# Kenya Service Provision Assessment Survey 2004

**National Coordinating Agency for  
Population and Development  
Nairobi, Kenya**

**Ministry of Health  
Nairobi, Kenya**

**Central Bureau of Statistics  
Nairobi, Kenya**

**ORC Macro  
Calverton, Maryland, USA**

November 2005

This report summarizes the findings of the 2004 Kenya Service Provision Assessment (KSPA) carried out by the National Coordinating Agency for Population and Development (NCAPD), and the Ministry of Health (MOH), with logistic support from the Central Bureau of Statistics (CBS). ORC Macro provided technical assistance through the MEASURE DHS project for this USAID, DFID, and UNICEF-funded project designed to collect information on health facility infrastructure, resources, and management systems, and on services for child health, family planning, maternal health, and selected communicable diseases. The survey also provides information on the capacity of health facilities to provide quality HIV/AIDS services. The opinions expressed in this report are those of the authors and do not necessarily reflect the views of the donor organisations.

Additional information about the KSPA 2004 may be obtained from the National Coordinating Agency for Population and Development, the Chancery, 4<sup>th</sup> Floor, Valley Road, Nairobi, Kenya (Telephone: 020 711-600/1; Fax: 020 710-281). Additional information about the MEASURE DHS project may be obtained from ORC Macro, 11785 Beltsville Drive, Suite 300, Calverton, MD 20705 (Telephone: 301-572-0200 and Fax: 301-572-0999, e-mail: reports@orcmacro.com)

## **Chapter 1            Survey Methodology .....1**

1.1	Overview.....	1
1.2	Institutional Framework and Objectives of the KSPA.....	1
1.3	KSPA 2004 Content and Methods for Data Collection .....	3
	1.3.1    Content of the KSPA 2004 .....	3
	1.3.2    Methods for Data Collection .....	3
1.4	Sampling .....	4
	1.4.1    Sample of Facilities .....	4
	1.4.2    Sample of Health Service Providers.....	6
	1.4.3    Sample for Observations and Exit Interviews .....	8
1.5	Survey Implementation.....	10
	1.5.1    Data Collection Instruments .....	10
	1.5.2    Training and Supervision of Data Collectors .....	10
	1.5.3    Data Collection.....	10
	1.5.4    Process for Data Management and Report Writing.....	11
	1.5.5    Data Analysis.....	11

## **Chapter 2            Overview of the Health System in Kenya .....13**

2.1	Historical Background of Kenya Health Framework .....	13
	2.1.1    The First Health Sector Strategic Plan (1999-2004).....	14
	2.1.2    Findings of the External Evaluation of NHSSP-I.....	14
2.2	Organisation of the Health Care System.....	15
	2.2.1    Organisation of the Ministry of Health.....	15
	2.2.2    The Health Care System.....	15
	2.2.3    Kenya Health Service .....	16
2.3	Health Facilities .....	17
	2.3.1    Dispensaries.....	17
	2.3.2    Health Centres .....	18
	2.3.3    District Hospitals .....	18

2.3.4	Provincial Hospitals.....	18
2.3.5	Teaching and Referral Hospitals .....	19
2.3.6	Private Maternity and Nursing Homes .....	19
2.3.7	Private Clinics .....	20
2.3.8	Voluntary Counselling and Testing (VCT) facilities.....	20
2.4	The Second Health Sector Strategic Plan (NHSSP-II): 2005-2010 .....	20
2.5	Health Manpower .....	21
2.6	Public Health Programmes .....	22
2.6.1	Reproductive and Child Health .....	22
2.7	Health Insurance .....	23
2.8	Financing the Health Sector.....	24
2.8.1	Current Financing Trends, Policies, and Expenditures .....	24
2.8.2	Ministry of Health Total Expenditures .....	25
2.9	General Recommendations for Future Health Sector Planning (2005-2010).....	25
<b>Chapter 3</b>	<b>Facility-Level Infrastructure, Resources, and Systems.....</b>	<b>27</b>
3.1	Basic Infrastructure and Resources to Support Utilisation of Services and Accessibility.....	27
3.1.1	Availability of Services and Human Resources and Accessibility of Health Care System.....	27
3.1.2	Facility Infrastructure Supportive of Client Utilisation and Quality Services.....	31
3.1.3	Infrastructure and Resources to Support Quality 24-Hour Emergency Services .....	32
3.2	Management Systems to Support and Maintain Quality Services and Appropriate Client Utilisation .....	36
3.2.1	Management, Quality Assurance, and Referral Systems.....	36
3.2.2	Supportive Management for Providers.....	41
3.2.3	Management Practices Supporting Community Involvement.....	42
3.2.4	Funding Mechanisms That Decrease Financial Barriers to Utilisation of Health Services.....	43
3.2.5	Maintenance and Repair of Equipment .....	44
3.3	Logistics Systems for Vaccines, Contraceptives, and Medicines (Pharmaceutical Commodities).....	47
3.3.1	Storage and Stock Monitoring Systems for Vaccines .....	49
3.3.2	Storage and Stock Monitoring Systems for Contraceptive Methods and Medicines.....	50
3.4	Systems for Infection Control.....	53

3.4.1	Capacity for Adherence to Standards for Quality Sterilisation or High-Level Disinfection Processes .....	55
3.4.2	Appropriate Storage Conditions for Processed Items.....	57
3.4.3	Infection Control in Service Delivery Area.....	57
3.4.4	Adequate Disposal of Hazardous Waste .....	58
<b>Chapter 4</b>	<b>Child Health Services .....</b>	<b>61</b>
4.1	Background.....	61
4.1.1	KSPA Approach to Collecting Child Health Information.....	61
4.1.2	Health Situation of Children in Kenya .....	62
4.2	Availability of Child Health Services .....	63
4.3	Capacity to Provide Quality Immunisation Services .....	65
4.3.1	Capacity to Maintain the Quality of Vaccines.....	66
4.3.2	Availability of Vaccines and Vitamin A .....	66
4.3.3	Availability of Equipment and Supplies for Vaccination Sessions .....	67
4.3.4	Availability of Administrative Components for Monitoring Immunisation Activities .....	69
4.4	Capacity to Provide Quality Outpatient Care for Sick Children.....	70
4.4.1	Infrastructure and Resources to Support Quality Assessment and Counseling for the Sick Child .....	71
4.4.2	Equipment and Supplies for Assessing and Providing Preventive Care for the Sick Child .....	72
4.4.3	Essential Medicines for Treating Sick Children.....	73
4.5	Management Practices Supportive of Quality Sick Child Services .....	76
4.5.1	Facility Documentation and Records .....	76
4.5.2	Practices Related to User Fees.....	77
4.5.3	Staff Development and Supervision .....	78
4.6	Adherence to Guidelines for Sick Child Service Provision.....	80
4.6.1	Full Assessment of Illnesses.....	80
4.6.2	Diagnosis-Specific Assessments .....	84
4.6.3	Other Observed Practices .....	86
4.6.4	Reducing Missed Opportunities for Promoting Child Health Care.....	87
4.6.5	Counseling on Child Health Issues and Supporting Continuity of Care .....	88
4.7	Caretaker Opinion from Exit Interviews.....	89
<b>Chapter 5</b>	<b>Family Planning Services .....</b>	<b>91</b>
5.1	Background.....	91

5.1.1	KSPA Approach to Collection of Family Planning Service Information .....	91
5.1.2	Family Planning Services in Kenya.....	92
5.2	Availability of Family Planning Services .....	92
5.3	Components Supporting Quality Family Planning Services.....	96
5.3.1	Infrastructure and Resources to Support Quality Assessment and Counselling of Family Planning Clients.....	64
5.3.2	Infrastructure and Resources for Examinations.....	97
5.3.3	Provision of STI Treatment for Family Planning Clients.....	99
5.3.4	Availability of Equipment and Supplies for Specific Methods .....	101
5.4	Management Practices That Support Quality Family Planning Services .....	102
5.4.1	Facility Documentation and Records .....	102
5.4.2	Practices Related to User Fees.....	103
5.4.3	Staff Development and Supervision .....	104
5.5	Adherence to Standards for Quality Service Provision .....	105
5.5.1	Assessment of Relevant History, Examination, and Counselling .....	106
5.5.2	Counselling and Client Assessment .....	106
5.5.3	Method-Specific Assessments and Examinations .....	108
5.5.4	Counselling of Clients .....	108
5.6	Client Opinion from Exit Interviews .....	109

## **Chapter 6 Maternal Health Services.....111**

6.1	Background on Maternal Health Care in Kenya.....	111
6.1.1	KSPA Approach to Collecting Maternal Health Information .....	112
6.1.2	Maternal Health and the Utilisation of Services in Kenya .....	114
6.2	Availability of Antenatal and Postnatal Care and Capacity to Provide Quality Services.....	114
6.2.1	Availability of Antenatal and Postnatal Care Services.....	115
6.2.2	Infrastructure and Resources to Support Quality Assessment and Counselling of ANC Clients.....	116
6.2.3	Infrastructure and Resources for Examinations.....	117
6.2.4	Essential Equipment and Supplies for Basic ANC.....	118
6.2.5	Additional Equipment and Supplies for Quality ANC and PNC Services.....	118
6.3	Management Practices Supportive of Quality ANC and PNC Services .....	121
6.3.1	Facility Documentation and Records .....	121
6.3.2	Practices Related to User Fees.....	122

6.3.3	Staff Development and Supervision .....	123
6.4	Adherence to Standards for Quality ANC Service Provision .....	124
6.4.1	Appropriate Assessment and Examination for ANC clients .....	124
6.4.2	Counselling to Promote a Healthy Outcome .....	126
6.4.3	Supporting Continuity of Care .....	127
6.5	Client Opinion of Service Provision .....	128
6.6	Availability of Delivery Services and Capacity to Provide Quality Delivery Care .....	128
6.6.1	Availability of Delivery Services .....	128
6.6.2	Domiciliary care practices .....	130
6.6.3	Infrastructure and Resources to Support Quality Delivery Services .....	130
6.7	Newborn Care Practices.....	141
6.8	Management Practices Supportive of Quality Delivery Services .....	143
6.8.1	Facility Documentation and Records .....	143
6.8.2	Systems for Quality Assurance, Including Maternal Death Reviews .....	144
6.8.3	Practices Related to User Fees.....	144
6.8.4	Staff Development and Supervision .....	145
6.8.5	Youth-friendly services .....	146
6.9	Availability of Emergency Obstetric Care.....	146
6.9.1	The Signal Functions for EmOC .....	146
6.9.2	Assessment of the UN Process Indicators for EmOc .....	148
<b>Chapter 7</b>	<b>Communicable Diseases: Services for Sexually Transmitted Infections, HIV/AIDS and Tuberculosis.....</b>	<b>151</b>
7.1	Background.....	151
7.1.1	KSPA Approach to Collection of Information on STI Services.....	151
7.1.2	The Health Situation Related to STIs, RTIs, and HIV/AIDS in Kenya .....	152
7.1.3	Health Situation Related to Tuberculosis in Kenya.....	153
7.2	Availability of STI Services .....	153
7.3	Capacity to Provide Quality STI Services .....	155
7.3.1	System Components to Support Utilization of Services.....	155
7.3.2	Infrastructure and Resources to Support Quality Assessment and Counselling .....	155
7.3.3	Infrastructure and Resources for Examinations and treatment.....	158

7.4	Management Practices Supportive of Quality Services.....	161
7.4.1	Facility Documentation and Records .....	161
7.4.2	Practices Related to User Fees.....	162
7.4.3	Staff Development and Supervision .....	163
7.5	Adherence to Standards for Quality Service Provision .....	164
7.5.1	Assessment of Relevant History.....	165
7.5.2	Physical Examinations and Laboratory Tests.....	165
7.5.3	Client Counselling .....	166
7.5.4	Client Opinion from Exit Interviews .....	166
7.6	Availability of HIV/AIDS Services .....	167
7.6.1	Systems for Testing and Providing HIV Test Results .....	168
7.6.2	Availability of PMTCT Services.....	170
7.7	Resources for Diagnosis and Management of Tuberculosis.....	172
7.7.1	TB Diagnosis .....	172
7.7.2	Availability of TB medicines .....	172
7.8	Facility-level Implementation of Universal Precautions .....	173

## Foreword

---

The 2004 Kenya Service Assessment (KSPA) is a follow-up to the 1999 KSPA, conducted in conjunction with the 2003 Kenya Demographic and Health Survey (KDHS). The information from the KSPA gives an indication of our progress towards attaining the Millennium Development Goals (MDGs).

The KSPA was designed to provide national and sub-national information on the availability and quality of services from a representative sample of 440 health facilities. These facilities included hospitals, health centres, dispensaries, maternities, clinics and VCT centres. The managing authorities of these facilities included the government, NGOs, and private and faith-based organisations (FBOs). The facilities were stratified by province and by district.

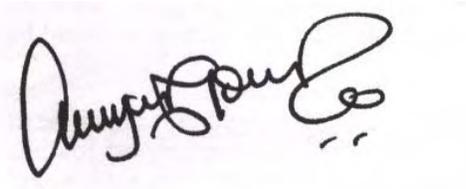

The services of interest to the KSPA included child health, family planning, maternal health (antenatal and delivery care), STIs, TB, and HIV/AIDS. There was a deliberate over-sampling of the facilities offering VCT, ART and PMTCT services.

The survey included interviews with the service providers, observations of a sample of consultations between the health providers and clients seeking these services, and interviews with clients after they were served. The preliminary findings were first reviewed with the health service providers, programme managers, and policymakers in preparation for national dissemination of the study report.

Although most of the facilities were equipped to provide primary health care and had essential commodity supplies and drugs available, the survey identified major weaknesses that require immediate remedy if we are to improve the quality of health service delivery.

In the National Health Sector Strategic Plan (NHSSP), reproductive health has been identified as one of the priority packages that the Ministry of Health will address. This KSPA report is therefore an important tool in the nation's efforts to address reproductive health concerns. Areas of intervention that may make a difference have been proposed and are included as recommendations.

It is hoped that policy and programme managers will focus on the problems identified through the two KSPA and recent DHS surveys to ensure that implementation of activities in the proposed areas of intervention is done in a coordinated manner. To this end, we are urging all stakeholders to play an active role in trying to close the gaps in the provision of high quality reproductive and child health services to the Kenyan population.

Prof. Peter Anyang' Nyong'o  
*Minister for Planning and National Development*

## Acknowledgments

---

The 2004 KSPA was accomplished through the collaborative efforts of staff from the Ministry of Health (MOH), the National Coordinating Agency for Population and Development (NCAPD), the Central Bureau of Statistics (CBS), and ORC Macro under the MEASURE DHS project. USAID, DFID and UNICEF provided financial support, while the Central Bureau of Statistics assisted in technical and logistical support.

We wish to acknowledge contributions from the various authors, members of the various technical committees, and other professionals who individually and collectively gave comments and advice in the process of writing the report.

We are especially grateful to the project co-coordinators for their contribution to the success of the project. We also recognize the contribution of ORC Macro throughout the design, implementation, and analysis of the KSPA 2004.

Finally, we wish to thank all the staff members of the various agencies who, in one way or another, contributed to the success of the exercise.

Of particular note and acknowledgement is the assistance offered in designing the survey instruments and in collecting, processing and analyzing the information. In this regard, we are truly grateful to the representatives from collaborating government ministries, universities, local and international NGOs, UNICEF, USAID, participants, and individuals.

Dr. Richard O. Muga, MBS  
*CEO/National Coordinating Agency for  
Population and Development*

## Key Findings

---

The 2004 Kenya Service Provision Assessment Survey (KSPA 2004) was conducted in a representative sample of 440 health facilities throughout Kenya. The survey covered all levels of facilities from dispensaries to hospitals and included government, private for-profit, non-governmental (NGO) and faith based organisation (FBO) managed facilities. The KSPA used interviews with health service providers and clients, as well as observations of provider-client consultations, to obtain information on the capacity of facilities to provide quality services and the existence of functioning systems to support quality services. The areas addressed were the overall facility infrastructure and resources, child health, family planning, maternal health services and services for specific infectious diseases (STIs, TB and HIV/AIDS). There was a special module on HIV/AIDS.

