or the retail outlet. For this reason, the market usually would be within a relatively few miles of the pasteurizing plant. Since a large investment is required to produce milk that complies with all health laws and regulations, competition will have to be met by a combination of good management, efficient plant operation and an able sales force.

3. RATE OF PROFIT

It should be emphasized that the information under "Production Requirements" on the next page illustrates typical U.S. cost relationships of the various factors entering into the manufacture in the United States of a specified product. It is generally recognized that profits before taxes of manufacturers in the United States may be appreciably lower than normally would be the case in a developing country. While certain imported capital items and specialized technical services may be higher in cost in developing countries, certain other significant production costs such as semi-skilled and unskilled labor, materials and supplies obtained locally may be significantly lower. Factors vitally affecting industrial production costs and profit margins such as degree of competition, size of market, availability of labor, availability of risk capital, relative financial risk, level of industry taxes, and general economic and political stability have widely differing interrelationships and impact on the selling price and profit margin of a manufactured product in a developing country as compared with the United States. Planned operations and production limits would, of necessity, have to be adapted to cost and profit conditions existing in a particular developing country as a first step in determining whether a more intensive survey of the manufacturing possibilities for a particular product and industry is warranted.

4. SELECTED GROSS PROFIT ITEMS

(See Supporting data on page 3)

The annual gross sales revenue is estimated at \$600,000.

The total fixed investment, plus working capital, is estimated at \$250,000.

The annual gross profit, before taxes, is estimated at \$30,000.

Based on these figures, the profit on gross sales, before taxes, amounts to about 5.0%.

(A gross profit on sales, before taxes, of 5.0%, while reflecting U.S. experience, should not be considered normal for a developing country where profit margins may be considerably higher in industry and trade.)

The annual profit on the total capital requirements, before taxes, would amount to about 12.0%.

5. COST PER MAN EMPLOYED

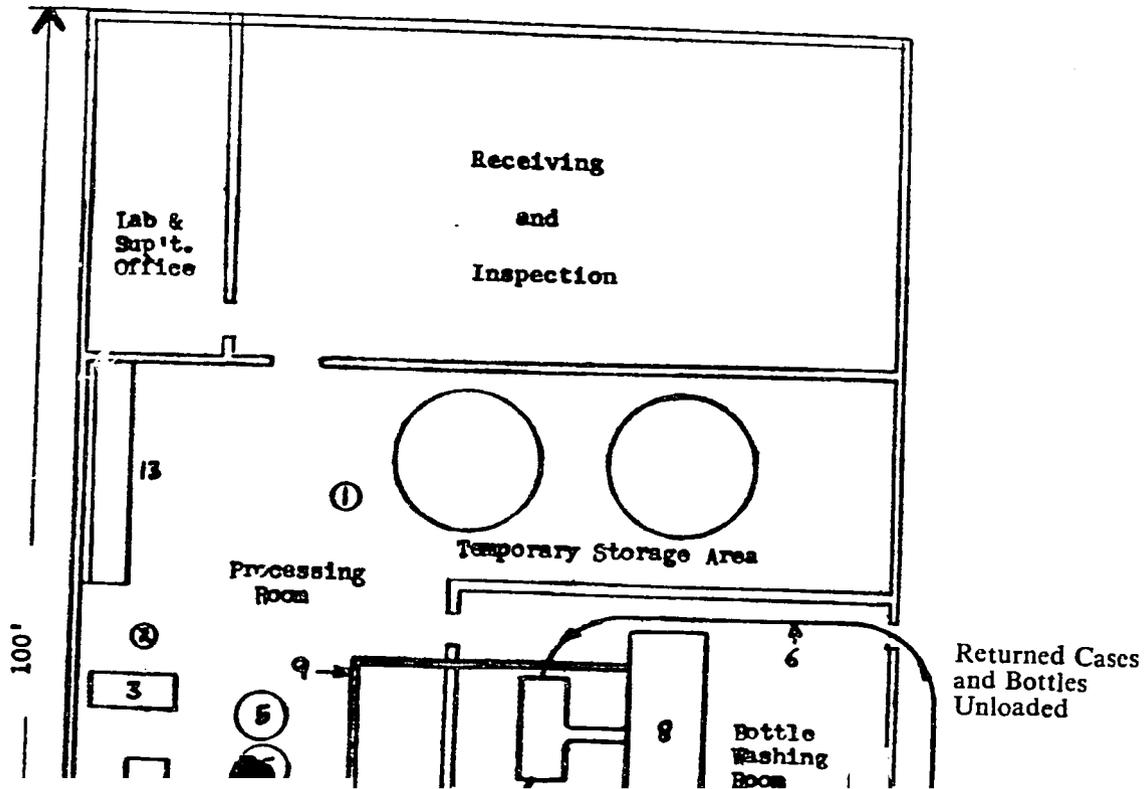

Six direct workers and ten indirect workers, or a total of sixteen workers, are employed.

The total fixed capital investment is estimated at \$ 193,000.

Based on these figures, the fixed investment per man employed would amount to about \$12,070.

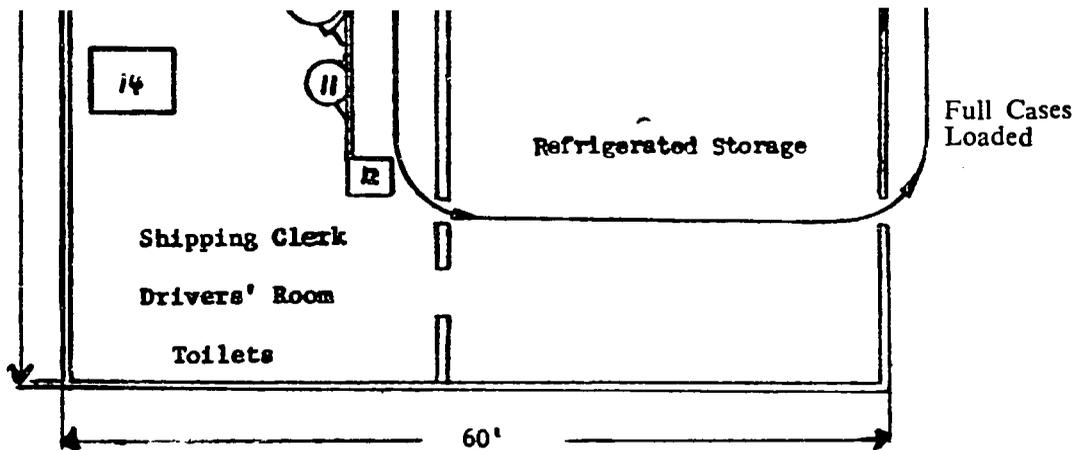

156

PLANT LAYOUT

BOTTLE

1/25

LAYOUT OF MARKET MILK PROCESSING PLANT

The exact arrangement of equipment will vary with the type of milk being bottled, the number of other dairy products manufactured, local laws, etc.

Olsen Publishing Company
14445 North 5th Street
Milwaukee, Wisconsin 53212

Lists all manufacturers of equipment and supplies used by the dairy industry.

VII. PROFESSIONAL ENGINEERING SERVICES

The services of professional engineers are desirable in the design of industrial plants even though the proposed plant may be small.

A correct design is one which provides the greatest economy in the investment of funds and establishes the basis of operation that will be most profitable in the beginning and will also be capable of expansion without expensive alteration.

The addresses of professional engineers who specialize in Industrial Design, some of whom may be willing to undertake such work on low cost projects overseas, can be secured by reference to the published cards in various engineering magazines.

They may also be reached through their national organizations, one of which is the:

National Society of Professional Engineers
2029 K Street, N. W.
Washington, D. C. 20006

Manufacturers of industrial equipment employ engineers familiar with the design and installation of their specialized products. These manufacturers are usually willing to give prospective customers the benefit of technical advice by those engineers in determining the suitability of their equipment in any proposed project. The equipment manufacturer also knows, and can recommend, professional engineers in private practice who are willing and able to provide appropriate consulting services.

PRE-INVESTMENT FEASIBILITY STUDY SUGGESTED

The foregoing information must be necessarily presented in concise form. Before an investment is made in a plant a feasibility study is suggested. The investor, for his planning, should have more information dealing with the specific locality contemplated. For obvious reasons, such information cannot be included in *Industry Profiles*. Such a study, therefore, should explore local factors and conditions, including costs, sources of raw materials and supplies, availability of utilities and fuel, manpower, transportation, etc.

The investor will need reasonably accurate information on Government and legal requirements, banking and financing, potential demand, competition, construction services, and manpower training requirements. Further, he should consider developing plans for management and production controls, operating procedures, and sales promotion.

ORDERING INSTRUCTIONS

The price of *Industry Profiles* is a minimum of \$3.00 for from one to five "*Profiles*." The purchaser may select up to five of any "*Profiles*" available.

Complete sets of the 250 *Industry Profiles* published in 1966, I. P. No. 66001 through I. P. No. 66250 consecutively, may be purchased for \$125.00 per set. Complete sets of the 150 *Industry Profiles* to be published in 1967, I. P. No. 67251 through I. P. No. 67400 consecutively, may be purchased for \$75.00 per set. The latter "*Profiles*" will automatically be shipped to full set purchasers upon release.

Address orders to: U.S. Department of Commerce
Clearinghouse for Federal Scientific and
Technical Information, 410.12
Springfield, Virginia 22151

Prepayment is required. Make check or money order payable to National Bureau of Standards—CFSTI. Clearinghouse deposit account holders may charge purchases to their accounts.

GENERAL INFORMATION

An *Index of Industry Profiles* is available on request from the agency for International Development, AA/PRR, Washington, D. C. 20523.

This *Industry Profile* was prepared for the U. S. Agency for International Development by International Development Services Inc., Washington, D. C.

162

INDUSTRY PROFILES

FLASHLIGHT AND RADIO BATTERIES

I. P. No. 67320

S. I. C. 3692

Industry Profiles are intended to promote the development of private industry in the developing countries by assembling economic and technical information in a professional analysis to support basic decisions in the establishment of small or medium-scale plants in a specific industry. The information contained in a profile is selected and organized for the guidance of the entrepreneur in the less developed country.

Industry Profiles contain basic information on market aspects, production rates, capital requirements, materials and supplies, utilities, manpower operating costs and sales revenues. Work-flow diagrams and, in some instances, machinery layouts are included along with references to sources of technical information, professional services, patents, materials and equipment.

The profiles adopt as a benchmark, productivity rates and costs which could be anticipated under conditions prevailing in the United States. Anticipated profits are before taxes. Since conditions vary widely from country to country, the entrepreneur using this profile must make suitable adjustments to conditions prevailing in his country. This profile should help in reaching correct assumptions.

PRODUCT DESCRIPTION

Leakproof primary batteries for flashlights and radios.

A. GENERAL EVALUATION OF PROSPECTS

This plant requires a fairly large capital investment despite the fact it uses relatively little skilled labor. Good management and supervision are necessary to maintain quality, to control costs and to keep abreast of technical developments. There is an expanding market, worldwide, for flashlight and radio batteries and in developing areas with a large and moderately prosperous population, there should be good possibilities for this plant.

B. MARKET ASPECTS1. USERS

Individuals, industrial concerns, mines, railroads and the military.

2. SALES CHANNELS AND EXTENT OF MARKET

Sales are made to electrical supply distributors, hardware stores, automotive wholesalers, chain stores, retail electrical and retail automotive outlets and direct to large-volume users. An attractive brand name, adequate advertising and publicity and an active sales campaign is advisable in the distribution of these productions. The market potential will depend to a great extent on the number of radios in the country. A large and moderately prosperous community is needed to provide a sales outlet for these products. A market survey should be made. Since a large fixed capital investment is required to set up this plant, no domestic competition should be expected unless other large producers have already established plants in the country. This plant should be able to meet competition from imported batteries since it would have the advantage of lower freight costs and, perhaps, freedom from import duties. Batteries are small, well packaged and easily transported. Shipping costs are normally low in relation to the product's value and, therefore, nationwide distribution should be contemplated. Some export sales to neighboring countries may also be made.

3. RATE OF PROFIT

It should be emphasized that the information under "Production Requirements" on the next page illustrates typical U.S. cost relationships of the various factors entering into the manufacture in the United States of a specified product. It is generally recognized that profits before taxes of manufacturers in the United States may be appreciably lower than normally would be the case in a developing country. While certain imported capital items and specialized technical services may be higher in cost in developing countries, certain other significant production costs such as semi-skilled and unskilled labor, materials and supplies obtained locally may be significantly lower. Factors vitally affecting industrial products costs and profit margins such as degree of competition, size of market, availability of labor, availability of risk capital, relative financial risk, level of industry taxes, and general economic and political stability have widely differing interrelationships and impact on the selling price and profit margin of a manufactured product in a developing country as compared with the United States. Such elements and relationships therefore would, of necessity, have to be adapted to cost and profit conditions existing in a particular developing country as a first step in determining whether a more intensive survey of the manufacturing possibilities for a particular product and industry is warranted.

4. SELECTED GROSS PROFIT ITEMS

(See supporting data on page 3)

The annual gross sales revenue is estimated at \$600,000.

The total fixed investment, plus working capital, is estimated at \$726,000.

The annual gross profit, before taxes, is estimated at \$60,000.

Using these figures, the profit on gross sales, before taxes, amounts to about 10%.

(A gross profit on sales, before taxes, of 16%, while reflecting U.S. experience, should not be considered normal for a developing country where profit margins may be considerably higher in industry and trade.)

The annual profit on the total capital requirements, before taxes, is estimated at about 8.3%.

5. COST PER MAN EMPLOYED

Fifty direct and eight indirect workers or a total of fifty-eight workers, are employed.

The total fixed capital investment is estimated at \$622,000.

Based on these figures, the fixed investment per man employed would amount to about \$10,730.

C. PRODUCTION REQUIREMENTS - FLASHLIGHT AND RADIO BATTERIES I.P. No. 67320

INDUSTRY PROFILES

CREOSOTED WOOD PRODUCTS

I. P. No. 67321

S. I. C. 2491

Industry Profiles are intended to promote the development of private industry in the developing countries by assembling economic and technical information in a professional analysis to support basic decisions in the establishment of small or medium-scale plants in a specific industry. The information contained in a profile is selected and organized for the guidance of the entrepreneur in the less developed country.

Industry Profiles contain basic information on market aspects, production rates, capital requirements, materials and supplies, utilities, manpower operating costs and sales revenues. Work-flow diagrams and, in some instances, machinery layouts are included along with references to sources of technical information, professional services, patents, materials and equipment.

The profiles adopt as a benchmark, productivity rates and costs which could be anticipated under conditions prevailing in the United States. Anticipated profits are before taxes. Since conditions vary widely from country to country, the entrepreneur using this profile must make suitable adjustments to conditions prevailing in his country. This profile should help in reaching correct assumptions.

PRODUCT DESCRIPTION

Bridge timbers, railroad ties, telephone poles, fence posts and other wood products that require creosoting to prevent deterioration caused by insects and decay.

A. GENERAL EVALUATION OF PROSPECTS

This industry is usually operated on a contract basis. Wood products are purchased by the end user and shipped to the creosoting plant for treatment, under contract, according to specifications, and for shipment as directed by the owner. This plant could be operated on the basis whereby the plant would itself purchase the wood products, then process and re-sell them. However, this second method of operation would require a large amount of working capital and, if any large orders were cancelled, the plant might have to carry the heavy investment for an indefinite period. If the potential gross annual sales volume for creosoted wood products is sufficient, the prospect for this plant should be good provided the plant is operated on a contract basis.

B. MARKET ASPECTS1. USERS

Construction companies, railroads, telephone and telegraph companies, governments and other concerns, needing the creosoting of wood products.

2. SALES CHANNELS AND EXTENT OF MARKET

Sales would be direct to companies using creosoted wood products. Sales methods would be by contract whereby the customers will furnish the wood products for creosoting at the plant. The sales potential depends upon the amount of creosoted wood products used within the country for construction purposes. Where suitable timber is not available, substitute materials such as concrete, iron or steel are sometimes used. A survey should be made to determine the sales potential of the domestic market. The extent of the market should be nationwide. This industry cannot be operated successfully on a small volume basis. Therefore, unless other creosoting plants exist within the country, no domestic competition can be expected. Creosoted wood products are not exported because of their bulk and weight.

3. RATE OF PROFIT

It should be emphasized that the information under "Production Requirements" on the next page illustrates typical U.S. cost relationships of the various factors entering into the manufacture in the United States of a specified product. It is generally recognized that profits before taxes of manufacturers in the United States may be appreciably lower than normally would be the case in a developing country. While certain imported capital items and specialized technical services may be higher in cost in developing countries, certain other significant production costs such as semi-skilled and unskilled labor, materials and supplies obtained locally may be significantly lower. Factors vitally affecting industrial products costs and profit margins such as degree of competition, size of market, availability of labor, availability of risk capital, relative financial risk, level of industry taxes, and general economic and political stability have widely differing interrelationships and impact on the selling price and profit margin of a manufactured product in a developing country as compared with the United States. Planned operations and production limits would, of necessity, have to be adapted to cost and profit conditions existing in a particular developing country as a first step in determining whether a more intensive survey of the manufacturing possibilities for a particular product and industry is warranted.

4. SELECTED GROSS PROFIT ITEMS

(See supporting data on page 3)

The annual gross sales revenue is estimated at \$370,000.

The total fixed investment, plus working capital, is estimated at \$628,000.

The annual gross profit, before taxes, is estimated at \$37,000.

Using these figures, the profit on gross sales, before taxes, amounts to about 10.0%.

(A gross profit on sales, before taxes, of 10.0%, while reflecting U.S. experience, should not be considered normal for a developing country where profit margins may be considerably higher in industry and trade.)

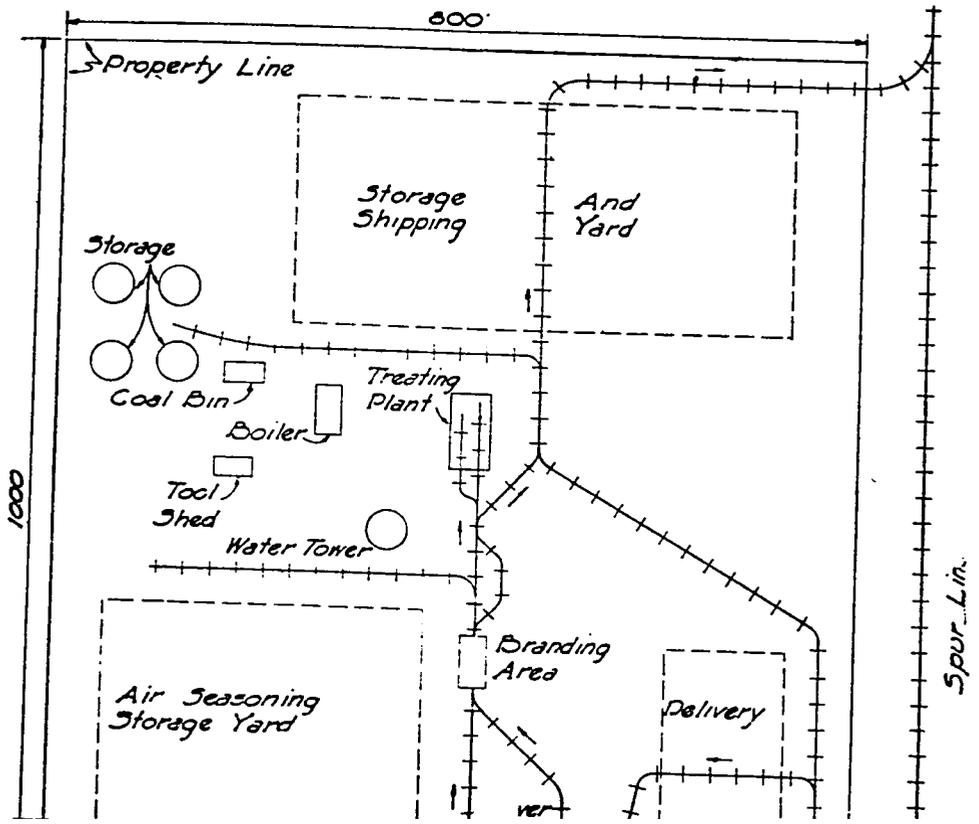

The annual profit on the total capital requirements, before taxes, is estimated at 59%

5. COST PER MAN EMPLOYED

Sixteen direct and eight indirect workers, or a total of twenty-four workers, are employed.

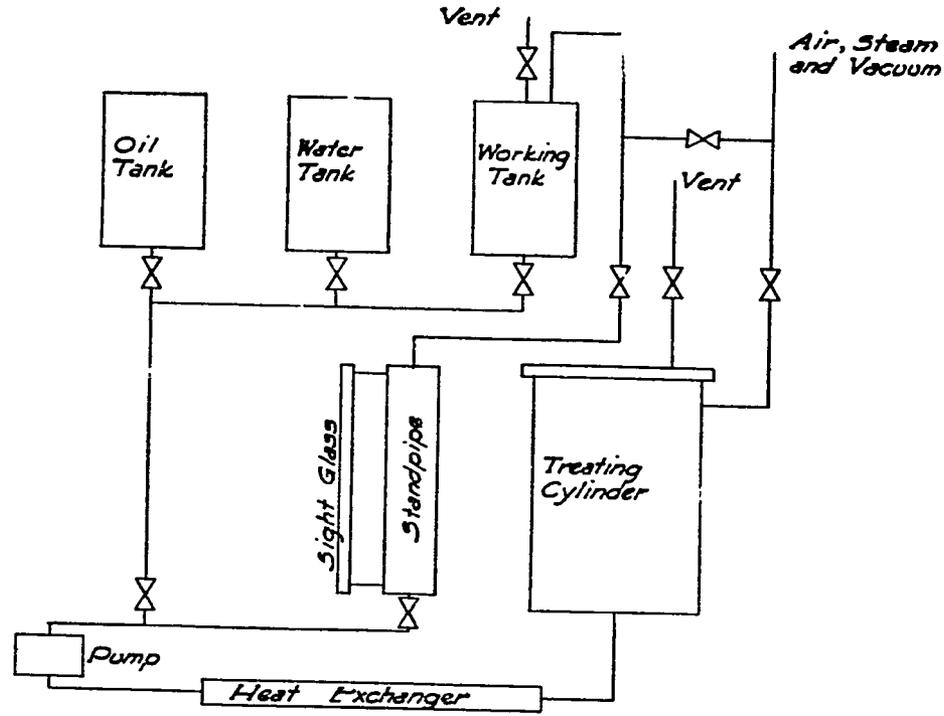

The total fixed capital investment is estimated at \$566,000.

Based on these figures, the fixed investment per man employed would amount to about \$23,585.

I.P. No. 67321

S.I.C. 2542

- Available U.S. Patent Office, Washington, D. C. 20231. \$.50 each
- A. Patent No. 3,061,508. October 1962. 5 p.
Wood preservation composition and method.
 - B. Patent No. 3,058,839 October 16, 1962 4 p.
Method of protecting wood from marine organisms.
 - C. Patent No. 3,046,217 July 24, 1966 3 p.
An improved wood preservative and its use.
 - D. Patent No. 2,988,477 1961 3 p.
Creosote composition of improved flowability and its production.
 - E. Patent No. 2,965,516 December 20, 1960 2 p.
Method for the preservation of the wooden structures.
 - F. Patent No. 2,931,737 April 5, 1960 3 p.
Impregnation process.
 - G. Patent No. 2,884,302 1959 6 p.
Impregnation of wooden poles with preservatives.
 - H. Patent No. 2,860,070 November 11, 1958 19 p.
Method of drying and impregnating wood.
 - I. Patent No. 2,833,006 1958 3 p.
Method of increasing the groundline protection of wood poles treated with oil-type preservatives.
 - J. Patent No. 2,799,597 July 16, 1957 2 p.
Method of impregnating wood with wood preserver.
 - K. Patent No. 2,786,784 March 21, 1957 16 p.
Process and apparatus for impregnating wood.

V. TECHNICAL INSTITUTES AND TRADE ASSOCIATIONS

- A. American Wood Preservers
839 - 17th Street, N. W.
Washington, D. C. 20006
- B. American Wood Preservers Institute
1707 "L" Street, N. W.
Washington, D. C. 20036
Both organizations publish monthly magazines concerning news of wood preserving industry.

VI. DIRECTORIES

- A. Directory of the Forest Products Industry. Annual. \$25.00
Miller Freeman Publications, Inc.
500 Howard Street
San Francisco, California 94105
Lists wood preserving plants and suppliers of equipment for wood preserving and other forest products industries.

VII. PROFESSIONAL ENGINEERING SERVICES

The services of professional engineers are desirable in the design of industrial plants even though the proposed plant may be small.

A correct design is one which provides the greatest economy in the investment of funds and establishes the basis of operation that will be most profitable in the beginning and will also be capable of expansion without expensive alteration.

The addresses of professional engineers who specialize in Industrial Design, some of whom may be willing to undertake such work on low cost projects overseas, can be secured by reference to the published cards in various engineering magazines.

They may also be reached through their national organizations, one of which is the:

National Society of Professional Engineers
2029 K Street, N. W.
Washington, D. C. 20006

Manufacturers of industrial equipment employ engineers familiar with the design and installation of their specialized product. These manufacturers are usually willing to give prospective customers the benefit of technical advice by those engineers in determining the suitability of their equipment in any proposed project. The equipment manufacturer also knows, and can recommend, professional engineers in private practice who are willing and able to provide appropriate consulting services.

PRE-INVESTMENT FEASIBILITY STUDY SUGGESTED

The foregoing information must be necessarily presented in concise form. Before an investment is made in a plant a feasibility study is suggested. The investor, for his planning, should have more information dealing with the specific locality contemplated. For obvious reasons, such information cannot be included in *Industry Profiles*. Such a study, therefore, should explore local factors and conditions, including costs, sources of raw materials and supplies, availability of utilities and fuel, manpower, transportation, etc.

The investor will need reasonably accurate information on Government and legal requirements, banking and financing, potential demand, competition, construction services, and manpower training requirements. Further, he should consider developing plans for management and production controls, operating procedures, and sales promotion.

ORDERING INSTRUCTIONS

The price of *Industry Profiles* is a minimum of \$3.00 for from one to five "*Profiles*." The purchaser may select up to five of any "*Profiles*" available.

Complete sets of the 250 *Industry Profiles* published in 1966, I. P. No. 66001 through I. P. No. 66250 consecutively, may be purchased for \$125.00 per set. Complete sets of the 150 *Industry Profiles* to be published in 1967, I. P. No. 67251 through I. P. No. 67400 consecutively, may be purchased for \$75.00 per set. The latter "*Profiles*" will automatically be shipped to full set purchasers upon release.

Address orders to: U.S. Department of Commerce
Clearinghouse for Federal Scientific and
Technical Information, 410.12
Springfield, Virginia 22151

Prepayment is required. Make check or money order payable to National Bureau of Standards—CFSTI. Clearinghouse deposit account holders may charge purchases to their accounts.

GENERAL INFORMATION

An *Index of Industry Profiles* is available on request from the agency for International Development, AA/PRR, Washington, D. C. 20523.

This *Industry Profile* was prepared for the U. S. Agency for International Development by International Development Services Inc., Washington, D. C.

176

WASHING MACHINES, HOUSEHOLD

I. P. No. 67322

S. I. C. 3633

Industry Profiles are intended to promote the development of private industry in the developing countries by assembling economic and technical information in a professional analysis to support basic decisions in the establishment of small or medium-scale plants in a specific industry. The information contained in a profile is selected and organized for the guidance of the entrepreneur in the less developed country.

Industry Profiles contain basic information on market aspects, production rates, capital requirements, materials and supplies, utilities, manpower operating costs and sales revenues. Work-flow diagrams and, in some instances, machinery layouts are included along with references to sources of technical information, professional services, patents, materials and equipment.

The profiles adopt as a benchmark, productivity rates and costs which could be anticipated under conditions prevailing in the United States. Anticipated profits are before taxes. Since conditions vary widely from country to country, the entrepreneur using this profile must make suitable adjustments to conditions prevailing in his country. This profile should help in reaching correct assumptions.

WASHING MACHINES, HOUSEHOLD

PRODUCT DESCRIPTION

Electric clothes washer for home use. This machine is intended to wash 14 pounds of clothing at one time. It washes, rinses and spin dries clothes automatically.

A. GENERAL EVALUATION OF PROSPECTS

Electricity is required for use of this product. Some areas of some countries do not have electric power--a factor that will directly influence sales. In many rural areas with electric power, the per capita income may be too low to allow purchase of this product. The bulk of sales of washing machines, therefore, will be made in urban areas where the per capita income is higher than in rural areas and where electric power is available.

B. MARKET ASPECTS

1. USERS

Private households. A larger washing machine would be needed for commercial purposes.

2. SALES CHANNELS AND EXTENT OF MARKET

These products are usually sold direct to retail stores. Washing machines cannot be made in small plants. Their production requires a fairly large investment in buildings, equipment, and materials. The plant described in this profile is mainly an assembly plant. Most of the material needed will be purchased ready for assembly. This includes the motors, plastic agitators, castings, pipes and hoses, completed wiring and all apparatus, switches, nuts and bolts and the enamel. This product is shipped in cardboard cartons and is easily transportable. If sales potential exists nationwide, national distribution is warranted. This plant should be able to compete against imported washing machines since it will have the advantage of freedom from import taxes and lower freight costs. A plant of this small size should not hope to compete in international markets against large mass producers of washing machines. A thorough analysis of marketing conditions and sales potential is mandatory before embarking on this investment venture.

3. RATE OF PROFIT

It should be emphasized that the information under "Production Requirements" on the next page illustrates typical U.S. cost relationships of the various factors entering into the manufacture in the United States of a specified product. It is generally recognized that profits before taxes of manufacturers in the United States may be appreciably lower than normally would be the case in a developing country. While certain imported capital items and specialized technical services may be higher in cost in developing countries, certain other significant production costs such as semi-skilled and unskilled labor, materials and supplies obtained locally may be significantly lower. Factors vitally affecting industrial products costs and profit margins such as degree of competition, size of market, availability of labor, availability of risk capital, relative financial risk, level of industry taxes, and general economic and political stability have widely differing interrelationships and impact on the selling price and profit margin of a manufactured product in a developing country as compared with the United States. Planned operations and production limits would, of necessity, have to be adapted to cost and profit conditions existing in a particular developing country as a first step in determining whether a more intensive survey of the manufacturing possibilities for a particular product and industry is warranted.

4. SELECTED GROSS PROFIT ITEMS

(See supporting data on page 3)

The annual gross sales revenue is estimated at \$420,000.

The total fixed investment, plus working capital, is estimated at \$188,600.

The annual gross profit, before taxes, is estimated at \$40,000.

Using these figures, the profit on gross sales, before taxes, amounts to 9.5%.

(A gross profit on sales, before taxes, of 9.5%, while reflecting U.S. experience, should not be considered normal for a developing country where profit margins may be considerably higher in industry and trade.)

