Small-Scale Autoclaves to Manage Medical Waste

A buyer’s guide to selecting autoclaves manufactured in India

September 2008
About this guide

There is a growing interest, globally, in more sustainable non-incineration approaches to treatment of medical waste. However, currently there is very little information on practical alternatives for treating medical waste in low resource settings. In this guide PATH has gathered information from manufacturers of small-scale Indian autoclaves as one option for treatment of medical waste. India was chosen as the focus country for the guide because of its large number of manufacturers of lower-cost, small-scale autoclaves.

Autoclaves can offer a safe, affordable means for sterilizing some medical waste, including highly infectious sharps waste. This booklet is intended to provide a starting point for managers interested in learning more about autoclaves and to aid in decision-making for purchase of medical waste autoclaves. It includes issues to consider when purchasing an autoclave, technical specifications of some devices, and a list of Indian manufacturers of autoclaves with current contact information. The information is based on desk research and has not been verified through bench testing or field evaluation. For further guidance on deciding whether an autoclave is appropriate for waste treatment in your setting, refer to the references listed at the end of this guide.

About PATH

PATH is an international, nonprofit organization that creates sustainable, culturally relevant solutions, enabling communities worldwide to break cycles of poor health. By collaborating with diverse public- and private-sector partners, PATH helps provide appropriate health technologies and vital strategies that improve global health and well-being.

In the field of safe injection and medical waste management, PATH has served for over 20 years in a global leadership role, championing improved approaches to injection safety for the developing world. PATH actively participated in establishing the Safe Injection Global Network (SIGN). As a founding member and chair of the Injection Safety Alliance in India, whose objectives and activities included reducing unnecessary injections, PATH carried out nationwide studies of injection safety in
Using Autoclaves to Manage Medical Waste

association with the government of India. PATH has also published relevant training materials and tools and trained health care workers—primarily in Africa, India, and Indonesia—on appropriate safe injection and medical waste management techniques.

The importance of safe treatment and disposal of medical waste

Between 10% and 25% of all medical waste is hazardous, and the majority of hazardous medical waste is infectious, meaning that it can transmit infections and may be harmful to health workers, the community, and the environment. Injection equipment (e.g., needles and syringes) and other sharps waste are often exposed to bloodborne pathogens and therefore carry the greatest risk of disease transmission if they are reused or handled in an unsafe manner. This risk creates a significant public health burden. The World Health Organization (WHO) estimates that 21 million hepatitis B infections, 2 million hepatitis C infections, and 260,000 HIV infections are inadvertently caused by injections administered with contaminated needles and syringes each year.

Proper segregation of medical waste into general waste, infectious waste, and sharps waste is the first step in preventing accidental injury and disease transmission. Once waste is properly segregated, it must be treated and disposed of in a safe manner according to facility and country policies for medical waste disposal. For an overview of medical waste treatment and disposal options, refer to Safe Management of Wastes from Health-Care Activities (WHO 1999). For further information on safe handling and disposal of medical waste, visit PATH’s Health Care Waste Management Resource Page (http://www.path.org/projects/health_care_waste_resources.php), which offers a convenient compilation of key guidance documents, training materials, and case studies.
Using autoclaves to treat infectious waste

Autoclaves are the most common non-incineration treatment method for medical waste.\(^1\) By using pressurized steam to heat the waste to a temperature of at least 121°C, autoclaves can sterilize infectious waste without causing airborne emissions that are created when waste is burned. Steam sterilization is an efficient method of treating medical waste because the moisture increases heat transfer and more effectively penetrates the waste load, reducing the time needed to achieve sterilization.

It is recommended that operators of autoclaves confirm that autoclaved waste is sterile by using a chemical or biological indicator. These indicators are commercially available and should be included with every batch of waste.

Segregation of waste is an important part of medical waste treatment when using an autoclave. Waste-containing mercury (e.g., broken thermometers) and high-mass waste such as body parts should not be sterilized by autoclave.