The objectives of the survey was to assess the strengths and weaknesses of the infrastructure and systems supporting these services, as well as to assess the adherence to standards in the delivery of curative care for sick children, family planning (family planning), antenatal care (ANC), and consultations for STIs.

The KSPA 2004 was undertaken jointly by the National Coordinating Agency for Population and Development (NCAPD), the Ministry of Health (MOH) and the Central Bureau of Statistics (CBS), with technical assistance from ORC Macro under the MEASURE DHS project. The United States Agency for International Development (USAID), the British Department for International Development (DfID) and the United Nations Children's Fund (UNICEF) provided financial support for the survey.

### Facility-Level Infrastructure, Resources and Systems

- Over half of all facilities offer the full package of services. The service most widely available are curative care for sick children, growth monitoring, child immunisation and adult STI services. Antenatal care and family planning services are slightly less available. Facility-based delivery services are available in just a third of all facilities, available in over 90 percent of hospitals. Almost all facilities had at least one qualified provider available. 24-hour emergency services are available in 57 and 59 percent of hospitals and maternities, respectively.
- Regular electricity or back-up generator is available in about half of facilities, mostly in hospitals and VCT facilities. Regular year-round water is available in only a quarter of facilities, however, client comfort amenities (client latrine, protected waiting area, basic level of cleanliness) are available in about 9 in 10 facilities.
- Routine Management committee meetings are held at least once every 6 months in about two-thirds of facilities, however, documentation of such meetings are missing in most facilities. Routine Management board meetings are held in less than half of facilities. Quality Assurance (QA) activities are not routinely carried out in most facilities and documentation of QA activities are missing as well in most facilities that report QA activities.
- Almost 9 in 10 facilities have routine external supervision at least once every 6 months, mostly government and NGO-managed facilities and about three-fourths of facilities provide routine in-service training to their staff.
- Only a small percentage of facilities had all items for infection control in service delivery areas with soap and disinfecting solutions the items usually missing, thus contributing to overall weak-

ness. Waste disposal is also inadequate in most facilities, particularly in health centres, dispensaries and in government facilities.

- Approximately three-fourths of facilities storing vaccines have adequate systems for monitoring vaccine storage temperature however 22 percent of facilities did not have refrigerator temperature in recommended range of 0°-8°C on the day of the survey. Among facilities storing contraceptive methods, 92 percent had adequate storage conditions, where items are stored in dry location, off the ground and protected from water, sun pests and rodents.
- Guidelines/protocols and visual aids are missing in most service areas and are not observed being used by providers in most facilities. The exception is the availability of visual aids in family planning service delivery areas. Guidelines for disinfection and sterilisation are missing in most service areas where items are sterilised or disinfected
- Community participation in management meetings and client feedback is rare, with less than half of government facilities having community participation in some management meetings.

### **Child Health Services**

- More than three-fourths of facilities offer the child health services of curative care, immunisation, and growth monitoring, with curative care being the most frequently offered child health service. Child immunisation is lowest in facilities in Nairobi province and private for-profit facilities are the least likely to offer immunisation services.
- Among facilities offering immunisation services and storing vaccines, 85 percent had all basic EPI vaccines available, and almost all those facilities that only offer immunisation services (but do not store vaccines) had adequate supplies of syringes and needles, and cold box with ice packs. Three-fourths had all assessed items for infection control (soap, water and sharps box) in the immunisation area with soap most often missing.
- Treatment guidelines of any kind (including IMCI treatment guidelines) are available in only 22 percent of facilities offering curative care for sick children. IMCI counselling cards for providers and IMCI mother cards are each available in only 5 percent of facilities. Similarly, visual aids for client education are lacking, available in less than 30 percent of facilities. Only 9 percent of interviewed child health providers had received any in-service training related to IMCI in the past 12 months.
- All first-line medicines are available in 83 percent of facilities however pre-referral medicines are less available, found in only a quarter of facilities offering outpatient care for sick children. Fansidar (SP) is more available as a first-line antimalarial medicine compared to amodiaquine.

### **Family Planning Services**

- Three-fourths of facilities offer some modern method of family planning. The combined oral pill, progestin-only injection and the male condom are the most widely offered methods in Kenya, available in almost 9 in 10 facilities. The majority of facilities offering these methods had them available on the day of the survey. Nine in 10 facilities offering family planning methods offer them 5 or more days per week.

- Infrastructure and resources considered important for family planning counselling (privacy, individual client cards, written family planning guidelines and family planning-related visual aids) are all available in just 1 in 5 facilities, with family planning guidelines most lacking. Visual aids, though widely available in family planning service sites, are rarely used by providers during family planning counselling sessions, observed being used during only 14 percent of family planning consultations.
- All items for infection control (hand-washing supplies, latex gloves, disinfecting solution and sharps box) are available in family planning service areas of 4 in 10 facilities. The items most lacking are disinfecting solution and soap. Less than 10 percent of facilities offering family planning have all items for client pelvic examination.
- In-service training received by family planning service providers is uncommon, with less than a third having received any such training in the past 3 years.

### **Maternal Health Services**

- Antenatal care (ANC) services are offered in four out of five facilities in Kenya, however, ANC, postnatal care (PNC) and tetanus toxoid vaccine services are available in only a third of all facilities.
- Three-fourths of facilities offering ANC services have service providers who can diagnose and treat STIs, however just a quarter of these facilities have at least one medicine to treat each of the four major STIs (trichomoniasis, chlamydia, syphilis and gonorrhoea). Medicine for treating gonorrhoea is most often lacking.
- Only 36 percent of interviewed ANC clients reported being counselled on warning/danger signs during pregnancy and 51 percent were counselled on delivery plans.
- Two in five facilities offer normal delivery services, and 39 percent of facilities offering delivery services have blank partographs. Only 13 percent have medicines for managing serious delivery complications, and 56 percent have newborn respiratory support (infant sized Ambu bag).
- Only six percent of interviewed providers of normal delivery services were able to mention all four signs/symptoms of postpartum haemorrhage (PPH) and 12 percent were able to mention all four expected interventions.

### **STI, TB and HIV/AIDS Services**

- STI services are available in approximately 9 in 10 facilities and are well integrated into ANC and family planning services. The primary location of STI services is the general outpatient department (OPD), with specialized STI service sites being rare. STI services are available five or more days a week in almost all facilities offering the services. However, only about one-fourth of facilities have at least one medicine available for treating each of the four major STIs, and medicines for treating gonorrhoea and candidiasis are the most lacking.
- About one-third of facilities offering STI services have all items to support quality STI counselling. STI guidelines are usually available; however, visual aids and condoms are commonly miss-

ing. They are available in the STI service sites of only 52 and 60 percent of facilities, respectively.

- The majority of facilities use the syndromic approach to diagnose and treat STIs. Discussions of any kind about condoms or HIV/AIDS were held during 70 percent of all STI client consultations and approximately 60 percent were counselled on risks of HIV/AIDS. Though condoms were offered to 21 percent of all STI clients, only 17 percent were counselled on its proper use.
- About one-third of facilities have all items for infection control at STI service sites, with disinfecting solution and soap the items most often missing
- Less than half of facilities offer any TB services, with 27 percent using the Directly Observed Treatment Short-Course (DOTS) strategy. Approximately two-thirds of those offering TB services have all first-line medicines, but only one-fourth have both first- and second-line medicines.
- While a third of all facilities have an HIV testing system only about one-fourth provide any PMTCT services. Antiretroviral therapy (ART) and post-exposure prophylaxis (PEP) are among the least offered HIV/AIDS services.

## Abbreviations

---

AIDS	Acquired immunodeficiency syndrome
ANC	Antenatal care
ARI	Acute respiratory infection
ART	Antiretroviral treatment

## **1.1 Overview**

The Kenya Service Provision Assessment of 2004 (KSPA 2004) survey is a follow-up of the Service Provision Assessment conducted in Kenya in 1999. The KSPA provides the Government with information necessary to monitor trends in facility performance. This information can be used to assess strengths and weaknesses of current strategies to improve maternal, child, and reproductive health, as well as services for sexually transmitted infections (STIs) and HIV/AIDS.

The survey was designed to extract information about the general performance of facilities that offer maternal, child, and reproductive health services, as well as services for specific infectious diseases (STIs, HIV/AIDS, and tuberculosis). The KSPA 2004 survey instruments are based on the KSPA 1999 instruments, but were designed to collect more comprehensive information. In addition, the KSPA 2004 added a complete module on HIV/AIDS. In effect, the KSPA 2004 is a combination of the maternal and child health (MCH) SPA, which has been conducted in several countries, and the more specialised HIV/AIDS SPA. Information to provide a picture of the strengths and weaknesses of the service delivery environment for each assessed service was collected from a representative sample of facilities managed by the public sector, the private sector, faith-based organisations (FBOs) and non-governmental organisations (NGOs) from all eight provinces of the country.

The KSPA 2004 provides national- and provincial-level representative information for all types of facilities. Findings can supplement household-based health information from the Kenya Demographic and Health Survey (KDHS) conducted in 2003, which provides information on health, fertility, nuptiality and utilisation of services by the overall population.

## **1.2 Institutional Framework and Objectives of the KSPA**

The KSPA 2004 was conducted by the National Coordinating Agency for Population and Development (NCAPD), an agency within the ministry of Planning and National Development; the Ministry of Health (MOH); and the Central Bureau of Statistics (CBS). ORC Macro provided technical assistance under the MEASURE DHS Project. The survey was funded by the United States Agency for International Development (USAID), the Department for International Development (DfID), and the United Nations Children's Fund (UNICEF).

The objectives of the 2004 KSPA were to

- Describe the preparedness of health facilities in Kenya to provide quality child, maternal, reproductive health, STI, tuberculosis, and HIV/AIDS services;
- Identify gaps in support services, resources, and processes used in providing client services that may affect facilities' capacity to provide quality services;
- Describe the tasks used in providing child, maternal and reproductive health services and the extent to which accepted standards for quality service provision are followed;
- Describe clients' perceptions of services and assess whether they understand instructions and follow-up advice received so that the best health outcome is achieved;
- Collect baseline information on health facilities' capacity to provide basic- and advanced-level HIV/AIDS care and support services, and their capacity to maintain record-keeping systems for monitoring HIV/AIDS preventive, diagnostic, care and support services;

- Compare findings among provinces, different types of facilities, and facilities managed by different authorities, and describe trends in findings between the KSPA 1999 and the KSPA 2004.

The data collection instruments were developed to respond to the following basic questions:

**1. To what extent are facilities prepared to provide high-priority services? What resources and support systems are available?**

For each of the high-priority services, the Facility Inventory Questionnaire and provider interviews were used to collect information on whether a facility has the capacity to provide the service at an acceptable standard of quality.

Capacity is measured by the presence of essential equipment and supplies in a location reasonable for providing a service. The facility characteristics assessed for quality of services include training and supervision of staff, availability of service delivery protocols and of materials for client education, availability and utilisation of health information records, the service delivery environment, and facility systems for maintaining equipment and supplies.

The survey assessed support systems for general management, quality assurance, logistics for medicines, equipment maintenance, infection control, and systems for monitoring activities (such as tracking service coverage rates and referrals). Interviewers asked whether a facility had these support systems in place, but also recorded data on whether or not those systems were functioning.

A facility's basic infrastructure can affect the standard of health services provided and influence how likely clients are to use the facility. The KSPA 2004 collected data on whether or not facilities had electricity, water, and client amenities; recorded what services the facility offered on which days of the week; and assessed staffing levels.

**2. To what extent does the service delivery process follow generally accepted standards of care?**

KSPA interviewers observed consultations between clients and providers to assess whether the process followed in service delivery meets standards for acceptable content and quality. Observers sat in on consultations for sick children, STI services, family planning services, and antenatal care. They recorded what information was shared between the client and provider and what process the provider followed when assessing the client, conducting procedures, and providing treatment. Facilities were asked to provide a sample of records on monitoring labour, to determine the extent to which established standards for delivery care were followed.

Each observed client was asked to participate in an exit interview, to ascertain the client's perception of information shared and services received. This information provides further insight on the quality of the client-provider interaction.

**3. What issues affect clients' and service providers' satisfaction with the service delivery environment?**

Interviewers collected information on issues related to clients' and providers' satisfaction through the client exit interviews and provider interviews.

Although the KSPA 2004 is a follow-up to the KSPA 1999, several factors limit direct comparison of the 1999 and 2004 findings:

1. The selection of health facilities for KSPA 1999 was tied to some extent to the 1998 KDHS clusters. This means that all health facilities in the country did not have an equal chance of being sampled. The 2004 KSPA used a random sample of health facilities, which insured that all facilities in the country had an equal chance of being sampled, in proportion to representation by facility and province.
2. The KSPA 2004 used more detailed questionnaires that collected slightly different information to conform to international standards.
3. North Eastern province was not included in the KSPA 1999 but was covered in 2004.
4. Stand-alone VCT facilities were included in 2004 but not in 1999.

### **1.3 KSPA 2004 Content and Methods for Data Collection**

#### **1.3.1 Content of the KSPA 2004**

The KSPA 2004 focussed on basic-level health services, particularly those important for women and children. Four high-priority health services, all interrelated to some extent, were assessed: child health, family planning, maternal health, and specific infectious diseases (STIs, HIV/AIDS, and tuberculosis).

For each of these four areas, the survey assessed whether components considered essential for quality health services were present and functioning. The components assessed are those commonly promoted in programmes supported by the Government and development partners. The KSPA 2004 also assessed whether more sophisticated components were present, such as higher-level diagnostic and treatment modalities, and support systems for the health services that are most often introduced after basic-level services have been put in place.

The *child health component* of the survey was designed to assess the availability of preventive services (immunisation and growth monitoring) and outpatient care for sick children, with a focus on the process followed in providing services to sick children. Service provision was compared to the standard set in the Guidelines for Integrated Management of Childhood Illnesses (IMCI).

The *family planning component* focuses on the process followed in counseling and providing contraceptive methods to the family planning client.

The *maternal health component* assessed counselling and screening during antenatal care (ANC) visits, the environment available during labour and delivery, and postnatal care.

The *infectious disease component* assessed the availability of services for diagnosing and treating STIs, as well as HIV/AIDS and tuberculosis diagnostic and treatment programmes.

#### **1.3.2 Methods for Data Collection**

Five main types of data collection tools were used:

1. In the *Facility Inventory Questionnaire*, interviewers collected information on the availability of resources, support systems, and infrastructure elements necessary to provide a level of service that generally meets accepted standards. The support services assessed were those that are commonly acknowledged as essential management tools for maintaining health services.
2. In the *Health Provider Interview*, interviewers asked providers about their qualifications (training, experience, and continued in-service training), the supervision they had received, and their perceptions of the service delivery environment.

3. The *Observation Protocol* was tailored to the service being provided. For sick child, antenatal care, family planning, and STI consultations, the observer assessed the extent to which service providers adhered to standards of care, based on generally accepted practices for good-quality service delivery. The observations included both the process used in conducting specific procedures and examinations and the content of information exchanged between the provider and the client (history, symptoms, and advice).

4. After clients were observed receiving a service, they were asked to participate in an *Exit Interview* as they left the facility. The exit interview included questions on the client's understanding of the consultation or examination, as well as his or her recollection of the instructions received about treatment or preventive behavior. The interviewer also elicited the client's perception of the service delivery environment.

5. The *HIV/AIDS Services* module assessed how inpatient and outpatient HIV/AIDS clients were handled, from the counselling and testing stage through the treatment, referral, and follow-up stages. Interviewers also asked for records and statistics on HIV/AIDS clients.

Together with the above-mentioned tools, which have been used in other SPA surveys, several Kenya-specific instruments were also used:

1. The *Maternal Health Statistics summary sheet* summarized information on complications, procedures, and outcomes for maternity clients.