The annual profit on the total capital requirements, before taxes, is estimated at 21.3%.

5. COST PER MAN EMPLOYED

Twenty direct and seven indirect workers, or a total of twenty-seven workers, are employed.

The total fixed capital investment is estimated at \$118,000.

Based on these figures, the fixed investment per man employed would amount to about \$4,400.

**C. PRODUCTION REQUIREMENTS - WASHING MACHINES,
HOUSEHOLD**

I.P. No. 67322
S.I.C. 3633

ANNUAL CAPACITY - ONE SHIFT OPERATION: 5,000 UNITS
NOTE: COSTS AND OPERATING DATA ARE BASED ON UNITED STATES PRICES AND PRACTICES**

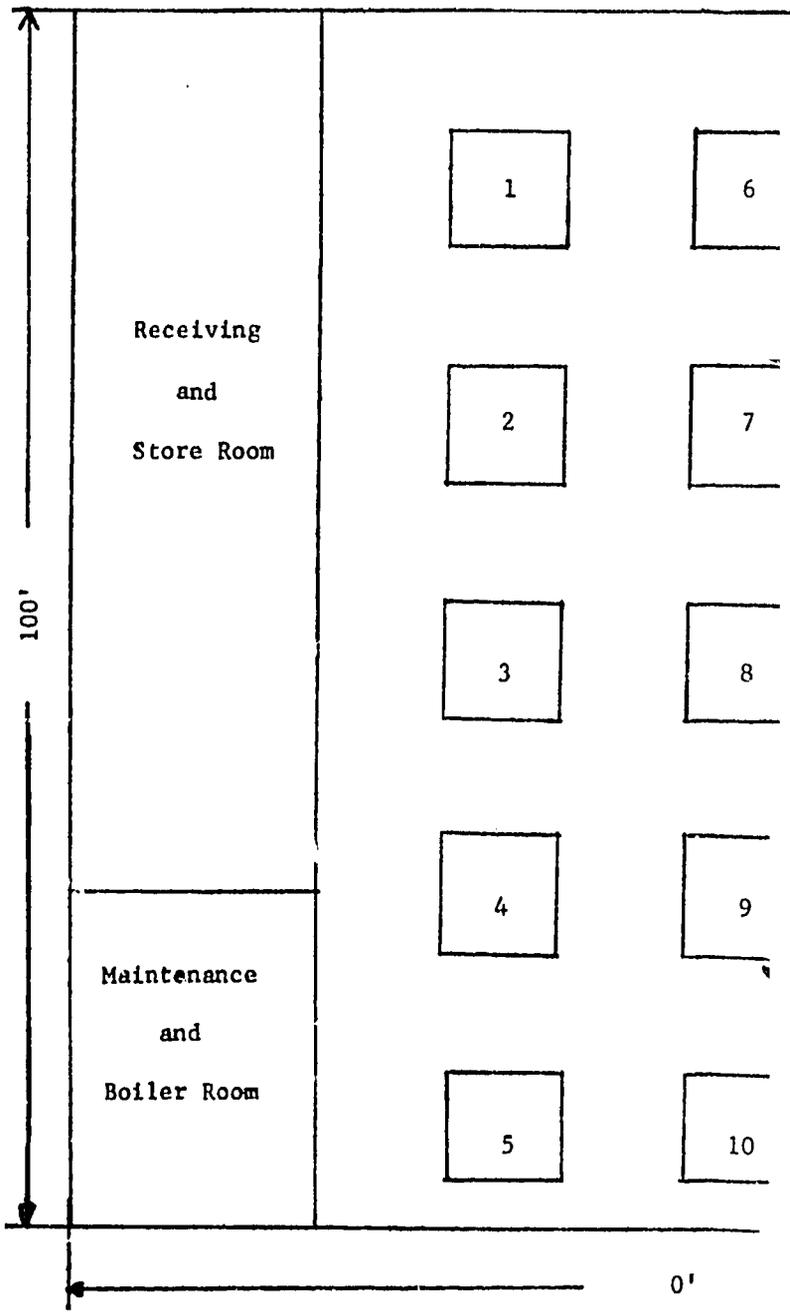

1. CAPITAL REQUIREMENTS			3. POWER, FUEL AND WATER		
a. Fixed Capital			Annual Cost

GENERAL INFORMATION

An *Index of Industry Profiles* is available on request from the agency for International Development, AA/PRR, Washington, D. C. 20523.

This *Industry Profile* was prepared for the U. S. Agency for International Development by International Development Services Inc., Washington, D. C.

INDUSTRY PROFILES

LIQUEFIED PETROLEUM GAS (DISTRIBUTION)

I. P. No. 67323

S. I. C. 5983

Industry Profiles are intended to promote the development of private industry in the developing countries by assembling economic and technical information in a professional analysis to support basic decisions in the establishment of small or medium-scale plants in a specific industry. The information contained in a profile is selected and organized for the guidance of the entrepreneur in the less developed country.

Industry Profiles contain basic information on market aspects, production rates, capital requirements, materials and supplies, utilities, manpower operating costs and sales revenues. Work-flow diagrams and, in some instances, machinery layouts are included along with references to sources of technical information, professional services, patents, materials and equipment.

The profiles adopt as a benchmark, productivity rates and costs which could be anticipated under conditions prevailing in the United States. Anticipated profits are before taxes. Since conditions vary widely from country to country, the entrepreneur using this profile must make suitable adjustments to conditions prevailing in his country. This profile should help in reaching correct assumptions.

PRODUCT DESCRIPTION

Liquefied petroleum gas purchased in bulk and distributed by tank truck or in cylinders or bottles to consumers.

A. GENERAL EVALUATION OF PROSPECTS

The success of this industry depends on the availability of natural gas or other fuels that may cost less. If natural gas or other, cheaper, fuels are not available locally and the sales potential for liquefied petroleum gas is adequate, the prospects for this industry should prove good. Fixed capital requirements are moderate in comparison with the annual estimated profits and no highly skilled workers are required. The figures shown in this profile are based on the bottling and distribution of liquefied petroleum gas. The production of bulk liquefied petroleum gas is covered in a separate profile (I. P. No. 67324).

B. MARKET ASPECTS

1. USERS

Homes, restaurants, hotels, trailers, boats, camps, farms and industrial plants.

2. SALES CHANNELS AND EXTENT OF MARKET

Sales would be made direct to consumers. Delivery would be made in bottles to users or in bulk to establishments engaged mainly in some other activity (such as a hardware store) but which act as local dealers in small-quantity bottled distribution. Empty cylinders would be picked up for refilling. The market for this product depends on so many variable factors that an accurate estimate of sales potential can be made only after a comprehensive survey is completed. The sale of liquefied petroleum gas is possible only where piped natural gas or other fuels are not available. If land owners have plenty of wood available on their own land, domestic sales would be curtailed. This plant should not expect to compete in export markets.

3. RATE OF PROFIT

It should be emphasized that the information under "Production Requirements" on the next page illustrates typical U. S. cost relationships of the various factors entering into the manufacture in the United States of a specified product. It is generally recognized that profits before taxes of manufacturers in the United States may be appreciably lower than normally would be the case in a developing country. While certain imported capital items and specialized technical services may be higher in cost in developing countries, certain other significant production costs such as semi-skilled and unskilled labor, materials and supplies obtained locally may be significantly lower. Factors vitally affecting industrial production costs and profit margins such as degree of competition, size of market, availability of labor, availability of risk capital, relative financial risk, level of industry taxes, and general economic and political stability have widely differing interrelationships and impact on the selling price and profit margin of a manufactured product in a developing country as compared with the United States. Planned operations and production limits would, of necessity, have to be adapted to cost and profit conditions existing in a particular developing country as a first step in determining whether a more intensive survey of the manufacturing possibilities for a particular product and industry is warranted.

4. SELECTED GROSS PROFIT ITEMS

(See supporting data on page 3)

The annual gross sales revenue is estimated at \$630,000.

The total fixed investment, plus working capital, is estimated at \$413,000.

The annual gross profit, before taxes, is estimated at \$83,000.

Using these figures, the profit on gross sales, before taxes, amounts to about 13.2%.

(A gross profit on sales, before taxes, of 13.2%, while reflecting U.S. experience, should not be considered normal for a developing country where profit margins may be considerably higher in industry and trade.)

The annual profit on the total capital requirements, before taxes, is estimated at about 20.1%.

5. COST PER MAN EMPLOYED

Nine direct and eleven indirect workers, or a total of twenty workers, are employed.

The total fixed capital investment is estimated at \$313,000.

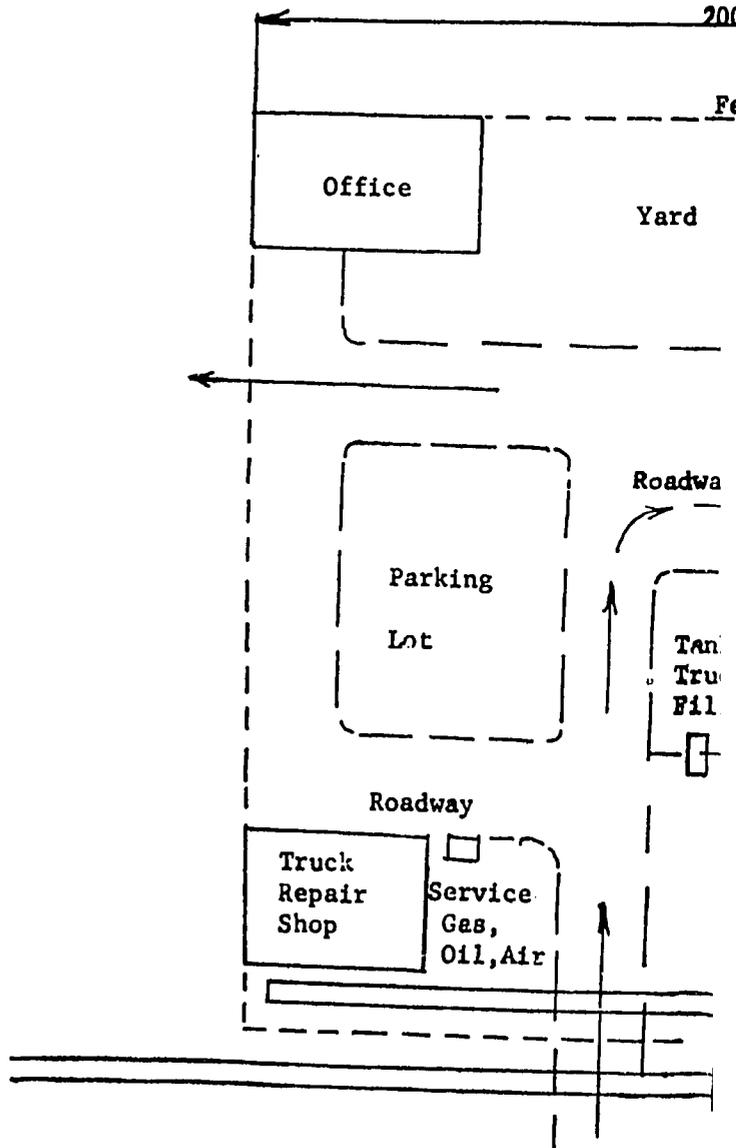

Based on these figures, the fixed investment per man employed would amount to \$15,650.

195

PRE-INVESTMENT FEASIBILITY STUDY SUGGESTED

The foregoing information must be necessarily presented in concise form. Before an investment is made in a plant a feasibility study is suggested. The investor, for his planning, should have more information dealing with the specific locality contemplated. For obvious reasons, such information cannot be included in *Industry Profiles*. Such a study, therefore, should explore local factors and conditions, including costs, sources of raw materials and supplies, availability of utilities and fuel, manpower, transportation, etc.

The investor will need reasonably accurate information on Government and legal requirements, banking and financing, potential demand, competition, construction services, and manpower training requirements. Further, he should consider developing plans for management and production controls, operating procedures, and sales promotion.

ORDERING INSTRUCTIONS

The price of *Industry Profiles* is a minimum of \$3.00 for from one to five "*Profiles*." The purchaser may select up to five of any "*Profiles*" available.

Complete sets of the 250 *Industry Profiles* published in 1966, I. P. No. 66001 through I. P. No. 66250 consecutively, may be purchased for \$125.00 per set. Complete sets of the 150 *Industry Profiles* to be published in 1967, I. P. No. 67251 through I. P. No. 67400 consecutively, may be purchased for \$75.00 per set. The latter "*Profiles*" will automatically be shipped to full set purchasers upon release.

Address orders to: U.S. Department of Commerce
Clearinghouse for Federal Scientific and
Technical Information, 410.12
Springfield, Virginia 22151

Prepayment is required. Make check or money order payable to National Bureau of Standards—CFSTI. Clearinghouse deposit account holders may charge purchases to their accounts.

GENERAL INFORMATION

An *Index of Industry Profiles* is available on request from the agency for International Development, AA/PRR, Washington, D. C. 20523.

This *Industry Profile* was prepared for the U. S. Agency for International Development by International Development Services Inc., Washington, D. C.

INDUSTRY PROFILES

LIQUEFIED PETROLEUM GAS (MANUFACTURED)

I. P. No. 67324

S. I. C. 1321

Industry Profiles are intended to promote the development of private industry in the developing countries by assembling economic and technical information in a professional analysis to support basic decisions in the establishment of small or medium-scale plants in a specific industry. The information contained in a profile is selected and organized for the guidance of the entrepreneur in the less developed country.

Industry Profiles contain basic information on market aspects, production rates, capital requirements, materials and supplies, utilities, manpower operating costs and sales revenues. Work-flow diagrams and, in some instances, machinery layouts are included along with references to sources of technical information, professional services, patents, materials and equipment.

The profiles adopt as a benchmark, productivity rates and costs which could be anticipated under conditions prevailing in the United States. Anticipated profits are before taxes. Since conditions vary widely from country to country, the entrepreneur using this profile must make suitable adjustments to conditions prevailing in his country. This profile should help in reaching correct assumptions.

PRODUCT DESCRIPTION

Liquefied petroleum gas produced from both refinery processes and wet natural gas and sold in bulk to distributors.

A. GENERAL EVALUATION OF PROSPECTS

The success of this industry depends on the availability of natural gas. If natural gas by direct pipeline or other, cheaper, fuels are not available locally and the sales potential of this product is adequate, the prospects for manufacture of liquefied petroleum gas should be good. The fixed capital requirements are fairly moderate in comparison with the annual estimated profits and only one skilled worker is needed. The figures shown in this profile are based on bulk sales. Distribution of liquefied petroleum gas is covered in a separate profile (I. P. No. 67323).

B. MARKET ASPECTS1. USERS

Sold in bulk to distributors for distribution to ultimate users. Consumers include homes, restaurants, hotels, trailers, camps, boats, farms and industrial plants.

2. SALES CHANNELS AND EXTENT OF MARKET

Sales would be made direct in bulk to distributors who would bottle the gas and sell it to users. An accurate estimate of market potential cannot be made unless a comprehensive survey of sales potential is undertaken because so many variable factors come into play. Sales of liquefied petroleum gas are possible only where piped natural gas, wood for fuel, or other, cheaper, fuels are not readily available. Liquefied petroleum gas is not an export product and this plant should not expect to compete in world markets.

3. RATE OF PROFIT

It should be emphasized that the information under "Production Requirements" on the next page illustrates typical U.S. cost relationships of the various factors entering into the manufacture in the United States of a specified product. It is generally recognized that profits before taxes of manufacturers in the United States may be appreciably lower than normally would be the case in a developing country. While certain imported capital items and specialized technical services may be higher in cost in developing countries, certain other significant production costs such as semi-skilled and unskilled labor, materials and supplies obtained locally may be significantly lower. Factors vitally affecting industrial products costs and profit margins such as degree of competition, size of market, availability of labor, availability of risk capital, relative financial risk, level of industry taxes, and general economic and political stability have widely differing interrelationships and impact on the selling price and profit margin of a manufactured product in a developing country as compared with the United States. Planned operations and production limits would, of necessity, have to be adapted to cost and profit conditions existing in a particular developing country as a first step in determining whether a more intensive survey of the manufacturing possibilities for a particular product and industry is warranted.

4. SELECTED GROSS PROFIT ITEMS

(See supporting data on page 3)

The annual gross sales revenue is estimated at \$ 192,000.

The total fixed investment, plus working capital, is estimated at \$ 248,600.

The annual gross profit, before taxes, is estimated at \$ 25,000.

Based on these figures, the profit on gross sales, before taxes, amounts to about 13%.

(A gross profit on sales, before taxes, of 13%, while reflecting U.S. experience, should not be considered normal for a developing country where profit margins may be considerably higher in industry and trade.)

The annual profit on the total capital requirements, before taxes, is estimated at about 10.1%.

5. COST PER MAN EMPLOYED

Six direct and four indirect workers, or a total of ten workers, are employed.

The total fixed capital investment is estimated at \$218,000.

Based on these figures, the fixed investment per man employed would amount to \$ 21,800.

142

C. PRODUCTION REQUIREMENTS - LIQUEFIED PETROLEUM GAS
(MANUFACTURED)

I.P. No. 67324
S.I.C. 1321

ANNUAL CAPACITY - THREE SHIFT OPERATION, 52 WEEKS PER YEAR:
211,700 BARRELS

NOTE: COSTS AND OPERATING DATA ARE BASED ON UNITED STATES PRICES AND PRACTICES**

1. CAPITAL REQUIREMENTS

<u>a. Fixed Capital</u>	<u>Cost</u>
Land - two acres	
Building - one story 20' x 50'	
Equipment, furniture & fixtures	
Prodn. tools & equipment	
Other tools & equipment	
Furniture & fixtures	
Transportation equipment	
Total fixed capital	\$ 218,000
<u>Principal items:</u>	
Three towers, 3 Accumulator Tanks, Vent Tank, Lean Oil Tank, Surge Tank, 2 Heat Exchangers, 2 Condensers, 3 Coolers, Recompressor, 4 Pumps, Steam Generator, Water Cooler, Piping and Valves, Maintenance Tools and Equipment, Oil	
 <u>b. Working Capital (30 days)</u>	
Direct materials	
Direct labor	
Manufacturing overhead	
Administrative costs	
Sales costs	
Freight-out, discounts, bad debts & allowances	
Sales revenue	
Training costs	
Total working capital	\$ 30,600
 <u>c. Total Capital Requirements</u>	 \$ 248,600

2. MATERIALS AND SUPPLIES

<u>a. Direct materials</u>	<u>Annual Requirements</u>	<u>Annual Cost</u>
Natural Gas	7,300 million cubic feet	
Total direct materials		\$ 36,500
 <u>b. Supplies</u>		
Lubricants & hand tools		
Absorber Oil		
Maintenance & spare parts		
Office supplies		
Gas, oil and maintenance of truck		
Total supplies		\$ 7,000
 <u>c. Availability of materials & supplies</u>		
All materials and supplies should be available locally.		

3. POWER, FUEL AND WATER

<u>Electric Power - one kilowatt connected load</u>	<u>Annual Cost</u>
Fuel - no fuel purchased - boiler maintenance	
Water - 200,000 gallons per day	\$ 3,200

4. DEPRECIATION

	<u>Yrs. life</u>	<u>Amount</u>
Building	20	
Prodn. tools & equipment	10	
Other tools & equipment	10	
Furniture & fixtures	10	
Transportation equipment	4	
Total depreciation		\$ 21,900

5. MANPOWER

	<u>Number</u>	<u>Annual Cost</u>
<u>a. Indirect labor</u>		
Supervisor-manager	1	
Chemist	1	
Office	1	
Truck Driver	1	
Total indirect labor	4	\$ 31,000
<u>b. Direct labor</u>		
Skilled workers	2	
Semi-skilled workers	2	
Unskilled workers	2	
Total direct labor	6	\$ 29,200
<u>c. Training needs</u>		
Supervisor must be fully experienced. He and one skilled worker should be able to train other workers and reach full production in 30 days.		

6. TRANSPORTATION

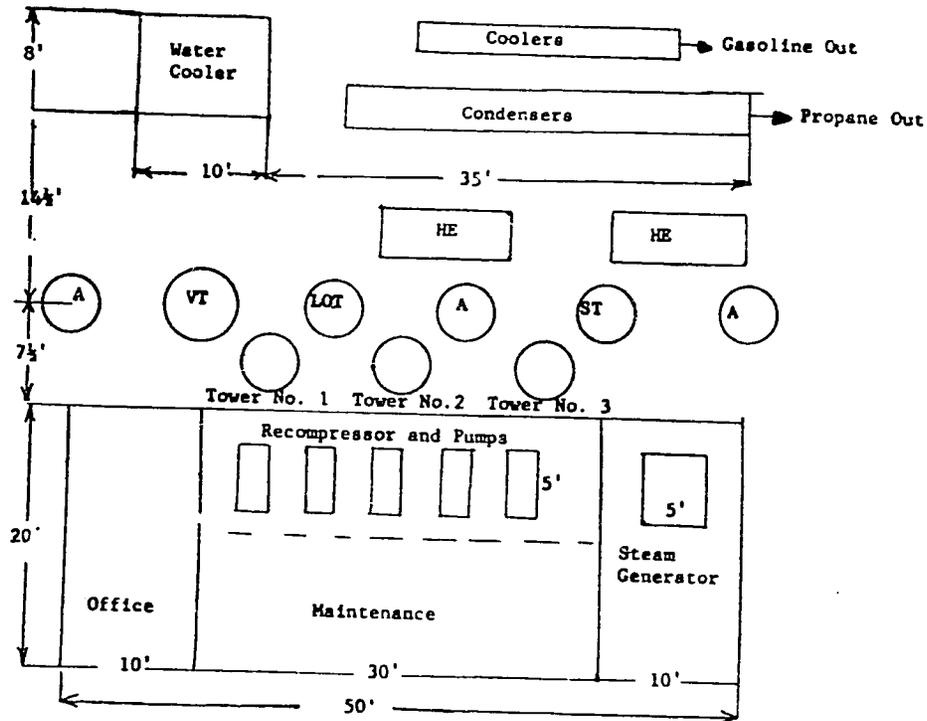

<u>a. Own transport equipment</u>	
Pickup Truck	
<u>b. External transport facilities</u>	
Annual shipments in and out amount to about 423,000 barrels. Railroad and good highways essential.	

7. TOTAL ANNUAL COSTS AND SALES REVENUE

Direct materials	\$ 36,500
Direct labor	29,200
Manufacturing overhead*	63,100
Total manufacturing cost	\$ 128,800
Interest on loans	
Insurance	
Legal	
Audit	
Contingencies	
Total administrative cost	\$ 21,200
Sales expense	\$ 12,000
Freight-out, travel discounts	
Allowances & bad debts	\$ 5,000
Total annual costs	\$ 167,000
Annual Gross Profit	\$ 25,000
ANNUAL SALES REVENUE	\$ 192,000

*Includes Supplies, Power, Fuel, Water, Depreciation and Indirect labor (2b-3-4-5a)
**It was not found practical to show individual item costs because of wide variations in price and other factors, consequently only representative totals are used.

VII. PROFESSIONAL ENGINEERING SERVICES

The services of professional engineers are desirable in the design of industrial plants even though the proposed plant may be small.

A correct design is one which provides the greatest economy in the investment of funds and establishes the basis of operation that will be most profitable in the beginning and will also be capable of expansion without expensive alteration.

The addresses of professional engineers who specialize in Industrial Design, some of whom may be willing to undertake such work on low cost projects overseas, can be secured by reference to the published cards in various engineering magazines.

They may also be reached through their national organizations, one of which is the:

National Society of Professional Engineers
2029 K Street, N.W.
Washington, D.C. 20006

Manufacturers of industrial equipment employ engineers familiar with the design and installation of their specialized products. These manufacturers are usually willing to give prospective customers the benefit of technical advice by those engineers in determining the suitability of their equipment in any proposed project. The equipment manufacturer also knows, and can recommend, professional engineers in private practice who are willing and able to provide appropriate consulting services.

PRE-INVESTMENT FEASIBILITY STUDY SUGGESTED

The foregoing information must be necessarily presented in concise form. Before an investment is made in a plant a feasibility study is suggested. The investor, for his planning, should have more information dealing with the specific locality contemplated. For obvious reasons, such information cannot be included in *Industry Profiles*. Such a study, therefore, should explore local factors and conditions, including costs, sources of raw materials and supplies, availability of utilities and fuel, manpower, transportation, etc.

The investor will need reasonably accurate information on Government and legal requirements, banking and financing, potential demand, competition, construction services, and manpower training requirements. Further, he should consider developing plans for management and production controls, operating procedures, and sales promotion.

ORDERING INSTRUCTIONS

The price of *Industry Profiles* is a minimum of \$3.00 for from one to five "Profiles." The purchaser may select up to five of any "Profiles" available.

Complete sets of the 250 *Industry Profiles* published in 1966, I. P. No. 66001 through I. P. No. 66250 consecutively, may be purchased for \$125.00 per set. Complete sets of the 150 *Industry Profiles* to be published in 1967, I. P. No. 67251 through I. P. No. 67400 consecutively, may be purchased for \$75.00 per set. The latter "Profiles" will automatically be shipped to full set purchasers upon release.

Clearinghouse for Federal Scientific and
Technical Information, 410.12
Springfield, Virginia 22151

Prepayment is required. Make check or money order payable to National Bureau of Standards—CFSTI. Clearinghouse deposit account holders may charge purchases to their accounts.

GENERAL INFORMATION

An *Index of Industry Profiles* is available on request from the agency for International Development, AA/PRR, Washington, D. C. 20523.

This *Industry Profile* was prepared for the U. S. Agency for International Development by International Development Services Inc., Washington, D. C.

DIMENSION HARDWOOD

I. P. No. 67325

S. I. C. 2426

Industry Profiles are intended to promote the development of private industry in the developing countries by assembling economic and technical information in a professional analysis to support basic decisions in the establishment of small or medium-scale plants in a specific industry. The information contained in a profile is selected and organized for the guidance of the entrepreneur in the less developed country.

Industry Profiles contain basic information on market aspects, production rates, capital requirements, materials and supplies, utilities, manpower operating costs and sales revenues. Work-flow diagrams and, in some instances, machinery layouts are included along with references to sources of technical information, professional services, patents, materials and equipment.

The profiles adopt as a benchmark, productivity rates and costs which could be anticipated under conditions prevailing in the United States. Anticipated profits are before taxes. Since conditions vary widely from country to country, the entrepreneur using this profile must make suitable adjustments to conditions prevailing in his country. This profile should help in reaching correct assumptions.

PRODUCT DESCRIPTION

Moldings and other stock machined to exact dimensions according to specifications supplied by customers.

A. GENERAL EVALUATION OF PROSPECTS

The prospects for this industry will be bright where the source of lumber is a long distance from the industrial center and the transportation facilities are inadequate. The cutting waste on lumber for most purposes varies from 20 to 40 percent. Therefore, when lumber is shipped and delivered in specified dimensions, kiln dried, ready for use, the shipping cost is considerably reduced. Such reductions in shipping costs represent sound sales arguments. When the source of lumber is near the industrial center and transportation facilities are adequate, there is less advantage in purchasing dimensioned lumber. A market survey should be made to determine if existing conditions will produce sufficient sales.

B. MARKET ASPECTS1. USERS

Industries and construction contractors are the principal users of dimension lumber. Small amounts are sometimes purchased by individuals.

2. SALES CHANNELS AND EXTENT OF MARKET

Sales are usually made direct to industries, large construction contractors and to lumber yards or building materials companies. The existing activity in home building and the kind of materials used for such construction are two important factors in determining market potential. A careful survey should be made to determine sales potential. Dimensional lumber is bulky and heavy but for long distance hauls it is usually shipped by the truck load or railroad car load. The market would be nationwide but industrial centers would consume the largest percentage. This industry cannot be operated successfully on a small basis. If an adequate supply of lumber is available within the country, this industry should have no difficulty in competing with imported dimension hardwood.

3. RATE OF PROFIT

It should be emphasized that the information under "Production Requirements" on the next page illustrates typical U.S. cost relationships of the various factors entering into the manufacture in the United States of a specified product. It is generally recognized that profits before taxes of manufacturers in the United States may be appreciably lower than normally would be the case in a developing country. While certain imported capital items and specialized technical services may be higher in cost in developing countries, certain other significant production costs such as semi-skilled and unskilled labor, materials and supplies obtained locally may be significantly lower. Factors vitally affecting industrial products costs and profit margins such as degree of competition, size of market, availability of labor, availability of risk capital, relative financial risk, level of industry taxes, and general economic and political stability have widely differing interrelationships and impact on the selling price and profit margin of a manufactured product in a developing country as compared with the United States. Planned operations and production limits would, of necessity, have to be adapted to cost and profit conditions existing in a particular developing country as a first step in determining whether a more intensive survey of the manufacturing possibilities for a particular product and industry is warranted.

4. SELECTED GROSS PROFIT ITEMS

(See supporting data on page 3)

The annual gross sales revenue is estimated at \$450,000.

The total fixed investment, plus working capital, is estimated at \$204,400.

The annual gross profit, before taxes, is estimated at \$36,000.

Using these figures, the profit on gross sales, before taxes, amounts to 8%.

(A gross profit on sales, before taxes, of 8%, while reflecting U.S. experience, should not be considered normal for a developing country where profit margins may be considerably higher in industry and trade.)

The annual profit on the total capital requirements, before taxes, is estimated at 17.6%.

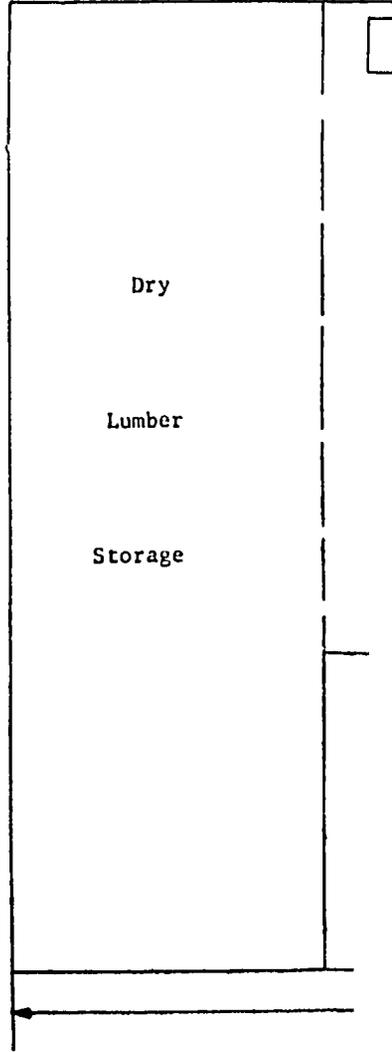

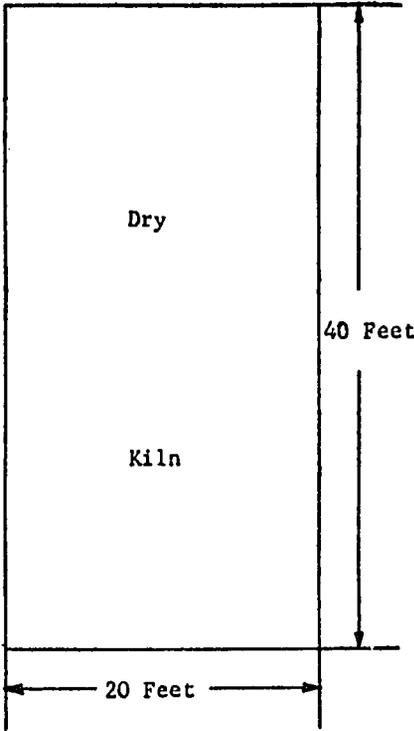

5. COST PER MAN EMPLOYED

Nine direct and five indirect workers, or a total of fourteen workers, are employed.