Using an autoclave may open up opportunities to consider recycling the sterilized plastic waste. If plastic waste is intended to be recycled, consider integrating needle remover devices for immediate removal of needles at all injection locations in the facility. Dispose of needles in a needle pit or a specially designed barrel.\(^†\) Alternatively, the needles and syringes can be shredded in safety boxes after they have been autoclaved. Cardboard safety boxes must first be placed in an autoclave bag—they should not be placed directly into an autoclave as the steam may break down the cardboard.

Shredding of plastic syringe waste may be done either before or after autoclaving: there is no consensus on a preferred strategy and there are advantages and disadvantages to both. Shredding plastic syringe waste after disinfection is safe, reduces the volume of the waste, and may facilitate the recycling process. When shredding infectious syringe waste before it has been sterilized, needles and syringes can be shredded in safety boxes after they have been autoclaved.

\(^†\) For more information on constructing a needle pit or barrel for use with needle removers, visit PATH’s Needle Remover Resource Page at http://www.path.org/projects/health_care_waste_needle_remover_resources.php.
disinfected, there is a risk that infectious matter may become aerosolized during the shredding process.

As with the handling of all medical waste, health workers and waste handlers operating a shredder should be supplied with personal protective equipment such as gloves, goggles, masks, and aprons. In addition, the shredder must be properly cleaned and sterilized following use.

**Infectious waste stream**

If using a needle remover:

- Infectious sharps waste
- Non-sharp infectious waste
- Autoclave
- Recycle plastic syringe waste
- Regular garbage
- Needle pit

Shredding plastic syringe waste may be done before or after disinfection. Follow the appropriate guidelines.
Prior to purchasing an autoclave, each facility should have a plan for regular collection and disposal of disinfected waste. Depending on local policy, waste disinfected in an autoclave may be disposed of in a municipal landfill or buried in a protected pit. In addition, every facility should have a comprehensive plan for the segregation, treatment, collection, and final disposal of all other medical waste sterilized at the facility.

Choosing the right autoclave for your needs

There is a wide selection of autoclaves that are commercially available, and their features vary greatly. This buyer’s guide focuses on small-scale autoclaves that can be used for sterilizing medical waste. Autoclaves intended for sterilizing waste are generally larger than those intended for sterilizing reusable equipment, and they come with bin-shaped containers or carts for holding the waste rather than trays. Medical waste must be autoclaved in specially designed autoclave bags that will withstand the steam and extreme heat.

What type?

Autoclaves achieve rapid sterilization at relatively low temperatures (121°C) by removing air from the chamber. This is done either through gravity displacement, in which the hot steam injected into the chamber forces air out through a vent in the bottom, or with a vacuum that removes the air from the chamber prior to beginning the steam sterilization cycle.

Gravity displacement autoclaves must be carefully loaded to avoid air pockets within the waste that would prevent the steam from fully penetrating the load and resulting in sub-optimal sterilizing temperatures. Likewise, gravity displacement does not work as well when waste is contained in autoclave bags because air pockets may be trapped in the bags.5

Vacuum autoclaves are a newer design, and achieve sterilizing temperatures more quickly by removing all air from the autoclave chamber prior to filling the chamber with steam.
There are many models of autoclaves to choose from. Generally, autoclaves may be defined by whether they are horizontal or vertical, rectangular or cylindrical, and frontloading or toploading. Some features may suit your needs better than others, depending on how waste is collected at your facility.

How large?

The autoclaves listed in this guide range between 35 liters and 200 liters in capacity and in some cases can be custom made to suit the needs of the user. Each autoclave should be purchased according to the amount of waste generated at the facility in which the device will be placed. In order to calculate the capacity needed you should consider the waste management policies in place that may influence what types of waste are treated, how often waste is treated, and what final disposal methods will be used. This will inform the calculations for frequency of operation of the autoclave, the size of each batch of waste to be treated, and subsequently the size of autoclave that will be needed. For example, if a facility has a recycling program in place, the plastic waste will be segregated and treated separately from other infectious waste. This may, in turn, affect the batch size and frequency of treatments needed to process the different types of waste at this facility.