2. The *District Health Management Team (DHMT) questionnaire* sought information about DHMTs' management of facilities, staff training, operations, budgeting, and record keeping.

3. The *Normal delivery record review* was used to collect information on the quality of care provided during normal labour and delivery.

4. The *Maternal Health Worker Knowledge questionnaire* assessed the health worker's knowledge of various symptoms that pregnant women experience and what actions need to be taken in response to those symptoms.

## 1.4 Sampling

Data were collected from a representative sample of facilities, a sample of health service providers at each facility, and a sample of sick children (SC), family planning (FAMILY PLANNING), antenatal (ANC), and STI clients.

### 1.4.1 Sample of Facilities

The sample used for the KSPA 2004 was obtained from a list of 4,742 health facilities in Kenya provided by the Ministry of Health. The list included hospitals, health centres, maternities, clinics, dispensaries and stand-alone VCT facilities, with different managing authorities, including government, non-governmental organisations (NGOs), private for-profit, and faith-based organisations (FBOs). The two national referral hospitals and all eight provincial general hospitals were purposely included in the sample. The rest of the facilities were sampled in such a way as to provide national and provincial representation. A sample size of 453 facilities was selected for the survey, based on logistic considerations, as well as the minimum sample size required for the desired analysis (margin of error of 10 percent). Since information on HIV/AIDS services constituted a separate interest, and given that these services were expected to be offered in only a fraction of facilities, facilities offering PMTCT and VCT services were oversampled to provide sufficient numbers for analysis. Thus, the KSPA final sample covered approximately 11 percent of all facilities, and for PMTCT and VCT services, sampling covered 34 and 42 percent, respectively of all available services.

Data were weighted during analysis to account for the differentials caused by oversampling and to represent the actual distribution of facilities in the country. Tables 1.1 and 1.2 provide information on the weighted percent distribution of facilities included in the sample, as well as the weighted and unweighted number of facilities. All other tables in the report bear the weighted numbers of facilities only; Tables 1.1 and 1.2 should be used to determine the actual number of facilities assessed by the SPA. Appendix Table A-1.1.1 gives additional details on the distribution of the sample by type of facility and province.

Interviewers were not able to survey several of the sampled facilities. Some declined to be assessed, some were closed for renovations, and some had ceased operation. These facilities were replaced with the nearest facility of the same type, under the same managing authority, and in the same district. In all, 440 facilities were assessed.

**Table 1.1 Distribution of facilities by type of facility, managing authority and province**

Percent distribution of facilities (weighted) and number of facilities (weighted and unweighted) by type of facility, managing authority and province, Kenya SPA 2004

Background characteristics	Percent distribution of facilities (weighted)	Number of facilities	
		Weighted	Unweighted

Delivery	37	164	256
Services for sexually transmitted infections <sup>1</sup>	92	403	391
Total	-	440	440

<sup>1</sup> This may include only laboratory examinations, only preventive measures, or client care.

### 1.4.2 Sample of Health Service Providers

A health service provider is defined as one who actually provides client services of some type, such as counseling, health education, consultation services, or laboratory and imaging services. For example, health workers were not eligible for observation or interview if they only complete registers and never provide any type of professional client services. The sample of health service providers was selected from providers who were present in the facility on the day of the survey and who provided services that were assessed by the KSPA. The ideal was to interview an average of eight providers in a facility. In facilities with fewer than eight health providers, all of the providers present on the day of the visit were interviewed. In facilities with more than eight providers, an average of eight providers were interviewed, including all providers whose work was observed. If interviewers observed fewer than eight providers, they also interviewed a random selection of the remaining health providers, to obtain an average of eight provider interviews.

Data were weighted during analysis to account for the differentials caused by oversampling or undersampling of providers with a particular qualification in a facility type and province. It should be pointed out that in a few cases, the staff present on the day of the survey may not be representative of the staff who normally provide the services being assessed.<sup>1</sup>

Table 1.3 provides general information on the weighted proportion of the providers interviewed as a percentage of the total number of providers assigned to facilities and present at the time of the survey, by background characteristics and provider qualification. It also gives the weighted and unweighted number of interviewed providers utilized for the analysis. Appendix Table A-1.2 provides additional information on the weighted and unweighted number of interviewed providers, by type of provider and type of facility.

<sup>1</sup> For example, the survey may have taken place at the same time as a special training event for a group of specialists, or evaluations that took a certain type of provider away from their services that day.

Table 1.3 Distribution of interviewed providers

Percent distribution of interviewed providers (weighted) and number of interviewed providers (weighted and unweighted), by type of facility, managing authority, province and qualification of provider, Kenya SPA 2004

Background characteristics	Percent distribution of interviewed providers (weighted)	Number of interviewed providers

<b>Total</b>	<b>100</b>	<b>2,081</b>	<b>2,081</b>

<sup>1</sup> Percentage smaller than 1.

<sup>2</sup> Other providers include social workers and nutritionists.

### 1.4.3 Sample for Observations and Exit Interviews

The sample for observations was opportunistic, meaning clients were selected for observation as they arrived, since it was not possible to know how many eligible clients would attend the facility on the day of the survey. Where numerous clients were present and eligible for observation, the rule was to observe a maximum of five clients for each provider of the service, with a maximum of 15 observations in any given facility for each service. In practice, however, at some facilities, interviewers observed fewer clients than were eligible for observation. This occurred primarily where multiple services were being offered to clients at the same time in different locations in a facility. Any family planning or ANC client who was also assessed for STI symptoms was observed both for elements related to STI services and elements related to either FAMILY PLANNING or ANC, whichever one was relevant. Interviewers attempted to give an exit interview to all observed clients (or sick child caretakers) before they left the facility.

For child health consultations, only children who were suffering from an illness (rather than an injury or a skin or eye infection) were selected for observation. When several eligible ANC or FAMILY PLANNING clients were waiting, interviewers tried to select two new clients for every one follow-up case. The day's caseload and logistics of organizing observations did not always allow them to meet this objective.

Table 1.4 gives the weighted percent distribution of observed consultations, as well as the weighted and unweighted numbers of observed clients, by service. The total (weighted) number of clients observed during the survey for each of the services was as follows: 1,379 sick children, 539 FAMILY PLANNING clients, 967 ANC clients, and 116 STI clients. Details on these clients' characteristics are presented in the relevant chapters of this report.

The observations were weighted using facility weights to adjust for overrepresentation of facilities, and subsequently observations, in the sample. It should be pointed out that in a few cases, the clients present on the day of the survey might not be representative of the clients who normally receive the services being assessed.<sup>2</sup>

Appendix Tables A-1.4 through A-1.6 describe the facilities included in the KSPA 2004. This includes the size of the facilities' catchment population (Appendix Table A-1.4), the median number of staff assigned to facilities by provider and facility type (Appendix Table A-1.5), and the median number of years of basic and technical training that interviewed providers had received, by type of provider (Appendix Table A-1.6).

---

<sup>2</sup> For example, if the survey coincided with a special event, such as a health fair, or a special campaign.

## **1.5 Survey Implementation**

### **1.5.1 Data Collection Instruments**

The KSPA 2004 survey instruments were based on generic questionnaires developed by the MEASURE DHS project and were adapted after consulting with technical specialists from the Government of Kenya, USAID, and NGOs knowledgeable about the health services and service programme priorities covered by the KSPA. All questionnaires were drafted in English. The client exit interview questionnaires were also translated into 12 local languages.

The survey instruments were pre-tested in 12 facilities over a two-week period in July 2004. A total of 23 interviewers, comprised of 11 nurses and 12 social scientists, underwent a one-week intensive training session in Nakuru, then conducted data collection in facilities in Nairobi, Machakos, Nakuru, and Kajiado. The observations and experiences gathered from the pre-test were used to improve the instruments for the main survey.

Some operational definitions developed for the KSPA 1999 were revised for the KSPA 2004. A training manual was also developed to support standardized data collection. Any differences between definitions used in 1999 and 2004 are discussed in the relevant chapters of this report.

### **1.5.2 Training and Supervision of Data Collectors**

Data collectors were primarily recruited from among clinical officers, nurses, and social scientists experienced in survey implementation and interviewing. Data collectors were trained for three weeks (22 August through 11 September 2004) for the main survey. Training included classroom lectures, practical experience in completing survey instruments in different types of health facilities, and role-plays for the observation and exit interviews. NCAPD field officers and team leaders, who were reporting to the NCAPD headquarters, as well as two technical advisors, supervised the teams during data collection. Four nurse (and clinical officer) interviewers were selected as regional field supervisors to assist in supervising the teams.

### **1.5.3 Data Collection**

Data collection began on 18 September 2004 and ended on 10 January 2005. A total of 17 teams of three or four interviewers (each with at least 2 nurses and one social scientist) were responsible for data collection. One interviewer in each team was selected to be the team leader, with the responsibility of final questionnaire checking before leaving the field. Each team was given a list of facilities to visit, with the facilities' name and location. Information on the intended visits was relayed to the sampled facilities before the visit, so that they could prepare to receive the interviewers. To this end, NCAPD field officers acted as liaisons between the data collection teams and the facilities to be visited. They also organized transport for the teams and ensured that enough questionnaires were available.

Data collection took one day in small facilities, while in larger facilities it took several days. In addition, if one of the services of interest was not being offered on the day of the survey, the teams returned on a day when the service was being offered, to observe and interview the clients that came that day. However, if the service was offered but no clients came, the teams did not revisit the facility.

The team leader ensured that the respondent for each component of the facility inventory was the most knowledgeable person for the particular health service or system component being assessed. Where relevant, the data collector indicated whether a specific item being assessed was observed, reported available but not observed, or not available, or whether it was uncertain if the item was available. Equipment, supplies, and resources for specific services were only recorded as available if they were in the relevant ser-

vice delivery area or in an immediately adjacent room. Informed consent was obtained from the facility in-charge, all respondents for the facility inventory questionnaire, and observed and interviewed providers and clients.

Quality control was ensured throughout the data collection period by holding monthly meetings to review progress and address any emerging issues. The technical advisors undertook field spot checks on a regular basis. There was regular telephone communication between the technical advisors and the data collectors. In addition, several teleconferences were held between NCAPD and ORC Macro to update on the progress and sort out any emerging problems.

#### **1.5.4 Process for Data Management and Report Writing**

Data management and analysis were carried out as follows:

*Field sorting and editing.* After completing data collection in each facility, the teams held sessions to sort and edit the questionnaires before handing them over to the field supervisors or NCAPD field officers for transmission to the NCAPD headquarters.

*Data sorting and editing at headquarters.* Once the questionnaires for each facility were received at headquarters, they were first sorted to ensure that they were in the correct order and none was missing. They were then edited to eliminate any mistakes that would prevent the computer from accepting information during data entry. In cases where there was a problem with the questionnaires from a facility, the data collection team was consulted so that the problem could be rectified.

*Data entry.* Nine data operators entered the data under the supervision of two NCAPD staff. CSPro software developed by ORC Macro and the U.S. Census Bureau was used for data entry. All questionnaires were entered twice to ensure that the data had been accurately keyed in. The data entry took place from September 2004 through January 2005.

*Data processing.* The design of the tabulation plan and the preparation of the programmes for producing statistical tables were carried out from January through February 2005. Data analysis, including clarification of unclear information, was carried out from March through May 2005. During data analysis, the analysis plan was revised on the basis of feedback from the NCAPD and the KSPA technical advisors to ensure that the analysis was appropriate for the Kenyan health system.

*Development of the final report.* The final report was written with input from ORC Macro, NCAPD, the Ministry of Health, the Central Bureau of Statistics, and the University of Nairobi, between June and August 2005.

#### **1.5.5 Data Analysis**

The following conventions were observed during the analysis of the KSPA data:

*Assessing the availability of items.* Unless specifically indicated, the KSPA considered only observed items as available.

*Observations.* When looking at the data on observed consultations, it should be noted that many facilities provide routine services for clients separately from the actual consultation (such as taking blood pressures and temperatures). There is often a period between these events and the point at which the primary provider assesses the client. Although KSPA interviewers were instructed to follow a client through the entire system, this was not always possible. Thus, when observers saw that services were being provided outside the consultation room on the day of the survey, the observed client was assumed to have received

these services. Where this system is used, multiple providers contribute to the services received by each client. The provider who ultimately diagnosed and prescribed was defined as the primary provider.

Observers assessed whether a practice occurred or a piece of information was shared. They did not attempt to verify whether the practice was correct or if the information shared was correct or complete.

*Provider information.* Frequently, providers indicated that they “personally provided” a service that the facility did not offer. It may be that providers indicated services they provide outside the facility. For the KSPA, only providers from facilities that offer the service in question were included in the analysis for that service.

*Development of aggregate variables.* Aggregating the data into subsets makes it possible to analyze many pieces of information and to see how they relate to the overall capacity to provide services. It also enables analysts to monitor changes in a facility’s capacity to provide services and in its adherence to standards, since there may be improvements in some items but not in others. There are not yet generally accepted aggregates of the health information collected in the KSPA. The aggregate variables presented in this report, however, represent an initial phase in the process of defining useful health information aggregates. They will be refined as users provide feedback on which aggregate variables are useful to policymakers and programme implementers.

*Dr. Richard Muga, Dr. Paul Kizito, Mr. Michael Mbayah, Dr. Terry Gakuruh*

This chapter provides an overview of the health system in Kenya as a context in which to view the findings of the 2004 Kenya Service Provision Assessment (KSPA 2004) survey. It presents information on the background of the Kenya Health Policy Framework and the general organisation of the healthcare system.

Health is defined here in its broad sense, being not only the absence of disease but also general mental, physical, and social well-being. In this definition, the environment in which people live—including access to nutritious food, safe water, sanitation, education and social cohesion—also determines health.

## **2.1 Historical Background of Kenya Health Framework**

In 1994, the Government of Kenya (GOK) approved the Kenya Health Policy Framework (KHPF) as a blueprint for developing and managing health services. It spells out the long-term strategic imperatives and the agenda for Kenya's health sector. To operationalise the document, the Ministry of Health (MOH) developed the Kenya Health Policy Framework Implementation Action Plan and established the Health Sector Reform Secretariat (HSRS) in 1996 under a Ministerial Reform Committee (MRC) in 1997 to spearhead and oversee the implementation process. A rationalisation programme within the MOH was also initiated. The above policy initiatives aimed at responding to the following constraints: decline in health sector expenditure, inefficient utilisation of resources, centralized decisionmaking, inequitable management information systems, outdated health laws, inadequate management skills at the district level, worsening poverty levels, increasing burden of disease, and rapid population growth.

The 1999 National Census estimated Kenya's population to be 28.7 million, of whom 56 percent was less than 20 years of age. In 2004, the population was estimated at 32.8 million. Life expectancy is on the decline, at 48 years for women and 47 for men, and expected to fall further due to the rising incidence and prevalence of HIV/AIDS. There is also a steady decline in the fertility rate, from 8.1 in 1978 to 5.4 in 1992, and to 4.9 in 2003 (but up from 4.7 in 1998). According to the 2003 Kenya Demographic and Health Survey (KDHS 2003), more married women are using modern contraceptive methods. The prevalence rate has risen from 18 percent in 1989 to 27 percent in 1993, 32 percent in 1998, and 33 percent in 2003.

Overall morbidity and mortality remain high, particularly among women and children. An infant mortality rate (IMR) of 62 in 1993 increased by 12 percentage points to 74 in 1998 and was not significantly different (at 77) in 2003. The under-five mortality rate also rose from 110 deaths per 1,000 live births in the period 1993-1998 to 115 in the 1998-2003 period. Maternal mortality in 2003 was estimated to be 414 maternal deaths per 100,000 live births, which is a decline from the 590 deaths estimated for 1998, but also with large sampling errors, which makes comparing the rates over time uncertain.