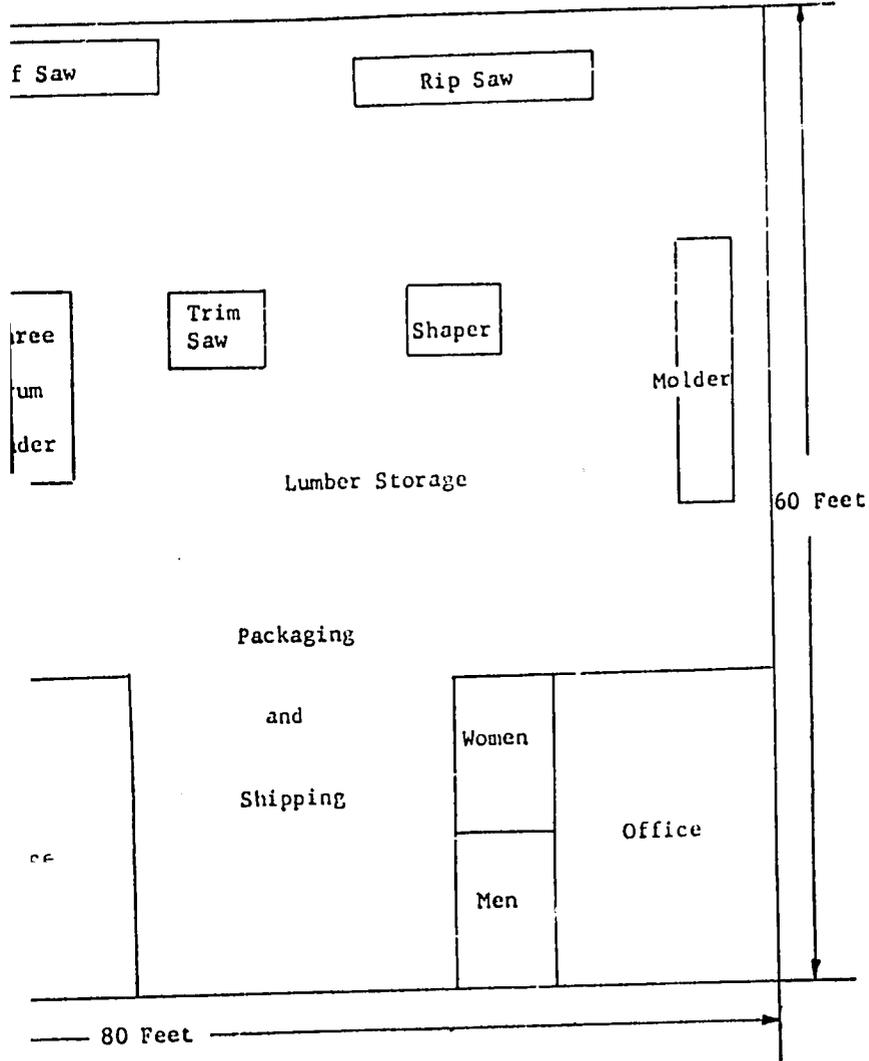

The total fixed capital investment is estimated at \$132,000.

Based on these figures, the fixed investment per man employed would amount to about \$9,430.

INDUSTRY PROFILES

CANNED CHERRIES

I. P. No. 67326

S. I. C. 2033

Industry Profiles are intended to promote the development of private industry in the developing countries by assembling economic and technical information in a professional analysis to support basic decisions in the establishment of small or medium-scale plants in a specific industry. The information contained in a profile is selected and organized for the guidance of the entrepreneur in the less developed country.

Industry Profiles contain basic information on market aspects, production rates, capital requirements, materials and supplies, utilities, manpower operating costs and sales revenues. Work-flow diagrams and, in some instances, machinery layouts are included along with references to sources of technical information, professional services, patents, materials and equipment.

The profiles adopt as a benchmark, productivity rates and costs which could be anticipated under conditions prevailing in the United States. Anticipated profits are before taxes. Since conditions vary widely from country to country, the entrepreneur using this profile must make suitable adjustments to conditions prevailing in his country. This profile should help in reaching correct assumptions.

PRODUCT DESCRIPTION

Canned cherries, 303 cans, size 303 x 406, net weight one pound

A. GENERAL EVALUATION OF PROSPECTS

Although a few small canning plants, including some cooperatives, are equipped to can only one or two products, it is now customary in the commercial canning industry, to operate the plant all year in order to derive maximum profits on the capital investment. This is accomplished by canning several products that are harvested at different seasons of the year. It is, therefore, suggested that several products be selected for canning that are grown in the area where the canning plant is to be located. These selections should include products that are harvested in the spring, summer and fall months, that will keep the plant busy during these seasons. For the winter months, it is recommended that such products as dry beans and pork and beans be canned. Under this method a full annual operation for the plant would be assured. The plant layout, as shown in this profile, is designed for the purpose of canning several seasonal products, thereby providing year round operation for the plant. A feasibility survey should be conducted to determine what products are available for canning at various seasons during the year, in what quantity and at what cost.

B. MARKET ASPECTS1. USERS

Homes, restaurants, hotels, institutions, military, wherever food is served.

2. SALES CHANNELS AND EXTENT OF MARKET

Sales are usually made to wholesalers for distribution to small retail stores and to large users, such as military. The extent of the market for canned cherries normally would be nationwide. If a plant is efficiently managed and operated it should have no difficulty in competing with imported canned fruits. Consumption of canned fruits will vary primarily with the climate, the availability of fresh fruits, the level of income and the degree of urbanization of the population. A comprehensive survey related to these, as well as other, factors should be conducted to determine existing competition and sales potential.

3. RATE OF PROFIT

It should be emphasized that the information under "Production Requirements" on the next page illustrates typical U.S. cost relationships of the various factors entering into the manufacture in the United States of a specified product. It is generally recognized that profits before taxes of manufacturers in the United States may be appreciably lower than normally would be the case in a developing country. While certain imported capital items and specialized technical services may be higher in cost in developing countries, certain other significant production costs such as semi-skilled and unskilled labor, materials and supplies obtained locally may be significantly lower. Factors vitally affecting industrial production costs and profit margins such as degree of competition, size of market, availability of labor, availability of risk capital, relative financial risk, level of industry taxes, and general economic and political stability have widely differing interrelationships and impact on the selling price and profit margin of a manufactured product in a developing country as compared with the United States. Planned operations and production limits would, of necessity, have to be adapted to cost and profit conditions existing in a particular developing country as a first step in determining whether a more intensive survey of the manufacturing possibilities for a particular product and industry is warranted.

4. SELECTED GROSS PROFIT ITEMS

(See supporting data on page 3)

The annual gross sales revenue is estimated at \$150,000.

The total fixed investment, plus working capital, is estimated at \$137,900.

The annual gross profit, before taxes, is estimated at \$7,500.

Based on these figures, the profit on gross sales, before taxes, amounts to about 5.0%.

(A gross profit on sales, before taxes, of 5.0%, while reflecting U.S. experience, should not be considered normal for a developing country, where profit margins may be considerably higher in industry and trade.)

The annual profit on the total capital requirements, before taxes, is estimated at 5.4%.

5. COST PER MAN EMPLOYED

Twenty-two direct workers and four indirect workers, or a total of 26 workers, are employed.

The total fixed capital investment is estimated at \$124,000.

Based on these figures, the fixed investment per man employed would amount to about \$4,770.

VII. PROFESSIONAL ENGINEERING SERVICES

The services of professional engineers are desirable in the design of industrial plants even though the proposed plant may be small.

A correct design is one which provides the greatest economy in the investment of funds and establishes the basis of operation that will be most profitable in the beginning and will also be capable of expansion without expensive alteration.

The addresses of professional engineers who specialize in Industrial Design, some of whom may be willing to undertake such work on low cost projects overseas, can be secured by reference to the published cards in various engineering magazines.

They may also be reached through their national organizations, one of which is the :

National Society of Professional Engineers
2029 K Street, N. W.
Washington, D. C. 20006

Manufacturers of industrial equipment employ engineers familiar with the design and installation of their specialized products. These manufacturers are usually willing to give prospective customers the benefit of technical advice by those engineers in determining the suitability of their equipment in any proposed project. The equipment manufacturer also knows, and can recommend, professional engineers in private practice who are willing and able to provide appropriate consulting services.

PRE-INVESTMENT FEASIBILITY STUDY SUGGESTED

The foregoing information must be necessarily presented in concise form. Before an investment is made in a plant a feasibility study is suggested. The investor, for his planning, should have more information dealing with the specific locality contemplated. For obvious reasons, such information cannot be included in *Industry Profiles*. Such a study, therefore, should explore local factors and conditions, including costs, sources of raw materials and supplies, availability of utilities and fuel, manpower, transportation, etc.

The investor will need reasonably accurate information on Government and legal requirements, banking and financing, potential demand, competition, construction services, and manpower training requirements. Further, he should consider developing plans for management and production controls, operating procedures, and sales promotion.

ORDERING INSTRUCTIONS

The price of *Industry Profiles* is a minimum of \$3.00 for from one to five "*Profiles*." The purchaser may select up to five of any "*Profiles*" available.

Complete sets of the 250 *Industry Profiles* published in 1966, I. P. No. 66001 through I. P. No. 66250 consecutively, may be purchased for \$125.00 per set. Complete sets of the 150 *Industry Profiles* to be published in 1967, I. P. No. 67251 through I. P. No. 67400 consecutively, may be purchased for \$75.00 per set. The latter "*Profiles*" will automatically be shipped to full set purchasers upon release.

Address orders to: U.S. Department of Commerce
Clearinghouse for Federal Scientific and
Technical Information, 410.12
Springfield, Virginia 22151

Prepayment is required. Make check or money order payable to National Bureau of Standards—CFSTI. Clearinghouse deposit account holders may charge purchases to their accounts.

GENERAL INFORMATION

An *Index of Industry Profiles* is available on request from the agency for International Development, AA/PRR, Washington, D. C. 20523.

This *Industry Profile* was prepared for the U. S. Agency for International Development by International Development Services Inc., Washington, D. C.

INDUSTRY PROFILES

CANNED ASPARAGUS

I. P. No. 67327

S. I. C. 2033

Industry Profiles are intended to promote the development of private industry in the developing countries by assembling economic and technical information in a professional analysis to support basic decisions in the establishment of small or medium-scale plants in a specific industry. The information contained in a profile is selected and organized for the guidance of the entrepreneur in the less developed country.

Industry Profiles contain basic information on market aspects, production rates, capital requirements, materials and supplies, utilities, manpower operating costs and sales revenues. Work-flow diagrams and, in some instances, machinery layouts are included along with references to sources of technical information, professional services, patents, materials and equipment.

The profiles adopt as a benchmark, productivity rates and costs which could be anticipated under conditions prevailing in the United States. Anticipated profits are before taxes. Since conditions vary widely from country to country, the entrepreneur using this profile must make suitable adjustments to conditions prevailing in his country. This profile should help in reaching correct assumptions.

CANNED ASPARAGUS

I. P. No. 67327
S. I. C. 2033
NOVEMBER 1967

PRODUCT DESCRIPTION

Canned asparagus, 303 cans, size 303 x 406, net weight one pound,

A. GENERAL EVALUATION OF PROSPECTS

Although a few small canning plants, including some cooperatives, are equipped to can only one or two products, it is now customary in the commercial canning industry, to operate the plant all year in order to derive maximum profits on the capital investment. This is accomplished by canning several products that are harvested at different seasons of the year. It is, therefore, suggested that several products be selected for canning that are grown in the area where the canning plant is to be located. These selections should include products that are harvested in the spring, summer and fall months, that will keep the plant busy during these seasons. For the winter months, it is recommended that such products as dry beans and pork and beans be canned. Under this method a full annual operation for the plant would be assured. The plant layout, as shown in this profile, designed for the purpose of canning several seasonal products, thereby providing year round operation for the plant. A feasibility survey should be conducted to determine what products are available for canning at various seasons during the year, in what quantity and at what cost.

B. MARKET ASPECTS

1. USERS

Homes, restaurants, hotels, institutions, military, wherever food is served.

2. SALES CHANNELS AND METHODS

Sales are usually made to wholesalers for distribution to small retail stores and to large users, such as military. The extent of the market for canned asparagus normally would be nationwide. If a plant is efficiently managed and operated it should have no difficulty in competing with imported canned vegetables. Consumption of canned vegetables will vary primarily with the climate, the availability of fresh vegetables, the level of income and the degree of urbanization of the population. A comprehensive survey related to these, as well as other, factors should be conducted to determine existing competition and sales potential.

3. RATE OF PROFIT

It should be emphasized that the information under "Production Requirements" on the next page illustrates typical U. S. cost relationships of the various factors entering into the manufacture in the United States of a specified product. It is generally recognized that profits before taxes of manufacturers in the United States may be appreciably lower than normally would be the case in a developing country. While certain imported capital items and specialized technical services may be higher in cost in developing countries, certain other significant production costs such as semi-skilled and unskilled labor, materials and supplies obtained locally may be significantly lower. Factors vitally affecting industrial production costs and profit margins such as degree of competition, size of market, availability of labor, availability of risk capital, relative financial risk, level of industry taxes, and general economic and political stability have widely differing interrelationships and impact on the selling price and profit margin of a manufactured product in a developing country as compared with the United States. Planned operations and production limits would, of necessity, have to be adapted to cost and profit conditions existing in a particular developing country as a first step in determining whether a more intensive survey of the manufacturing possibilities for a particular product and industry is warranted.

4. SELECTED GROSS PROFIT ITEMS

(See supporting data on page 3)

The annual gross sales revenue is estimated at \$256,000.
The total fixed investment, plus working capital, is estimated at \$147,800.
The annual gross profit, before taxes, is estimated at \$13,000.
Based on these figures, the profit on gross sales, before taxes, amounts to about 5.1%.
(A gross profit on sales, before taxes, of 5.1%, while reflecting U. S. experience, should not be considered normal for a developing country where profit margins may be considerably higher in industry and trade.)
The annual profit on the total capital requirements, before taxes, is estimated at 8.8%.

5. COST PER MAN EMPLOYED

Twenty-six direct workers and four indirect workers, or a total of thirty workers are employed.
The total fixed capital investment is estimated at \$127,000.
Based on these figures, the fixed investment per man employed would amount to about \$4,225.

C. PRODUCTION REQUIREMENTS - CANNED ASPARAGUS

GENERAL INFORMATION

An *Index of Industry Profiles* is available on request from the agency for International Development, AA/PRR, Washington, D. C. 20523.

This *Industry Profile* was prepared for the U. S. Agency for International Development by International Development Services Inc., Washington, D. C.

226

INDUSTRY PROFILES

CANNED BEETS

I. P. No. 67328

S. I. C. 2033

Industry Profiles are intended to promote the development of private industry in the developing countries by assembling economic and technical information in a professional analysis to support basic decisions in the establishment of small or medium-scale plants in a specific industry. The information contained in a profile is selected and organized for the guidance of the entrepreneur in the less developed country.

Industry Profiles contain basic information on market aspects, production rates, capital requirements, materials and supplies, utilities, manpower operating costs and sales revenues. Work-flow diagrams and, in some instances, machinery layouts are included along with references to sources of technical information, professional services, patents, materials and equipment.

The profiles adopt as a benchmark, productivity rates and costs which could be anticipated under conditions prevailing in the United States. Anticipated profits are before taxes. Since conditions vary widely from country to country, the entrepreneur using this profile must make suitable adjustments to conditions prevailing in his country. This profile should help in reaching correct assumptions.

PRODUCT DESCRIPTION

Canned beets, 303 cans, size 303 x 406, net weight one pound.

A. GENERAL EVALUATION OF PROSPECTS

Although a few small canning plants, including some cooperatives, are equipped to can only one or two products, it is now customary in the commercial canning industry, to operate the plant all year in order to derive maximum profits on the capital investment. This is accomplished by canning several products that are harvested at different seasons of the year. It is, therefore, suggested that several products be selected for canning that are grown in the area where the canning plant is to be located. These selections should include products that are harvested in the spring, summer and fall months, that will keep the plant busy during these seasons. For the winter months, it is recommended that such products as dry beans and pork and beans be canned. Under this method a full annual operation for the plant would be assured. The plant layout, as shown in this profile, is designed for the purpose of canning several seasonal products, thereby providing year round operation for the plant. A feasibility survey should be conducted to determine what products are available for canning at various seasons during the year, in what quantity and at what cost.

B. MARKET ASPECTS1. USERS

Homes, restaurants, hotels, institutions, military, wherever food is served

2. SALES CHANNELS AND EXTENT OF MARKET

Sales are usually made to wholesalers for distribution to small retail stores and to large users, such as military. The extent of the market for canned beets normally would be nationwide. If a plant is efficiently managed and operated it should have no difficulty in competing with imported canned vegetables. Consumption of canned vegetables will vary primarily with the climate, the availability of fresh vegetables, the level of income and the degree of urbanization of the population. A comprehensive survey related to these, as well as other, factors should be conducted to determine existing competition and sales potential.

3. RATE OF PROFIT

It should be emphasized that the information under "Production Requirements" on the next page illustrates typical U.S. cost relationships of the various factors entering into the manufacture in the United States of a specified product. It is generally recognized that profits before taxes of manufacturers in the United States may be appreciably lower than normally would be the case in a developing country. While certain imported capital items and specialized technical services may be higher in cost in developing countries, certain other significant production costs such as semi-skilled and unskilled labor, materials and supplies obtained locally may be significantly lower. Factors vitally affecting industrial production costs and profit margins such as degree of competition, size of market, availability of labor, availability of risk capital, relative financial risk, level of industry taxes, and general economic and political stability have widely differing interrelationships and impact on the selling price and profit margin of a manufactured product in a developing country as compared with the United States. Planned operations and production limits would, of necessity, have to be adapted to cost and profit conditions existing in a particular developing country as a first step in determining whether a more intensive survey of the manufacturing possibilities for a particular product and industry is warranted.

4. SELECTED GROSS PROFIT ITEMS

(See supporting data on page 3)

The annual gross sales revenue is estimated at \$255,000

The total fixed investment, plus working capital, is estimated at \$155,800.

The annual gross profit, before taxes, is estimated at \$14,000.

Based on these figures, the profit on gross sales, before taxes, amounts to about 5.5%.

(A gross profit on sales, before taxes, of 5.5%, while reflecting U. S. experience, should not be considered normal for a developing country where profit margins may be considerably higher in industry and trade.)

The annual profit on the total capital requirements, before taxes, is estimated at 9.0%.

5. COST PER MAN EMPLOYED

Twenty direct workers and four indirect workers, or a total of twenty-four workers, are employed.

The total fixed capital investment is estimated at \$135,000.

Based on these figures, the fixed investment per man employed would amount to about \$5,620.

C. PRODUCTION REQUIREMENTS - CANNED BEETS
ANNUAL CAPACITY - ONE SHIFT OPERATION - 33 WEEKS:
2,370,000 CANS

I.P. No. 67328
 S.I.C. 2033

NOTE : COSTS AND OPERATING DATA ARE BASED ON UNITED STATES PRICES AND PRACTICES**

1. CAPITAL REQUIREMENTS

<u>a. Fixed Capital</u>	<u>Cost</u>
Land - 2 acres	
Building - one story, 100' x 120'	
Equipment, furniture & fixtures	
Prodn. tools & equipment	
Other tools & equipment	
Furniture & fixtures	
Transportation equipment	
Total fixed capital	\$135,000
<u>Principal Items :</u>	
Conveyor with Hopper, 2 Sinks, 5 Work Tables, 2 Soak Tanks, Belt Conveyor, 4 Cooking Kettles, Accumulation Table, 3 Can Reformers, 2 Can Flangers, 3 Can Bottom Seamers, Can Tester, Can Washer, H.P. Filler, 2 Syrup or Brine Kettles, Exhaust Box, Closer, Tramway & Hoist, Auxiliary Kettle, 3 Retorts (4 crates), 30 Crates, 10 Crate Dollies, Labeler, Can Conveyor, Roller Conveyor, Lift Truck with Pallets, Compressor, Platform Scales, Boiler 100 H.P.-120 P S L, Cleaning Reef, Washer, Grader, Blancher, Abrasive Peeler, Washer	
<u>b. Working Capital (15 days)</u>	
Direct materials	
Direct labor	
Manufacturing overhead	
Administrative costs	
Sales costs	
Freight-out, discounts, bad debts & allowances	
Sales revenue	
Training costs	
Total working capital	\$ 20,800
<u>c. Total Capital Requirements</u>	\$155,800

2. MATERIALS AND SUPPLIES

<u>a. Direct Materials</u>	<u>Annual Requirements</u>	<u>Annual Cost</u>
Beets	1,400 tons	
Cans	2,370,000	
Additives		
Labels and Cartons		
Total direct materials		\$116,000
<u>b. Supplies</u>		
Lubricants & hand tools		
Cutting tools & abrasives		
Maintenance & spare parts		
Office supplies		
Gas, oil and maintenance of truck		
Total supplies		\$ 1,900
<u>c. Availability of materials & supplies</u>		
Beets must be available locally. Labels and cartons should be available locally. Cans may have to be imported.		

<u>3. POWER, FUEL AND WATER</u>	<u>Annual Cost</u>
Electric Power - 16 3/4 H. P. connected load	
Fuel - oil	
Water - must be potable	\$ 6,000

<u>4. DEPRECIATION</u>	<u>Yrs. life</u>	<u>Amount</u>
Building	20	
Prodn. tools & equipment	10	
Other tools & equipment	10	
Furniture & fixtures	10	
Transportation equipment	4	
Total depreciation		\$ 10,700

<u>5. MANPOWER</u>	<u>Number</u>	<u>Annual Cost</u>
<u>a. Indirect labor</u>		
Manager	1	
Clerk	1	
Inspectors	1	
Truck Driver	1	
Total indirect labor	<u>4</u>	\$ 18,900

<u>b. Direct labor</u>		
Skilled workers	2	
Semi-skilled workers	3	
Unskilled workers	15	
Total direct labor	<u>20</u>	\$ 50,500

c. Training needs
 The manager and the inspector should be fully experienced. They with 2 skilled workers should be able to train all workers and reach full production in about one week.

6. TRANSPORTATION

<u>a. Own transport equipment</u>	
Truck	
<u>b. External transport facilities</u>	
During the canning season the input at the plant will amount to about 7.1 tons per day. Good highways.	

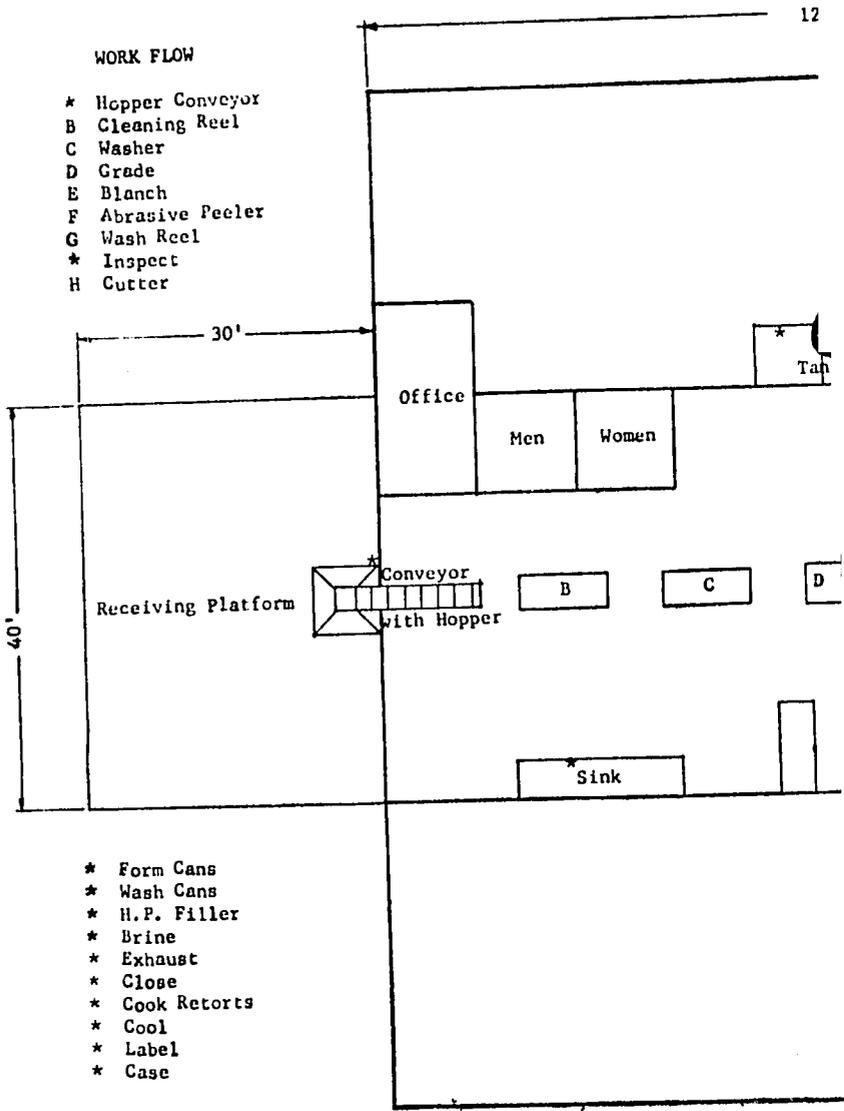

7. TOTAL ANNUAL COSTS AND SALES REVENUE

Direct materials	\$116,000
Direct labor	50,500
Manufacturing overhead*	<u>37,500</u>
Total manufacturing cost	\$ 204,000
Interest on loans	
Insurance	
Legal	
Audit	
Contingencies	
Total administrative cost	\$ 15,000
Sales expense	\$ 16,000
Freight-out, travel discounts	
Allowances & bad debts	\$ 6,000
Total annual costs	\$ 241,000
Annual Gross Profit	\$ 14,000
ANNUAL SALES REVENUE	\$ 255,000

*Includes Supplies, Power, Fuel, Water, Depreciation and Indirect labor (2b-3-4-5a)
 **It was not found practical to show individual item costs because of wide variations in price and other factors, consequently only representative totals are used.

VII. PROFESSIONAL ENGINEERING SERVICES

The services of professional engineers are desirable in the design of industrial plants even though the proposed plant may be small.

A correct design is one which provides the greatest economy in the investment of funds and establishes the basis of operation that will be most profitable in the beginning and will also be capable of expansion without expensive alteration.

The addresses of professional engineers who specialize in Industrial Design, some of whom may be willing to undertake such work on low cost projects overseas, can be secured by reference to the published cards in various engineering magazines.

They may also be reached through their national organizations, one of which is the:

National Society of Professional Engineers
2029 K Street, N.W.
Washington, D.C. 20006

Manufacturers of industrial equipment employ engineers familiar with the design and installation of their specialized products. These manufacturers are usually willing to give prospective customers the benefit of technical advice by those engineers in determining the suitability of their equipment in any proposed project. The equipment manufacturer also knows, and can recommend, professional engineers in private practice who are willing and able to provide appropriate consulting services.

PRE-INVESTMENT FEASIBILITY STUDY SUGGESTED

The foregoing information must be necessarily presented in concise form. Before an investment is made in a plant a feasibility study is suggested. The investor, for his planning, should have more information dealing with the specific locality contemplated. For obvious reasons, such information cannot be included in *Industry Profiles*. Such a study, therefore, should explore local factors and conditions, including costs, sources of raw materials and supplies, availability of utilities and fuel, manpower, transportation, etc.

The investor will need reasonably accurate information on Government and legal requirements, banking and financing, potential demand, competition, construction services, and manpower training requirements. Further, he should consider developing plans for management and production controls, operating procedures, and sales promotion.

ORDERING INSTRUCTIONS

The price of *Industry Profiles* is a minimum of \$3.00 for from one to five "*Profiles*." The purchaser may select up to five of any "*Profiles*" available.

Complete sets of the 250 *Industry Profiles* published in 1966, I. P. No. 66001 through I. P. No. 66250 consecutively, may be purchased for \$125.00 per set. Complete sets of the 150 *Industry Profiles* to be published in 1967, I. P. No. 67251 through I. P. No. 67400 consecutively, may be purchased for \$75.00 per set. The latter "*Profiles*" will automatically be shipped to full set purchasers upon release.

Address orders to: U.S. Department of Commerce
Clearinghouse for Federal Scientific and
Technical Information, 410.12
Springfield, Virginia 22151

Prepayment is required. Make check or money order payable to National Bureau of Standards—CFSTI. Clearinghouse deposit account holders may charge purchases to their accounts.

GENERAL INFORMATION

INDUSTRY PROFILES

CANNED PEACHES

I. P. No. 67329

S. I. C. 2033

Industry Profiles are intended to promote the development of private industry in the developing countries by assembling economic and technical information in a professional analysis to support basic decisions in the establishment of small or medium-scale plants in a specific industry. The information contained in a profile is selected and organized for the guidance of the entrepreneur in the less developed country.

Industry Profiles contain basic information on market aspects, production rates, capital requirements, materials and supplies, utilities, manpower operating costs and sales revenues. Work-flow diagrams and, in some instances, machinery layouts are included along with references to sources of technical information, professional services, patents, materials and equipment.

The profiles adopt as a benchmark, productivity rates and costs which could be anticipated under conditions prevailing in the United States. Anticipated profits are before taxes. Since conditions vary widely from country to country, the entrepreneur using this profile must make suitable adjustments to conditions prevailing in his country. This profile should help in reaching correct assumptions.

CANNED PEACHES

PRODUCT DESCRIPTION

Canned peaches, 303 cans, size 303 x 406, net weight one pound.

A. GENERAL EVALUATION OF PROSPECTS

Although a few small canning plants, including some cooperatives, are equipped to can only one or two products, it is now customary in the commercial canning industry, to operate the plant all year in order to derive maximum profits on the capital investment. This is accomplished by canning several products that are harvested at different seasons of the year. It is, therefore, suggested that several products be selected for canning that are grown in the area where the canning plant is to be located. These selections should include products that are harvested in the spring, summer, and fall months, that will keep the plant busy during these seasons. For the winter months, it is recommended that such products as dry beans and pork and beans be canned. Under this method a full annual operation for the plant would be assured. The plant layout, as shown in this profile, is designed for the purpose of canning several seasonal products, thereby providing year round operation for the plant. A feasibility survey should be conducted to determine what products are available for canning at various seasons during the year, in what quantity, and at what cost.