Sample calculation for autoclave size

A hospital produces 3 liters per day of plastic syringe waste (after needles are removed), 1 safety box (1L) of infectious sharps waste such as broken vials and scalpels, and 15 liters per day of other infectious waste. Of the non-sharp infectious waste, 8 liters are infectious waste that may not be placed in an autoclave, such as body parts or placentas. This amount is subtracted from the total infectious waste, so the health center is left with 7 liters of non-sharp infectious waste appropriate for disinfection in an

<table>

<td></td>
</tr>
</tbody>
</table>

/ 5 autoclave cycles per day

= 2.2 liters*  

* Capacity needed will vary depending on the number of cycles run each day.
autoclave, 3 liters of plastic syringe waste, and 1L of other sharps waste. The autoclave the hospital is considering purchasing can run up to 5 cycles per day, so they determine the capacity needed will be \((7L + 3L + 1L)/5\) cycles per day = 2L capacity needed. To reduce the number of cycles that the autoclave is run each day, a slightly larger capacity device may be preferred.

**What temperature?**

WHO recommends that for treatment of medical waste in an autoclave, the sterilization cycle should reach 121°C with 1 bar pressure for 60 minutes. While this is a good general rule to follow, actual sterilization time will vary depending on the autoclave and size and composition of the load (metals and plastics achieve sterilization more quickly than saturated gauze and other wet materials). Refer to the manufacturer’s operation manual for specific instructions on time requirements for sterilization.

**What features?**

Autoclaves come with many different features depending on the size, type, and intended use. In general, standard features include:

**Pressure gauge**

The pressure gauge enables operators to confirm that the chamber is reaching the proper pressure to achieve sterile conditions.

**Temperature indicator**

Along with the pressure gauge, a thermostat helps the operator track optimal conditions within the autoclave during a cycle.

**Temperature recorder**

A temperature recorder provides a retrospective analysis of the temperature inside the chamber throughout the duration of the autoclave cycle. This is useful for tracking the length of proper sterilization temperatures inside the autoclave.
Steam release valve
A steam release valve maintains the appropriate level of pressure within the chamber.

Door lock
A door lock prevents the chamber door from being opened while it is pressurized, which is very dangerous and can cause serious injury.

Safety valve
This valve is an extra safety precaution that prevents the operator from inadvertently opening the autoclave chamber before it is completely depressurized.

User controls
User controls allow the operator to adjust temperature settings, pressure settings, and duration of the cycle. They are useful for modifying the sterilization cycle depending on the type and quantity of waste.

Automatic shut-off
This feature allows the operator to be away from the autoclave during the cycle without concern of running the device longer than the recommended duration. This is a particular concern when there is no continuous water supply.
**Timer alarm**
When the automatic shut-off feature is not available, an alarm can be used to alert the operator that the autoclave cycle is complete.

**Continuous water supply**
When available, continuous water supply (water faucet connected to the autoclave) relieves the burden of refilling the autoclave before each cycle. By ensuring the autoclave never runs out of water, it also prevents damage to the equipment caused by overheating.

**Water level detection**
This feature sounds an alarm when the water level is too low to provide sufficient steam to run the sterilization cycle to completion, and alerts operators of action needed to prevent damage to heating elements.

**How much will it cost?**
Prices vary based on size, durability, type of device, and extra features. In general, capital cost for an autoclave used for medical waste and manufactured in a middle income country is between US$1,300 and US$11,000 excluding the price of consumables needed to operate the equipment.

**Other considerations**

**Operator training**
A skilled operator is required for running an autoclave. This person must be trained in proper loading, routine monitoring, and safe operation of the device, and must have solid knowledge of safe medical waste practices.

**Spare parts**
Verify that the manufacturer or supplier will service and repair the unit they are selling, and can provide spare parts. This is critical for proper function of the device as autoclaves are pressurized and can be dangerous if not maintained and repaired properly. Typically, the spare part that wears out first is the gasket seal to the pressure chamber, but each manufacturer’s device is different, and, in general,
spare parts are not interchangeable. When obtaining price quotes from manufacturers you may wish to ask if any spare parts are included.