Malaria is the leading cause of outpatient morbidity in Kenya, accounting for one-third of all new cases reported. After malaria, the most common illnesses seen in outpatient clinics are diseases of the respiratory system, skin diseases, diarrhoea, and intestinal parasites. Other frequent health problems include accidental injuries, urinary tract infections, eye infections, rheumatism, and other infections. Combined, these ten leading conditions account for nearly four-fifths of the total outpatient cases reported. This pattern has persisted for the past decade. Recurrent outbreaks of highland malaria and widespread emergence of drug resistance strains have aggravated the problem of malaria.

In 2003, full immunisation coverage declined to under 60 percent (from 65 percent in 1998 and 78 percent in 1993), with the percentage of children receiving no vaccinations at all increasing from 3 percent in 1998 to 6 percent in 2003. The major causes of this decrease in coverage are the declining availability, access to, and quality of public health services; the increasing level of poverty is a main underlying factor. In addition, because fewer people are dying from immunisable diseases, the focus on immunisation services has reduced, and funding has decreased.

The challenge facing the government is to reverse this decline. The National Development Plan of 2002-2008 states that the health care system in its current form (at the time of the National Plan's preparation) does not operate efficiently. Some of the areas targeted in the plan include drugs, personnel, and facility utilisation. Drugs, which account for 14 percent of the health budget, were deemed to be the most promising area for improvement, particularly in drugs' selection and quantification. Staffing norms for key cadres would be developed for deployment purposes. The plan also calls for formulating a health manpower policy, to develop and retain human resources in the sector.

### **2.1.1 The First Health Sector Strategic Plan (1999-2004)**

The development of the first National Health Sector Strategic Plan (NHSSP-I) for the period 1999-2004 was a follow-up to the Ministry of Health's efforts to translate the policy objectives into an implementable programme (MOH, 1999a). In addition to taking into account past constraints, the document involved key stakeholders in the planning process from the start through consultative workshops within the Ministry itself and with other stakeholders, such as development partners, public sector, districts, and provinces, the private sectors, NGOs, religious groups, professional organisations, communities, and users of health services, as well as teaching and research institutions. The end product thus incorporated the views and priorities of all these groups.

### **2.1.2 Findings of the External Evaluation of NHSSP-I**

The NHSSP-I was evaluated in September 2004 by an external team of independent consultants. The evaluation found that

*"...despite having well focused national health policies and reform agenda whose overriding strategies were focused on improving health care delivery services and systems through efficient and effective health management systems and reform, the overall implementation of NHSSP-I (1999-2004) did not manage to make a breakthrough in terms of transforming the critical health sector interventions and operations towards meeting the most significant targets and indicators of health and socio economic development as expected by the plan". This may be attributed to a set of factors, most of which are inter-related, such as*

- *Absence of a legislative framework to support decentralisation;*
- *Lack of well articulated, prioritized and costed strategic plan;*
- *Inadequate consultations amongst MOH staff themselves and other key stakeholders involved in the provision of health care services;*
- *Lack of institutional coordination and ownership of the strategic plan leading to inadequate monitoring of activities;*
- *Weak management systems;*
- *Low personnel morale at all levels; and*
- *Inadequate funding and low level of resource accountability.*

As a result, the efforts made under NHSSP-I did not contribute toward improving Kenyans' health status. Rather, health indicators showed a downward trend. Infant and child mortality rates increased. The use of

health services in public facilities declined; in 1990 there were 0.6 new consultations per person, while in 1996, there were only 0.4 new consultations per person. The doctor-to-population ratio declined from the 1980s to the 1990s. The public sector's contributions to healthcare stagnated, going from US\$12 per person in 1990 to US\$6 per person in 2002. In more general development terms, poverty levels also increased, going from 47 percent in 1999 to 56 percent in 2002.

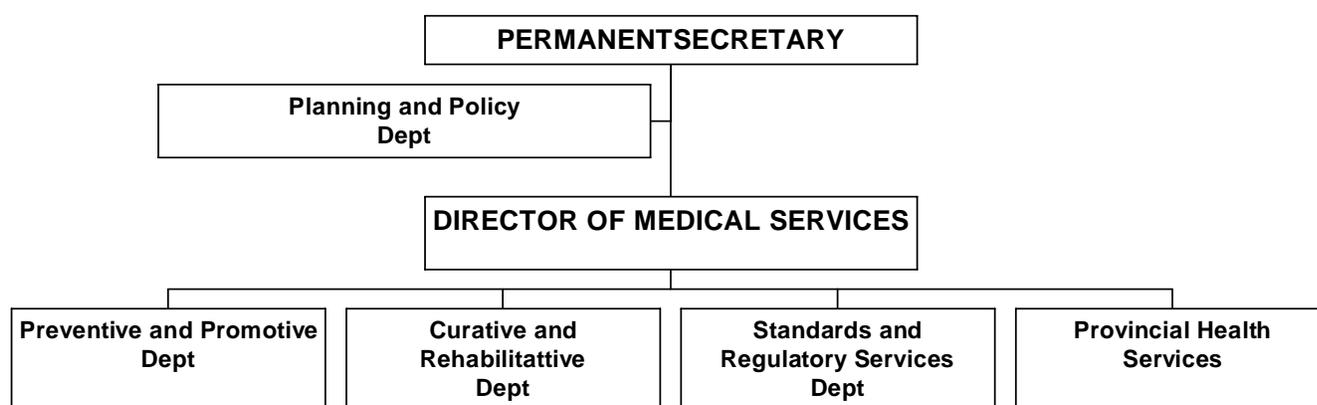

## 2.2 Organisation of the Health Care System

This section presents a brief overview of the organisation of the health care system in Kenya.

### 2.2.1 Organisation of the Ministry of Health

The Department of Preventive and Promotive Services (Figure 2.1) is responsible for the Reproductive and Child Health Programme, the Malaria Control Programme, the National AIDS/STI Control Programme, the Occupational Health Programme, the Parasite Diseases Control Programme, and others, with Maternal, Child Health, and Family Planning services included under the Reproductive and Child Health Unit.

Figure 2.1 Ministry of Health organisational diagram

### 2.2.2 The Health Care System

The health sector comprises the public system, with major players including the MOH and parastatal organisations, and the private sector, which includes private for-profit, NGO, and FBO facilities. Health services are provided through a network of over 4,700 health facilities countrywide, with the public sector system accounting for about 51 percent of these facilities.

The public health system consists of the following levels of health facilities: national referral hospitals, provincial general hospitals, district hospitals, health centres, and dispensaries.

*National referral hospitals* are at the apex of the health care system, providing sophisticated diagnostic, therapeutic, and rehabilitative services. The two national referral hospitals are Kenyatta National Hospital in Nairobi and Moi Referral and Teaching Hospital in Eldoret. The equivalent private referral hospitals are Nairobi Hospital and Aga Khan Hospital in Nairobi.

*Provincial hospitals* act as referral hospitals to their district hospitals. They also provide very specialized care. The provincial level acts as an intermediary between the national central level and the districts. They

oversee the implementation of health policy at the district level, maintain quality standards, and coordinate and control all district health activities. Similar private hospitals at the provincial level include Aga Khan Hospitals in Kisumu and Mombasa.

*District hospitals* concentrate on the delivery of health care services and generate their own expenditure plans and budget requirements based on guidelines from headquarters through the provinces.

The network of *health centres* provides many of the ambulatory health services. Health centres generally offer preventive and curative services, mostly adapted to local needs.

*Dispensaries* are meant to be the system's first line of contact with patients, but in some areas, health centres or even hospitals are effectively the first points of contact. Dispensaries provide wider coverage for preventive health measures, which is a primary goal of the health policy.

The government health service is supplemented by privately owned and operated hospitals and clinics and faith-based organisations' hospitals and clinics, which together provide between 30 and 40 percent of the hospital beds in Kenya.

### **2.2.3 Kenya Health Service**

*Services at the provincial and district level.* As a result of health sector reforms that have decentralized health services, services are integrated as one goes down the hierarchy of health structure from the national level to the provincial and district levels. Under decentralisation, the district handles supervisory responsibilities. Unfortunately, supervision has not been very effective, as one technical person may supervise several technical areas of service delivery at lower levels.

*Structure of service delivery.* The Provincial Health Management Team (PHMT) provides supervision and management support to the districts and sub-districts within the province.

At the district level, curative services are provided by district hospitals and mission hospitals. Public health services are managed by the District Health Management Team (DHMT) and Public Health Unit of the district hospitals. The DHMT and District Health Management Board (DHMB) provide management and supervision support to rural health facilities (sub-district hospitals, health centres, and dispensaries).

At the sub-district level, both preventive and curative services are provided by the health centres as well as dispensaries and outreach services to the communities within the catchment areas. Basic preventive and curative services for minor ailments are being addressed at the community and household level with the introduction of the community package.

*Non-governmental organisations, faith-based organisations and the private sector.* Although several health-oriented NGOs operate throughout the country, the population covered by these NGO health services cannot be easily determined. The MOH and external donors support the health services offered by NGOs and the private sector in several ways. Depending on their comparative advantage, NGOs, FBOs, and community-based organisations (CBOs) undertake specific health services. The MOH provides support to mission health facilities by training their staff as well as seconding staff to these facilities and offering drugs and vaccines.

Currently, the private sector (both for-profit and not-for-profit) contributes over 40 percent of health services in the country, providing mainly curative health services and very few preventive services.

Modalities exist for MOH supervision and monitoring of NGO, FBO and other private-sector facilities. The NGOs and private facilities work with communities in collaboration with the DHMT. The commu-

nity programmes report to the DHMBs, which reports to the headquarters through the Provincial Health Management Boards. Their activities are guided by MOH standards and protocols.

## 2.3 Health Facilities

Tables 2.1 and 2.2 show the distribution of health facilities and hospital beds and cots by province. As seen in Table 2.1, the overall number of health facilities increased between 2001 and 2002. Although there was a decline in the number of hospital beds/cots per 100,000 population between 2003 and 2004, there has been a drastic increase from the numbers for 2001 and 2002.

Facility type	2001	2002
Hospitals/maternalities	500	514
Health centres	611	634
Dispensaries	3,310	3,351
Total	4,421	4,499
Number of beds and cots	58,080	60,657
Number of beds and cots per 100,000 population	18.9	19.2

Source: Health Management Information System, Ministry of Health, 2005

### 2.3.1 Dispensaries

The dispensaries are at the lowest level of the public health system and are the first point of contact with patients. They are staffed by enrolled nurses, public health technicians, and dressers (medical assistants). The enrolled nurses provide antenatal care and treatment for simple medical problems during pregnancy such as anaemia, and occasionally conduct normal deliveries. Enrolled nurses also provide basic outpatient curative care.

### **2.3.2 Health Centres**

Health centres are staffed by midwives or nurses, clinical officers, and occasionally by doctors. They provide a wider range of services, such as basic curative and preventive services for adults and children, as well as reproductive health services. They also provide minor surgical services such as incision and drainage. They augment their service coverage with outreach services, and refer severe and complicated conditions to the appropriate level, such as the district hospital.

### **2.3.3 District Hospitals**

District hospitals are the facilities for clinical care at the district level. They are the first referral hospital and form an integral part of the district health system.

A district hospital should provide the following:

- Curative and preventive care and promotion of health of the people in the district;
- Quality clinical care by a more skilled and competent staff than those of the health centres and dispensaries;
- Treatment techniques such as surgery not available at health centres;
- Laboratory and other diagnostic techniques appropriate to the medical, surgical, and outpatient activities of the district hospital;
- Inpatient care until the patient can go home or back to the health centre;
- Training and technical supervision to health centres, as well as resource centre for health centres at each district hospital;
- Twenty-four hour services;
- The following clinical services:
  - ◆ Obstetrics and gynaecology;
  - ◆ Child health;
  - ◆ Medicine;
  - ◆ Surgery, including anaesthesia;
- Accident and emergency services;
- Non-clinical support services;
- Referral services;
- Contribution to the district-wide information generation, collection planning, implementation and evaluation of health service programmes.

### **2.3.4 Provincial Hospitals**

Provincial hospitals form a secondary level of health care for their location. They provide services to a geographically well-defined area. Provincial hospitals are an integral part of the provincial health system. They provide specialized care, involving skills and competence not available at district hospitals, which makes them the next level of referral after district hospitals. Their personnel include medical professionals, such as general surgeons, general medical physicians, paediatricians, general and specialized nurses, midwives, and public health staff.

Provincial hospitals should provide clinical services in the following disciplines:

- Medicine;
- General surgery and anaesthesia;
- Paediatrics;
- Obstetrics and gynaecology;

- Dental services;
- Psychiatry;
- Accident and emergency services;
- Ear, nose and throat;
- Ophthalmology;
- Dermatology;
- ICU (intensive care unit) and HDU (high dependency unit) services.

They should also provide the following services:

- Laboratory and diagnostic techniques for referrals from the lower levels of the health care system;
- Teaching and training for health care personnel such as nurses and medical officer interns;
- Supervision and monitoring of district hospital activities;
- Technical support to district hospitals such as specific outreach services.

### **2.3.5 Teaching and Referral Hospitals**

Moi Referral and Teaching Hospital and Kenyatta Hospital are the referral and teaching hospitals in Kenya. They are centres of excellence and provide complex health care requiring more complex technology and highly skilled personnel. They have a high concentration of resources and are relatively expensive to run. They also support the training of health workers at both pre-service and in-service levels.

Teaching and referral hospitals have the following functions:

*Health care.* Referral hospitals provide complex curative tertiary care. They also provide preventive care and participate in public health programmes for the local community and the total primary health care system. Referrals from the districts and provinces are ultimately received and managed at the referral hospitals. The referral hospitals have a specific role in providing information on various health problems and diseases. They provide extra-mural treatment alternatives to hospitalisation, such as day surgery, home care, home hospitalisation and outreach services.

*Quality of care.* Teaching hospitals should provide leadership in setting high clinical standards and treatment protocols. The best quality of care in the country should be found at teaching and referral hospitals.

*Access to care.* Patients may only have access to tertiary care through a well-developed referral system.

*Research.* With their concentration of resources and personnel, teaching and referral hospitals contribute in providing solutions to local and national health problems through research, as well as contributing to policy formulation.

*Teaching and training.* Teaching is one of the primary functions of these hospitals. They provide both basic and post-graduate training for health professionals.

### **2.3.6 Private Maternity and Nursing Homes**

Private maternity homes fall under the governance of the Kenya Registered Midwives Association (KRMA). Some maternity and nursing homes are run by other health care professionals, such as doctors and clinical officers. Working in close collaboration with the Reproductive Health and Child Health Divisions of the Ministry of Health, they offer reproductive and family planning services. In addition, some child welfare activities are carried out on their premises by health staff of public health facilities.

### **2.3.7 Private Clinics**

These provide mostly curative services and are operated by FBOs, NGOs, nurses/midwives, clinical officers and doctors.

### **2.3.8 Voluntary Counselling and Testing (VCT) facilities**

VCT facilities provide HIV/AIDS counselling and testing services. They may be managed by the government, NGOs, FBOs, or private for-profit enterprises.

## **2.4 The Second Health Sector Strategic Plan (NHSSP-II): 2005-2010**

In a renewed effort to improve health service delivery, the Ministry of Health and stakeholders have reviewed the NHSSP-I service delivery system in order to devise a new strategy for making it more effective and accessible to as many people as possible (MOH, 2004a). The recommended changes are contained in the Second Health Sector Strategic Plan. This plan proposes to improve service delivery by using the following levels of care delivery (see Figure 2.2).