B. MARKET ASPECTS

1. USERS

Homes, restaurants, hotels, institutions, military, wherever food is served.

2. SALES CHANNELS AND EXTENT OF MARKET

Sales are usually made to wholesalers for distribution to small retail stores and to large users, such as military. The extent of the market for canned peaches normally would be nationwide. If a plant is efficiently managed and operated it should have no difficulty in competing with imported canned fruits. Consumption of canned fruits will vary primarily with the climate, the availability of fresh fruits, the level of income, and the degree of urbanization of the population. A comprehensive survey related to these, as well as other, factors should be conducted to determine existing competition and sales potential.

3. RATE OF PROFIT

It should be emphasized that the information under "Production Requirements" on the next page illustrates typical U.S. cost relationships of the various factors entering into the manufacture in the United States of a specified product. It is generally recognized that profits before taxes of manufacturers in the United States may be appreciably lower than normally would be the case in a developing country. While certain imported capital items and specialized technical services may be higher in cost in developing countries, certain other significant production costs such as semi-skilled and unskilled labor, materials and supplies obtained locally may be significantly lower. Factors vitally affecting industrial production costs and profit margins such as degree of competition, size of market, availability of labor, availability of risk capital, relative financial risk, level of industry taxes, and general economic and political stability have widely differing interrelationships and impact on the selling price and profit margin of a manufactured product in a developing country as compared with the United States. Planned operations and production limits would, of necessity, have to be adapted to cost and profit conditions existing in a particular developing country as a first step in determining whether a more intensive survey of the manufacturing possibilities for a particular product and industry is warranted.

4. SELECTED GROSS PROFIT ITEMS

(See supporting data on page 3)

The annual gross sales revenue is estimated at \$131,000.

The total fixed investment, plus working capital, is estimated at \$139,300.

The annual gross profit, before taxes, is estimated at \$6,600.

Based on these figures, the profit on gross sales, before taxes, amounts to about 5.04%.

(A gross profit on sales, before taxes, of 5.04%, while reflecting U.S. experience, should not be considered normal for a developing country where profit margins may be considerably higher in industry and trade.)

The annual profit on the total capital requirements, before taxes, is estimated at 4.7%.

5. COST PER MAN EMPLOYED

Twenty-three direct workers and four indirect workers, or a total of 27, are employed.

The total fixed capital investment is estimated at \$129,000.

Based on these figures, the fixed investment per man employed would amount to \$4,777.

VII. PROFESSIONAL ENGINEERING SERVICES

The services of professional engineers are desirable in the design of industrial plants even though the proposed plant may be small.

A correct design is one which provides the greatest economy in the investment of funds and establishes the basis of operation that will be most profitable in the beginning and will also be capable of expansion without expensive alteration.

The addresses of professional engineers who specialize in Industrial Design, some of whom may be willing to undertake such work on low cost projects overseas, can be secured by reference to the published cards in various engineering magazines.

They may also be reached through their national organizations, one of which is the :

National Society of Professional Engineers
2029 K Street, N. W.
Washington, D. C. 20006

Manufacturers of industrial equipment employ engineers familiar with the design and installation of their specialized products. These manufacturers are usually willing to give prospective customers the benefit of technical advice by those engineers in determining the suitability of their equipment in any proposed project. The equipment manufacturer also knows, and can recommend, professional engineers in private practice who are willing and able to provide appropriate consulting services.

241

PRE-INVESTMENT FEASIBILITY STUDY SUGGESTED

The foregoing information must be necessarily presented in concise form. Before an investment is made in a plant a feasibility study is suggested. The investor, for his planning, should have more information dealing with the specific locality contemplated. For obvious reasons, such information cannot be included in *Industry Profiles*. Such a study, therefore, should explore local factors and conditions, including costs, sources of raw materials and supplies, availability of utilities and fuel, manpower, transportation, etc.

The investor will need reasonably accurate information on Government and legal requirements, banking and financing, potential demand, competition, construction services, and manpower training requirements. Further, he should consider developing plans for management and production controls, operating procedures, and sales promotion.

ORDERING INSTRUCTIONS

The price of *Industry Profiles* is a minimum of \$3.00 for from one to five "*Profiles*." The purchaser may select up to five of any "*Profiles*" available.

Complete sets of the 250 *Industry Profiles* published in 1966, I. P. No. 66001 through I. P. No. 66250 consecutively, may be purchased for \$125.00 per set. Complete sets of the 150 *Industry Profiles* to be published in 1967, I. P. No. 67251 through I. P. No. 67400 consecutively, may be purchased for \$75.00 per set. The latter "*Profiles*" will automatically be shipped to full set purchasers upon release.

Address orders to: U.S. Department of Commerce
Clearinghouse for Federal Scientific and
Technical Information, 410 12
Springfield, Virginia 22151

Prepayment is required. Make check or money order payable to National Bureau of Standards—CFSTI. Clearinghouse deposit account holders may charge purchases to their accounts.

GENERAL INFORMATION

An *Index of Industry Profiles* is available on request from the agency for International Development, AA/PRR, Washington, D. C. 20523.

This *Industry Profile* was prepared for the U. S. Agency for International Development by International Development Services Inc., Washington, D. C.

INDUSTRY PROFILES

CANNED HOMINY

I. P. No. 67330

S. I. C. 2033

Industry Profiles are intended to promote the development of private industry in the developing countries by assembling economic and technical information in a professional analysis to support basic decisions in the establishment of small or medium-scale plants in a specific industry. The information contained in a profile is selected and organized for the guidance of the entrepreneur in the less developed country.

Industry Profiles contain basic information on market aspects, production rates, capital requirements, materials and supplies, utilities, manpower operating costs and sales revenues. Work-flow diagrams and, in some instances, machinery layouts are included along with references to sources of technical information, professional services, patents, materials and equipment.

The profiles adopt as a benchmark, productivity rates and costs which could be anticipated under conditions prevailing in the United States. Anticipated profits are before taxes. Since conditions vary widely from country to country, the entrepreneur using this profile must make suitable adjustments to conditions prevailing in his country. This profile should help in reaching correct assumptions.

PRODUCT DESCRIPTION

Canned hominy, 303 cans, size 303 x 406, net weight one pound.

A. GENERAL EVALUATION OF PROSPECTS

Although a few small canning plants, including some cooperatives are equipped to can only one or two products, it is now customary in the commercial canning industry, to operate the plant all year in order to derive maximum profits on the capital investment. This is accomplished by canning several products that are harvested at different seasons of the year. It is, therefore, suggested that several products be selected for canning that are grown in the area where the canning plant is to be located. These selections should include products that are harvested in the spring, summer and fall months, that will keep the plant busy during these seasons. For the winter months, it is recommended that such products as dry beans and pork and beans be canned. Under this method a full annual operation for the plant would be assured. The plant layout, as shown in this profile, is designed for the purpose of canning several seasonal products, thereby providing year round operation for the plant. A feasibility survey should be conducted to determine what products are available for canning at various seasons during the year, in what quantity and at what cost.

B. MARKET ASPECTS1. USERS

Homes, restaurants, hotels, institutions, military, wherever food is served.

2. SALES CHANNELS AND EXTENT OF MARKET

Sales are usually made to wholesalers for distribution to small retail stores and to large users, such as military. The extent of the market for canned hominy normally would be nationwide. If a plant is efficiently managed and operated it should have no difficulty in competing with imported canned vegetables. Consumption of canned vegetables will vary primarily with the climate, the availability of fresh vegetables, the level of income and the degree of urbanization of the population. A comprehensive survey related to these, as well as other, factors should be conducted to determine existing competition and sales potential.

3. RATE OF PROFIT

It should be emphasized that the information under "Production Requirements" on the next page illustrates typical U.S. cost relationships of the various factors entering into the manufacture in the United States of a specified product. It is generally recognized that profits before taxes of manufacturers in the United States may be appreciably lower than normally would be the case in a developing country. While certain imported capital items and specialized technical services may be higher in cost in developing countries, certain other significant production costs such as semi-skilled and unskilled labor, materials and supplies obtained locally may be significantly lower. Factors vitally affecting industrial production costs and profit margins such as degree of competition, size of market, availability of labor, availability of risk capital, relative financial risk, level of industry taxes, and general economic and political stability have widely differing interrelationships and impact on the selling price and profit margin of a manufactured product in a developing country as compared with the United States. Planned operations and production limits would, of necessity, have to be adapted to cost and profit conditions existing in a particular developing country as a first step in determining whether a more intensive survey of the manufacturing possibilities for a particular product and industry is warranted.

4. SELECTED GROSS PROFIT ITEMS

(See supporting data on page 3)

The annual gross sales revenue is estimated at \$90,000.

The total fixed investment, plus working capital, is estimated at \$132,700.

The annual gross profit, before taxes, is estimated at \$5,000.

Based on these figures, the profit on gross sales, before taxes, amounts to about 5.5%.

(A gross profit on sales, before taxes, of 5.5%, while reflecting U.S. experience, should not be considered normal for a developing country where profit margins may be considerably higher in industry and trade.)

The annual profit on the total capital requirements, before taxes, is estimated at 3.8%.

5. COST PER MAN EMPLOYED

Twenty direct workers and four indirect workers, or a total of twenty-four workers, are employed.

The total fixed capital investment is estimated at \$125,000.

Based on these figures, the fixed investment per man employed would amount to about \$5,200.

C. PRODUCTION REQUIREMENTS - CANNED HOMINY
ANNUAL CAPACITY - ONE SHIFT OPERATION--8 WEEKS:
 570,000 CANS

I.P. No. 67330
 S.I.C. 2033

NOTE: COSTS AND OPERATING DATA ARE BASED ON UNITED STATES PRICES AND PRACTICES**

1. CAPITAL REQUIREMENTS

a. Fixed Capital	<u>Cost</u>
Land - 2 acres	
Building - one story 100' x 120'	
Equipment, furniture & fixtures	
Prodn. tools & equipment	
Other tools & equipment	
Furniture & fixtures	
Transportation equipment	
Total fixed capital	\$ 125,000
<u>Principal items:</u>	
Conveyor with Hopper, 2 Sinks, 5 Work Tables, 2 Soak Tanks, Belt Conveyor, 4 Cooking Kettles, Accumulation Table, 3 Can Reformers, 2 Can Flangers, 3 Can Bottom Seamers, Can Tester, Can Washer, H.P. Filler, 2 Syrup or Brine Kettles, Exhaust Box, Closer, Tramway & Hoist Auxiliary Kettle, 3 Retorts (4 crates), 30 Crates, 10 Crate Dollies, Labeler, Can Conveyor, Roller Conveyor, Lift-Truck with Pallets, Compressor, Platform Scales, Boiler 100 H. P. - 120 PSI, Dry Clean Blower Lye Tank, Huller, Washer, Blanch, Washer	
b. Working Capital (15 days)	
Direct materials	
Direct labor	
Manufacturing overhead	
Administrative costs	
Sales costs	
Freight-out, discounts, bad debts & allowances	
Sales revenue	
Training costs	
Total working capital	\$ 7,700
c. Total Capital Requirements	\$ 132,700

2. MATERIALS AND SUPPLIES

a. Direct materials	<u>Annual Requirements</u>	<u>Annual Cost</u>
Corn	740 tons	
Cans	570,000	
Additive:		
Labels and Cartons		
Total direct materials		\$ 37,000
b. Supplies		
Lubricants & hand tools		
Cutting tools & abrasives		
Maintenance & spare parts		
Office supplies		
Gas, oil & maintenance of truck		
Total supplies		\$ 1,800
c. Availability of materials & supplies		
Corn must be available locally. Labels and cartons should be available locally. Cans may have to be imported.		

3. POWER, FUEL AND WATER

Electric Power - 15 1/4H.P. connected load		<u>Annual Cost</u>
Fuel - oil		
Water - must be potable		
		\$ 1,700

4. DEPRECIATION

	<u>Yrs. life</u>	<u>Amount</u>
Building	20

This profile should help in reaching correct assumptions.

PRODUCT DESCRIPTION

Canned okra, 303 cans, size 303 x 406, net weight one pound.

A. GENERAL EVALUATION OF PROSPECTS

Although a few small canning plants, including some cooperatives, are equipped to can only one or two products, it is now customary in the commercial canning industry to operate the plant all year in order to derive maximum profits on the capital investment. This is accomplished by canning several products that are harvested at different seasons of the year. It is, therefore, suggested that several products be selected for canning that are grown in the area where the canning plant is to be located. These selections should include products that are harvested in the spring, summer, and fall months, that will keep the plant busy during these seasons. For the winter months, it is recommended that such products as dry beans and pork and beans be canned. Under this method a full annual operation for the plant would be assured. The plant layout, as shown in this profile, is designed for the purpose of canning several seasonal products, thereby providing year round operation for the plant. A feasibility survey should be conducted to determine what products are available for canning at various seasons during the year, in what quantity, and at what cost.

B. MARKET ASPECTS1. USERS

Homes, restaurants, hotels, institutions, military, wherever food is served.

2. SALES CHANNELS AND EXTENT OF MARKET

Sales are usually made to wholesalers for distribution to small retail stores and to large users, such as military. The extent of the market for canned okra normally would be nationwide. If a plant is efficiently managed and operated it should have no difficulty in competing with imported canned vegetables. Consumption of canned vegetables will vary primarily with the climate, the availability of fresh vegetables, the level of income, and the degree of urbanization of the population. A comprehensive survey related to these, as well as other factors, should be conducted to determine existing competition and sales potential.

3. RATE OF PROFIT

It should be emphasized that the information under "Production Requirements" on the next page illustrates typical U. S. cost relationships of the various factors entering into the manufacture in the United States of a specified product. It is generally recognized that profits before taxes of manufacturers in the United States may be appreciably lower than normally would be the case in a developing country. While certain imported capital items and specialized technical services may be higher in cost in developing countries, certain other significant production costs such as semi-skilled and unskilled labor, materials and supplies obtained locally may be significantly lower. Factors vitally affecting industrial products costs and profit margins such as degree of competition, size of market, availability of labor, availability of risk capital, relative financial risk, level of industry taxes, and general economic and political stability have widely differing interrelationships and impact on the selling price and profit margin of a manufactured product in a developing country as compared with the United States. Planned operations and production limits would, of necessity, have to be adapted to cost and profit conditions existing in a particular developing country as a first step in determining whether a more intensive survey of the manufacturing possibilities for a particular product and industry is warranted.

4. SELECTED GROSS PROFIT ITEMS

(See supporting data on page 3)

The annual gross sales revenue is estimated at \$130,000.

The total fixed investment, plus working capital, is estimated at \$139,800.

The annual gross profit, before taxes, is estimated at \$7,000.

Using these figures, the profit on gross sales, before taxes, amounts to about 5.4%.

(A gross profit on sales, before taxes, of 5.4%, while reflecting U.S. experience, should not be considered normal for a developing country where profit margins may be considerably higher in industry and trade.)

The annual profit on the total capital requirements, before taxes, is estimated at 5.0%.

5. COST PER MAN EMPLOYED

Twenty direct workers and four indirect workers, or a total of twenty-four workers, are employed.

The total fixed capital investment is estimated at \$129,000.

Based on these figures, the fixed investment per man employed would amount to \$5,375.

VII. PROFESSIONAL ENGINEERING SERVICES

The services of professional engineers are desirable in the design of industrial plants even though the proposed plant may be small.

A correct design is one which provides the greatest economy in the investment of funds and establishes the basis of operation that will be most profitable in the beginning and will also be capable of expansion without expensive alteration.

The addresses of professional engineers who specialize in Industrial Design, some of whom may be willing to undertake such work on low cost projects overseas, can be secured by reference to the published cards in various engineering magazines.

They may also be reached through their national organizations, one of which is the:

National Society of Professional Engineers
2029 K Street, N.W.
Washington, D.C. 20006

Manufacturers of industrial equipment employ engineers familiar with the design and installation of their specialized products. These manufacturers are usually willing to give prospective customers the benefit of technical advice by those engineers in determining the suitability of their equipment in any proposed project. The equipment manufacturer also knows, and can recommend, professional engineers in private practice who are willing and able to provide appropriate consulting services.

PRE-INVESTMENT FEASIBILITY STUDY SUGGESTED

The foregoing information must be necessarily presented in concise form. Before an investment is made in a plant a feasibility study is suggested. The investor, for his planning, should have more information dealing with the specific locality contemplated. For obvious reasons, such information cannot be included in *Industry Profiles*. Such a study, therefore, should explore local factors and conditions, including costs, sources of raw materials and supplies, availability of utilities and fuel, manpower, transportation, etc.

The investor will need reasonably accurate information on Government and legal requirements, banking and financing, potential demand, competition, construction services, and manpower training requirements. Further, he should consider developing plans for management and production controls, operating procedures, and sales promotion.

ORDERING INSTRUCTIONS

The price of *Industry Profiles* is a minimum of \$3.00 for from one to five "Profiles." The purchaser may select up to five of any "Profiles" available.

Complete sets of the 250 *Industry Profiles* published in 1966, I. P. No. 66001 through I. P. No. 66250 consecutively, may be purchased for \$125.00 per set. Complete sets of the 150 *Industry Profiles* to be published in 1967, I. P. No. 67251 through I. P. No. 67400 consecutively, may be purchased for \$75.00 per set. The latter "Profiles" will automatically be shipped to full set purchasers upon release.

Address orders to: U.S. Department of Commerce
Clearinghouse for Federal Scientific and
Technical Information, 410.12
Springfield, Virginia 22151

Prepayment is required. Make check or money order payable to National Bureau of Standards—CFSTI. Clearinghouse deposit account holders may charge purchases to their accounts.

GENERAL INFORMATION

An *Index of Industry Profiles* is available on request from the agency for International Development, AA/PRR, Washington, D. C. 20523.

This *Industry Profile* was prepared for the U. S. Agency for International Development by International Development Services Inc., Washington, D. C.

251

INDUSTRY PROFILES

CANNED SWEET POTATOES

I. P. No. 67332

S. I. C. 2033

Industry Profiles are intended to promote the development of private industry in the developing countries by assembling economic and technical information in a professional analysis to support basic decisions in the establishment of small or medium-scale plants in a specific industry. The information contained in a profile is selected and organized for the guidance of the entrepreneur in the less developed country.

Industry Profiles contain basic information on market aspects, production rates, capital requirements, materials and supplies, utilities, manpower operating costs and sales revenues. Work-flow diagrams and, in some instances, machinery layouts are included along with references to sources of technical information, professional services, patents, materials and equipment.

The profiles adopt as a benchmark, productivity rates and costs which could be anticipated under conditions prevailing in the United States. Anticipated profits are before taxes. Since conditions vary widely from country to country, the entrepreneur using this profile must make suitable adjustments to conditions prevailing in his country. This profile should help in reaching correct assumptions.

PRODUCT DESCRIPTION

Canned sweet potatoes, 303 cans, size 303 x 406, net weight one pound

A. GENERAL EVALUATION OF PROSPECTS

Although a few small canning plants, including some cooperatives, are equipped to can only one or two products, it is now customary in the commercial canning industry, to operate the plant all year in order to derive maximum profits on the capital investment. This is accomplished by canning several products that are harvested at different seasons of the year. It is, therefore, suggested that several products be selected for canning that are grown in the area where the canning plant is to be located. These selections should include products that are harvested in the spring, summer, and fall months, that will keep the plant busy during these seasons. For the winter months, it is recommended that such products as dry beans and pork and beans be canned. Under this method a full annual operation for the plant would be assured. The plant layout, as shown in this profile, is designed for the purpose of canning several seasonal products, thereby providing year round operation for the plant. A feasibility survey should be conducted to determine what products are available for canning at various seasons during the year, in what quantity, and at what cost.

B. MARKET ASPECTS1. USERS

Homes, restaurants, hotels, institutions, military, wherever food is served.

2. SALES CHANNELS AND EXTENT OF MARKET

Sales are usually made to wholesalers for distribution to small retail stores and to large users, such as military. The extent of the market for canned sweet potatoes normally would be nationwide. If a plant is efficiently managed and operation it should have no difficulty in competing with imported canned vegetables. Consumption of canned vegetables will vary primarily with the climate, the availability of fresh vegetables, the level of income, and the degree of urbanization of the population. A comprehensive survey related to these, as well as other, factors should be conducted to determine existing competition and sales potential.

3. RATE OF PROFIT

It should be emphasized that the information under "Production Requirements" on the next page illustrates typical U.S. cost relationships of the various factors entering into the manufacture in the United States of a specified product. It is generally recognized that profits before taxes of manufacturers in the United States may be appreciably lower than normally would be the case in a developing country. While certain imported capital items and specialized technical services may be higher in cost in developing countries, certain other significant production costs such as semi-skilled and unskilled labor, materials and supplies obtained locally may be significantly lower. Factors vitally affecting industrial products costs and profit margins such as degree of competition, size of market, availability of labor, availability of risk capital, relative financial risk, level of industry taxes, and general economic and political stability have widely differing interrelationships and impact on the selling price and profit margin of a manufactured product in a developing country as compared with the United States. Planned operations and production limits would, of necessity, have to be adapted to cost and profit conditions existing in a particular developing country as a first step in determining whether a more intensive survey of the manufacturing possibilities for a particular product and industry is warranted.

4. SELECTED GROSS PROFIT ITEMS

(See supporting data on page 3)

The annual gross sales revenue is estimated at \$140,000.

The total fixed investment, plus working capital, is estimated at \$146,800.

The annual gross profit, before taxes, is estimated at \$7,500.

Using these figures, the profit on gross sales, before taxes, amounts to about 5.4%.

(A gross profit on sales, before taxes, of 5.4%, while reflecting U.S. experience, should not be considered normal for a developing country where profit margins may be considerably higher in industry and trade.)

The annual profit on the total capital requirements, before taxes, is estimated at 5.1%.

5. COST PER MAN EMPLOYED

Seventeen direct workers and four indirect workers, or a total of twenty-one workers, are employed.

The total fixed capital investment is estimated at \$135,000.

Based on these figures, the fixed investment per man employed would amount to about \$6,425.

C. PRODUCTION REQUIREMENTS CANNED SWEET POTATOES
ANNUAL CAPACITY - ONE SHIFT OPERATION 12 WEEKS:
860,000 CANS

267

CANNED STRAWBERRIES

I. P. No. 67333
S.I.C. 2033
NOVEMBER 1967

PRODUCT DESCRIPTION

Canned strawberries, 303 cans, size 303 x 406, net weight one pound.

A. GENERAL EVALUATION OF PROSPECTS

Although a few small canning plants, including some cooperatives, are equipped to can only one or two products, it is now customary in the commercial canning industry, to operate the plant all year in order to derive maximum profits on the capital investment. This is accomplished by canning several products that are harvested at different seasons of the year. It is, therefore, suggested that several products be selected for canning that are grown in the area where the canning plant is to be located. These selections should include products that are harvested in the spring, summer, and fall months, that will keep the plant busy during these seasons. For the winter months, it is recommended that such products as dry beans and pork and beans be canned. Under this method a full annual operation for the plant would be assured. The plant layout, as shown in this profile, is designed for the purpose of canning several seasonal products, thereby providing year round operation for the plant. A feasibility survey should be conducted to determine what products are available for canning at various seasons during the year, in what quantity, and at what cost.

B. MARKET ASPECTS

1. USERS

Homes, restaurants, hotels, institutions, military, wherever food is served.

2. SALES CHANNELS AND EXTENT OF MARKET

Sales are usually made to wholesalers for distribution to small retail stores and to large users, such as military. The extent of the market for canned strawberries normally would be nationwide. If a plant is efficiently managed and operated it should have no difficulty in competing with imported canned fruits. Consumption of canned fruits will vary primarily with the climate, the availability of fresh fruits, the level of income and the degree of urbanization of the population. A comprehensive survey related to these, as well as other, factors should be conducted to determine existing competition and sales potential.

3. RATE OF PROFIT

It should be emphasized that the information under "Production Requirements" on the next page illustrates typical U.S. cost relationships of the various factors entering into the manufacture in the United States of a specified product. It is generally recognized that profits before taxes of manufacturers in the United States may be appreciably lower than normally would be the case in a developing country. While certain imported capital items and specialized technical services may be higher in cost in developing countries, certain other significant production costs such as semi-skilled and unskilled labor, materials and supplies obtained locally may be significantly lower. Factors vitally affecting industrial production costs and profit margins such as degree of competition, size of market, availability of labor, availability of risk capital, relative financial risk, level of industry taxes, and general economic and political stability have widely differing interrelationships and impact on the selling price and profit margin of a manufactured product in a developing country as compared with the United States. Planned operations and production limits would, of necessity, have to be adapted to cost and profit conditions existing in a particular developing country as a first step in determining whether a more intensive survey of the manufacturing possibilities for a particular product and industry is warranted.

4. SELECTED GROSS PROFIT ITEMS

(See supporting data on page 3)

The annual gross sales revenue is estimated at \$270,000.

The total fixed investment, plus working capital, is estimated at \$149,200.

The annual gross profit, before taxes, is estimated at \$14,000.

Based on these figures, the profit on gross sales, before taxes, amounts to about 5.2%.

(A gross profit on sales, before taxes, of 5.2%, while reflecting U.S. experience, should not be considered normal for a developing country where profit margins may be considerably higher in industry and trade.)

The annual profit on the total capital requirements, before taxes, is estimated at 9.4%.

5. COST PER MAN EMPLOYED

Twenty direct workers and four indirect workers, or a total of 24 workers, are employed.

The total fixed capital investment is estimated at \$ 129,000.

Based on these figures, the fixed investment per man employed would amount to \$5,375.

VII. PROFESSIONAL ENGINEERING SERVICES

The services of professional engineers are desirable in the design of industrial plants even though the proposed plant may be small.

A correct design is one which provides the greatest economy in the investment of funds and establishes the basis of operation that will be most profitable in the beginning and will also be capable of expansion without expensive alteration.

The addresses of professional engineers who specialize in Industrial Design, some of whom may be willing to undertake such work on low cost projects overseas, can be secured by reference to the published cards in various engineering magazines.

They may also be reached through their national organizations, one of which is the:

National Society of Professional Engineers
2029 K Street, N. W.
Washington, D. C. 20006

Manufacturers of industrial equipment employ engineers familiar with the design and installation of their specialized products. These manufacturers are usually willing to give prospective customers the benefit of technical advice by those engineers in determining the suitability of their equipment in any proposed project. The equipment manufacturer also knows, and can recommend, professional engineers in private practice who are willing and able to provide appropriate consulting services.

PRE-INVESTMENT FEASIBILITY STUDY SUGGESTED

The foregoing information must be necessarily presented in concise form. Before an investment is made in a plant a feasibility study is suggested. The investor, for his planning, should have more information dealing with the specific locality contemplated. For obvious reasons, such information cannot be included in *Industry Profiles*. Such a study, therefore, should explore local factors and conditions, including costs, sources of raw materials and supplies, availability of utilities and fuel, manpower, transportation, etc.

The investor will need reasonably accurate information on Government and legal requirements, banking and financing, potential demand, competition, construction services, and manpower training requirements. Further, he should consider developing plans for management and production controls, operating procedures, and sales promotion.

ORDERING INSTRUCTIONS

The price of *Industry Profiles* is a minimum of \$3.00 for from one to five "*Profiles*." The purchaser may select up to five of any "*Profiles*" available.

Complete sets of the 250 *Industry Profiles* published in 1966, I. P. No. 66001 through I. P. No. 66250 consecutively, may be purchased for \$125.00 per set. Complete sets of the 150 *Industry Profiles* to be published in 1967, I. P. No. 67251 through I. P. No. 67400 consecutively, may be purchased for \$75.00 per set. The latter "*Profiles*" will automatically be shipped to full set purchasers upon release.

Address orders to: U.S. Department of Commerce
Clearinghouse for Federal Scientific and
Technical Information, 410.12
Springfield, Virginia 22151

Prepayment is required. Make check or money order payable to National Bureau of Standards—CFSTI. Clearinghouse deposit account holders may charge purchases to their accounts.

GENERAL INFORMATION

An *Index of Industry Profiles* is available on request from the agency for International Development, AA/PRR, Washington, D. C. 20523.

This *Industry Profile* was prepared for the U. S. Agency for International Development by International Development Services Inc., Washington, D. C.

INDUSTRY PROFILES

CANNED SLICED APPLES

I. P. No. 67334
S. I. C. 2033

Industry Profiles are intended to promote the development of private industry in the developing countries by assembling economic and technical information in a professional analysis to support basic decisions in the establishment of small or medium-scale plants in a specific industry. The information contained in a profile is selected and organized for the guidance of the entrepreneur in the less developed country.

Industry Profiles contain basic information on market aspects, production rates, capital requirements, materials and supplies, utilities, manpower operating costs and sales revenues. Work-flow diagrams and, in some instances, machinery layouts are included along with references to sources of technical information, professional services, patents, materials and equipment.

The profiles adopt as a benchmark, productivity rates and costs which could be anticipated under conditions prevailing in the United States. Anticipated profits are before taxes. Since conditions vary widely from country to country, the entrepreneur using this profile must make suitable adjustments to conditions prevailing in his country. This profile should help in reaching correct assumptions.

275

PRODUCT DESCRIPTION

Canned sliced apples, 303 cans, size 303 x 406, net weight one pound.

A. GENERAL EVALUATION OF PROSPECTS

Although a few small canning plants, including some cooperatives, are equipped to can only one or two products, it is now customary in the commercial canning industry, to operate the plant all year in order to derive maximum profits on the capital investment. This is accomplished by canning several products that are harvested at different seasons of the year. It is, therefore, suggested that several products be selected for canning that are grown in the area where the canning plant is to be located. These selections should include products that are harvested in the spring, summer, and fall months, that will keep the plant busy during these seasons. For the winter months, it is recommended that such products as dry beans and pork and beans be canned. Under this method a full annual operation for the plant would be assured. The plant layout, as shown in this profile, is designed for the purpose of canning several seasonal products, thereby providing year round operation for the plant. A feasibility survey should be conducted to determine what products are available for canning at various seasons during the year, in what quantity, and at what cost.

B. MARKET ASPECTS1. USERS

Homes, restaurants, hotels, institutions, military, wherever food is served.

2. SALES CHANNELS AND EXTENT OF MARKET

Sales are usually made to wholesalers for distribution to small retail stores and to large users, such as military. The extent of the market for canned sliced apples normally would be nationwide. If a plant is efficiently managed and operated it should have no difficulty in competing with imported canned fruits. Consumption of canned fruits will vary primarily with the climate, the availability of fresh fruits, the level of income, and the degree of urbanization of the population. A comprehensive survey related to these, as well as other factors should be conducted to determine existing competition and sales potential.