Consumables
Special bags that are resistant to high temperatures but penetrable to steam must be used to line bins used to collect waste for autoclaving. Biological or chemical indicators should be used to confirm sterility of treated waste. Buyers must consider the logistics of supplying bags and other consumables when they purchase the autoclave, and ensure that the associated cost is incorporated into the facility’s waste management budget.

Waste water disposal
Autoclaves generate steam which condenses and runs off as water. When considering where to install an autoclave, note the availability of drainage for disposal of water runoff from the sterilization cycle. Depending on the type of waste in the autoclave, this water may or may not be suitable for open drainage.

Maintenance
As with all complex instruments, some maintenance will be required to keep the autoclave operating well. When developing a medical waste management plan for a facility, be sure to allocate budget and human resources for maintenance. This should include regular purchasing of consumables, monitoring of the accuracy of thermocouples and pressure gauges, replacing filters and gaskets, and inspecting for cracks, leaks, or other damage.

Energy availability
Autoclaves require a reliable source of electricity in order to maintain the pressurization and temperatures necessary to properly sterilize infectious waste. If a facility does not have sufficient electricity, they should consider alternative treatment methods.

Import and export regulations
Regulations for importing and exporting autoclaves will vary by country. When considering the purchase of an autoclave, be sure to research import and export regulations that may affect the procurement process.
The autoclaves listed in this guide are manufactured in India and fall under Chapter 81, Heading 8402 of the Indian Trade Clarification based on Harmonized System of Coding (ITC-HS) codes, which define types of steam-generating products/sterilizers/boilers. Products covered under this category of equipment are among the freely exportable goods and there are no restrictions imposed on their export from India.
Listing of autoclaves for the treatment of medical waste

Alphabetically by manufacturer

The following section contains a listing of autoclave products and details about specific products, where that information is available. At the end is a list of the contact information for all manufacturers, which can be used to obtain additional information on the products and prices.

This information was compiled from the manufacturer’s websites, promotional materials, and interviews with manufacturer representatives, and is subject to change.

The mention of specific companies or of certain manufacturers’ products does not imply that they are endorsed or recommended by PATH or the US Agency for International Development in preference to others of a similar nature that are not mentioned.
## Vertical autoclave

### Conica Enterprises

#### Horizontal steam sterilizer

| Standard features | • Triple walled with steam jacket and separate boiler  
|                   | • Inner chamber and steam jacket made of heavy gauge stainless steel sheet  
|                   | • Door and back plates made of stainless steel |
| Working pressure  | 1.2–1.5kg/cm²; 15–22 psi |
| Power mode       | 440V, 3-phase, 50Hz/AC |
| Working temperature | 122°C |

#### High pressure radial automatic steam sterilizer

| Standard features | • Pressure control device  
|                   | • Low water level cut-off system  
|                   | • Front panel is provided with working pilot lamps  
|                   | • Timer for sterilizing |
| Working pressure  | 1.2–1.5kg/cm²; 15–22 psi |
| Working temperature | 122°C |
| Other comments   | • Medical grade 16-gauge stainless steel |
**Vertical radial locking autoclave**

| Standard features | • Steam release  
|                   | • Double safety valves and drain  
|                   | • Specially designed heat resistance gasket  
|                   | • Low water level cut-off device system |
| Working temperature | 122°C |
| Other comments | • Portable vertical cylindrical single chamber autoclave with central locking system lid  
|                   | • Cylindrical drum and outer cover made out of stainless steel  
|                   | • Top lid of solid die-pressed stainless steel |

• Temperature gauge  
• Pressure release valve  
• Safety valve |
| **Working pressure** | 5–20 psi |
| **Optional features** | • Automatic low water cut-off device  
• Musical bell timer  
• Vacuum breaker valve  
• Pressure control switch |
| **Other comments** | • Double/triple wall  
• Inner chamber made of stainless steel  
• Outer chamber made of mild steel/stainless steel |
### Model Number
AU600 and AU615