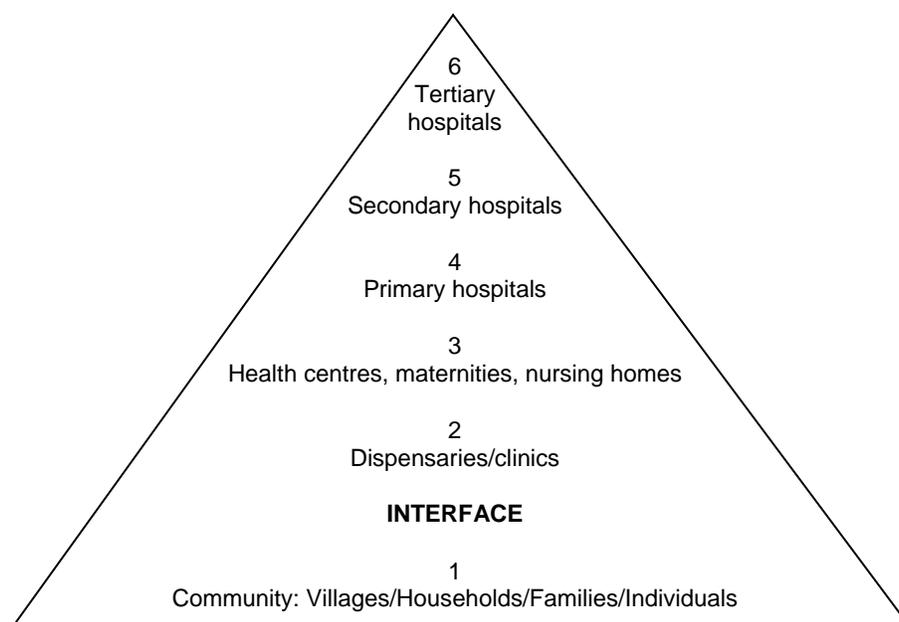

Level 1, the community level, is the foundation of the service delivery priorities. Once the community is allowed to define its own priorities and once services are provided that supports such priorities, real ownership and commitment can be expected. Important gains can be reached to reverse the downward trend in health status at the interface between the health services and the community. Village Health Committees (VHC) will be organised in each community through which households and individuals can participate and contribute to their own health and that of their village.

Levels 2 and 3 (dispensaries, health centres, and maternity/nursing homes) will handle Kenya Essential Package for Health (KEPH) activities related predominantly to promotive and preventive care, but also various curative services.

Levels 4-6 (primary, secondary and tertiary hospitals) will undertake mainly curative and rehabilitative activities of their service delivery package. They will address to a limited extent preventive/promotive care.

In this way, the existing vertical programmes will come together to provide services to the age groups at these various levels. The plan adopts a broader approach—a move from the emphasis on disease burden to the promotion of individual health based on the various stages of the human cycle: pregnancy and the newborn (up to two weeks of age); early childhood (two weeks to five years); late childhood (6-12 years); youth and adolescence (13-24 years); adulthood (25-59); and the elderly (60+ years).

Figure 2.2 Levels of health care delivery in the Kenya Essential Package for Health (KEPH)

## 2.5 Health Manpower

Table 2.3 presents the number of health providers, both registered and in training, in comparison to the population.

Personnel	Registered medical personnel				Medical personnel in training	
	2003		2004		2003/2004	2004/2005
	Number	Number per 100,000 population	Number	Number per 100,000 population		
Doctors	4,813	15	5,016	16	1,818	2,177
Dentists	772	3	841	3	141	147
Pharmacists	1,881	6	2,570	8	295	266
Pharmacists and pharmacy technologists	1,405	4	1,620	5	132	142
Bsc. Nursing	-	-	280	1	302	349
Registered nurses	9,869	33	10,210	32	1,281	1,342
Enrolled nurses	30,212	100	30,562	96	3,940	4,015
Clinical officers	4,804	16	4,953	16	406	425
Public health officers	1,216	4	1,314	4	282	296
Public health technicians	5,627	19	5,861	18	289	307
<b>Total</b>	<b>60,509</b>	<b>192</b>	<b>63,227</b>	<b>198</b>	<b>9,086</b>	<b>9,455</b>

Source: Health Management Information System, Ministry of Health, 2005

The total number of registered medical personnel increased slightly (by 4.3 percent) from 60,599 in 2003 to 63,277 in 2004. The number of medical personnel per 100,000 population improved from 192.1 in

2003 to 197.6 in 2004, and the number of medical personnel undergoing training increased by 4.1 percent, from 9,086 in 2003 to 9,455 in 2004.

## **2.6 Public Health Programmes**

The MOH is focusing on a number of health priorities in Kenya, and specific health programmes have been developed to address these priorities.

### **2.6.1 Reproductive and Child Health**

The Ministry of Health has sanctioned the existence and free unfettered operation of the Reproductive Health and Child Health Divisions. The Divisions have provided an annual report based on data from provincial, district, sub-district and rural health facilities.

The components of the reproductive health programmes are as follows (MOH, 1996):

- Safe motherhood, including antenatal, safe delivery, and postnatal care, especially breastfeeding, infant health and women's health;
- Family planning;
- Prevention and treatment of unsafe abortions and post-abortion care;
- Prevention and treatment of reproductive tract infections, including sexually transmitted diseases and HIV/AIDS;
- Prevention and treatment of infertility;
- Management of cancer, including prevention and management of cervical cancers;
- Discouragement of harmful traditional practices that affect the reproductive health of men and women, such as female genital mutilation;
- Information and counselling on human sexuality, responsible sexual behaviour, responsible parenthood, preconception care, and sexual health;
- Gender and reproductive rights.

The reproductive health care system, which was designed for adults, is currently being modified to meet the needs of adolescents as well.

The Child Health Division constitutes all child health activities aimed at promoting and maintaining the optimal growth and development of children age 0-18 years. Its specific responsibilities are:

- To ensure survival, growth and development of children age 0-5 years;
- To promote health in all children, pre-school and school-age, including adolescents (up to 18 years), both in and out of school;
- To promote good nutrition to children, expectant and nursing mothers, the sick, and the general population, including elimination of micronutrient deficiencies;
- Promotion of child's rights and child protection.

The following strategies are applied to ensure quality child health:

Early childhood:

- Integrated Management of Childhood Illnesses (IMCI) 0-5 years
- Comprehensive school health programme 6-18 years

#### Neonatal health care:

- Nutrition programme;
- Promotion of exclusive breastfeeding for six months and timely intervention of complementary feeding;
- Immunisation;
- Growth promotion and nutrition rehabilitation;
- Curative care for minor ailments and injuries;
- Promotion of family/household practices that have greatest impact on child health;
- Child rights promotion.

#### School health services:

- Screening and examination of school children and food vendors;
- Immunisation and micronutrient supplementation;
- Health education on current public health issues;
- Management of minor ailments and injuries;
- Introduction of life skills and moral values including reproductive health;
- Maintenance of a hygienic school environment;
- School deworming;
- Referrals.

#### Adolescent health:

- Referrals identification and management of common health problems affecting adolescents;
- Provision of services focused on adolescents, including counselling, information, education and communication (IEC), and reproductive health issues in general;
- Referrals.

## 2.7 Health Insurance

Table 2.4 shows a breakdown of National Hospital Insurance Fund resources by receipts, benefits and contributions net of benefits for the 1999/2000-2003/2004 financial years. Total receipts rose by 4.6 per cent (from Ksh. 2,523.9 million in 2002/2003 to Ksh. 2639.5 million in 2003/2004). Benefits accrued to members, however, dropped by 13.3 percent (from Ksh. 822 million in 2002/2003 to Ksh. 713 million in 2003/2004). Contributions net of benefits continued to rise throughout the five-year period (from Ksh. 1,286 million in 1999/2000 to Ksh. 1,926.2 million in 2003/2004).

Financial year	Receipts (millions)	Benefits (millions)	Contributions net of benefits (millions)
1999/2000	1,694.3	497.9	1,196.4
2000/2001	2,147.7	710.0	1,437.7
2001/2002	2,143.9	591.4	1,552.5
2002/2003	2,523.9	822.0	1,701.9
2003/2004	2,639.5	713.3	1,926.2

Source: MOH, National Hospital Insurance Fund, 2005

## 2.8 Financing the Health Sector

Adequate resources are critical to sustainable provision of health services. The Kenya policy framework of 1994 identified several methods of health services financing, including taxation, user fees, donor funds, and health insurance. These methods have evolved into important mechanisms for funding health services in the country. They should reflect the cost of service provision as well as the ability of the population to pay. In the non-governmental sector, health services are financed primarily through the revenue collected from fees and insurance premiums charged to service users. These are based on costs of service provision and on ability to pay.

### 2.8.1 Current Financing Trends, Policies, and Expenditures

Over the past decade, real financing allocations to the public sector have declined or remained constant. Reviews of public expenditures and budgets in Kenya show that total health spending constitutes about 8 percent of the total government expenditure and that recurrent expenditures have been consistently higher than the development expenditures, both in absolute terms, and as a percentage of the GDP. Per capita total health spending stands at about Ksh. 500 (US\$6.2), far below the WHO's recommended level of US\$34 per capita.

The per capita expenditure falls short of the Government of Kenya's commitment to spend 15 percent of its total budget on health, as agreed in the Abuja Declaration. The under-financing of the health sector has thus reduced its ability to ensure an adequate level of service provision to the population.

The GOK funds the health sector through budgetary allocations to the MOH and related government departments. However, tax revenues are unreliable sources of health finance, because of macroeconomic conditions such as poor growth, national debt, and inflation, which often affect health allocations. A manifestation of the health budget shortfalls is the widespread lack of adequate drugs and pharmaceuticals, staff shortages, and poor maintenance of equipment, transport, and facilities.

Over the past two decades, the GOK has pursued a policy of cost sharing to bridge the gap between actual budgets and the level of resources needed to fund public health sector activities. The revenue from the cost-sharing programme has continued to grow in absolute terms and as a percentage of the recurrent government budget. In 2002-03, cost sharing contributed over 8 percent of the recurrent expenditure and about 21 percent of the non-wage recurrent budget of the MOH.

However, because of the worsening poverty situation in the country, the MOH has changed its cost sharing policy and replaced it with a "10/20" policy, in which dispensaries and health centres are not to charge user fees for curative care other than 10 or 20 Ksh for client cards.

In addition, the MOH is planning to introduce in the coming years a National Social Health Insurance Fund (NSHIF). This is a social health insurance scheme to which everyone would contribute without exemption. For administrative purposes, contributions should be per head and not per family, although current entitlements in the National Hospital Insurance Fund also include family members of the insured. For those too poor to pay, the government would pay for them. In its tenth year of phased implementation, the scheme would be targeted to give comprehensive health care to 80 percent of the population. The sources of funding would include payroll harmonisation, general taxation, informed sector contributions, donations and grants. The scheme is outlined in Sessional Paper No. 2 of 2004 (Ministry of Health, 2004c).

The health budget allocation has continued to be skewed in favour of tertiary and secondary care facilities, which absorb 70 percent of health expenditures. Yet primary care units, being the first line of contact with the population, provide the bulk of health services and are cost effective in dealing with the disease conditions prevalent in communities.

Health personnel expenditures are high, compared to expenditures on drugs, pharmaceuticals, and other medical inputs such as medical equipment and supplies. Personnel spending accounts for about 50 percent of the budget, leaving 30 percent for drugs and medical supplies, 11 percent for operations and maintenance (O&M) at the facility level and 10 percent for other recurrent expenses. Expenditures for curative care constitute more than 48 percent of the total MOH budget.

The GOK works closely with development partners to raise money for the health sector. Donor contributions to the health sector have been on the increase, rising from 8 percent of the health budget in 1994-95 to 16 percent in the fiscal 2001-2002. In some years, donor contributions accounted for over 90 percent of the development budget of the MOH.

In summary, the Ministry of Health Public Expenditure Review (Ministry of Health, 2004b) reported that the flow of funding to health facilities, especially at the primary care level, is poor. Leakages amount to 22 percent of the user fee revenue collected. The review advised allocating more resources to community-based facilities, where health resources have been shown to be most effective in dealing with prevailing disease conditions and in promoting and improving people's health.

## 2.8.2 Ministry of Health Total Expenditures

Budgetary allocations to the MOH between 2000 and 2005 have increased steadily (Ksh. 12 billion in 2000-01 to Ksh. 23 billion in 2004-05). Table 2.5 shows MOH expenditures for both the Recurrent Account and the Development Account. Recurrent expenditures have increased both in absolute terms and as a proportion of total GOK spending and GDP, while development expenditures are somewhat variable, reflecting fluctuations in donor spending (Ministry of Health, 2005b).

Table 2.5 Ministry of Health expenditures					
Kenya Ministry of Health expenditures, for the Recurrent and Development Accounts, in Ksh and US\$ (millions), by year, Kenya SPA 2004					
	2000-2001	2001-2002	2002-2003	2003-2004	2004-2005

## 2.9 General Recommendations for Future Health Sector Planning (2005-2010)

The overall thrust for future planning in the health sector should be to firmly address the downward spiral of deteriorating health status. The goal should be to reduce health inequalities and to reverse the downward trend in the impact and outcome indicators. These health inequalities exist between urban and rural

populations and between districts and provinces (66 percent of the population of Western Province is below the poverty line, compared with 46 percent in Central Province). They are related to gender, education and disability. The goal to reduce health inequalities can only be achieved effectively by involving the population itself in decisions on priority setting and consequently in the allocation of the resources. This requires a fundamental change in the existing governance structures in order to allow such a community ownership to take place.

Future planning needs to recognize that “reversing the trends” cannot be achieved by the government health sector alone. Active involvement and partnership with other stakeholders in the provision of care is needed. A functioning health system should be established that relies upon collaboration and partnership with all stakeholders whose policies and services have an impact on health outcomes.

The system should give a frame for sector-wide approach arrangement and bring flexibility for rapid disbursement of budgetary resources. A human resource plan will need to be developed to better staff the lower health facilities for effective primary health care. The new plan should strengthen monitoring evaluation and reporting system. Additional resources should be dedicated to commodity security, especially for vaccines, reproductive health commodities, and essential drugs.

Gradually introducing the National Social Health Insurance Fund (NSHIF) to provide universal health care will help to reduce the current inequalities in access to care.

*Dr. Josephine Kibaru, Christopher Ndayara Omolo, Nzomo Mulatya*

This chapter reports on facility-level infrastructure and availability of resources and critical systems to support provision of quality services in health facilities, and access to the general health care system in the country. Although it is feasible to offer health services under a variety of conditions, there are certain infrastructure and health system components that are believed to be necessary for a consistent level of quality and appropriate utilisation of health services.

The chapter is divided into three parts. The first part provides information on whether facilities have the infrastructure and resources to support quality services and appropriate service utilisation. These include the following:

- Availability of a basic package of health services and qualified staff in a facility;
- Facility infrastructure supportive of client utilisation and delivery of quality services; and
- Facility infrastructure supportive of quality, 24-hour emergency services.

The first part of the chapter also reports on facilities' catchment area and staffing pattern.

The second part of the chapter considers management components for supporting quality services and appropriate utilisation of services. These include the following:

- Systems for addressing management issues;
- Staff development activities through supervision and in-service training;
- Community participation;
- Funding mechanisms to decrease financial barriers to utilisation.

Finally, the chapter considers critical systems for supporting quality of services in facilities:

- Logistics systems to support quality maintenance and availability of medicines, vaccines, and contraceptive methods
- Systems and practices for infection control.

### **3.1 Basic Infrastructure and Resources to Support Utilisation of Services and Accessibility**

#### **3.1.1 Availability of Services and Human Resources and Accessibility of Health Care System**

The availability of basic health services, the frequency with which the services are offered, the presence of qualified staff, and the accessibility of the health care system all contribute to client utilisation of a health facility. Table 3.1 and Figure 3.1 provide details on basic services and staff availability, while Tables 3.1.2 and 3.1.3 provide aggregate information on facility catchment area and staffing patterns. Additional information describing what specific services are available, by type of facility and province, is provided in Appendix Tables A-3.1 and A-3.2.

#### ***Availability of Basic Services and Qualified Staff***

The Kenya health care service delivery system is comprised of a network of facilities providing both preventive and curative health services. Only some hospitals, health centres, and maternities are expected to

offer the full range of basic services (outpatient services for sick children and for STIs, temporary methods of family planning, antenatal care, immunisation, and child growth monitoring). If a facility does not offer all services, it should not be assumed that the facility is working below standard. It does mean, however, that clients may have to visit several different facilities to meet all of their family's basic health needs.