3. RATE OF PROFIT

It should be emphasized that the information under "Production Requirements" on the next page illustrates typical U. S. cost relationships of the various factors entering into the manufacture in the United States of a specified product. It is generally recognized that profits before taxes of manufacturers in the United States may be appreciably lower than normally would be the case in a developing country. While certain imported capital items and specialized technical services may be higher in cost in developing countries, certain other significant production costs such as semi-skilled and unskilled labor, materials and supplies obtained locally may be significantly lower. Factors vitally affecting industrial production costs and profit margins such as degree of competition, size of market, availability of labor, availability of risk capital, relative financial risk, level of industry taxes, and general economic and political stability have widely differing interrelationships and impact on the selling price and profit margin of a manufactured product in a developing country as compared with the United States. Planned operations and production limits would, of necessity, have to be adapted to cost and profit conditions existing in a particular developing country as a first step in determining whether a more intensive survey of the manufacturing possibilities for a particular product and industry is warranted.

4. SELECTED GROSS PROFIT ITEMS

(See supporting data on page 3)

The annual gross sales revenue is estimated at \$185,000.

The total fixed investment, plus working capital, is estimated at \$148,700.

The annual gross profit, before taxes, is estimated at \$9,600.

Based on these figures, the profit on gross sales, before taxes, amounts to about 5.2%.

(A gross profit on sales, before taxes, of 5.2%, while reflecting U. S. experience, should not be considered normal for a developing country where profit margins may be considerably higher in industry and trade.)

The annual profit on the total capital requirements, before taxes, is estimated at 6.4%.

5. COST PER MAN EMPLOYED

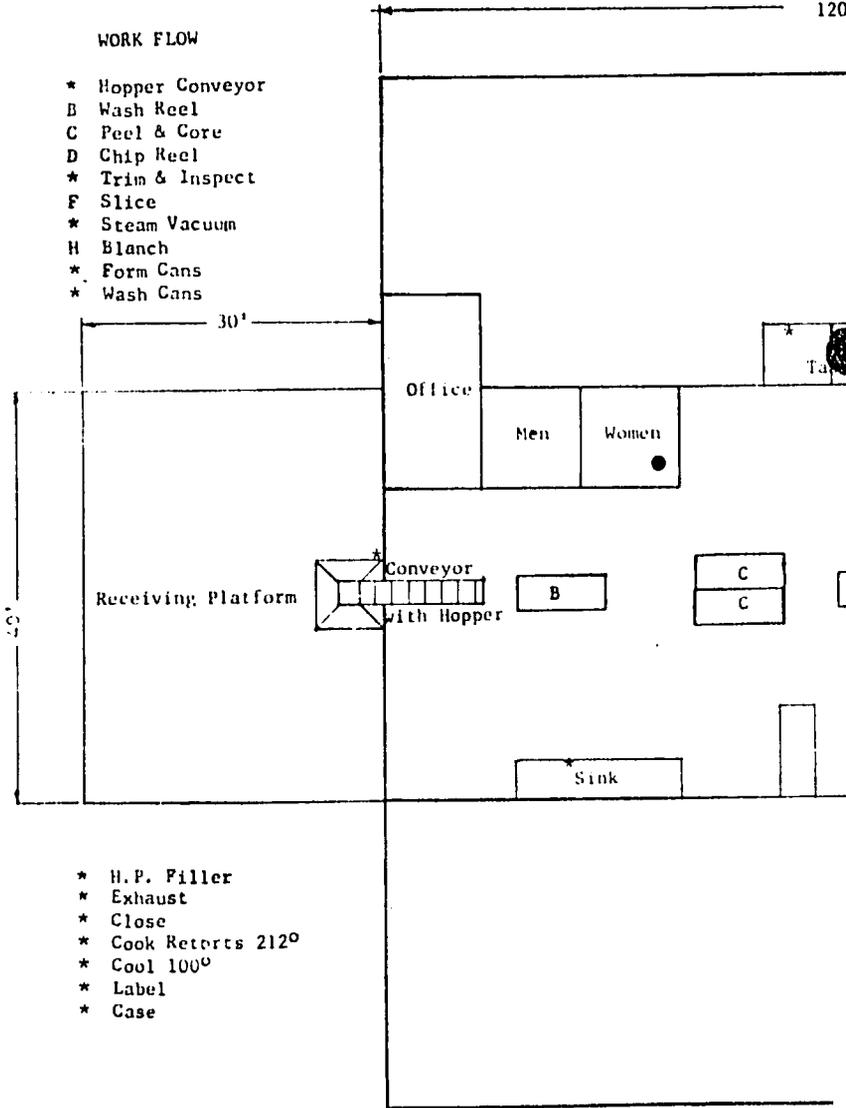

Twenty direct workers and four indirect workers, or a total of 24 workers, are employed.

The total fixed capital investment is estimated at \$133,000.

Based on these figures, the fixed investment per man employed would amount to \$5,540.

INDUSTRY PROFILES

CANNED BLUEBERRIES

I. P. No. 67335

S. I. C. 2033

Industry Profiles are intended to promote the development of private industry in the developing countries by assembling economic and technical information in a professional analysis to support basic decisions in the establishment of small or medium-scale plants in a specific industry. The information contained in a profile is selected and organized for the guidance of the entrepreneur in the less developed country.

Industry Profiles contain basic information on market aspects, production rates, capital requirements, materials and supplies, utilities, manpower operating costs and sales revenues. Work-flow diagrams and, in some instances, machinery layouts are included along with references to sources of technical information, professional services, patents, materials and equipment.

The profiles adopt as a benchmark, productivity rates and costs which could be anticipated under conditions prevailing in the United States. Anticipated profits are before taxes. Since conditions vary widely from country to country, the entrepreneur using this profile must make suitable adjustments to conditions prevailing in his country. This profile should help in reaching correct assumptions.

PRODUCT DESCRIPTION

Canned blueberries, 303 cans, size 303 x 406, net weight one pound.

A. GENERAL EVALUATION OF PROSPECTS

Although a few small canning plants, including some cooperatives, are equipped to can only one or two products, it is now customary in the commercial canning industry, to operate the plant all year in order to derive maximum profits on the capital investment. This is accomplished by canning several products that are harvested at different seasons of the year. It is, therefore, suggested that several products be selected for canning that are grown in the area where the canning plant is to be located. These selections should include products that are harvested in the spring, summer, and fall months, that will keep the plant busy during these seasons. For the winter months, it is recommended that such products as dry beans and pork and beans be canned. Under this method a full annual operation for the plant would be assured. The plant layout, as shown in the profile, is designed for the purpose of canning several seasonal products, thereby providing year round operation for the plant. A feasibility survey should be conducted to determine what products are available for canning at various seasons during the year, in what quantity, and at what cost.

B. MARKET ASPECTS1. USERS

Homes, restaurants, hotels, institutions, military, wherever food is served.

2. SALES CHANNELS AND EXTENT OF MARKET

Sales are usually made to wholesalers for distribution to small retail stores and to large users, such as military. The extent of the market for canned blueberries normally would be nationwide. If a plant is efficiently managed and operated it should have no difficulty in competing with imported canned fruits. Consumption of canned fruits will vary primarily with the climate, the availability of fresh fruits, the level of income, and the degree of urbanization of the population. A comprehensive survey related to these, as well as other, factors should be conducted to determine existing competition and sales potential.

3. RATE OF PROFIT

It should be emphasized that the information under "Production Requirements" on the next page illustrates typical U. S. cost relationships of the various factors entering into the manufacture in the United States of a specified product. It is generally recognized that profits before taxes of manufacturers in the United States may be appreciably lower than normally would be the case in a developing country. While certain imported capital items and specialized technical services may be higher in cost in developing countries, certain other significant production costs such as semi-skilled and unskilled labor, materials and supplies obtained locally may be significantly lower. Factors vitally affecting industrial production costs and profit margins such as degree of competition, size of market, availability of labor, availability of risk capital, relative financial risk, level of industry taxes, and general economic and political stability have widely differing interrelationships and impact on the selling price and profit margin of a manufactured product in a developing country as compared with the United States. Planned operations and production limits would, of necessity, have to be adapted to cost and profit conditions existing in a particular developing country as a first step in determining whether a more intensive survey of the manufacturing possibilities for a particular product and industry is warranted.

4. SELECTED GROSS PROFIT ITEMS

(See supporting data on page 3)

The annual gross sales revenue is estimated at \$210,000.

The total fixed investment, plus working capital, is estimated at \$145,600.

The annual gross profit, before taxes, is estimated at \$11,000.

Using these figures, the profit on gross sales, before taxes, amounts to about 5.2%.

(A gross profit on sales, before taxes, of 5.2%, while reflecting U.S. experience, should not be considered normal for a developing country, where profit margins may be considerably higher in industry and trade.)

The annual profit on the total capital requirements, before taxes, is estimated at 7.5%.

5. COST PER MAN EMPLOYED

Twenty direct workers, and four indirect workers, or a total of 24 workers, are employed.

The total fixed capital investment is estimated at \$128,000.

Based on these figures, the fixed investment per man employed would amount to \$5,325.

VII. PROFESSIONAL ENGINEERING SERVICES

The services of professional engineers are desirable in the design of industrial plants even though the proposed plant may be small.

A correct design is one which provides the greatest economy in the investment of funds and establishes the basis of operation that will be most profitable in the beginning and will also be capable of expansion without expensive alteration.

The addresses of professional engineers who specialize in Industrial Design, some of whom may be willing to undertake such work on low cost projects overseas, can be secured by reference to the published cards in various engineering magazines.

They may also be reached through their national organizations, one of which is the :

National Society of Professional Engineers
2029 K Street, N.W.
Washington, D.C. 20006

Manufacturers of industrial equipment employ engineers familiar with the design and installation of their specialized products. These manufacturers are usually willing to give prospective customers the benefit of technical advice by those engineers in determining the suitability of their equipment in any proposed project. The equipment manufacturer also knows, and can recommend, professional engineers in private practice who are willing and able to provide appropriate consulting services.

PRE-INVESTMENT FEASIBILITY STUDY SUGGESTED

The foregoing information must be necessarily presented in concise form. Before an investment is made in a plant a feasibility study is suggested. The investor, for his planning, should have more information dealing with the specific locality contemplated. For obvious reasons, such information cannot be included in *Industry Profiles*. Such a study, therefore, should explore local factors and conditions, including costs, sources of raw materials and supplies, availability of utilities and fuel, manpower, transportation, etc.

The investor will need reasonably accurate information on Government and legal requirements, banking and financing, potential demand, competition, construction services, and manpower training requirements. Further, he should consider developing plans for management and production controls, operating procedures, and sales promotion.

ORDERING INSTRUCTIONS

The price of *Industry Profiles* is a minimum of \$3.00 for from one to five "*Profiles*." The purchaser may select up to five of any "*Profiles*" available.

Complete sets of the 250 *Industry Profiles* published in 1966, I. P. No. 66001 through I. P. No. 66250 consecutively, may be purchased for \$125.00 per set. Complete sets of the 150 *Industry Profiles* to be published in 1967, I. P. No. 67251 through I. P. No. 67400 consecutively, may be purchased for \$75.00 per set. The latter "*Profiles*" will automatically be shipped to full set purchasers upon release.

Address orders to: U.S. Department of Commerce
Clearinghouse for Federal Scientific and
Technical Information, 410.12
Springfield, Virginia 22151

Prepayment is required. Make check or money order payable to National Bureau of Standards—CFSTI. Clearinghouse deposit account holders may charge purchases to their accounts.

GENERAL INFORMATION

An *Index of Industry Profiles* is available on request from the agency for International Development, AA/PRR, Washington, D. C. 20523.

This *Industry Profile* was prepared for the U. S. Agency for International Development by International Development Services Inc., Washington, D. C.

INDUSTRY PROFILES

CANNED APRICOTS

I. P. No. 67336

S. I. C. 2033

Industry Profiles are intended to promote the development of private industry in the developing countries by assembling economic and technical information in a professional analysis to support basic decisions in the establishment of small or medium-scale plants in a specific industry. The information contained in a profile is selected and organized for the guidance of the entrepreneur in the less developed country.

Industry Profiles contain basic information on market aspects, production rates, capital requirements, materials and supplies, utilities, manpower operating costs and sales revenues. Work-flow diagrams and, in some instances, machinery layouts are included along with references to sources of technical information, professional services, patents, materials and equipment.

The profiles adopt as a benchmark, productivity rates and costs which could be anticipated under conditions prevailing in the United States. Anticipated profits are before taxes. Since conditions vary widely from country to country, the entrepreneur using this profile must make suitable adjustments to conditions prevailing in his country. This profile should help in reaching correct assumptions.

291

PRODUCT DESCRIPTION

Canned apricots, 303 cans, size 303 x 406, net weight one pound.

A. GENERAL EVALUATION OF PROSPECTS

Although a few small canning plants, including some cooperatives, are equipped to can only one or two products, it is now customary in the commercial canning industry, to operate the plant all year in order to derive maximum profits on the capital investment. This is accomplished by canning several products that are harvested at different seasons of the year. It is, therefore, suggested that several products be selected for canning that are grown in the area where the canning plant is to be located. These selections should include products that are harvested in the spring, summer, and fall months, that will keep the plant busy during these seasons. For the winter months, it is recommended that such products as dry beans and pork and beans be canned. Under this method a full annual operation for the plant would be assured. The plant layout, as shown in this profile, is designed for the purpose of canning several seasonal products, thereby providing year round operation for the plant. A feasibility survey should be conducted to determine what products are available for canning at various seasons during the year, in what quantity, and at what cost.

B. MARKET ASPECTS1. USERS

Homes, restaurants, hotels, institutions, military, wherever food is served.

2. SALES CHANNELS AND EXTENT OF MARKET

Sales are usually made to wholesalers for distribution to small retail stores and to large users, such as military. The extent of the market for canned apricots normally would be nationwide. If a plant is efficiently managed and operated it should have no difficulty in competing with imported canned fruits. Consumption of canned fruits will vary primarily with the climate, the availability of fresh fruits, the level of income, and the degree of urbanization of the population. A comprehensive survey related to these, as well as other, factors should be conducted to determine existing competition and sales potential.

3. RATE OF PROFIT

It should be emphasized that the information under "Production Requirements" on the next page illustrates typical U.S. cost relationships of the various factors entering into the manufacture in the United States of a specified product. It is generally recognized that profits before taxes of manufacturers in the United States may be appreciably lower than normally would be the case in a developing country. While certain imported capital items and specialized technical services may be higher in cost in developing countries, certain other significant production costs such as semi-skilled and unskilled labor, materials and supplies obtained locally may be significantly lower. Factors vitally affecting industrial products costs and profit margins such as degree of competition, size of market, availability of labor, availability of risk capital, relative financial risk, level of industry taxes, and general economic and political stability have widely differing interrelationships and impact on the selling price and profit margin of a manufactured product in a developing country as compared with the United States. Planned operations and production limits would, of necessity, have to be adapted to cost and profit conditions existing in a particular developing country as a first step in determining whether a more intensive survey of the manufacturing possibilities for a particular product and industry is warranted.

4. SELECTED GROSS PROFIT ITEMS

(See supporting data on page 3)

The annual gross sales revenue is estimated at \$ 117,000.

The total fixed investment, plus working capital, is estimated at \$ 137,200.

The annual gross profit, before taxes, is estimated at \$ 6,000.

Using these figures, the profit on gross sales, before taxes, amounts to about 5.2%.

(A gross profit on sales, before taxes, of 5.2%, while reflecting U.S. experience, should not be considered normal for a developing country where profit margins may be considerably higher in industry and trade.)

The annual profit on the total capital requirements, before taxes, is estimated at about 4.3%.

5. COST PER MAN EMPLOYED

Twenty direct workers and four indirect workers, or a total of twenty-four workers, are employed.

The total fixed capital investment is estimated at \$127,000.

Based on these figures, the fixed investment per man employed would amount to \$ 5,300.

VII. PROFESSIONAL ENGINEERING SERVICES

The services of professional engineers are desirable in the design of industrial plants even though the proposed plant may be small.

A correct design is one which provides the greatest economy in the investment of funds and establishes the basis of operation that will be most profitable in the beginning and will also be capable of expansion without expensive alteration.

The addresses of professional engineers who specialize in Industrial Design, some of whom may be willing to undertake such work on low cost projects overseas, can be secured by reference to the published cards in various engineering magazines.

They may also be reached through their national organizations, one of which is the:

National Society of Professional Engineers
2029 K Street, N.W.
Washington, D.C. 20006

Manufacturers of industrial equipment employ engineers familiar with the design and installation of their specialized products. These manufacturers are usually willing to give prospective customers the benefit of technical advice by those engineers in determining the suitability of their equipment in any proposed project. The equipment manufacturer also knows, and can recommend, professional engineers in private practice who are willing and able to provide appropriate consulting services.

PRE-INVESTMENT FEASIBILITY STUDY SUGGESTED

The foregoing information must be necessarily presented in concise form. Before an investment is made in a plant a feasibility study is suggested. The investor, for his planning, should have more information dealing with the specific locality contemplated. For obvious reasons, such information cannot be included in *Industry Profiles*. Such a study, therefore, should explore local factors and conditions, including costs, sources of raw materials and supplies, availability of utilities and fuel, manpower, transportation, etc.

The investor will need reasonably accurate information on Government and legal requirements, banking and financing, potential demand, competition, construction services, and manpower training requirements. Further, he should consider developing plans for management and production controls, operating procedures, and sales promotion.

ORDERING INSTRUCTIONS

The price of *Industry Profiles* is a minimum of \$3.00 for from one to five "*Profiles*." The purchaser may select up to five of any "*Profiles*" available.

Complete sets of the 250 *Industry Profiles* published in 1966, I. P. No. 66001 through I. P. No. 66250 consecutively, may be purchased for \$125.00 per set. Complete sets of the 150 *Industry Profiles* to be published in 1967, I. P. No. 67251 through I. P. No. 67400 consecutively, may be purchased for \$75.00 per set. The latter "*Profiles*" will automatically be shipped to full set purchasers upon release.

Prepayment is required. Make check or money order payable to National Bureau of Standards—CFSTI. Clearinghouse deposit account holders may charge purchases to their accounts.

GENERAL INFORMATION

An *Index of Industry Profiles* is available on request from the agency for International Development, AA/PRR, Washington, D. C. 20523.

This *Industry Profile* was prepared for the U. S. Agency for International Development by International Development Services Inc., Washington, D. C.

INDUSTRY PROFILES

CANNED CREAM STYLE CORN

I. P. No. 67337

S. I. C. 2033

Industry Profiles are intended to promote the development of private industry in the developing countries by assembling economic and technical information in a professional analysis to support basic decisions in the establishment of small or medium-scale plants in a specific industry. The information contained in a profile is selected and organized for the guidance of the entrepreneur in the less developed country.

Industry Profiles contain basic information on market aspects, production rates, capital requirements, materials and supplies, utilities, manpower operating costs and sales revenues. Work-flow diagrams and, in some instances, machinery layouts are included along with references to sources of technical information, professional services, patents, materials and equipment.

The profiles adopt as a benchmark, productivity rates and costs which could be anticipated under conditions prevailing in the United States. Anticipated profits are before taxes. Since conditions vary widely from country to country, the entrepreneur using this profile must make suitable adjustments to conditions prevailing in his country. This profile should help in reaching correct assumptions.

PRODUCT DESCRIPTION

Canned cream style corn, 303 cans, size 303 x 406, net weight one pound.

A. GENERAL EVALUATION OF PROSPECTS

Although a few small canning plants, including some cooperatives, are equipped to can only one or two products, it is now customary in the commercial canning industry, to operate the plant all year in order to derive maximum profits on the capital investment. This is accomplished by canning several products that are harvested at different seasons of the year. It is, therefore, suggested that several products be selected for canning that are grown in the area where the canning plant is to be located. These selections should include products that are harvested in the spring, summer and fall months, that will keep the plant busy during these seasons. For the winter months, it is recommended that such products as dry beans and pork and beans be canned. Under this method a full annual operation for the plant would be assured. The plant layout, as shown in this profile, designed for the purpose of canning several seasonal products, thereby providing year round operation for the plant. A feasibility survey should be conducted to determine what products are available for canning at various seasons during the year, in what quantity and at what cost.

B. MARKET ASPECTS1. USERS

Homes, restaurants, hotels, institutions, military, wherever food is served.

2. SALES CHANNELS AND EXTENT OF MARKET

Sales are usually made to wholesalers for distribution to small retail stores and to large users, such as military. The extent of the market for canned cream style corn normally would be nationwide. If a plant is efficiently managed and operated it should have no difficulty in competing with imported canned vegetables. Consumption of canned vegetables will vary primarily with the climate, the availability of fresh vegetables, the level of income, and the degree of urbanization of the population. A comprehensive survey related to these, as well as other, factors should be conducted to determine existing competition and sales potential.

3. RATE OF PROFIT

It should be emphasized that the information under "Production Requirements" on the next page illustrates typical U. S. cost relationships of the various factors entering into the manufacture in the United States of a specified product. It is generally recognized that profits before taxes of manufacturers in the United States may be appreciably lower than normally would be the case in a developing country. While certain imported capital items and specialized technical services may be higher in cost in developing countries, certain other significant production costs such as semi-skilled and unskilled labor, materials and supplies obtained locally may be significantly lower. Factors vitally affecting industrial production costs and profit margins such as degree of competition, size of market, availability of labor, availability of risk capital, relative financial risk, level of industry taxes, and general economic and political stability have widely differing interrelationships and impact on the selling price and profit margin of a manufactured product in a developing country as compared with the United States. Planned operations and production limits would, of necessity, have to be adapted to cost and profit conditions existing in a particular developing country as a first step in determining whether a more intensive survey of the manufacturing possibilities for a particular product and industry is warranted.

4. SELECTED GROSS PROFIT ITEMS

(See supporting data on page 3)

The annual gross sales revenue is estimated at \$92,000.

The total fixed investment, plus working capital, is estimated at \$138,700.

The annual gross profit, before taxes, is estimated at \$5,000.

Using these figures, the profit on gross sales, before taxes, amounts to about 5.4%.

(A gross profit on sales, before taxes, of 5.4%, while reflecting U. S. experience, should not be considered normal for a developing country where profit margins may be considerably higher in industry and trade.)

The annual profit on the total capital requirements, before taxes, is estimated at 3.6%.

5. COST PER MAN EMPLOYED

Eighteen direct workers and four indirect workers, or a total of twenty-two workers, are employed.

The total fixed capital investment is estimated at \$131,000.

Based on these figures, the fixed investment per man employed would amount to about \$5,950.

VII. PROFESSIONAL ENGINEERING SERVICES

The services of professional engineers are desirable in the design of industrial plants even though the proposed plant may be small.

A correct design is one which provides the greatest economy in the investment of funds and establishes the basis of operation that will be most profitable in the beginning and will also be capable of expansion without expensive alteration.

The addresses of professional engineers who specialize in the Industrial Design, some of whom may be willing to undertake such work on low cost projects overseas, can be secured by reference to the published cards in various engineering magazines.

They may also be reached through their national organizations, one of which is the:

National Society of Professional Engineers
2029 K Street, N. W.
Washington, D. C. 20006

Manufacturers of industrial equipment employ engineers familiar with the design and installation of their specialized products. These manufacturers are usually willing to give prospective customers the benefit of technical advice by those engineers in determining the suitability of their equipment in any proposed project. The equipment manufacturer also knows, and can recommend, professional engineers in private practice who are willing and able to provide appropriate consulting services.

304

PRE-INVESTMENT FEASIBILITY STUDY SUGGESTED

The foregoing information must be necessarily presented in concise form. Before an investment is made in a plant a feasibility study is suggested. The investor, for his planning, should have more information dealing with the specific locality contemplated. For obvious reasons, such information cannot be included in *Industry Profiles*. Such a study, therefore, should explore local factors and conditions, including costs, sources of raw materials and supplies, availability of utilities and fuel, manpower, transportation, etc.

The investor will need reasonably accurate information on Government and legal requirements, banking and financing, potential demand, competition, construction services, and manpower training requirements. Further, he should consider developing plans for management and production controls, operating procedures, and sales promotion.

ORDERING INSTRUCTIONS

The price of *Industry Profiles* is a minimum of \$3.00 for from one to five "*Profiles*." The purchaser may select up to five of any "*Profiles*" available.

Complete sets of the 250 *Industry Profiles* published in 1966, I. P. No. 66001 through I. P. No. 66250 consecutively, may be purchased for \$125.00 per set. Complete sets of the 150 *Industry Profiles* to be published in 1967, I. P. No. 67251 through I. P. No. 67400 consecutively, may be purchased for \$75.00 per set. The latter "*Profiles*" will automatically be shipped to full set purchasers upon release.

Address orders to: U.S. Department of Commerce
Clearinghouse for Federal Scientific and
Technical Information, 410.12
Springfield, Virginia 22151

Prepayment is required. Make check or money order payable to National Bureau of Standards—CFSTI. Clearinghouse deposit account holders may charge purchases to their accounts.

GENERAL INFORMATION

An *Index of Industry Profiles* is available on request from the agency for International Development, AA/PRR, Washington, D. C. 20523.

This *Industry Profile* was prepared for the U. S. Agency for International Development by International Development Services Inc., Washington, D. C.

INDUSTRY PROFILES

CANNED DRY BEANS

I. P. No. 67338

S. I. C. 2033

Industry Profiles are intended to promote the development of private industry in the developing countries by assembling economic and technical information in a professional analysis to support basic decisions in the establishment of small or medium-scale plants in a specific industry. The information contained in a profile is selected and organized for the guidance of the entrepreneur in the less developed country.

Industry Profiles contain basic information on market aspects, production rates, capital requirements, materials and supplies, utilities, manpower operating costs and sales revenues. Work-flow diagrams and, in some instances, machinery layouts are included along with references to sources of technical information, professional services, patents, materials and equipment.

The profiles adopt as a benchmark, productivity rates and costs which could be anticipated under conditions prevailing in the United States. Anticipated profits are before taxes. Since conditions vary widely from country to country, the entrepreneur using this profile must make suitable adjustments to conditions prevailing in his country. This profile should help in reaching correct assumptions.

PRODUCT DESCRIPTION

Canned dry beans, 303 cans, size 303 x 406, net weight one pound

A. GENERAL EVALUATION OF PROSPECTS

Although a few small canning plants, including some cooperatives, are equipped to can only one or two products, it is now customary in the commercial canning industry, to operate the plant all year in order to derive maximum profits on the capital investment. This is accomplished by canning several products that are harvested at different seasons of the year. It is, therefore, suggested that several products be selected for canning that are grown in the area where the canning plant is to be located. These selections should include products that are harvested in the spring, summer and fall months, that will keep the plant busy during these seasons. For the winter months, it is recommended that such products as dry beans and pork and beans be canned. Under this method a full annual operation for the plant would be assured. The plant layout, as shown in this profile, is designed for the purpose of canning several seasonal products, thereby providing year round operation for the plant. A feasibility survey should be conducted to determine what products are available for canning at various seasons during the year, in what quantity, and at what cost.

B. MARKET ASPECTS

1. USERS

Homes, restaurants, hotels, institutions, military, wherever food is served.

2. SALES CHANNELS AND EXTENT OF MARKET

Sales are usually made to wholesalers for distribution to small retail stores and to large users, such as military. The extent of the market for canned dry beans normally would be nationwide. If a plant is efficiently managed and operated it should have no difficulty in competing with imported canned dry beans. Consumption of this product will vary primarily with the climate, the level of income and the degree of urbanization of the population. A comprehensive survey related to these, as well as other, factors should be conducted to determine existing competition and sales potential.

3. RATE OF PROFIT

It should be emphasized that the information under "Production Requirements" on the next page illustrates typical U.S. cost relationships of the various factors entering into the manufacture in the United States of a specified product. It is generally recognized that profits before taxes of manufacturers in the United States may be appreciably lower than normally would be the case in a developing country. While certain imported capital items and specialized technical services may be higher in cost in developing countries, certain other significant production costs such as semi-skilled and unskilled labor, materials and supplies obtained locally may be significantly lower. Factors vitally affecting industrial products costs and profit margins such as degree of competition, size of market, availability of labor, availability of risk capital, relative financial risk, level of industry taxes, and general economic and political stability have widely differing interrelationships and impact on the selling price and profit margin of a manufactured product in a developing country as compared with the United States. Planned operations and production limits would, of necessity, have to be adapted to cost and profit conditions existing in a particular developing country as a first step in determining whether a more intensive survey of the manufacturing possibilities for a particular product and industry is warranted.

4. SELECTED GROSS PROFIT ITEMS

(See supporting data on page 3)

The annual gross sales revenue is estimated at \$187,000.

The total fixed investment, plus working capital, is estimated at \$144,800.

The annual gross profit, before taxes, is estimated at \$10,000.

Using these figures, the profit on gross sales, before taxes, amounts to about 5.4%.

(A gross profit on sales, before taxes, of 5.4%, while reflecting U.S. experience, should not be considered normal for a developing country where profit margins may be considerably higher in industry and trade.)

The annual profit on the total capital requirements, before taxes, is estimated at 6.9%.

5. COST PER MAN EMPLOYED

Twenty direct workers and four indirect workers or a total of twenty-four workers, are employed.

The total fixed capital investment is estimated at \$129,000.

Based on these figures, the fixed investment per man employed would amount to \$5,375.

CANNED SPINACH

I. P. No. 67339

S. I. C. 2033

Industry Profiles are intended to promote the development of private industry in the developing countries by assembling economic and technical information in a professional analysis to support basic decisions in the establishment of small or medium-scale plants in a specific industry. The information contained in a profile is selected and organized for the guidance of the entrepreneur in the less developed country.

Industry Profiles contain basic information on market aspects, production rates, capital requirements, materials and supplies, utilities, manpower operating costs and sales revenues. Work-flow diagrams and, in some instances, machinery layouts are included along with references to sources of technical information, professional services, patents, materials and equipment.

The profiles adopt as a benchmark, productivity rates and costs which could be anticipated under conditions prevailing in the United States. Anticipated profits are before taxes. Since conditions vary widely from country to country, the entrepreneur using this profile must make suitable adjustments to conditions prevailing in his country. This profile should help in reaching correct assumptions.

PRODUCT DESCRIPTION

Canned spinach, 303 cans, size 303 x 406, net weight one pound.

A. GENERAL EVALUATION OF PROSPECTS

Although a few small canning plants, including some cooperatives, are equipped to can only one or two products, it is now customary in the commercial canning industry, to operate the plant all year in order to derive maximum profits on the capital investment. This is accomplished by canning several products that are harvested at different seasons of the year. It is, therefore, suggested that several products be selected for canning that are grown in the area where the canning plant is to be located. These selections should include products that are harvested in the spring, summer, and fall months, that will keep the plant busy during these seasons. For the winter months, it is recommended that such products as dry beans and pork and beans be canned. Under this method a full annual operation for the plant would be assured. The plant layout, as shown in this profile, is designed for the purpose of canning several seasonal products, thereby providing year round operation for the plant. A feasibility survey should be conducted to determine what products are available for canning at various seasons during the year, in what quantity, and at what cost.