#### Standard features
- Safety valve
- Pressure gauge
- Pressure release valve
- Water level indicator
- Stainless steel basket
- Radial locking system with pedal lifting device

#### Working pressure
5–20 psi

#### Certification

#### Optional features
- Automatic low water cut-off device
- Digital temperature indicator
- Dial type analog temperature gauge
- Mechanical timer 60 minutes with alarm system

#### Other comments
- Triple wall with steam jacket; inner and outer chamber made of stainless steel

## Horizontal high pressure autoclave

| Standard features | • Automatic pressure control switch  
|                   | • Three-way valve for sterilization cycle  
|                   | • Water level indicator  
|                   | • Temperature gauge  
|                   | • Pressure release valve  
|                   | • Safety valve  

| Working pressure | 5–20 psi  
| Power mode       | Single phase 440 Volts AC  
| Certification    | ISO 9001:2000, CE, GMP certified  

| Optional features | • Automatic low water cut-off device  
|                  | • Timer with alarm  
|                  | • Vacuum breaker valve  
|                  | • Pressure control switch  

| Other comments | • Triple walled with steam jacket  
|                | • Inner and outer chamber made of stainless steel  
|                | • Outer chamber works as steam stock jacket  
|                | • Radial locking system with pedal lifting device

</table>
| Standard features | • Water level indicator  
• Pressure gauge  
• Safety valve  
• Steam release cock  
• Indicating lamp  
• Pressure control switch |
| Working pressure | 10–20 psi |
| Power mode | 440 volts; 3-phase 4 wire 50 cycles supply |
| Certification | ISO 9002 |
| Optional features | • Digital temperature indicator  
• Thermograph to record sterilizing temperature and time  
• Door at back  
• Fully automatic PLC base |
| Other comments | • Double walled  
• Inner and outer chamber made of 304-grade stainless steel  
• Hinged door made of stainless steel plate  
• Radial locking system ensures complete risk-free and leak-proof sterilizing cycle  
• Vertical model is also available |
**Neelam Industries**

### Autoclave/steam sterilizer

<table>
<thead>
<tr>
<th>Model Number</th>
<th>NI/GMP/STR</th>
</tr>
</thead>
</table>
| **Standard features** | • Standard cycle operating  
• Pressure -1 bar to + 4 bar  
• High-pressure high-volume cycle  
• Leak test cycle |
| **Working pressure** | 15 psi |
| **Power mode** | 220 Volts AC |
| **Cycle duration** | 1–1.5 hrs |
| **Certification** | ISO 9001, I.S. 3829 or ASTM specifications |
| **Price (internal dimension)** | US$10,144 (400 x 450 x 900 mm) |
| **Optional features** | Another high-pressure high-volume cycle with post vacuum pulses can be provided |
| **Other comments** | • Fully automatic by means of PLC base controls, which operate pneumatically, actuated solenoid valves  
• Four cycles and programs  
• No water hookup required (water is added manually) |
## Vertical autoclave (deluxe model)

# Horizontal autoclave

### Standard features
- Multiple operating valve door
- Quick vacuum drying apparatus
- Accidental vacuum breaker
- Safety valve
- Dial type thermometer
- Plug screen
- Chamber condensate line
- Pressure and compound gauge
- Steam generator (boiler)
- Electrical control box

### Working pressure
- 5–20 psi; recommended 15–17 psi

### Power mode
- 440 volts, three-phase 50 Hz.

### Working temperature
- 121°C

### Optional features
- Automatic pressure control switch
- Automatic water cut-off device
- Temperature gauge (dial-type)
- Mechanical timer with alarm system

### Other comments
- Available in rectangular and cylindrical models
- Unit has outer chamber, inner chamber, boiler, lid and jacket, all made of 304-grade stainless steel
- Includes a three-way valve or a multiport valve made of stainless steel for controlling sterilization cycle
- Unit is mounted on a tubular stand