**Table 3.1 Availability of basic services and qualified staff to meet client needs**

Percentage of facilities that provide the indicated package of services, at the indicated frequencies, with the indicated qualification of staff, by type of facility, managing authority and province, Kenya SPA 2004

Background characteristics	Percentage of facilities with:				Number of facilities (weighted)

<b>Total</b>	<b>57</b>	<b>44</b>	<b>16</b>	<b>16</b>	<b>440</b>

Note: Refer to Table 1.1 for the actual number of facilities included in survey and analysis. Weighting results in small numbers for some categories of facilities.

<sup>1</sup> The basic services consist of outpatient services for sick children and for adult sexually transmitted infections, temporary methods of family planning, antenatal care, immunisation, and child growth monitoring.

<sup>2</sup> The services and defined minimum frequencies are the following: curative care for children offered at least five days per week, STI services offered at least one day per week, and preventive or elective services (any temporary methods of family planning, antenatal care, immunisation, and growth monitoring) offered at least one day per week.

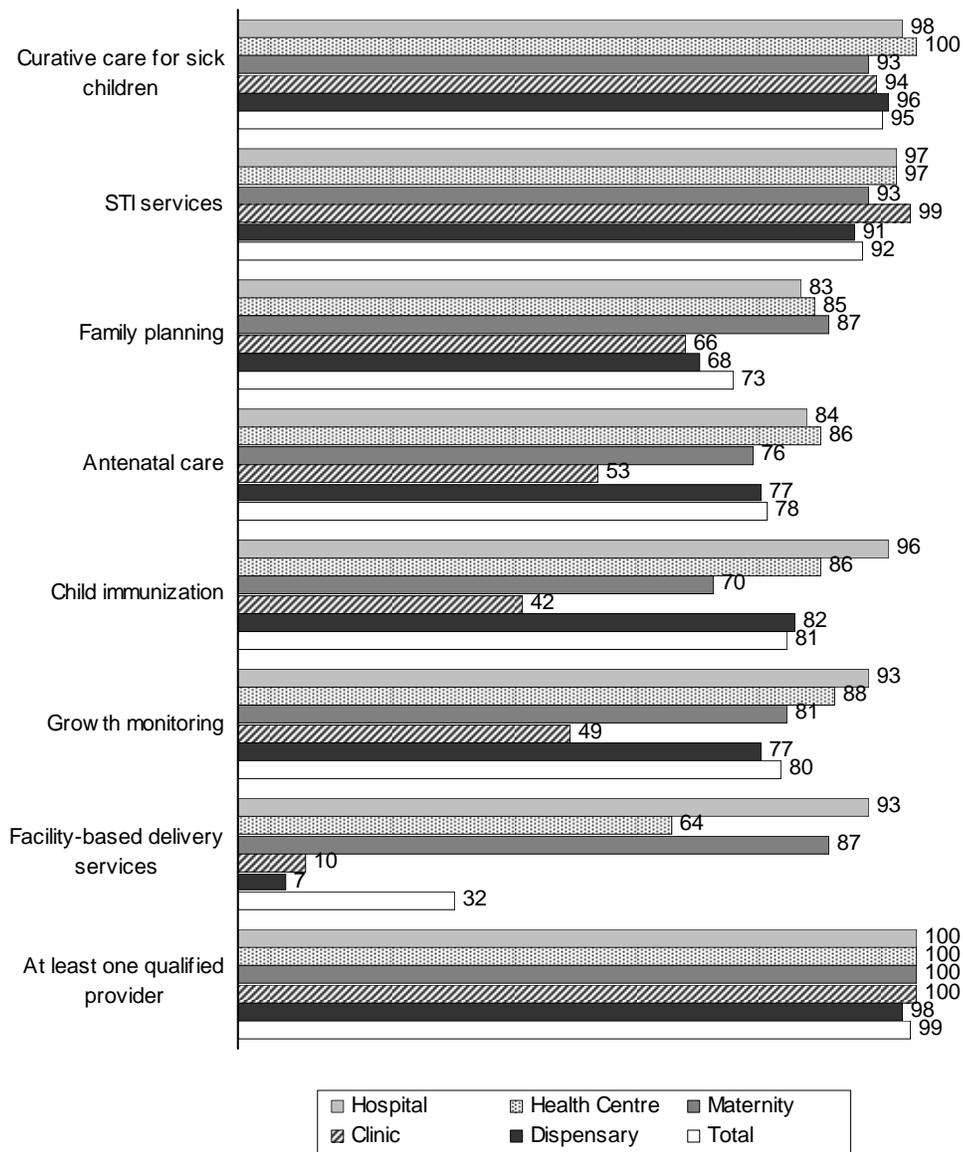

<sup>3</sup> Qualified providers of curative care are enrolled and registered nurses, enrolled and registered midwives, clinical officers and medical doctors.

In general, 57 percent of facilities offer the full range of services, with hospitals (66 percent) and health centres (65 percent) more likely than dispensaries (55 percent) and maternities (52 percent) to provide these services (Table 3.1). Because of their specialized nature, stand-alone VCT facilities are less likely to provide these services. Approximately 4 in 10 facilities offer these services at the KSPA defined minimum frequencies. Hospitals and health centres are more likely to offer the full range of basic services at

the defined minimum frequencies (53 and 54 percent, respectively) than are other types of facilities. Similarly, government-managed facilities (58 percent) and facilities in Nyanza province (75 percent) are more likely to provide services at the defined frequencies. Only 16 percent of facilities offer the full range of basic services at the minimum frequencies, as well as provide 24-hour delivery services, with hospitals and maternities more likely (50 and 42 percent, respectively) than other types of facilities (Table 3.1). This may be a reflection of the current nationwide shortage of specialized health care providers.

The services most widely available are curative care for sick children and STI services. All facilities, however, have at least one qualified provider available (Figure 3.1).

Figure 3.1 Availability of staff to meet basic client needs (N=440)

Kenya SPA 2004

Services are widely available to meet basic client needs for curative care for sick children and for STI services; other services are less widely available. Facility-based delivery services are available in 32 percent of all facilities (including clinics and dispensaries, which are not expected to offer these services) (Figure 3.1). A considerable proportion of health centres also offer facility-based delivery services. Quite a substantial percentage of dispensaries (23 percent) do not offer growth monitoring and antenatal care services (Figure 3.1).

### **Catchment Area**

Although overall coverage and physical access to health care services seem quite good in Kenya, with almost 80 percent of the population living within 5 kilometres of a facility (KDHS 1993), the KSPA 2004 findings indicate that facilities have the challenge of serving very large populations. The median population in a hospital catchment area is more than 100,000, while dispensaries, which have limited staff, serve a catchment population of around 8,000 (Table 3.1.1). Wide provincial differentials are notable, with facilities in Nairobi province having a catchment population seven times higher than the average catchment population in Eastern and Rift Valley provinces.<sup>1</sup> Government- and FBO-managed facilities also seem to serve much larger catchment populations than facilities managed by other authorities. It is possible that the catchment areas of government and non-government facilities overlap, since government catchment areas are constructed to serve the entire population, whereas non-governmental facilities define their own catchment areas, usually without coordinating with the MOH.

**Table 3.1.1 Facility catchment areas**

### **Staffing**

Different kinds of health facilities have different staffing patterns. Unsurprisingly, hospitals and higher-level facilities are better staffed, with more qualified staff than lower-level facilities. The findings presented in Tables 3.1.2 and 3.1.3 demonstrate that there are shortages of health professionals in Kenyan facilities. Dispensaries have a median of one enrolled midwife while health centres have a median of one enrolled nurse and one enrolled midwife. Hospitals have a median of three doctors.

<sup>1</sup> These differences reflect population densities as well as resources available. It is up to health planners to ensure that the size and diversity of facilities match the area's population density and geophysical characteristics.

**Table 3.1.2 Staffing patterns**

### 3.1.2 Facility Infrastructure Supportive of Client Utilisation and Quality Services

In theory, quality health services can be provided in the most minimal service delivery setting. However, clients and staff are more likely to be satisfied with the facility if basic comfort amenities and infrastructure components are available, such as a functioning latrine, a comfortable waiting area, and a regular water supply. These components also help staff provide higher-quality services. Table 3.2 provides summary information on these infrastructure elements by facility type and province, and Appendix Tables A-3.3 and A-3.4 provide more details on their availability.

As Table 3.2 indicates, about 9 in 10 facilities have the assessed client comfort amenities, with each assessed element missing in very few facilities (1 to 7 percent) (Appendix Table A-3.3). Twenty-six percent of all facilities have a regular water supply. This varies by the type of facility, from 23 percent in health centres to 47 percent in stand-alone VCT facilities. Almost half of all facilities have regular electricity or a functioning generator with fuel. Hospitals, stand-alone VCT facilities, NGO-managed facilities, and facilities in Nairobi are most likely to have regular electricity or a functioning generator.

Only one-fourth of facilities have all the client comfort amenities and infrastructure elements that the KSPA assessed, including a regular water supply and regular electricity. Stand-alone VCT facilities (40 percent) and NGO-managed facilities (49 percent) were most likely to have all these elements, as were facilities in Nairobi province (48 percent).

**Table 3.2 Service and facility infrastructure**

<sup>2</sup> Year-round water supplied in facility, or available within 500 meters of facility

<sup>3</sup> Electricity routinely available during service hours or a backup generator with fuel

### 3.1.3 Infrastructure and Resources to Support Quality 24-Hour Emergency Services

Twenty-four-hour care can save lives when clients have serious illnesses or maternity complications. Not all types of health facilities are expected to provide 24-hour emergency services. However, because 24-hour care is so important, it is useful to assess all facilities' capacity to provide services 24 hours a day. For purposes of the KSPA 2004, a facility is said to have basic 24-hour emergency services if it offers emergency on-site treatment, with the capacity to monitor a seriously ill client overnight until it is possible to refer the client to an inpatient setting if necessary. This means the facility must have at least two qualified providers, a duty schedule indicating staff are on site or on call 24 hours a day, available overnight beds, a patient latrine, 24-hour emergency communication, and an on-site water source at least sometimes during the year.

Table 3.3 provides information on facilities that meet these requirements. It also shows which facilities meet these requirements and have a regular supply of water and electricity. Figure 3.2 presents information on the availability of individual items, for the facilities where 24-hour services might commonly be expected.

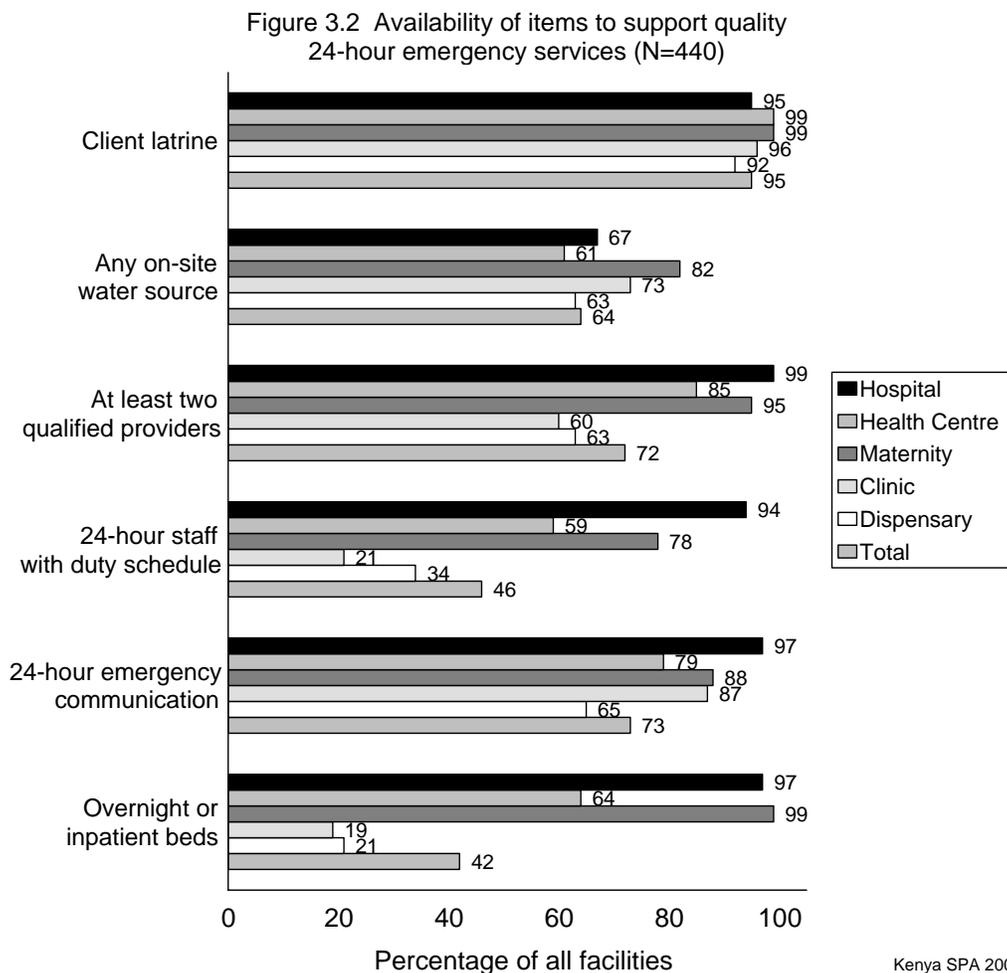

<b>Table 3.3 Service and facility infrastructure to support quality 24-hour emergency services</b>

North Eastern	8	0	8
Nyanza	21	4	54
Rift Valley	17	10	126
Western	21	9	29
<b>Total</b>	<b>16</b>	<b>9</b>	<b>440</b>
<p>Note: Refer to Table 1.1 for the actual number of facilities included in survey and analysis. Weighting results in small numbers for some categories of facilities.</p> <p><sup>1</sup> At least two qualified providers assigned to facility, duty schedule was observed indicating staff are on site or on call 24 hours a day, availability of overnight beds, a patient latrine, 24-hour emergency communication, and an on-site water source at least sometimes during the year.</p> <p><sup>2</sup> Availability of all basic components to support quality 24-hour emergency services, as well as a year-round on-site water source and a electricity routinely available during service hours or backup generator with fuel</p>			

Overall, only 16 percent of facilities have all the basic components to support 24-hour emergency services. This includes clinics, dispensaries, and stand-alone VCT facilities, which are not expected to provide 24-hour emergency services. When clinics, dispensaries and stand-alone VCT facilities are excluded from the analysis, the proportion of facilities having all the assessed basic components for 24-hour emergency services is 57 percent of hospitals, 59 percent of maternities and 20 percent of health centres (Table 3.3). This brings the national average to only 31 percent (table not shown), despite the fact that according

to the Ministry of Health categorisation, all these facility types are expected to be able to offer 24-hour services. Hospitals in particular most often lacked an on-site water source, which kept them from meeting the criteria for quality 24-hour service. Interestingly, although dispensaries, clinics and stand-alone VCT facilities are not expected to offer 24-hour services, some of them do indeed have the needed components (Table 3.3). NGO-managed facilities are the most likely to have all the items needed to support 24-hour emergency services. There are no clear provincial differences, although facilities in North Eastern province were least likely to meet the 24-hour criteria (8 percent).

According to the KSPA definition, a regular source of water (non-seasonal and on site) and a regular supply of electricity (24-hour electricity with minimum interruption, or a generator with fuel available) are not considered essential for providing 24-hour emergency services. However, they are certainly preferable. The basic 24-hour components described above, plus regular water and electricity, are available at only 1 in 10 facilities (Table 3.3). Hospitals and maternities are most likely to have all these infrastructure components (34 and 31 percent, respectively); similarly, NGO-managed facilities are more likely than others to have them. Almost no facilities in North Eastern province have all these components.