B. MARKET ASPECTS1. USERS

Homes, restaurants, hotels, institutions, military, wherever food is served.

2. SALES CHANNELS AND EXTENT OF MARKET

Sales are usually made to wholesalers for distribution: small retail stores and to large users, such as military. The extent of the market for canned spinach normally would be nationwide. If a plant is efficiently managed and operated it should have no difficulty in competing with imported canned vegetables. Consumption of canned vegetables will vary primarily with the climate, the availability of fresh vegetables, the level of income, and the degree of urbanization of the population. A comprehensive survey related to these, as well as other, factors should be conducted to determine existing competition and sales potential.

3. RATE OF PROFIT

It should be emphasized that the information under "Production Requirements" on the next page illustrates typical U.S. cost relationships of the various factors entering into the manufacture in the United States of a specified product. It is generally recognized that profits before taxes of manufacturers in the United States may be appreciably lower than normally would be the case in a developing country. While certain imported capital items and specialized technical services may be higher in cost in developing countries, certain other significant production costs such as semi-skilled and unskilled labor, materials and supplies obtained locally may be significantly lower. Factors vitally affecting industrial products costs and profit margins such as degree of competition, size of market, availability of labor, availability of risk capital, relative financial risk, level of industry taxes, and general economic and political stability have widely differing interrelationships and impact on the selling price and profit margin of a manufactured product in a developing country as compared with the United States. Planned operations and production limits would, of necessity, have to be adapted to cost and profit conditions existing in a particular developing country as a first step in determining whether a more intensive survey of the manufacturing possibilities for a particular product and industry is warranted.

4. SELECTED GROSS PROFIT ITEMS

(See supporting data on page 3)

The annual gross sales revenue is estimated at \$70,000.

The total fixed investment, plus working capital, is estimated at \$134,000.

The annual gross profit, before taxes, is estimated at \$4,000.

Using these figures, the profit on gross sales, before taxes, amounts to about 5.7%.

(A gross profit on sales, before taxes, of 5.7%, while reflecting U.S. experience, should not be considered normal for a developing country where profit margins may be considerably higher in industry and trade.)

The annual profit on the total capital requirements, before taxes, is estimated at 3.0%.

5. COST PER MAN EMPLOYED

Twenty direct workers and four indirect workers, or a total of twenty-four workers, are employed.

The total fixed capital investment is estimated at \$128,000.

Based on these figures, the fixed investment per man employed would amount to \$5,325.

Conveyor with Hopper, 2 Sinks, 5 Work Tables, 2 Soak Tanks, Belt Conveyor, 4 Cooking Kettles, Accumulation Table, 3 Can Reformers, 2 Can Flangers, 3 Can Bottom Seamers, Can Tester, Can Washer, H.P. Filler, 2 Syrup or Brine Kettles, Exhaust Box, Closer, Tramway & Hoist, Auxiliary Kettle, 3 Reorts (4 crates), 30 Crates, 10 Crate Dollies, Labeler, Can Conveyor, Roller Conveyor, Lift-Truck with Pallets, Compressor, Platform Scales Boiler 100 H.P. -- 120 P.S.I., Washer, Blancher, Washer Reel, Drain Belt		
b. <u>Working Capital (15 days)</u>		
Direct materials		
Direct labor		
Manufacturing overhead		
Administrative costs		
Sales costs		
Freight-out, discounts, bad debts & allowances		
Sales revenue		
Training costs		
Total working capital		\$ 6,000
c. <u>Total Capital Requirements</u>		\$ 134,000

2. MATERIALS AND SUPPLIES		
a. <u>Direct materials</u>	Annual Requirements	Annual Cost
Spinach	150 tons	
Cans	440,000	
Additives		
Labels and Cartons		
Total direct materials		\$ 20,900
b. <u>Supplies</u>		
Lubricants & hand tools		
Cutting tools & abrasives		
Maintenance & spare parts		
Office supplies		
Gas, oil & maintenance of truck		
Total supplies		\$ 1,800
c. <u>Availability of materials & supplies</u>		
Spinach must be available locally. Labels and cartons would be available locally. Cans may have to be imported.		

3. POWER, FUEL AND WATER			Annual Cost
Electric Power - 15-1/2 H.P. connected load			
Fuel - oil			
Water - must be potable			
			\$ 1,000
4. <u>DEPRECIATION</u>			
	Yrs. life		Amount
Building	20		
Prodn. tools & equipment	10		
Other tools & equipment	10		
Furniture & fixtures	10		
Transportation Equipment	4		
Total depreciation			\$ 10,000
5. <u>MANPOWER</u>			
	Number		Annual Cost
a. <u>Indirect labor</u>			
Manager	1		
Clerk	1		
Inspector	1		
Truck driver	1		
Total indirect labor	4		\$ 3,500
b. <u>Direct labor</u>			
Skilled workers	2		
Semi-skilled workers	3		
Unskilled workers	15		
Total direct labor	20		\$ 10,400
c. <u>Training needs</u>			
The manager and the inspector should be fully experienced. They, with the two skilled workers, should be able to train all workers and reach full production in about one week.			
6. <u>TRANSPORTATION</u>			
a. <u>Own transport equipment</u>			
Truck			
b. <u>External transport facilities</u>			
During the canning season the input at this plant will amount to about 4.2 tons per day. Good highways.			
7. <u>TOTAL ANNUAL COSTS AND SALES REVENUE</u>			
Direct materials	\$ 20,900		
Direct labor	10,400		
Manufacturing overhead*	16,300		
Total manufacturing cost			\$ 47,600
Interest on loans			
Insurance			
Legal			
Audit			
Contingencies			
Total administrative cost			8,400
Sales expense			8,000
Freight-out, travel discounts			
Allowances & bad debts			2,000
Total annual costs			\$ 66,000
Annual Gross Profit			\$ 4,000
<u>ANNUAL SALES REVENUE</u>			\$ 70,000

*Includes Supplies, Power, Fuel, Water, Depreciation and Indirect labor (2b-3-4-5a)

**It was not found practical to show individual item costs because of wide variations in price and other factors, consequently only representative totals are used.

VII. PROFESSIONAL ENGINEERING SERVICES

The services of professional engineers are desirable in the design of industrial plants even though the proposed plant may be small.

A correct design is one which provides the greatest economy in the investment of funds and establishes the basis of operation that will be most profitable in the beginning and will also be capable of expansion without expensive alteration.

The addresses of professional engineers who specialize in Industrial Design, some of whom may be willing to undertake such work on low cost projects overseas, can be secured by reference to the published cards in various engineering magazines.

They may also be reached through their national organizations, one of which is the :

National Society of Professional Engineers
2029 K Street, N. W.
Washington, D. C. 20006

Manufacturers of industrial equipment employ engineers familiar with the design and installation of their specialized products. These manufacturers are usually willing to give prospective customers the benefit of technical advice by those engineers in determining the suitability of their equipment in any proposed project. The equipment manufacturer also knows, and can recommend, professional engineers in private practice who are willing and able to provide appropriate consulting services.

PRE-INVESTMENT FEASIBILITY STUDY SUGGESTED

The foregoing information must be necessarily presented in concise form. Before an investment is made in a plant a feasibility study is suggested. The investor, for his planning, should have more information dealing with the specific locality contemplated. For obvious reasons, such information cannot be included in *Industry Profiles*. Such a study, therefore, should explore local factors and conditions, including costs, sources of raw materials and supplies, availability of utilities and fuel, manpower, transportation, etc.

The investor will need reasonably accurate information on Government and legal requirements, banking and financing, potential demand, competition, construction services, and manpower training requirements. Further, he should consider developing plans for management and production controls, operating procedures, and sales promotion.

ORDERING INSTRUCTIONS

The price of *Industry Profiles* is a minimum of \$3.00 for from one to five "*Profiles*." The purchaser may select up to five of any "*Profiles*" available.

Complete sets of the 250 *Industry Profiles* published in 1966, I. P. No. 66001 through I. P. No. 66250 consecutively, may be purchased for \$125.00 per set. Complete sets of the 150 *Industry Profiles* to be published in 1967, I. P. No. 67251 through I. P. No. 67400 consecutively, may be purchased for \$75.00 per set. The latter "*Profiles*" will automatically be shipped to full set purchasers upon release.

Address orders to: U.S. Department of Commerce
Clearinghouse for Federal Scientific and
Technical Information, 410.12
Springfield, Virginia 22151

Prepayment is required. Make check or money order payable to National Bureau of Standards—CFSTI. Clearinghouse deposit account holders may charge purchases to their accounts.

GENERAL INFORMATION

An *Index of Industry Profiles* is available on request from the agency for International Development, AA/PRR, Washington, D. C. 20523.

This *Industry Profile* was prepared for the U. S. Agency for International Development by International Development Services Inc., Washington, D. C.

INDUSTRY PROFILES

CANNED WAX BEANS

I. P. No. 67340

S. I. C. 2033

Industry Profiles are intended to promote the development of private industry in the developing countries by assembling economic and technical information in a professional analysis to support basic decisions in the establishment of small or medium-scale plants in a specific industry. The information contained in a profile is selected and organized for the guidance of the entrepreneur in the less developed country.

Industry Profiles contain basic information on market aspects, production rates, capital requirements, materials and supplies, utilities, manpower operating costs and sales revenues. Work-flow diagrams and, in some instances, machinery layouts are included along with references to sources of technical information, professional services, patents, materials and equipment.

The profiles adopt as a benchmark, productivity rates and costs which could be anticipated under conditions prevailing in the United States. Anticipated profits are before taxes. Since conditions vary widely from country to country, the entrepreneur using this profile must make suitable adjustments to conditions prevailing in his country. This profile should help in reaching correct assumptions.

PRODUCT DESCRIPTION

Canned wax beans, 303 cans, size 303 x 406, net weight one pound.

A. GENERAL EVALUATION OF PROSPECTS

Although a few small canning plants, including some cooperatives, are equipped to can only one or two products, it is now customary in the commercial canning industry, to operate the plant all year in order to derive maximum profits on the capital investment. This is accomplished by canning several products that are harvested at different seasons of the year. It is, therefore, suggested that several products be selected for canning that are grown in the area where the canning plant is to be located. These selections should include products that are harvested in the spring, summer and fall months, that will keep the plant busy during these seasons. For the winter months, it is recommended that such products as dry beans and pork and beans be canned. Under this method a full annual operation for the plant would be assured. The plant layout, as shown in this profile, is designed for the purpose of canning several seasonal products, thereby providing year round operation for the plant. A feasibility survey should be conducted to determine what products are available for canning at various seasons during the year, in what quantity and at what cost.

B. MARKET ASPECTS1. USERS

Homes, restaurants, hotels, institutions, military, wherever food is served.

2. SALES CHANNELS AND EXTENT OF MARKET

Sales are usually made to wholesalers for distribution to small retail stores and to large users, such as military. The extent of the market for canned wax beans normally would be nationwide. If a plant is efficiently managed and operated it should have no difficulty in competing with imported canned vegetables. Consumption of canned vegetables will vary primarily with the climate, the availability of fresh vegetables, the level of income and the degree of urbanization of the population. A comprehensive survey related to these, as well as other, factors should be conducted to determine existing competition and sales potential.

3. RATE OF PROFIT

It should be emphasized that the information under "Production Requirements" on the next page illustrates typical U.S. cost relationships of the various factors entering into the manufacture in the United States of a specified product. It is generally recognized that profits before taxes of manufacturers in the United States may be appreciably lower than normally would be the case in a developing country. While certain imported capital items and specialized technical services may be higher in cost in developing countries, certain other significant production costs such as semi-skilled and unskilled labor, materials and supplies obtained locally may be significantly lower. Factors vitally affecting industrial products costs and profit margins such as degree of competition, size of market, availability of labor, availability of risk capital, relative financial risk, level of industry taxes, and general economic and political stability have widely differing interrelationships and impact on the selling price and profit margin of a manufactured product in a developing country as compared with the United States. Planned operations and production limits would, of necessity, have to be adapted to cost and profit conditions existing in a particular developing country as a first step in determining whether a more intensive survey of the manufacturing possibilities for a particular product and industry is warranted.

4. SELECTED GROSS PROFIT ITEMS

(See supporting data on page 3)

The annual gross sales revenue is estimated at \$96,000

The total fixed investment, plus working capital, is estimated at \$141,000.

The annual gross profit, before taxes, is estimated at \$5,000.

Using these figures, the profit on gross sales, before taxes, amounts to about 5.2%.

(A gross profit on sales, before taxes, of 5.2%, while reflecting U. S. experience, should not be considered normal for a developing country where profit margins may be considerably higher in industry and trade.)

The annual profit on the total capital requirements, before taxes, is estimated at 3.6%.

5. COST PER MAN EMPLOYED

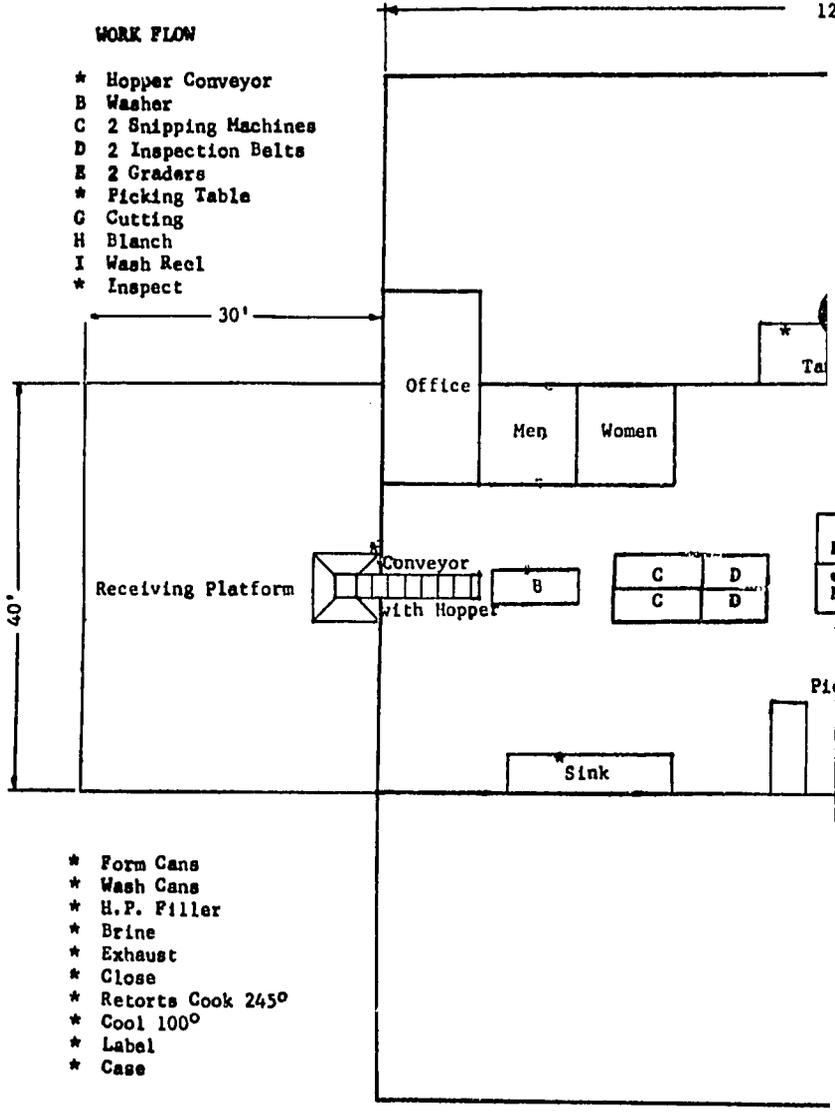

Seventeen direct workers and four indirect workers, or a total of twenty-one workers, are employed.

The total fixed capital investment is estimated at \$133,000.

Based on these figures, the fixed investment per man employed would amount to about \$6,325.

INDUSTRY PROFILES

CANNED BLACKEYED PEAS

I. P. No. 67341

S. I. C. 2033

Industry Profiles are intended to promote the development of private industry in the developing countries by assembling economic and technical information in a professional analysis to support basic decisions in the establishment of small or medium-scale plants in a specific industry. The information contained in a profile is selected and organized for the guidance of the entrepreneur in the less developed country.

Industry Profiles contain basic information on market aspects, production rates, capital requirements, materials and supplies, utilities, manpower operating costs and sales revenues. Work-flow diagrams and, in some instances, machinery layouts are included along with references to sources of technical information, professional services, patents, materials and equipment.

The profiles adopt as a benchmark, productivity rates and costs which could be anticipated under conditions prevailing in the United States. Anticipated profits are before taxes. Since conditions vary widely from country to country, the entrepreneur using this profile must make suitable adjustments to conditions prevailing in his country. This profile should help in reaching correct assumptions.

PRODUCT DESCRIPTION

Canned blackeyed peas, 303 cans, size 303 x 406, net weight one pound.

A. GENERAL EVALUATION OF PROSPECTS

Although a few small canning plants, including some cooperatives are equipped to can only one or two products, it is now customary in the commercial canning industry, to operate the plant all year in order to derive maximum profits on the capital investment. This is accomplished by canning several products that are harvested at different seasons of the year. It is, therefore, suggested that several products be selected for canning that are grown in the area where the canning plant is to be located. These selections should include products that are harvested in the spring, summer and fall months, that will keep the plant busy during these seasons. For the winter months, it is recommended that such products as dry beans and pork and beans be canned. Under this method a full annual operation for the plant would be assured. The plant layout, as shown in this profile, is designed for the purpose of canning several seasonal products, thereby providing year round operation for the plant. A feasibility survey should be conducted to determine what products are available for canning at various seasons during the year, in what quantity and at what cost.

B. MARKET ASPECTS1. USERS

Homes, restaurants, hotels, institutions, military, wherever food is served.

2. SALES CHANNELS AND EXTENT OF MARKET

Sales are usually made to wholesalers for distribution to small retail stores and to large users, such as military. The extent of the market for canned blackeyed peas normally would be nationwide. If a plant is efficiently managed and operated it should have no difficulty in competing with imported canned vegetables. Consumption of canned vegetables will vary primarily with the climate, the availability of fresh vegetables, the level of income, and the degree of urbanization of the population. A comprehensive survey related to these, as well as other, factors should be conducted to determine existing competition and sales potential.

3. RATE OF PROFIT

It should be emphasized that the information under "Production Requirements" on the next page illustrates typical U.S. cost relationships of the various factors entering into the manufacture in the United States of a specified product. It is generally recognized that profits before taxes of manufacturers in the United States may be appreciably lower than normally would be the case in a developing country. While certain imported capital items and specialized technical services may be higher in cost in developing countries, certain other significant production costs such as semi-skilled and unskilled labor, materials and supplies obtained locally may be significantly lower. Factors vitally affecting industrial products costs and profit margins such as degree of competition, size of market, availability of labor, availability of risk capital, relative financial risk, level of industry taxes, and general economic and political stability have widely differing interrelationships and impact on the selling price and profit margin of a manufactured product in a developing country as compared with the United States. Planned operations and production limits would, of necessity, have to be adapted to cost and profit conditions existing in a particular developing country as a first step in determining whether a more intensive survey of the manufacturing possibilities for a particular product and industry is warranted.

4. SELECTED GROSS PROFIT ITEMS

(See supporting data on page 3)

The annual gross sales revenue is estimated at \$190,000.

The total fixed investment, plus working capital, is estimated at \$145,200.

The annual gross profit, before taxes, is estimated at \$10,000.

Using these figures, the profit on gross sales, before taxes, amounts to about 5.3%.

(A gross profit on sales, before taxes, of 5.3%, while reflecting U.S. experience, should not be considered normal for a developing country where profit margins may be considerably higher in industry and trade.)

The annual profit on the total capital requirements, before taxes, is estimated at 6.9%.

5. COST PER MAN EMPLOYED

Twenty direct workers and four indirect workers, or a total of twenty-four workers, are employed.

The total fixed capital investment is estimated at \$129,000.

Based on these figures, the fixed investment per man employed would amount to about \$5,375.

VII. PROFESSIONAL ENGINEERING SERVICES

The services of professional engineers are desirable in the design of industrial plants even though the proposed plant may be small.

A correct design is one which provides the greatest economy in the investment of funds and establishes the basis of operation that will be most profitable in the beginning and will also be capable of expansion without expensive alteration.

The addresses of professional engineers who specialize in Industrial Design, some of whom may be willing to undertake such work on low cost projects overseas, can be secured by reference to the published cards in various engineering magazines.

They may also be reached through their national organizations, one of which is the:

National Society of Professional Engineers
2029 K Street, N. W.
Washington, D. C. 20006

Manufacturers of industrial equipment employ engineers familiar with the design and installation of their specialized products. These manufacturers are usually willing to give prospective customers the benefit of technical advice by those engineers in determining the suitability of their equipment in any proposed project. The equipment manufacturer also knows, and can recommend, professional engineers in private practice who are willing and able to provide appropriate consulting services.

PRE-INVESTMENT FEASIBILITY STUDY SUGGESTED

The foregoing information must be necessarily presented in concise form. Before an investment is made in a plant a feasibility study is suggested. The investor, for his planning, should have more information dealing with the specific locality contemplated. For obvious reasons, such information cannot be included in *Industry Profiles*. Such a study, therefore, should explore local factors and conditions, including costs, sources of raw materials and supplies, availability of utilities and fuel, manpower, transportation, etc.

The investor will need reasonably accurate information on Government and legal requirements, banking and financing, potential demand, competition, construction services, and manpower training requirements. Further, he should consider developing plans for management and production controls, operating procedures, and sales promotion.

ORDERING INSTRUCTIONS

The price of *Industry Profiles* is a minimum of \$3.00 for from one to five "*Profiles*." The purchaser may select up to five of any "*Profiles*" available.

Complete sets of the 250 *Industry Profiles* published in 1966, I. P. No. 66001 through I. P. No. 66250 consecutively, may be purchased for \$125.00 per set. Complete sets of the 150 *Industry Profiles* to be published in 1967, I. P. No. 67251 through I. P. No. 67400 consecutively, may be purchased for \$75.00 per set. The latter "*Profiles*" will automatically be shipped to full set purchasers upon release.

Address orders to: U.S. Department of Commerce
Clearinghouse for Federal Scientific and
Technical Information, 410.12
Springfield, Virginia 22151

Prepayment is required. Make check or money order payable to National Bureau of Standards—CFSTI. Clearinghouse deposit account holders may charge purchases to their accounts.

GENERAL INFORMATION

An *Index of Industry Profiles* is available on request from the agency for International Development, AA/PRR, Washington, D. C. 20523.

This *Industry Profile* was prepared for the U. S. Agency for International Development by International Development Services Inc., Washington, D. C.

INDUSTRY PROFILES

CANNED TOMATOES

I. P. No. 67342

S. I. C. 2033

Industry Profiles are intended to promote the development of private industry in the developing countries by assembling economic and technical information in a professional analysis to support basic decisions in the establishment of small or medium-scale plants in a specific industry. The information contained in a profile is selected and organized for the guidance of the entrepreneur in the less developed country.

Industry Profiles contain basic information on market aspects, production rates, capital requirements, materials and supplies, utilities, manpower operating costs and sales revenues. Work-flow diagrams and, in some instances, machinery layouts are included along with references to sources of technical information, professional services, patents, materials and equipment.

The profiles adopt as a benchmark, productivity rates and costs which could be anticipated under conditions prevailing in the United States. Anticipated profits are before taxes. Since conditions vary widely from country to country, the entrepreneur using this profile must make suitable adjustments to conditions prevailing in his country. This profile, should help in reaching correct assumptions.

CANNED TOMATOES

PRODUCT DESCRIPTION

Canned tomatoes, 303 cans, size 303 x 406, net weight one pound.

A. GENERAL EVALUATION OF PROSPECTS

Although a few small canning plants, including some cooperatives, are equipped to can only one or two products, it is now customary in the commercial canning industry, to operate the plant all year in order to derive maximum profits on the capital investment. This is accomplished by canning several products that are harvested at different seasons of the year. It is, therefore, suggested that several products be selected for canning that are grown in the area where the canning plant is to be located. These selections should include products that are harvested in the spring, summer, and fall months, that will keep the plant busy during these seasons. For the winter months, it is recommended that such products as dry beans and pork and beans be canned. Under this method a full annual operation for the plant would be assured. The plant layout, as shown in this profile, is designed for the purpose of canning several seasonal products, thereby providing year round operation for the plant. A feasibility survey should be conducted to determine what products are available for canning at various seasons during the year, in what quantity, and at what cost.

B. MARKET ASPECTS

1. USERS

Homes, restaurants, hotels, institutions, military, wherever food is served.

2. SALES CHANNELS AND EXTENT OF MARKET

Sales are usually made to wholesalers for distribution to small retail stores and to large users such as military. The extent of the market for canned tomatoes normally would be nationwide. If a plant is efficiently managed and operated it should have no difficulty in competing with imported canned vegetables. Consumption of canned vegetables will vary primarily with the climate, the availability of fresh vegetables, the level of income, and the degree of urbanization of the population. A comprehensive survey related to these, as well as other, factors should be conducted to determine existing competition and sales potential.

3. RATE OF PROFIT

It should be emphasized that the information under "Production Requirements" on the next page illustrates typical U. S. cost relationships of the various factors entering into the manufacture in the United States of a specified product. It is generally recognized that profits before taxes of manufacturers in the United States may be appreciably lower than normally would be the case in a developing country. While certain imported capital items and specialized technical services may be higher in cost in developing countries, certain other significant production costs such as semi-skilled and unskilled labor, materials and supplies obtained locally may be significantly lower. Factors vitally affecting industrial products costs and profit margins such as degree of competition, size of market, availability of labor, availability of risk capital, relative financial risk, level of industry taxes, and general economic and political stability have widely differing interrelationships and impact on the selling price and profit margin of a manufactured product in a developing country as compared with the United States. Planned operations and production limits would, of necessity, have to be adapted to cost and profit conditions existing in a particular developing country as a first step in determining whether a more intensive survey of the manufacturing possibilities for a particular product and industry is warranted.

4. SELECTED GROSS PROFIT ITEMS

(See supporting data on page 3)

The annual gross sales revenue is estimated at \$167,000.

The total fixed investment, plus working capital, is estimated at \$139,400.

The annual gross profit, before taxes, is estimated at \$9,000.

Using these figures, the profit on gross sales, before taxes, amounts to about 5.4%.

(A gross profit on sales, before taxes, of 5.4%, while reflecting U. S. experience, should not be considered normal for a developing country where profit margins may be considerably higher in industry and trade.)

The annual profit on the total capital requirements, before taxes, is estimated at 6.5%.

5. COST PER MAN EMPLOYED

Twenty-seven direct workers and four indirect workers, or a total of thirty-one workers, are employed.

The total fixed capital investment is estimated at \$125,000.

Based on these figures, the fixed investment per man employed would amount to \$4,025.

C. PRODUCTION REQUIREMENTS - CANNED TOMATOES
ANNUAL CAPACITY - ONE SHIFT OPERATION - 16 WEEKS :
1,150,000 CANS

This profile should help in reaching correct assumptions.

301

CANNED CREAM OF CELERY SOUP, READY TO SERVE

PRODUCT DESCRIPTION

Canned cream of celery soup, ready to serve, 303 cans, size 303 x 406, net weight one pound.

A. GENERAL EVALUATION OF PROSPECTS

Although a few small canning plants, including some cooperatives, are equipped to can only one or two products, it is now customary in the commercial canning industry, to operate the plant all year in order to derive maximum profits on the capital investment. This is accomplished by canning several products that are harvested at different seasons of the year. It is, therefore, suggested that several products be selected for canning that are grown in the area where the canning plant is to be located. These selections should include products that are harvested in the spring, summer, and fall months, that will keep the plant busy during these seasons. For the winter months, it is recommended that such products as dry beans and pork and beans be canned. Under this method a full annual operation for the plant would be assured. The plant layout, as shown in this profile, is designed for the purpose of canning several seasonal products, thereby providing year round operation for the plant. A feasibility survey should be conducted to determine what products are available for canning at various seasons during the year, in what quantity, and at what cost.

B. MARKET ASPECTS

1. USERS

Homes, restaurants, hotels, institutions, military, wherever food is served.

2. SALES CHANNELS AND EXTENT OF MARKET

Sales are usually made to wholesalers for distribution to small retail stores and to large users, such as military. The extent of the market for canned cream of celery soup normally would be nationwide. If a plant is efficiently managed and operated it should have no difficulty in competing with imported canned soups. Consumption of canned soups will vary primarily with the climate, the availability of fresh vegetables, the level of income, and the degree of urbanization of the population. A comprehensive survey related to these, as well as other, factors should be conducted to determine existing competition and sales potential.

3. RATE OF PROFIT

It should be emphasized that the information under "Production Requirements" on the next page illustrates typical U. S. cost relationships of the various factors entering into the manufacture in the United States of a specified product. It is generally recognized that profits before taxes of manufacturers in the United States may be appreciably lower than normally would be the case in a developing country. While certain imported capital items and specialized technical services may be higher in cost in developing countries, certain other significant production costs such as semi-skilled and unskilled labor, materials and supplies obtained locally may be significantly lower. Factors vitally affecting industrial production costs and profit margins such as degree of competition, size of market, availability of labor, availability of risk capital, relative financial risk, level of industry taxes, and general economic and political stability have widely differing interrelationships and impact on the selling price and profit margin of a manufactured product in a developing country as compared with the United States. Planned operations and production limits would, of necessity, have to be adapted to cost and profit conditions existing in a particular developing country as a first step in determining whether a more intensive survey of the manufacturing possibilities for a particular product and industry is warranted.

4. SELECTED GROSS PROFIT ITEMS

(See supporting data on page 3)

The annual gross sales revenue is estimated at \$98,000.

The total fixed investment, plus working capital, is estimated at \$133,100.

The annual gross profit, before taxes, is estimated at \$5,000.

Based on these figures, the profit on gross sales, before taxes, amounts to about 5.1%.

(A gross profit on sales, before taxes, of 5.1%, while reflecting U.S. experience, should not be considered normal for a developing country, where profit margins may be considerably higher in industry and trade.)

The annual profit on the total capital requirements, before taxes, is estimated at 3.8%.

5. COST PER MAN EMPLOYED

Fifteen direct workers, and four indirect workers, or a total of nineteen workers, are employed.

The total fixed capital investment is estimated at \$125,000.

Based on these figures, the fixed investment per man employed would amount to \$6,600.

VII. PROFESSIONAL ENGINEERING SERVICES

The services of professional engineers are desirable in the design of industrial plants even though the proposed plant may be small.

A correct design is one which provides the greatest economy in the investment of funds and establishes the basis of operation that will be most profitable in the beginning and will also be capable of expansion without expensive alteration.

The addresses of professional engineers who specialize in Industrial Design, some of whom may be willing to undertake such work on low cost projects overseas, can be secured by reference to the published cards in various engineering magazines.

They may also be reached through their national organizations, one of which is the :

National Society of Professional Engineers
2029 K Street, N.W.
Washington, D.C. 20006

Manufacturers of industrial equipment employ engineers familiar with the design and installation of their specialized products. These manufacturers are usually willing to give prospective customers the benefit of technical advice by those engineers in determining the suitability of their equipment in any proposed project. The equipment manufacturer also knows, and can recommend, professional engineers in private practice who are willing and able to provide appropriate consulting services.

PRE-INVESTMENT FEASIBILITY STUDY SUGGESTED

The foregoing information must be necessarily presented in concise form. Before an investment is made in a plant a feasibility study is suggested. The investor, for his planning, should have more information dealing with the specific locality contemplated. For obvious reasons, such information cannot be included in *Industry Profiles*. Such a study, therefore, should explore local factors and conditions, including costs, sources of raw materials and supplies, availability of utilities and fuel, manpower, transportation, etc.

The investor will need reasonably accurate information on Government and legal requirements, banking and financing, potential demand, competition, construction services, and manpower training requirements. Further, he should consider developing plans for management and production controls, operating procedures, and sales promotion.

ORDERING INSTRUCTIONS

The price of *Industry Profiles* is a minimum of \$3.00 for from one to five "*Profiles*." The purchaser may select up to five of any "*Profiles*" available.

Complete sets of the 250 *Industry Profiles* published in 1966, I. P. No. 66001 through I. P. No. 66250 consecutively, may be purchased for \$125.00 per set. Complete sets of the 150 *Industry Profiles* to be published in 1967, I. P. No. 67251 through I. P. No. 67400 consecutively, may be purchased for \$75.00 per set. The latter "*Profiles*" will automatically be shipped to full set purchasers upon release.

Address orders to: U.S. Department of Commerce
Clearinghouse for Federal Scientific and
Technical Information, 410.12
Springfield, Virginia 22151

Prepayment is required. Make check or money order payable to National Bureau of Standards—CFSTI. Clearinghouse deposit account holders may charge purchases to their accounts.

GENERAL INFORMATION

An *Index of Industry Profiles* is available on request from the agency for International Development, AA/PRR, Washington, D. C. 20523.

354

INDUSTRY PROFILES

CANNED CREAM OF ASPARAGUS SOUP, READY TO SERVE

I. P. No. 67344

S. I. C. 2033

Industry Profiles are intended to promote the development of private industry in the developing countries by assembling economic and technical information in a professional analysis to support basic decisions in the establishment of small or medium-scale plants in a specific industry. The information contained in a profile is selected and organized for the guidance of the entrepreneur in the less developed country.

Industry Profiles contain basic information on market aspects, production rates, capital requirements, materials and supplies, utilities, manpower operating costs and sales revenues. Work-flow diagrams and, in some instances, machinery layouts are included along with references to sources of technical information, professional services, patents, materials and equipment.

The profiles adopt as a benchmark, productivity rates and costs which could be anticipated under conditions prevailing in the United States. Anticipated profits are before taxes. Since conditions vary widely from country to country, the entrepreneur using this profile must make suitable adjustments to conditions prevailing in his country. This profile should help in reaching correct assumptions.

352

PRODUCT DESCRIPTION

Canned cream of asparagus soup, ready to serve, 303 cans, size 303 x 406, net weight one pound.

A. GENERAL EVALUATION OF PROSPECTS

Although a few small canning plants, including some cooperatives, are equipped to can only one or two products, it is now customary in the commercial canning industry to operate the plant all year in order to derive maximum profits on the capital investment. This is accomplished by canning several products that are harvested at different seasons of the year. It is, therefore, suggested that several products be selected for canning that are grown in the area where the canning plant is to be located. These selections should include products that are harvested in the spring, summer, and fall months, that will keep the plant busy during these seasons. For the winter months, it is recommended that such products as dry beans and pork and beans be canned. Under this method a full annual operation for the plant would be assured. The plant layout, as shown in this profile, is designed for the purpose of canning several seasonal products, thereby providing year round operation for the plant. A feasibility survey should be conducted to determine what products are available for canning at various seasons during the year, in what quantity, and at what cost.

B. MARKET ASPECTS

1. USERS

Homes, restaurants, hotels, institutions, military, wherever food is served.

2. SALES CHANNELS AND EXTENT OF MARKET

Sales are usually made to wholesalers for distribution to small retail stores and to large users, such as military. The extent of the market for canned cream of asparagus soup normally would be nationwide. If a plant is efficiently managed and operated it should have no difficulty in competing with imported canned soups. Consumption of canned soups will vary primarily with the climate, the availability of fresh vegetables, the level of income and the degree of urbanization of the population. A comprehensive survey related to these, as well as other, factors should be conducted to determine existing competition and sales potential.

3. RATE OF PROFIT

It should be emphasized that the information under "Production Requirements" on the next page illustrates typical U.S. cost relationships of the various factors entering into the manufacture in the United States of a specified product. It is generally recognized that profits before taxes of manufacturers in the United States may be appreciably lower than normally would be the case in a developing country. While certain imported capital items and specialized technical services may be higher in cost in developing countries, certain other significant production costs such as semi-skilled and unskilled labor, materials and supplies obtained locally may be significantly lower. Factors vitally affecting industrial production costs and profit margins such as degree of competition, size of market, availability of labor, availability of risk capital, relative financial risk, level of industry taxes, and general economic and political stability have widely differing interrelationships and impact on the selling price and profit margin of a manufactured product in a developing country as compared with the United States. Planned operations and production limits would, of necessity, have to be adapted to cost and profit conditions existing in a particular developing country as a first step in determining whether a more intensive survey of the manufacturing possibilities for a particular product and industry is warranted.

4. SELECTED GROSS PROFIT ITEMS

(See supporting data on page 3)

The annual gross sales revenue is estimated at \$98,000.

The total fixed investment, plus working capital, is estimated at \$134,300.

The annual gross profit, before taxes, is estimated at \$5,000.

Based on these figures, the profit on gross sales, before taxes, amounts to about 5.1%.

(A gross profit on sales, before taxes, of 5.1%, while reflecting U.S. experience, should not be considered normal for a developing country where profit margins may be considerably higher in industry and trade.)

The annual profit on the total capital requirements, before taxes, is estimated at 4.0%.

5. COST PER MAN EMPLOYED

Seventeen direct workers and four indirect workers, or a total of 21 workers, are employed.

The total fixed capital investment is estimated at \$ 126,000.

Based on these figures, the fixed investment per man employed would amount to about \$6,000.

Industry Profiles contain basic information on market aspects, production rates, capital requirements, materials and supplies, utilities, manpower operating costs and sales revenues. Work-flow diagrams and, in some instances, machinery layouts are included along with references to sources of technical information, professional services, patents, materials and equipment.

The profiles adopt as a benchmark, productivity rates and costs which could be anticipated under conditions prevailing in the United States. Anticipated profits are before taxes. Since conditions vary widely from country to country, the entrepreneur using this profile must make suitable adjustments to conditions prevailing in his country. This profile should help in reaching correct assumptions.

PRODUCT DESCRIPTION

Machine-sewn work gloves with plastic fronts, canvas backs and knit wristlets.

A. GENERAL EVALUATION OF PROSPECTS

These gloves are more expensive than common canvas work gloves. The investment in fixed capital needed for the manufacture of 400,000 pairs per year is quite small. Variation in output can be easily achieved by varying the number of sewing machines employed. The degree of skilled labour required is small; the raw materials are inexpensive and readily attainable. Many of the developing countries should be able to support a plant of this kind if the domestic market is large enough.

B. MARKET ASPECT

1. USERS

Workmen in all types of activities where protective gloves are required.

2. SALES CHANNELS AND EXTENT OF MARKET

This plant will sell to wholesalers, to large retail distributors and will make direct sales to large organizations such as railroads and mines whenever possible. Competition from manufacturers of ordinary canvas gloves and of gloves with a cowhide split palm can be expected to be heavy. Competition from hand-sewn gloves made of other materials will also be keen. Work gloves are exported all over the world and competition in all markets is very keen. A plant of the size described in this profile could not hope to compete against large mass producers of gloves in the world marketplace but some sales might be made in bordering countries. Standard sizes of gloves vary from country to country; therefore, sales of gloves made in this plant should be concentrated in the domestic market.

3. RATE OF PROFIT

It should be emphasized that the information under "Production Requirements" on the next page illustrates typical U.S. cost relationships of the various factors entering into the manufacture in the United States of a specified product. It is generally recognized that profits before taxes of manufacturers in the United States may be appreciably lower than normally would be the case in a developing country. While certain imported capital items and specialized technical services may be higher in cost in developing countries, certain other significant production costs such as semi-skilled and unskilled labor, materials and supplies obtained locally may be significantly lower. Factors vitally affecting industrial products costs and profit margins such as degree of competition, size of market, availability of labor, availability of risk capital, relative financial risk, level of industry taxes, and general economic and political stability have widely differing interrelationships and impact on the selling price and profit margin of a manufactured product in a developing country as compared with the United States. Planned operations and production limits would, of necessity, have to be adapted to cost and profit conditions existing in a particular developing country as a first step in determining whether a more intensive survey of the manufacturing possibilities for a particular product and industry is warranted.

4. SELECTED GROSS PROFIT ITEMS

(See supporting data on page 3)

The annual gross sales revenue is estimated at \$178,000.

The total fixed investment, plus working capital, is estimated at \$59,000.

The annual gross profit, before taxes, is estimated at \$13,000.

Based on these figures, the profit on gross sales, before taxes, amounts to about 7.3%.

(A gross profit on sales, of 7.3%, before taxes, while reflecting U.S. experience, should not be considered normal for a developing country where profit margins may be considerably higher in industry and trade.)

The annual profit on the total capital requirements, before taxes, would amount to about 22.0%.

5. COST PER MAN EMPLOYED

Thirteen direct workers and four indirect workers or a total of seventeen workers, are employed. The total fixed capital investment is estimated at \$28,000.

Based on these figures, the fixed investment per man employed would amount to about \$1,650.

ANNUAL CAPACITY - ONE SHIFT OPERATION: 400,000 PAIR
211,700 BARRELS

NOTE: COSTS AND OPERATING DATA ARE BASED ON UNITED STATES PRICES AND PRACTICES**

I. CAPITAL REQUIREMENTS

a. Fixed Capital	<u>Cost</u>
Land - 5,000 sq. ft.	
Building - one story 30' x 70'	
Equipment, furniture & fixtures	
Prodn. tools & equipment	
Other tools & equipment	
Furniture & fixtures	
Transportation equipment	
Total fixed capital	\$ 28,000
<u>Principal items:</u>	
Cloth spreader	
Cutting table	
Electric cloth cutter	
Electric drill	
10 Sewing machines	
Work tables and chairs	
Clicker machines and dies	
b. Working Capital (30 days)	
Direct materials	
Direct labor	
Manufacturing overhead	
Administrative costs	
Sales costs	
Freight-out, discounts, bad debts & allowances	
Sales revenue	
Training costs	
Total working capital	\$ 31,000
c. Total Capital Requirements	\$ 59,000

2. MATERIALS AND SUPPLIES

a. Direct materials	<u>Annual Requirements</u>	<u>Annual Cost</u>
Canvas	30,000 yds.	
Plastic cloth	24,000 yds.	
Knit wrists	58,000 yds.	
Packaging		
Total direct materials		\$ 35,500
b. Supplies		
Lubricants & hand tools		
Cutting tools & abrasives		
Maintenance & spare parts		
Office supplies		
Gas, oil and maintenance of truck		
Total supplies		\$ 1,700
c. Availability of materials & supplies		
All supplies should be available locally.		
Plastic cloth may have to be imported.		

3. POWER, FUEL AND WATER

Electric Power - 5 H.P.	<u>Annual Cost</u>
connected load	
Fuel - heating as required	
Water - sanitation & fire protection	
	\$ 800

4. DEPRECIATION

	<u>Yrs. life</u>	<u>Amount</u>
Building	20	
Prodn. tools & equipment	10	
Other tools & equipment	10	
Furniture & fixtures	10	
Transportation equipment	4	
Total depreciation		\$ 2,700

5. MANPOWER

	<u>Number</u>	<u>Annual Cost</u>
a. Indirect labor		
Manager	1	
Office	1	
Machine Fixer	1	
Truck Driver	1	
Total indirect labor	4	\$ 32,000
b. Direct labor		
Skilled workers	1	
Semi-skilled workers	10	
Unskilled workers	2	
Total direct labor	13	\$ 63,200
c. Training needs		
Manager and one skilled worker should be able to train all workers and reach full production in about a month.		

6. TRANSPORTATION

a. Own transport equipment	
Truck	
b. External transport facilities	
Production of 1,600 pairs gloves per day.	
Good highways.	

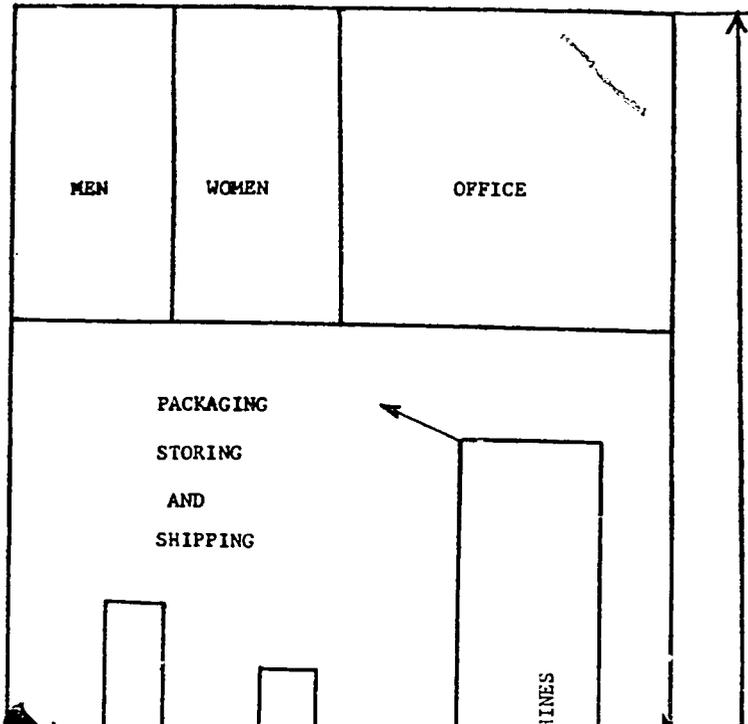

7. TOTAL ANNUAL COSTS AND SALES

<u>REVENUE</u>	
Direct materials	\$ 35,500
Direct labor	63,200
Manufacturing overhead*	37,200
Total manufacturing cost	\$ 135,900
Interest on loans	
Insurance	
Legal	
Audit	
Contingencies	
Total administrative cost	\$ 12,100
Sales expense	\$ 12,000
Freight-out, travel discounts	
Allowances & bad debts	\$ 5,000
Total annual costs	\$ 165,000
Annual Gross Profit	\$ 13,000
ANNUAL SALES REVENUE	\$ 178,000

*Includes Supplies, Power, Fuel, Water, Depreciation and Indirect labor (2b-3-4-5a)
**It was not found practical to show individual item costs because of wide variations in price and other factors, consequently only representative totals are used.

VII. PROFESSIONAL ENGINEERING SERVICES

The services of professional engineers are desirable in the design of industrial plants even though the proposed plant may be small.

A correct design is one which provides the greatest economy in the investment of funds and establishes the basis of operation that will be most profitable in the beginning and will also be capable of expansion without expensive alteration.

The addresses of professional engineers who specialize in Industrial Design, some of whom may be willing to undertake such work on low cost projects overseas, can be secured by referring to the published cards in various engineering magazines.

They may also be reached through their national organizations, one of which is the:

National Society of Professional Engineers
2029 K Street, N.W.
Washington, D.C. 20006

Manufacturers of industrial equipment employ engineers familiar with the design and installation of their specialized products. These manufacturers are usually willing to give prospective customers the benefit of technical advice by those engineers in determining the suitability of their equipment in any proposed project. The equipment manufacturer also knows, and can recommend, professional engineers in private practice who are willing and able to provide appropriate consulting services.

PRE-INVESTMENT FEASIBILITY STUDY SUGGESTED

The foregoing information must be necessarily presented in concise form. Before an investment is made in a plant a feasibility study is suggested. The investor, for his planning, should have more information dealing with the specific locality contemplated. For obvious reasons, such information cannot be included in *Industry Profiles*. Such a study, therefore, should explore local factors and conditions, including costs, sources of raw materials and supplies, availability of utilities and fuel, manpower, transportation, etc.

The investor will need reasonably accurate information on Government and legal requirements, banking and financing, potential demand, competition, construction services, and manpower training requirements. Further, he should consider developing plans for management and production controls, operating procedures, and sales promotion.

ORDERING INSTRUCTIONS

The price of *Industry Profiles* is a minimum of \$3.00 for from one to five "*Profiles*." The purchaser may select up to five of any "*Profiles*" available.

Complete sets of the 250 *Industry Profiles* published in 1966, I. P. No. 66001 through I. P. No. 66250 consecutively, may be purchased for \$125.00 per set. Complete sets of the 150 *Industry Profiles* to be published in 1967, I. P. No. 67251 through I. P. No. 67400 consecutively, may be purchased for \$75.00 per set. The latter "*Profiles*" will automatically be shipped to full set purchasers upon release.

Address orders to: U.S. Department of Commerce
Clearinghouse for Federal Scientific and
Technical Information, 410.12
Springfield, Virginia 22151

Prepayment is required. Make check or money order payable to National Bureau of Standards—CFSTI. Clearinghouse deposit account holders may charge purchases to their accounts.

GENERAL INFORMATION

An *Index of Industry Profiles* is available on request from the agency for International Development, AA/PRR, Washington, D. C. 20523.

This *Industry Profile* was prepared for the U. S. Agency for International Development by International Development Services Inc., Washington, D. C.

INDUSTRY PROFILES

NON-FERROUS METALS FOUNDRY

I. P. No. 67346

S. I. C. 3362

Industry Profiles are intended to promote the development of private industry in the developing countries by assembling economic and technical information in a professional analysis to support basic decisions in the establishment of small or medium-scale plants in a specific industry. The information contained in a profile is selected and organized for the guidance of the entrepreneur in the less developed country.

Industry Profiles contain basic information on market aspects, production rates, capital requirements, materials and supplies, utilities, manpower operating costs and sales revenues. Work-flow diagrams and, in some instances, machinery layouts are included along with references to sources of technical information, professional services, patents, materials and equipment.

The profiles adopt as a benchmark, productivity rates and costs which could be anticipated under conditions prevailing in the United States. Anticipated profits are before taxes. Since conditions vary widely from country to country, the entrepreneur using this profile must make suitable adjustments to conditions prevailing in his country. This profile should help in reaching correct assumptions.

PRODUCT DESCRIPTION

Alloy castings, usually with copper base. The product described in this profile is brass but other non-ferrous alloys can be produced in this plant.

A. GENERAL EVALUATION OF PROSPECTS

Due to the large number of skilled workers required in this factory, good management and careful supervision are necessary. Compared with the production volume, the capital requirements are relatively low and an excellent profit should accrue if the plant is efficiently operated. In countries where mechanized industry prevails and where there is increasing use of consumer durable goods, the prospects for this industry appear excellent.

B. MARKET ASPECTS1. USERS

The principal users of these products are other industries. Demands for replacement parts by machinery repair establishments are usually produced by jobbing foundries.

2. SALES CHANNELS AND EXTENT OF MARKET

Sales would be direct to other industries, such industries sometimes furnishing patterns. Demand will depend on industrial development of concerns using non-ferrous castings. It should not be difficult to survey the principal local users of non-ferrous castings and to discover their current sources of supply. The value of these items, in relation to their weight and bulk, is high and transport costs do not usually place close limits on the extent of the domestic market. However, castings are made chiefly to individual specifications and customers normally prefer to use a manufacturer with whom they can maintain close touch. These products are commonly exported but, other things being equal, purchasers usually prefer to use a local manufacturer. Some export sales to nearby areas in neighboring countries may be possible but export sales are unlikely to constitute a large share of total sales.

3. RATE OF PROFIT

It should be emphasized that the information under "Production Requirements" on the next page illustrates typical U.S. cost relationships of the various factors entering into the manufacture in the United States of a specified product. It is generally recognized that profits before taxes of manufacturers in the United States may be appreciably lower than normally would be the case in a developing country. While certain imported capital items and specialized technical services may be higher in cost in developing countries, certain other significant production costs such as semi-skilled and unskilled labor, materials and supplies obtained locally may be significantly lower. Factors vitally affecting industrial products costs and profit margins such as degree of competition, size of market, availability of labor, availability of risk capital, relative financial risk, level of industry taxes, and general economic and political stability have widely differing interrelationships and impact on the selling price and profit margin of a manufactured product in a developing country as compared with the United States. Planned operations and production limits would, of necessity, have to be adapted to cost and profit conditions existing in a particular developing country as a first step in determining whether a more intensive survey of the manufacturing possibilities for a particular product and industry is warranted.

4. SELECTED GROSS PROFIT ITEMS

(See supporting data on page 3)

The annual gross sales revenue is estimated at \$850,000.

The total fixed investment, plus working capital, is estimated at \$188,000.

The annual gross profit, before taxes, is estimated at \$94,000.

Using these figures, the profit on gross sales, before taxes, amounts to about 11.1%.

(A gross profit on sales, before taxes, of 11.1%, while reflecting U.S. experience, should not be considered normal for a developing country, where profit margins may be considerably higher in industry and trade.)

The annual profit on the total capital requirements, before taxes, is estimated at about 50%.

5. COST PER MAN EMPLOYED

Forty direct and six indirect workers, or a total of 46 workers, are employed.

The total fixed capital investment is estimated at \$48,000.

Based on these figures, the fixed investment per man employed would amount to about \$1,045.

Industry Profiles are intended to promote the development of private industry in the developing countries by assembling economic and technical information in a professional analysis to support basic decisions in the establishment of small or medium-scale plants in a specific industry. The information contained in a profile is selected and organized for the guidance of the entrepreneur in the less developed country.

Industry Profiles contain basic information on market aspects, production rates, capital requirements, materials and supplies, utilities, manpower operating costs and sales revenues. Work-flow diagrams and, in some instances, machinery layouts are included along with references to sources of technical information, professional services, patents, materials and equipment.

The profiles adopt as a benchmark, productivity rates and costs which could be anticipated under conditions prevailing in the United States. Anticipated profits are before taxes. Since conditions vary widely from country to country, the entrepreneur using this profile must make suitable adjustments to conditions prevailing in his country. This profile should help in reaching correct assumptions.

PRODUCT DESCRIPTION

Shirts made from wash and wear cotton material in a variety of styles, made to be worn with suits and ties.

A. GENERAL EVALUATION OF PROSPECTS

Since wash and wear shirts save a great deal of work and laundering expense and are equally as attractive as other shirts, they are becoming increasingly popular. The type and amount of machinery needed to produce wash and wear shirts is the same as for other shirts. Therefore, it might be possible to produce this shirt in the same plant that produces other types of shirts. (See Industry Profile No. 67362 covering Men's Sport Shirts.)

B. MARKET ASPECTS1. USERS

Male adults and teenagers.

2. SALES CHANNELS AND EXTENT OF MARKET

This plant would sell directly to large stores and to wholesalers for resale to small retailers and dry goods stores. The rate of consumption of men's wash and wear shirts will depend to a great extent upon the capita income and the clothing habits of the population of the country. These shirts are packaged well in cardboard boxes making shipment easy anywhere within the country and, in some cases, it might be possible to export these shirts to neighboring countries not having a plant manufacturing wash and wear shirts. The only domestic market competition that could be expected would arise from factories similar to this. The small size of this plant would prohibit it from competing in international markets.

3. RATE OF PROFIT

It should be emphasized that the information under "Production Requirements" on the next page illustrates typical U. S. cost relationships of the various factors entering into the manufacture in the United States of a specified product. It is generally recognized that profits before taxes of manufacturers in the United States may be appreciably lower than normally would be the case in a developing country. While certain imported capital items and specialized technical services may be higher in cost in developing countries, certain other significant production costs such as semi-skilled and unskilled labor, materials and supplies obtained locally may be significantly lower. Factors vitally affecting industrial products costs and profit margins such as degree of competition, size of market, availability of labor, availability of risk capital, relative financial risk, level of industry taxes, and general economic and political stability have widely differing interrelationships and impact on the selling price and profit margin of a manufactured product in a developing country as compared with the United States. Planned operations and production limits would, of necessity, have to be adapted to cost and profit conditions existing in a particular developing country as a first step in determining whether a more intensive survey of the manufacturing possibilities for a particular product and industry is warranted.

4. SELECTED GROSS PROFIT ITEMS

(See supporting data on page 3)

The annual gross sales revenue is estimated at \$500,000.

The total fixed investment, plus working capital, is estimated at \$161,600.

The annual gross profit, before taxes, is estimated at \$36,000.

Based on these figures, the profit on gross sales, before taxes, amounts to 7.2%.

(A gross profit on sales, before taxes, of 7.2%, while reflecting U.S. experience, should not be considered normal for a developing country where profit margins may be considerably higher in industry and trade.)

The annual profit on the total capital requirements, before taxes, would amount to about 22.4%.

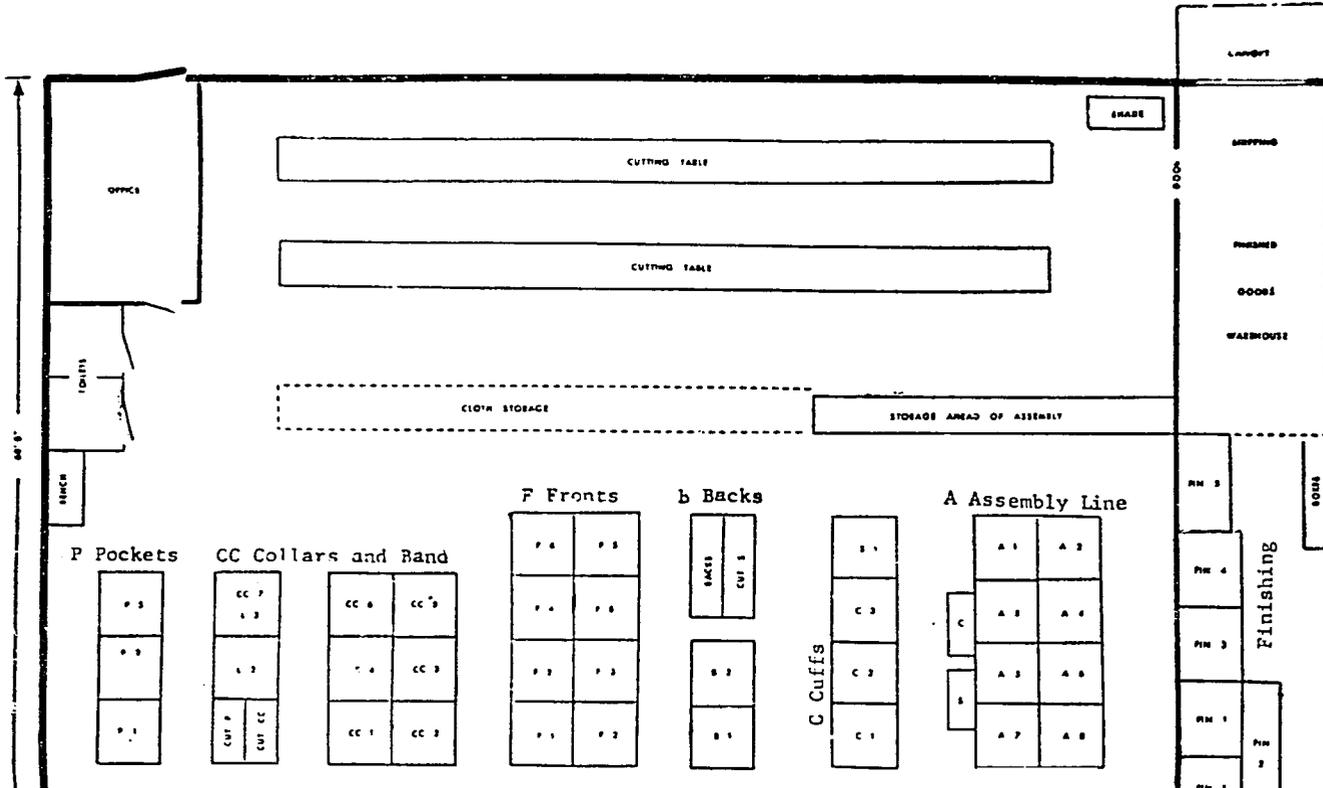

5. COST PER MAN EMPLOYED

Thirty-four direct workers nine indirect workers, or a total of forty-three workers, are employed.

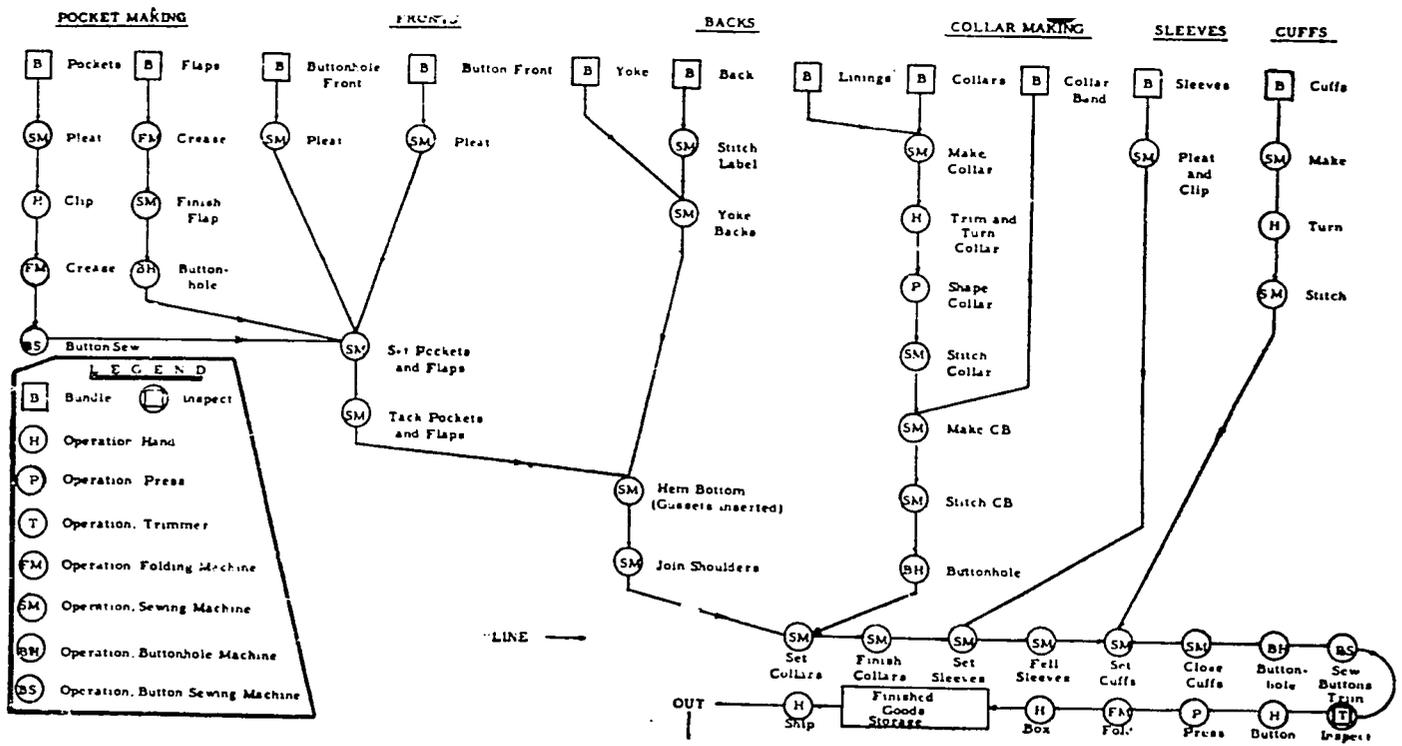

The total fixed capital investment is estimated at \$ 73,000.