The KSPA 2004 defined 24-hour duty staff availability as the facility having some form of observed duty schedule or roster that indicated that staff was officially on duty or on call. Twenty-four-hour staff availability with a written duty schedule is most commonly found in hospitals and maternities (94 and 78 percent, respectively) (Figure 3.2).

More than 90 percent of hospitals and maternities have at least two qualified providers assigned to them (Figure 3.2). A review of the availability of overnight beds shows that essentially only hospitals and maternities are adequately equipped to provide overnight emergency care (Appendix Table A-3.3). It is common for health centres to have qualified providers who live on the premises, with the assumption that they are available to provide 24-hour emergency care to clients, and that arrangements are made with district officials for another qualified provider to be assigned if the regular providers plan to be away for an extended period of time. Among health centres, 76 percent report having qualified providers living on site; 9 percent of these providers have no duty schedule (Table A-3.3). It is not clear whether arrangements are routinely made for emergency staff availability if some of the service providers are out of the facility for a day or an evening. It is, however, notable that 85 percent of health centres have at least two qualified providers to provide 24-hour services (Figure 3.2), although only 20 percent of health centres have the defined basic infrastructure components to support 24-hour emergency services. Approximately three-fourths of all facilities have 24-hour emergency communication, with almost all hospitals and 88 percent of maternities having access to emergency communication.

## Key Findings

### *Basic Services*

A full package of basic services is available in 57 percent of health facilities, and is available at the KSPA defined minimum frequency in 44 percent of facilities. This package is most commonly found in hospitals and health centres (53 and 54 percent, respectively)

A full package of maternal, child, STI and reproductive health services, available at the defined minimum frequency, together with 24-hour facility-based delivery services, is available at only 16 percent of all facilities. This includes 50 percent of hospitals, 42 percent of maternities, and 34 percent of health centres.

Facility-based 24-hour delivery services are available in almost all hospitals, in 87 percent of maternities, and in 64 percent of health centres in the country.

### *Infrastructure and Emergency Services*

Infrastructure support (all client comfort amenities, water, and electricity) are regularly available in almost a quarter of all facilities.

Approximately two-thirds of all facilities have an on-site water source; however, only a quarter have water available year-round.

Almost half of facilities have a regular supply of electricity or backup generator. This figure rises to 89 percent in hospitals and 80 percent in stand-alone VCT facilities.

Hospitals and maternities are the primary sites where 24-hour emergency service infrastructure support is available (57 and 59 percent, respectively)

At the national level, facilities located in North Eastern province are least likely to have the assessed components to support 24-hour emergency services.

## **3.2 Management Systems to Support and Maintain Quality Services and Appropriate Client Utilisation**

Basic management and administrative systems are required to ensure that health services can be consistently provided as planned with an acceptable level of quality.

### **3.2.1 Management, Quality Assurance, and Referral Systems**

Information on the availability of functioning systems for each of the assessed components is shown in Table 3.4. Further information on the components is shown in Figures 3.3 through 3.6, and Appendix Tables A-3.5 and A-3.6.

#### *Management*

To function well, a health facility must have a systematic and routine method for addressing management issues. A “facility management system” means an established system for considering management or administrative issues. These may be meetings to discuss scheduling or day-to-day issues, or meetings to discuss broader management aspects such as financing, utilisation, or plans for health-related campaigns. They must, however, be regularly scheduled meetings with specific staff having defined areas of responsibility. The KSPA 2004 sought information for some evidence of functioning management committee meetings held at least every six months, and asked for some official documentation of proceedings. A committee was considered to be functioning if there was a record of meetings with documented decisions and follow-up on issues that are discussed. Service delivery at the district level is managed through the District Health Management Teams (DHMTs).

Overall, about 7 in 10 facilities report having routine management committees that meet at least every six months. This is similar to the KSPA 1999 findings, where 66 percent of facilities reported regular management committee meetings. Almost 4 in 10 facilities said they meet monthly or more often, one-fourth reported that they meet every 2-3 months, and 6 percent said they meet every 4-6 months (Figure 3.3, Appendix Table A-3.5).

Thirty-four percent of facilities meet at least every six months and have documentation of recent meetings (Table 3.4, Figure 3.3). Hospitals (50 percent) and stand-alone VCT facilities (56 percent) are most likely to have both regular meetings and documentation, compared to other types of facilities. Similarly, facilities in Eastern province (59 percent) are more likely than those in other provinces, particularly those in Nairobi and North Eastern provinces (19 and 18 percent, respectively), to have management committee meetings at least every six months and have documentation of the most recent meetings (Table 3.4).

Kenya SPA 2004

### Quality Assurance

Quality assurance (QA), which refers to a system for monitoring quality of care, identifying problems, and instituting changes to resolve the identified problems, is very important in the provision of health care. Quality assurance requires an established standard against which quality is measured; there must also be systematic means whereby results are assessed and interventions developed. Activities for quality assurance might include medical record audits, supervisory checklists with client care issues, a supervisor observing consultations, or holding meetings to discuss client care problems or trends in client utilisation data from a health management information system (HMIS).

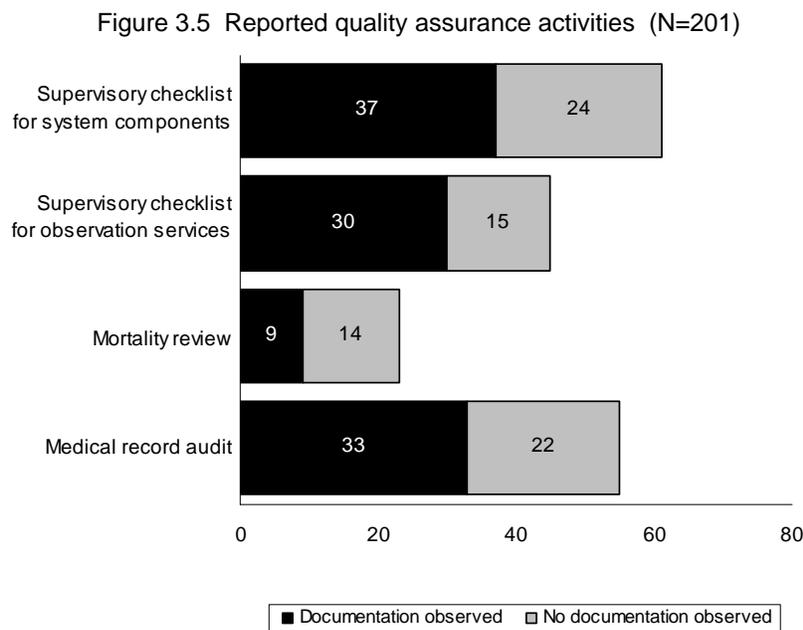

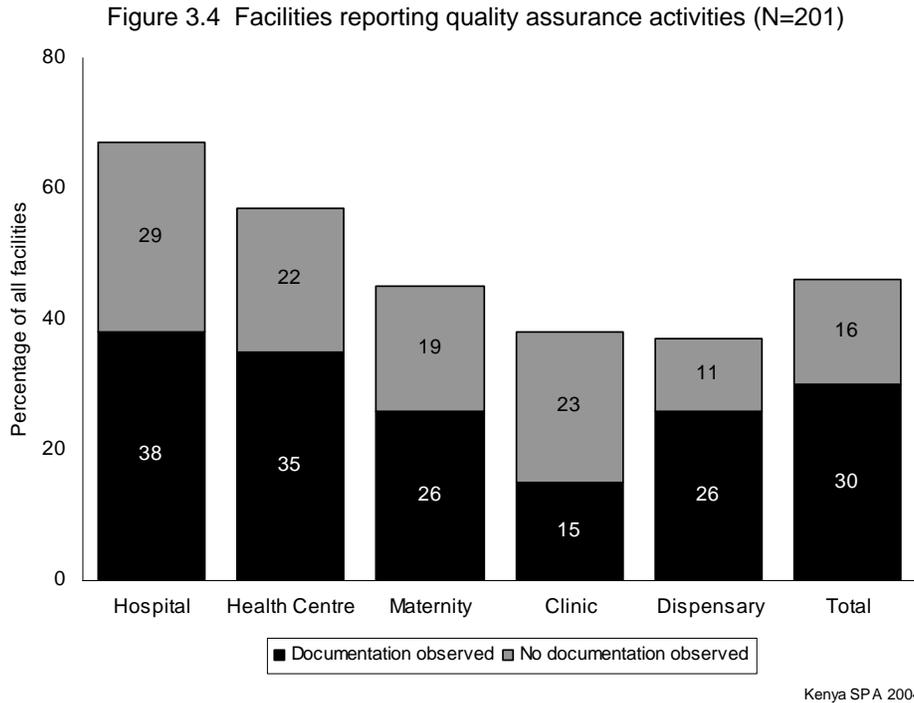

Table 3.4 and Figures 3.4 and 3.5 provide information on how many facilities reported conducting quality assurance, and which quality assurance activities they reported. The different activities or approaches assessed are as follows:

- **A supervisory checklist for health systems** which looks for the presence of equipment and supplies, completeness of HMIS accounts, and other process indicators.
- **A supervisory checklist for health service provision** which indicates specific content for patient assessment, treatment or consultation. This is often used for observing care provision.
- **Facility-wide review of mortality**, which refers to a structured system for reviewing the care of each client who dies. There will normally be a committee established for this purpose.
- **Medical record/register audit**, which refers to checking medical records for the presence of specific items or information. These may be simply the presence or absence of specific items, or may be more detailed to assess if protocols were followed.

Less than half (46 percent) of health facilities in the country report quality assurance activities; 30 percent have documentation of their QA activities. Hospitals and health centres are more likely to report quality assurance activities (67 and 57 percent, respectively) and also to have documentation of QA activities (38 and 35 percent, respectively) (Figure 3.4). NGO-managed facilities are more likely than others to report

QA activities and have documentation (Table 3.4). As with management committee meetings, facilities in Eastern provinces are more likely than facilities in other provinces (58 percent) to report QA activities and also have documentation.

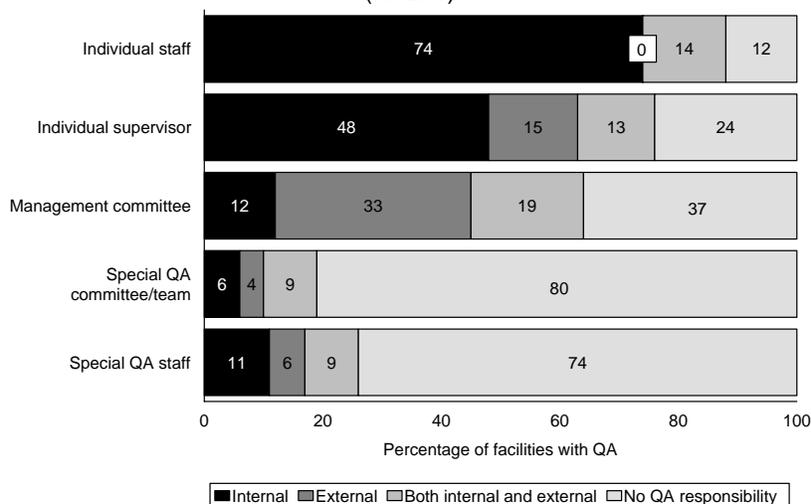

The most common QA activities are having a supervisory checklist for health system components (61 percent of facilities reporting QA, with 37 percent having documentation) and conducting medical record audits (55 percent, with 33 percent having documentation) (Figure 3.5).

Only 23 percent of facilities reporting QA activities conduct a facility-wide review of mortality. However, among hospitals, where this is most applicable, 63 percent report conducting mortality reviews, with 37 percent having documentation to substantiate this (data not shown). Among maternities, 22 percent report conducting a mortality review, but only 11 percent have supporting documentation.

Among facilities with QA activities, the people reported as responsible for QA included those based inside as well as outside the facility. Figure 3.6 presents data on who implements and reviews facilities' QA activities. When asked about individual staff members, three-fourths of facilities report that QA activities are conducted by individual staff members based within the facility, and 12 percent report that individual staff members have no QA responsibility. When asked about management committees, 12 percent of facilities report that an internal management committee is responsible for QA, while 33 percent have an external management committee that conducts QA activities.

Figure 3.6 Percentage of facilities with indicated person(s) or group(s) responsible for implementation and/or review of QA activities, by whether they are based internal or external to the facility (N=201)

Kenya SPA 2004

### Referral Systems

When clients are referred to another facility without any formal documentation, they risk being refused services, or having services delayed if the referral facility must assess them as totally new clients. Thus, having a systematic means to refer clients to a higher-level facility is an important aspect of quality of care. If clients are confident that they will be assisted in gaining access to higher-level facilities when needed, they may be less likely to bypass lower-level facilities for their health needs. The KSPA 2004 collected information on whether facilities have any official, printed forms which at minimum document the reason for referral and list any treatment already provided.

Only 16 percent of facilities either have an observed referral form, or are the referral facility (Table 3.4). Hospitals and stand-alone VCT facilities (44 and 61 percent, respectively), 35 percent of NGO-managed and 39 percent of private for-profit facilities have formal client referral forms. At the provincial level, almost half of facilities in Nairobi province have an observed referral form, or are the referral facility. However, in North Eastern province, referral forms are almost non-existent, available in only 1 percent of facilities.

### **3.2.2 Supportive Management for Providers**

The KSPA 2004 collected information on whether facilities have supervisory and staff development activities, which are important for supporting quality care. Summary information on supportive management practices at the facility level is provided in Table 3.5, with further details provided in Appendix Tables A-3.7 and A-3.8.

#### ***External Supervision***

Supervision from external managers provides an opportunity to ensure that system-wide standards and protocols are followed at the facility level and to promote an “organisational culture” wherein it is expected that these standards and protocols will be implemented. It also provides an opportunity to expose staff to a wider scope of ideas and relevant experiences, including on-job-training (OJT) for some providers. External supervision can also act as a motivator to service providers, especially if the supervisor is supportive. A facility reporting at least one visit by external supervisors during the past six months is defined for KSPA purposes as having routine external supervision. Overall, 87 percent of facilities have routine external supervision, with government- and NGO-managed facilities being more likely (91 percent each) than others to have such supervision. At the provincial level, facilities in Nairobi have the weakest routine external supervision (54 percent), compared with facilities in Western and Nyanza provinces (96 percent each).

#### ***In-Service Training***

To maintain the levels of knowledge and technical competence they achieved during basic training, health service providers must continually be exposed to current and new information. The KSPA assessed whether health service providers had received any formal or structured in-service training on topics related to the service offered. It is recognized that health service providers may receive new information and individual instruction related to their work during routine supervisory visits, but the KSPA did not assess this type of instruction.

If at least half of the interviewed health service providers at a facility had received any in-service training relevant to their service in the 12 months preceding the survey, the KSPA defines the facility as having routine staff development activities. Overall, three-fourths (76 percent) of facilities satisfied these criteria. Stand-alone VCT facilities and hospitals are more likely than other facility types to conduct routine staff development (91 p and 85 percent, respectively). NGO facilities have slightly more staff development activities (84 percent), and facilities in Nairobi and Coast provinces have a slight edge over facilities in other provinces, each at 83 percent (Table 3.5).

#### ***Supervision of Health Service Providers***

In addition to general supervision of facility activities, the work of individual staff must be assessed so that each person’s strengths and weaknesses can be identified and appropriate support can be provided. If at least half of the interviewed health service providers in a facility had been personally supervised at least once during the past six months, the KSPA defined the facility as providing routine staff supervision. Over 80 percent of facilities met the KSPA criteria for routine staff supervision. Maternities and clinics have the weakest routine staff supervision (60 and 67 percent, respectively). The level of individual supervision is higher in health centres (89 percent). Supervision in NGO facilities is universal and is lowest in private facilities at 65 percent. At the provincial level, facilities in Nairobi and Central provinces are weakest in supervision (72 percent each), compared with Nyanza (95 percent).