Based on these figures, the fixed investment per man employed would amount to about \$1,700.

VII. PROFESSIONAL ENGINEERING SERVICES

The services of professional engineers are desirable in the design of industrial plants even though the proposed plant may be small.

A correct design is one which provides the greatest economy in the investment of funds and establishes the basis of operation that will be most profitable in the beginning and will also be capable of expansion without expensive alteration.

The addresses of professional engineers who specialize in Industrial Design, some of whom may be willing to undertake such work on low cost projects overseas, can be secured by reference to the published cards in various engineering magazines.

They may also be reached through their national organizations, one of which is the :

National Society of Professional Engineers
2029 K Street, N. W.
Washington, D.C. 20006

Manufacturers of industrial equipment employ engineers familiar with the design and installation of their specialized products. These manufacturers are usually willing to give prospective customers the benefit of technical advice by those engineers in determining the suitability of their equipment in any proposed project. The equipment manufacturer also knows, and can recommend, professional engineers in private practice who are willing and able to provide appropriate consulting services.

PRE-INVESTMENT FEASIBILITY STUDY SUGGESTED

The foregoing information must be necessarily presented in concise form. Before an investment is made in a plant a feasibility study is suggested. The investor, for his planning, should have more information dealing with the specific locality contemplated. For obvious reasons, such information cannot be included in *Industry Profiles*. Such a study, therefore, should explore local factors and conditions, including costs, sources of raw materials and supplies, availability of utilities and fuel, manpower, transportation, etc.

The investor will need reasonably accurate information on Government and legal requirements, banking and financing, potential demand, competition, construction services, and manpower training requirements. Further, he should consider developing plans for management and production controls, operating procedures, and sales promotion.

ORDERING INSTRUCTIONS

The price of *Industry Profiles* is a minimum of \$3.00 for from one to five "*Profiles*." The purchaser may select up to five of any "*Profiles*" available.

Complete sets of the 250 *Industry Profiles* published in 1966, I. P. No. 66001 through I. P. No. 66250 consecutively, may be purchased for \$125.00 per set. Complete sets of the 150 *Industry Profiles* to be published in 1967, I. P. No. 67251 through I. P. No. 67400 consecutively, may be purchased for \$75.00 per set. The latter "*Profiles*" will automatically be shipped to full set purchasers upon release.

Address orders to: U.S. Department of Commerce
Clearinghouse for Federal Scientific and
Technical Information, 410.12
Springfield, Virginia 22151

Prepayment is required. Make check or money order payable to National Bureau of Standards—CFSTI. Clearinghouse deposit account holders may charge purchases to their accounts.

GENERAL INFORMATION

An *Index of Industry Profiles* is available on request from the agency for International Development, AA/PRR, Washington, D. C. 20523.

This *Industry Profile* was prepared for the U. S. Agency for International Development by International Development Services Inc., Washington, D. C.

INDUSTRY PROFILES

MEN'S AND YOUTHS SUITS

I. P. No. 67348

S. I. C. 2311

Industry Profiles are intended to promote the development of private industry in the developing countries by assembling economic and technical information in a professional analysis to support basic decisions in the establishment of small or medium-scale plants in a specific industry. The information contained in a profile is selected and organized for the guidance of the entrepreneur in the less developed country.

Industry Profiles contain basic information on market aspects, production rates, capital requirements, materials and supplies, utilities, manpower operating costs and sales revenues. Work-flow diagrams and, in some instances, machinery layouts are included along with references to sources of technical information, professional services, patents, materials and equipment.

The profiles adopt as a benchmark, productivity rates and costs which could be anticipated under conditions prevailing in the United States. Anticipated profits are before taxes. Since conditions vary widely from country to country, the entrepreneur using this profile must make suitable adjustments to conditions prevailing in his country. This profile should help in reaching correct assumptions.

PRODUCT DESCRIPTION

Two-piece suits for men and youths made from worsted fabric.

A. GENERAL EVALUATION OF PROSPECTS

The success of this industry will depend upon the ready availability of the necessary raw materials and upon the styling and workmanship of these suits. Quality will be an important factor in meeting the heavy competition that can be expected from imported clothing of this type. The capital requirements for this plant are modest in relation to the gross sales revenue and the number of people employed.

B. MARKET ASPECTS1. USERS

Men and youths.

2. SALES CHANNELS AND EXTENT OF MARKET

Sales would be made direct to retail clothing stores. The population required to support the output of this plant depends to a great extent upon a relatively high per capita income. If the income in rural areas is low, this plant would have to depend on the urban areas alone to maintain the sales volume. Since this product is easily handled and its value is high in relation to its transportation costs, the domestic market should extend nationwide. Some export sales to neighboring countries not having a plant of this type may be made. This plant should have no difficulty competing against small factories producing hard-made suits. The principal competition will come from imports. However, with the advantages of lower freight rates and of not having to pay duties, this plant should be able to meet import competition.

3. RATE OF PROFIT

It should be emphasized that the information under "Production Requirements" on the next page illustrates typical U.S. cost relationships of the various factors entering into the manufacture in the United States of a specified product. It is generally recognized that profits before taxes of manufacturers in the United States may be appreciably lower than normally would be the case in a developing country. While certain imported capital items and specialized technical services may be higher in cost in developing countries, certain other significant production costs such as semi-skilled and unskilled labor, materials and supplies obtained locally may be significantly lower. Factors vitally affecting industrial products costs and profit margins such as degree of competition, size of market, availability of labor, availability of risk capital, relative financial risk, level of industry taxes, and general economic and political stability have widely differing interrelationships and impact on the selling price and profit margin of a manufactured product in a developing country as compared with the United States. Planned operations and production limits would, of necessity, have to be adapted to cost and profit conditions existing in a particular developing country as a first step in determining whether a more intensive survey of the manufacturing possibilities for a particular product and industry is warranted.

4. SELECTED GROSS PROFIT ITEMS

(See supporting data on page 3)

The annual gross sales revenue is estimated at \$410,000.

The total fixed investment, plus working capital, is estimated at \$139,100.

The annual gross profit, before taxes, is estimated at \$30,000.

Based on these figures, the profit on gross sales, before taxes, amounts to about 7.3%.

(A gross profit on sales, before taxes, of 7.3%, while reflecting U.S. experience, should not be considered normal for a developing country where profit margins may be considerably higher in industry and trade.)

The annual profit on the total capital requirements, before taxes, would amount to about 22.0%.

5. COST PER MAN EMPLOYED

Thirty direct workers and six indirect workers, or a total of thirty-six workers, are employed.

The total fixed capital investment is estimated at \$66,000.

Based on these figures, the fixed investment per man employed would amount to about \$1,835.

INDUSTRY PROFILES

KEROSENE LANTERNS

I. P. No. 67349

S. I. C. 3642

Industry Profiles are intended to promote the development of private industry in the developing countries by assembling economic and technical information in a professional analysis to support basic decisions in the establishment of small or medium-scale plants in a specific industry. The information contained in a profile is selected and organized for the guidance of the entrepreneur in the less developed country.

Industry Profiles contain basic information on market aspects, production rates, capital requirements, materials and supplies, utilities, manpower operating costs and sales revenues. Work-flow diagrams and, in some instances, machinery layouts are included along with references to sources of technical information, professional services, patents, materials and equipment.

The profiles adopt as a benchmark, productivity rates and costs which could be anticipated under conditions prevailing in the United States. Anticipated profits are before taxes. Since conditions vary widely from country to country, the entrepreneur using this profile must make suitable adjustments to conditions prevailing in his country. This profile should help in reaching correct assumptions.

PRODUCT DESCRIPTION

Lanterns using kerosene oil for fuel. Made in two sizes--large and small--and equipped with glass globes.

A. GENERAL EVALUATION OF PROSPECTS

The estimated gross profit, before taxes, shown for this industry, in comparison with the gross sales, are fairly good. However, the estimated gross profits, before taxes, in comparison with the total capital requirements are not as favorable. The potential sales for these products will depend on the existing conditions within each country and can be determined only by a sales survey. There are many uses for lanterns of this type but the product gets heavy competition from substitutes. For example, lanterns with red globes are often used to indicate danger on highways but flame torches are used nearly as often for the same purpose. A survey of the market potential should, therefore, be made.

B. MARKET ASPECTS1. USERS

Farms, highways, mines, construction work, wherever a portable light is required.

2. SALES CHANNELS AND EXTENT OF MARKET

Direct sales to hardware stores and large department stores and direct to public works projects and other large-scale enterprises able to buy in big quantities. Since there are many substitutes for kerosene lanterns (battery-operated flash lights, flame torches and lamps using fuels other than kerosene), the market required cannot be determined by population with any reasonable accuracy. A survey of market potential must be made. Production of these lanterns requires a great deal of capital and investment in machinery and equipment and no competition from small producers can, therefore, be expected. A plant of this production capability would not be able to compete in world markets but some export sales to neighboring countries not having this plant's capacity might be expected.

3. RATE OF PROFIT

It should be emphasized that the information under "Production Requirements" on the next page illustrates typical U.S. cost relationships of the various factors entering into the manufacture in the United States of a specified product. It is generally recognized that profits before taxes of manufacturers in the United States may be appreciably lower than normally would be the case in a developing country. While certain imported capital items and specialized technical services may be higher in cost in developing countries, certain other significant production costs such as semi-skilled and unskilled labor, materials and supplies obtained locally may be significantly lower. Factors vitally affecting industrial products costs and profit margins such as degree of competition, size of market, availability of labor, availability of risk capital, relative financial risk, level of industry taxes, and general economic and political stability have widely differing interrelationships and impact on the selling price and profit margin of a manufactured product in a developing country as compared with the United States. Planned operations and production limits would, of necessity, have to be adapted to cost and profit conditions existing in a particular developing country as a first step in determining whether a more intensive survey of the manufacturing possibilities for a particular product and industry is warranted.

4. SELECTED GROSS PROFIT ITEMS

(See supporting data on page 3)

The annual gross sales revenue is estimated at \$180,000.

The total fixed investment, plus working capital, is estimated at \$193,000.

The annual gross profit, before taxes, is estimated at \$18,000.

Using these figures, the profit on gross sales, before taxes, amounts to 10%.

(A gross profit on sales, before taxes, of 10%, while reflecting U.S. experience, should not be considered normal for a developing country where profit margins may be considerably higher in industry and trade.)

The annual profit on the total capital requirements, before taxes, is estimated at 9.3%

5. COST PER MAN EMPLOYED

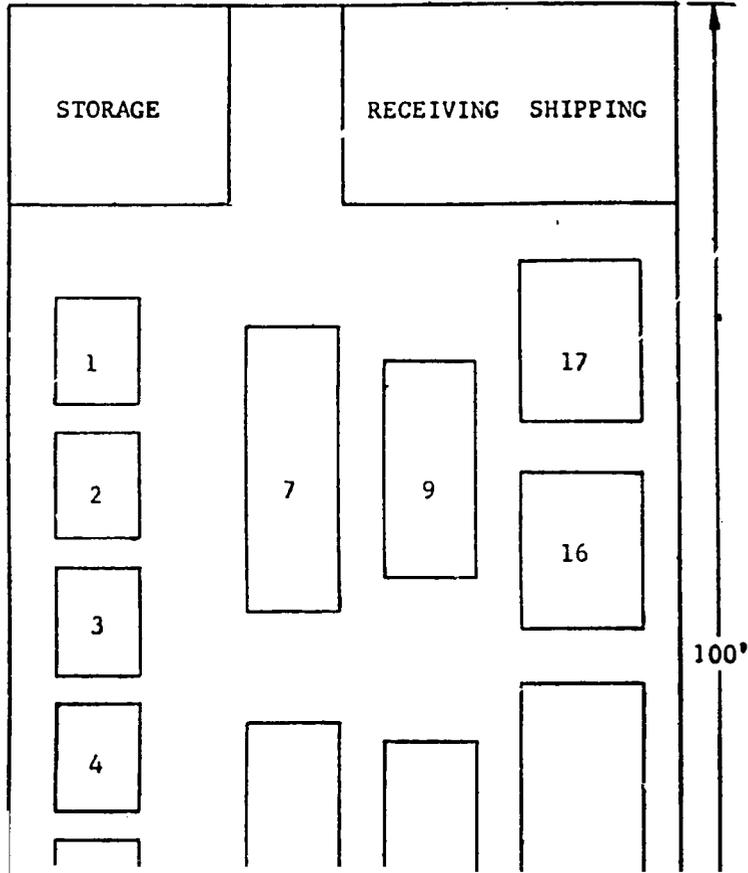

Ten direct and six indirect workers, or a total of sixteen workers, are employed.

The total fixed capital investment is estimated at \$164,000.

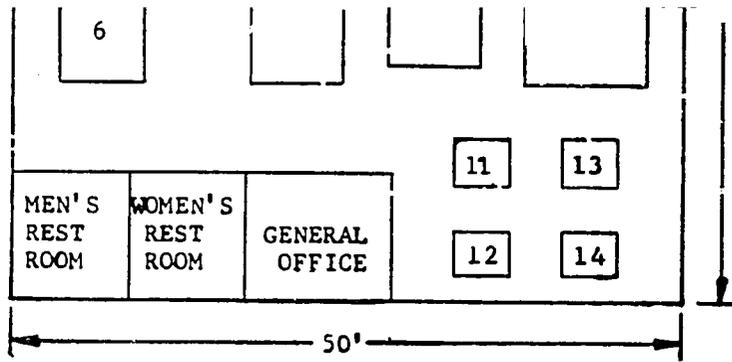

Based on these figures, the fixed investment per man employed would amount to about \$10,250.

Magazine of metalworking production, covering machinery, tools, design and production engineering problems and management of metalworking industries.

- B. **Lighting.** Monthly. Controlled free distribution.

W.R.C. Smith Publishing Co.
1760 Peachtree Road, N. W.
Atlanta, Georgia 30309

Devoted to the lighting and lamp industry.

III. BUSINESS MANAGEMENT MATERIALS

- A. **The First Two Years: Problems of Small Firm Growth and Survival.** Kurt B. Mayer and Sidney Goldstein. 233 pp. \$1.00.

Superintendent of Documents
U. S. Government Printing Office
Washington, D. C. 20402

Insights and clues concerning the entire process of small business formation, growth, and decline.

- B. **A Handbook of Small Business Finance.** Jack Zwick. 80 pp. 1965. No. 15 in the Small Business Management Series (Seventh Edition).

Superintendent of Documents
U. S. Government Printing Office
Washington, D. C. 20402

Points out major areas of financial management and describes a few of the techniques that can help small businessmen understand past decisions and to make better decisions in the future.

- C. **Improving Materials Handling in Small Plants.** \$.20

Small Business Management Series No. 4
U. S. Government Printing Office
Washington, D. C. 20402

Prepared by Small Business Administration to assist in the development of management in small business.

IV. REPRESENTATIVE U.S. PATENTS

Available U.S. Patent Office, Washington, D. C. 20231. \$.50 each

- | | | |
|----------------------------------------------------------------------------|---------------|------|
| A. Patent No. 3,131,872
Lantern of the hydro-carbon burning type. | May 5, 1964 | 7 p. |
| B. Patent No. 2,985,751
Portable type lantern using combustible fluids. | May 23, 1961 | 5 p. |
| C. Patent No. 2,841,694
Portable gas lantern. | July 1, 1958 | 4 p. |
| D. Patent No. 2,796,753
Gaseous fuel lamp. | June 25, 1957 | 4 p. |
| E. Patent No. 1,413,244
Kerosene lantern. | 1922 | 8 p. |
| F. Patent No. 1,182,824
Lantern. | 1916 | 5 p. |

V. TECHNICAL INSTITUTES AND TRADE ASSOCIATIONS

No known technical institutes or trade associations for the lantern industry.

VI. DIRECTORIES

- A. Directory of Metalworking Machinery (2 Volumes) \$7.50

U.S. Government Printing Office
Division of Public Documents
Washington, D. C. 20402

U.S. metalworking manufacturers listed by manufacturer's code and machine types.

VII. PROFESSIONAL ENGINEERING SERVICES

The services of professional engineers are desirable in the design of industrial plants even though the proposed plant may be small.

A correct design is one which provides the greatest economy in the investment of funds and establishes the basis of operation that will be most profitable in the beginning and will also be capable of expansion without expensive alteration.

The addresses of professional engineers who specialize in Industrial Design, some of whom may be willing to undertake such work on low cost projects overseas, can be secured by reference to the published cards in various engineering magazines.

They may also be reached through their national organizations, one of which is the:

National Society of Professional Engineers
2029 K Street, N. W.
Washington, D. C. 20006

Manufacturers of industrial equipment employ engineers familiar with the design and installation of their specialized product. These manufacturers are usually willing to give prospective customers the benefit of technical advice by those engineers in determining the suitability of their equipment in any proposed project. The equipment manufacturer also knows, and can recommend, professional engineers in private practice who are willing and able to provide appropriate consulting services.

PRE-INVESTMENT FEASIBILITY STUDY SUGGESTED

The foregoing information must be necessarily presented in concise form. Before an investment is made in a plant a feasibility study is suggested. The investor, for his planning, should have more information dealing with the specific locality contemplated. For obvious reasons, such information cannot be included in *Industry Profiles*. Such a study, therefore, should explore local factors and conditions, including costs, sources of raw materials and supplies, availability of utilities and fuel, manpower, transportation, etc.

The investor will need reasonably accurate information on Government and legal requirements, banking and financing, potential demand, competition, construction services, and manpower training requirements. Further, he should consider developing plans for management and production controls, operating procedures, and sales promotion.

ORDERING INSTRUCTIONS

The price of *Industry Profiles* is a minimum of \$3.00 for from one to five "*Profiles*." The purchaser may select up to five of any "*Profiles*" available.

Complete sets of the 250 *Industry Profiles* published in 1966, I. P. No. 66001 through I. P. No. 66250 consecutively, may be purchased for \$125.00 per set. Complete sets of the 150 *Industry Profiles* to be published in 1967, I. P. No. 67251 through I. P. No. 67400 consecutively, may be purchased for \$75.00 per set. The latter "*Profiles*" will automatically be shipped to full set purchasers upon release.

Address orders to: U.S. Department of Commerce
Clearinghouse for Federal Scientific and
Technical Information, 410.12
Springfield, Virginia 22151

Prepayment is required. Make check or money order payable to National Bureau of Standards—CFSTI. Clearinghouse deposit account holders may charge purchases to their accounts.

GENERAL INFORMATION

An *Index of Industry Profiles* is available on request from the agency for International Development, AA/PRR, Washington, D. C. 20523.

This *Industry Profile* was prepared for the U. S. Agency for International Development by International Development Services Inc., Washington, D. C.

INDUSTRY PROFILES

BICYCLE TIRES AND INNERTUBES

I. P. No. 67350

S. I. C. 3011

Industry Profiles are intended to promote the development of private industry in the developing countries by assembling economic and technical information in a professional analysis to support basic decisions in the establishment of small or medium-scale plants in a specific industry. The information contained in a profile is selected and organized for the guidance of the entrepreneur in the less developed country.

Industry Profiles contain basic information on market aspects, production rates, capital requirements, materials and supplies, utilities, manpower operating costs and sales revenues. Work-flow diagrams and, in some instances, machinery layouts are included along with references to sources of technical information, professional services, patents, materials and equipment.

The profiles adopt as a benchmark, productivity rates and costs which could be anticipated under conditions prevailing in the United States. Anticipated profits are before taxes. Since conditions vary widely from country to country, the entrepreneur using this profile must make suitable adjustments to conditions prevailing in his country. This profile should help in reaching correct assumptions.

PRODUCT DESCRIPTION

Good grade, heavy duty bicycle tires and tubes to fit 26-inch diameter rims.

A. GENERAL EVALUATION OF PROSPECTS

The total capital requirements for this industry amount to about \$848,600 and the annual sales are estimated at over \$1,000,000. The cost of the raw materials amounts to about \$500,400. Therefore, the most important factors to be considered when evaluating the prospects for this industry are the local availability of the necessary raw materials at satisfactory costs and the local sales potential. A comprehensive survey of these relevant factors should be made and, if the results of the survey are favorable, this plant should be a good investment.

B. MARKET ASPECTS

1. USERS

Bicycle manufacturers and, for tire replacements, the general public.

2. SALES CHANNELS AND EXTENT OF MARKET

Sales will be made direct to bicycle manufacturers and direct to retail stores for replacement sales. The sales demand for these products will depend on (1) the existence of bicycle manufacturing industry within the country and (2) the number of bicycles in use throughout the country. A survey is required to determine market potential. Bicycle tires and tubes are relatively light and well packaged and the selling price permits long distance shipment. Bicycles are used in rural and urban areas so the distribution of tires and tubes should be nationwide. The manufacture of these products requires a large investment. They cannot be produced on a small volume basis. Competition would arise from other large producers if any. If raw materials are available locally and the plant is well managed, this industry should have no difficulty competing against imported products. While this plant could not compete in world markets against mass producers of tires and tubes, some export sales to neighboring countries could be made.

3. RATE OF PROFIT

It should be emphasized that the information under "Production Requirements" on the next page illustrates typical U.S. cost relationships of the various factors entering into the manufacture in the United States of a specified product. It is generally recognized that profits before taxes of manufacturers in the United States may be appreciably lower than normally would be the case in a developing country. While certain imported capital items and specialized technical services may be higher in cost in developing countries, certain other significant production costs such as semi-skilled and unskilled labor, materials and supplies obtained locally may be significantly lower. Factors vitally affecting industrial products costs and profit margins such as degree of competition, size of market, availability of labor, availability of risk capital, relative financial risk, level of industry taxes, and general economic and political stability have widely differing interrelationships and impact on the selling price and profit margin of a manufactured product in a developing country as compared with the United States. Planned operations and production limits would, of necessity, have to be adapted to cost and profit conditions existing in a particular developing country as a first step in determining whether a more intensive survey of the manufacturing possibilities for a particular product and industry is warranted.

4. SELECTED GROSS PROFIT ITEMS

(See supporting data on page 3)

The annual gross sales revenue is estimated at \$1,090,000.

The total fixed investment, plus working capital, is estimated at \$848,600.

The annual gross profit, before taxes, is estimated at \$90,000.

Using these figures, the profit on gross sales, before taxes, amounts to about 8.3%.

(A gross profit on sales, before taxes, of 8.3%, while reflecting U.S. experience, should not be considered normal for a developing country, where profit margins may be considerably higher in industry and trade.)

The annual profit on the total capital requirements, before taxes, is estimated at about 10.6%.

5. COST PER MAN EMPLOYED

Forty-two direct and ten indirect workers, or a total of fifty-two workers, are employed.

The total fixed capital investment is estimated at \$666,000.

Based on these figures, the fixed investment per man employed would amount to about \$12,800

404

C. PRODUCTION REQUIREMENTS - BICYCLE TIRES AND INNERTUBES

I.P. No. 67350

ANNUAL CAPACITY - ONE SHIFT OPERATION : 500,000 SETS OF TIRES AND TUBES

S.I.C. 3011

NOTE: COSTS AND OPERATING DATA ARE BASED ON UNITED STATES PRICES AND PRACTICES**

1. CAPITAL REQUIREMENTS

a. <u>Fixed Capital</u>		<u>Cost</u>
Land - one acre		
Building - 100' x 100' or 10,000 sq. ft.		
Local materials may be used.		
Equipment, furniture & fixtures		
Prodn. tools & equipment		
Other tools & equipment		
Furniture & fixtures		
Transportation equipment		
Total fixed capital		\$ 666,000
<u>Principal items:</u>		
Internal mixer	20 Tube curing molds	
Rubber mixer	10 Dual tire vulcanizing presses	
3 Sheetting mills		
Slab cutter	20 Single tube vulcanizing presses	
Strainer		
Dryer	Compressor	
Calender	Tube production line machinery	
3 Extruders	Steam production equipment	
Bead insulating & winding set-up		
Bias cutter		
12 Building wheels		
20 Tire curing molds		
b. <u>Working Capital (30 days)</u>		
Direct materials		
Direct labor		
Manufacturing overhead		
Administrative costs		
Sales costs		
Freight-out, discounts, bad debts & allowances		
Sales revenue		
Training costs		
Total working capital		\$ 182,600
c. <u>Total Capital Requirements</u>		\$ 848,600

2. MATERIALS AND SUPPLIES

a. <u>Direct materials</u>	<u>Annual Requirements</u>	<u>Annual Cost</u>
Rubber	532,100 lbs.	
Carbon black	253,530 lbs.	
Process oil	125,700 lbs.	
Zinc oxide	19,719 lbs.	
Accelerator, tubes	1,252 lbs.	
Accelerator, tires	6,260 lbs.	
Vulcanizing agent	16,589 lbs.	
Fabric	313,000 lbs.	
Bead wire	120,505 lbs.	
Tube boxes		
Valves		
Total direct materials		\$ 500,400
b. <u>Supplies</u>		
Lubricants & hand tools		
Cutting tools & abrasives		
Maintenance & spare parts		
Office supplies		
Gas, oil and maintenance of truck		
Total supplies		\$ 8,700
c. <u>Availability of materials & supplies</u>		

Many of the materials would have to imported into most countries. The supplies should be available locally.

3. POWER, FUEL AND WATER

Electric Power - 280 H.P. connected load	<u>Annual Cost</u>
Fuel - 300 tons of coal	
Water - 10,000,000 gallons	
	\$ 11,200

4. DEPRECIATION

	<u>Yrs. life</u>	<u>Amount</u>
Building	20	
Prodn. tools & equipment	10	
Other tools & equipment	10	
Furniture & fixtures	10	
Transportation equipment	4	
Total depreciation		\$ 64,300

5. MANPOWER

	<u>Number</u>	<u>Annual Cost</u>
a. <u>Indirect labor</u>		
Manager & plant engineer	2	
Office	3	
Maintenance	4	
Truck Driver	1	
Total indirect labor	10	\$ 73,000
b. <u>Direct labor</u>		
Skilled workers	7	
Semi-skilled workers	21	
Unskilled workers	14	
Total direct labor	42	\$ 197,400

c. Training needs

Manager and plant engineer must be thoroughly experienced. They with 7 skilled workers should be able to train other workers and reach full production in 30 days.

6. TRANSPORTATION

a. <u>Own transport equipment</u>	
Truck	
b. <u>External transport facilities</u>	
In and out shipments amount to about 8.5 tons per day.	
Railroad and good highways essential.	

7. TOTAL ANNUAL COSTS AND SALES

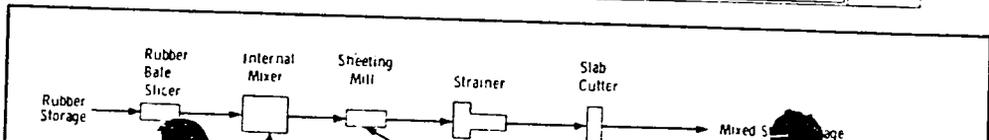

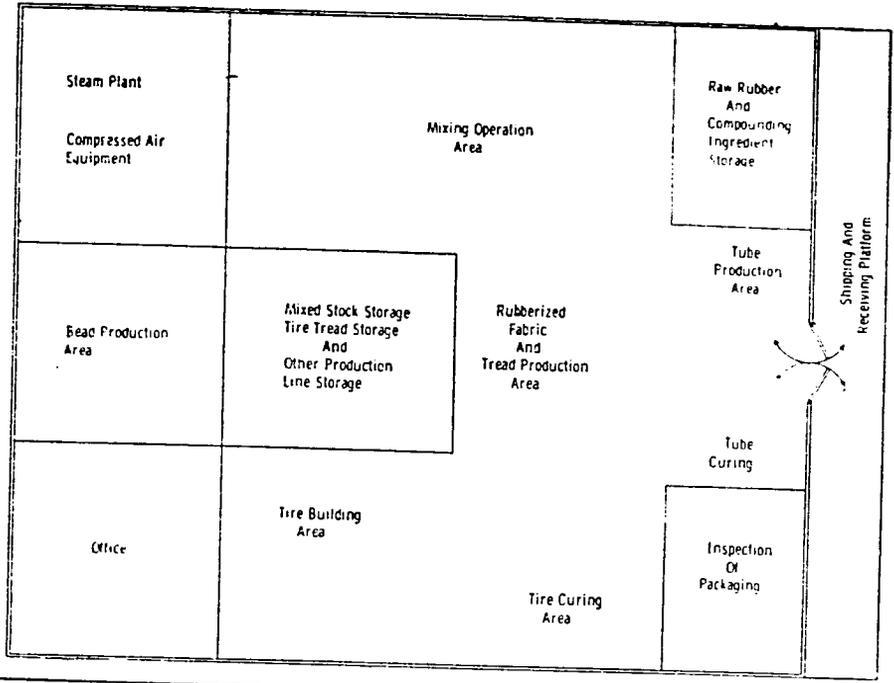

<u>REVENUE</u>	
Direct materials	\$ 500,400
Direct labor	197,400
Manufacturing overhead*	157,200
Total manufacturing cost	\$ 855,000
Interest on loans	
Insurance	
Legal	
Audit	
Contingencies	
Total administrative cost	\$ 75,000
Sales expense	\$ 48,000
Freight-out, travel discounts	
Allowances & bad debts	\$ 22,000
Total annual costs	\$ 1,000,000
Annual Gross Profit	\$ 90,000
<u>ANNUAL SALES REVENUE</u>	\$ 1,090,000

*Includes Supplies, Power, Fuel, Water, Depreciation and Indirect labor (2b-3-4-5a)

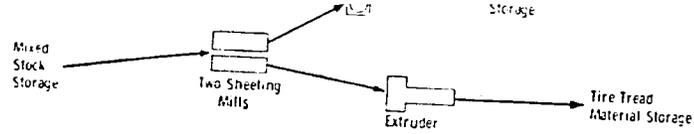

**It was not found practical to show individual item costs because of wide variations in price and other factors, consequently only representative totals are used.