The survey results also give details of facilities that conduct regular in-service training in addition to routine staff supervision. Overall, 67 percent of facilities meet both these supportive management criteria.

Table 3.5 Supporting management practices at the facility level

Percentage of facilities that had an external supervisory visit during the past 6 months, and percentage where at least half of the interviewed health service providers received the indicated management support, by type of facility, managing authority and province, Kenya SPA 2004

Background characteristics	Percentage of facilities with external supervisory visit during the past 6 months	Percentage of facilities where at least half of the interviewed service providers:			Percentage of facilities with supportive management practices <sup>2</sup>	Number of facilities with at least 1 eligible health service provider (weighted) <sup>3</sup>

Total	87	76	84	67	59	440

Note: Refer to Table 1.1 for the actual number of facilities included in survey and analysis. Weighting results in small numbers for some categories of facilities.

<sup>1</sup> This refers to structured in-service sessions and does not include individual instruction received during routine supervision.

<sup>2</sup> Facility received external supervision within the past 6 months; at least half of all interviewed health service providers both received in-service training relevant to the services they provided during the past 12 months and were personally supervised during the past 6 months.

<sup>3</sup> Interviewed providers who did not personally provide one of the services assessed by the KSPA (i.e., administrators who might have been interviewed) are excluded.

### 3.2.3 Management Practices Supporting Community Involvement

Encouraging community input into a facility's functions makes the facility more accountable to the community it serves and helps it understand the community's needs. This in turn results in better health-seeking behaviour, which improves the health of the population.

#### *Community Representation*

Overall, 44 percent of facilities have routine community participation in some management meetings (Table 3.6). However, such involvement is minimal in maternities (4 percent). Community participation in management meetings for NGO-managed facilities and in facilities in the North Eastern province is relatively strong (63 and 67 percent, respectively). Only 49 percent of government-managed facilities report community involvement in management meetings, despite the fact that government policy requires every facility to have a management committee or board, for community ownership.

**Table 3.6 Management practices supporting community feedback and access to facility**

Note: Refer to Table 1.1 for the actual number of facilities included in survey and analysis. Weighting results in small numbers for some categories of facilities.

<sup>1</sup> Some mechanism for eliciting client opinion is reported, and there is documentation indicating that client opinions are reviewed.

<sup>2</sup> Either community representation at management meetings or a system for eliciting client opinion is in place.

### ***Client Feedback***

The KSPA 2004 also assessed whether facilities have a system for acquiring client opinion and feedback. The findings show that very few facilities—only 9 percent—have such a system (Table 3.6). Twenty-eight percent of stand-alone VCT facilities elicit client opinion and have a system to review it; this is the largest proportion among all types of facilities. Among facilities with different managing authorities, only 2 and 4 percent of faith-based organisation and private for-profit facilities, respectively, elicit client opinion and have a system for reviewing it. Such systems exist in only 1 percent of facilities in Western Province and are non-existent in Central Province.

### **3.2.4 Funding Mechanisms That Decrease Financial Barriers to Utilisation of Health Services**

User fees may have either a positive effect on utilisation of health facilities (by increasing the funds available to the facility) or a negative effect (by deterring poor clients from using services). User fees with ex-

emption schemes for vulnerable people often help to augment inadequate facility budgets. However, providing exemptions or discounts for poor clients can result in budget shortages if there is no system for reimbursing these exempted or discounted costs. Other methods that encourage appropriate utilisation by poor clients but that also reimburse facilities for client services include insurance plans, credit plans (delayed payment for services received today), and charity or equity funds that reimburse the costs of particular subsets of clients to increase their access to care through decreasing their out-of-pocket payments at the time of service utilisation. In any case, health facilities should clearly display their fees for services, which is a quality of care standard that improves accountability, reduces the likelihood of corruption, and helps the client calculate the costs they will incur in seeking such services.

Health insurance may be provided through an employer or it may be purchased independently. People belonging to health insurance plans may have specific facilities where they receive services. Any services that insured clients receive through the general public sector are usually not covered by the insurance plan, which means that except for the National Health Insurance Fund (NHIF), health insurance is not usually a source of reimbursement for public sector facilities.

Table 3.7 summarizes facilities' funding options. Details on these funding options and components for which facilities charge fees appear in Appendix Tables A-3.9 and A-3.10.

### ***Practices Related to User Fees and Additional Sources of Funding***

As of June-July 2004, according to government policy, dispensaries and health centres are not to charge user fees for curative care, apart from clients having to pay for client cards. The KSPA findings, however, do not show that facilities have adopted this new policy. Approximately 9 in 10 facilities routinely have some form of user fees for adult curative services (Table 3.7), and as indicated in Appendix Table A-3.10, about half of all health centres and dispensaries still do charge for client consultations. Overall, half of all facilities with client user fees charge for a client chart or record, while 53 percent charge for consultation. Less than half of NGO-managed facilities report routine user fees for adult curative care. Contrary to expectation, routine user fees for adult curative care are not charged by all private for-profit facilities; only 80 percent routinely charge these fees.

Among facilities charging some form of user fees for adult curative services, 42 percent report that they have an additional source of funding (Appendix Table A-3.9). Hospitals, NGO-managed facilities and facilities in the North Eastern province are most likely to have additional sources of funding outside of routine running budget or direct client fees used in the facility. The source of additional funding is usually the central government and donors (Appendix Table A-3.9).

### **3.2.5 Maintenance and Repair of Equipment**

To provide quality services, a facility must have the means to ensure that facility equipment and infrastructure are maintained in functioning condition. Some machinery should routinely receive preventive maintenance. Some equipment may require minor repairs or replacement, and buildings and infrastructure require routine maintenance and periodic repair. For purposes of the KSPA 2004, infrastructure refers to such things as buildings and roads within the facility complex.

Summary information on systems for maintenance and repair or replacement for large and small equipment is provided in Table 3.8. Detailed information on what systems are used and which people are responsible for maintaining facilities' equipment is provided in Appendix Tables A-3.11 and A-3.12.

Some 4 in 10 facilities report preventive maintenance programmes for major equipment such as generators or sterilisers (Table 3.8); among hospitals, the facilities most likely to have major equipment requiring maintenance, 76 percent have such programmes. These systems are also common in NGO-managed

**Table 3.7 Facility funding mechanism**

<sup>1</sup> Includes charges for client cards/charts or record, and for consultations

<sup>2</sup> Source of reimbursement is in lieu of out-of-pocket payments by clients and may be from insurance systems, reimbursement from external charities, or other sources of funds (e.g., NGOs) for poor clients.

facilities (81 percent) and in facilities in the Eastern province (75 percent). Among facilities with preventive maintenance programmes for large equipment, 24 percent have on-site staff responsible for the programme, while 67 percent employ external technicians (Appendix Table A-3.11).

With regards to small equipment such as stethoscopes and sphygmomanometers, 87 percent of facilities have systems for repair or replacement. This is widespread among facilities of all types, managing authorities, and provinces. Facilities use different methods for maintaining or replacing small equipment, including on-site repair, sending equipment outside for repair or replacement, and purchasing or paying for new equipment from funds on hand. Thirteen percent of facilities report on-site repair, while 67 percent send equipment outside for repair or replacement.

Less than half of facilities have a system for maintaining and repairing their building or infrastructure (Table 3.8); hospitals (81 percent) are most likely to have such a system. NGO-managed facilities and

private for-profit facilities are also relatively likely to have such a system. There is not much differential at the provincial level, though facilities in Nyanza province are the least likely to have a system for maintenance and repair of building or infrastructure.

<b>Table 3.8 Facility systems for maintenance and repair of equipment and infrastructure</b>

## Key Findings

About two-thirds of facilities hold routine management meetings; however, only about one-third have documentation of a recent meeting.

Nationally, only 46 percent of health facilities report quality assurance (QA) activities, and 30 percent have documentation of the QA tools used.

Eighty-seven percent of all facilities report receiving external supervision during the past six months. A notable weakness was in Nairobi province, where only 54 percent of facilities report at least one visit by external supervisors during the six months before the survey.

Formal in-service training for health providers is provided on a routine basis, with three in four facilities having at least half of all providers receive related in-service training during the past 12 months.

Systems for eliciting community input for facility activities are not widespread. Less than half of facilities have routine community participation in management committee meetings, and only 9 percent have any formal means for seeking client feedback.

Seventy-six percent of hospitals have preventive maintenance programmes for major equipment, and 87 percent of facilities have systems for repair or replacement of small equipment.

### 3.3 Logistics Systems for Vaccines, Contraceptives, and Medicines (Pharmaceutical Commodities)

To ensure that necessary pharmaceutical commodities are available for daily use, facilities must make sure that the commodities are stored under conditions that protect them from damage, they must have monitoring systems to minimize waste resulting from commodity expiration, and systems must exist to monitor stock and to ensure timely ordering and re-supply of the needed commodities.

Information on storage conditions and stock monitoring for vaccines is presented in Table 3.9, and information for contraceptive methods and medicines is shown in Table 3.10. Details for each element assessed for monitoring the cold chain for vaccine storage are shown in Figure 3.7, and details for the vaccine stock monitoring systems are shown in Figures 3.8 and 3.9. Similar information on storage conditions and stock monitoring systems for contraceptive methods and medicines is provided in Figures 3.10 and 3.11. Further details on storage conditions are provided in Appendix Tables A-3.15 and A-3.16, and details on commodity ordering systems are given in Appendix Tables A-3.17 through A-3.21.

<b>Total<sup>3</sup></b>	<b>73</b>	<b>77</b>	<b>320</b>

Note: Refer to Table 1.1 for the actual number of facilities included in survey and analysis. Weighting results in small numbers for some categories of facilities.

<sup>1</sup> Functioning thermometer in refrigerator, temperature chart up to date, and refrigerator temperature 0° to 8°C at time of survey

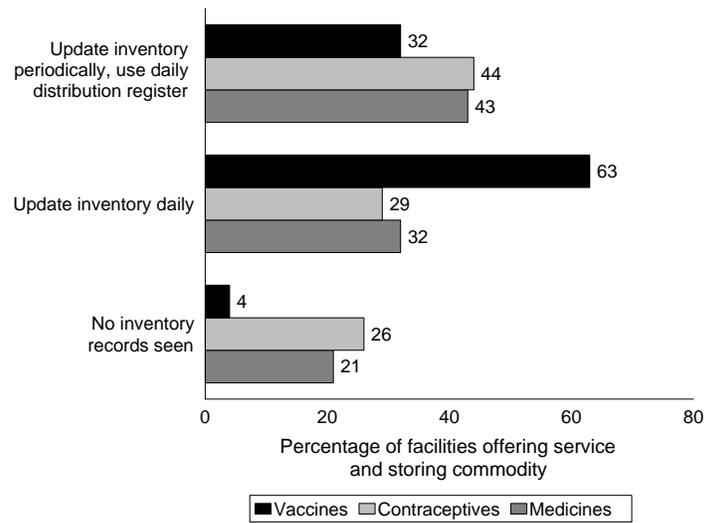

<sup>2</sup> No expired items present, items stored by expiration date, and up-to-date inventory available

<sup>3</sup> Totals include data from six NGO facilities (weighted).

All commodities were assessed to ensure the presence of a valid expiration date on at least one unit. For selected vaccines, contraceptive methods, and medicines, the entire stock was assessed for validity of expiration date, for storage by expiration date, and for concordance with the inventory. If any of the checked items were found to be out of compliance, the stock monitoring system for that commodity was marked as not functioning.

Facilities often do not update their inventory daily but rather maintain a daily register of distributed items. They then tally the distributed items and update the inventory later, often monthly. Information on the inventory system used for each commodity type is presented in Figure 3.7. If the official inventory record is not up-to-date, but there is a register where the current inventory can be quickly calculated (and this tallies with the actual commodity stock), the facility is defined as having an up-to-date inventory. Between 32 and 44 percent of facilities use daily distribution registers and only update inventory records periodically (as opposed to daily) for vaccines, contraceptives and medicines.

Figure 3.7 Inventory system used for stored commodities: vaccines (N=332), contraceptives (N=298), and medicines (N=429)

Kenya SPA 2004

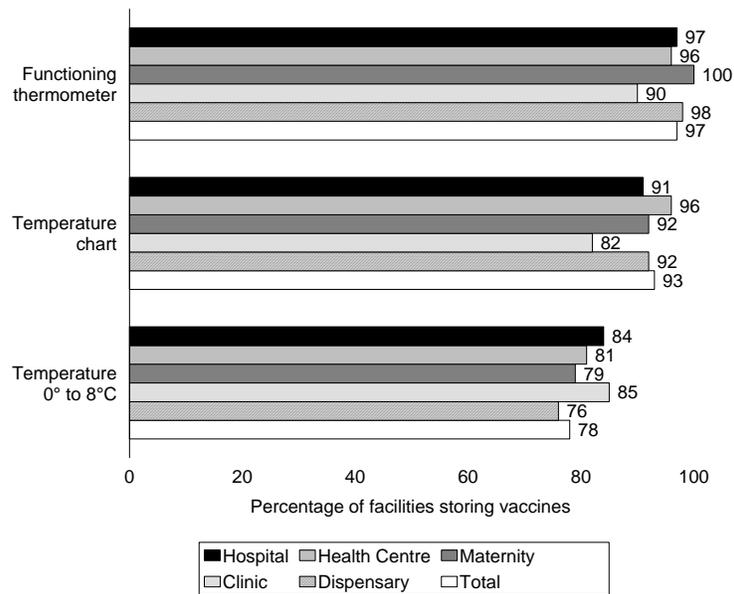

### 3.3.1 Storage and Stock Monitoring Systems for Vaccines

Vaccines must be stored at an appropriate temperature to maintain potency. WHO and UNICEF policy is to monitor the refrigerator or cold box temperature at least twice daily and to record the temperature on a graph as proof of monitoring (WHO, 1998). To assess facilities' vaccine storage conditions, KSPA observers checked for (1) the presence of a functioning thermometer in the refrigerator, (2) a temperature of 0° to 8°C at the time of the survey, and (3) a completed temperature graph (completed twice a day) for the prior 30 days.

#### *Storage Conditions*

Among facilities that routinely store vaccines, 73 percent have all the necessary components for adequate temperature monitoring (Table 3.9). Private for-profit facilities and facilities in Nyanza province have the weakest systems, with only 56 and 26 percent respectively having all the needed items for monitoring storage temperature (Table 3.9). Figure 3.8 gives details for each element that a facility needs for monitoring storage temperature. In general, 97 percent of facilities have a functioning thermometer and 93 percent have a temperature chart, and in 78 percent of facilities, a temperature of 0° to 8°C (the UNICEF recommendation for vaccine storage at the health centre level) was found at the time of the survey. This implies that 22 percent of health facilities do not adhere to the standard requirements for maintaining a proper vaccine storage temperature. Almost all facilities do place the vaccine refrigerator so that it is protected from sunlight (Appendix Table A-3.13).

Figure 3.8 Elements for monitoring vaccine storage conditions (N=320)

Kenya SPA 2004

### Stock Monitoring Systems

Vaccine stock monitoring systems were assessed using the tetanus toxoid (TT); diphtheria, pertussis, and tetanus (DPT); measles; hepatitis B; hepatitis-DPT (Hep-DPT); and measles, mumps, and rubella (MMR) vaccines. Very few facilities have expired vaccines present (Figure 3.9). The practice of storing vaccines by expiration date and maintaining an up-to-date inventory is widespread, with 9 in 10 facilities storing vaccines by expiration date and 86 percent having an up-to-date inventory.

Hospitals are more consistent than other types of facilities (90 percent) in maintaining vaccine monitoring systems (Table 3.9). Among the provinces, Nairobi has the weakest stock monitoring system, with 49 percent having an adequate system (Table 3.9).

### 3.3.2 Storage and Stock Monitoring Systems for Contraceptive Methods and Medicines

To prevent chemical deterioration and contamination, facilities must store medications and contraceptives away from sunlight, under dry conditions, and in an area protected from rodent or pest infestation.

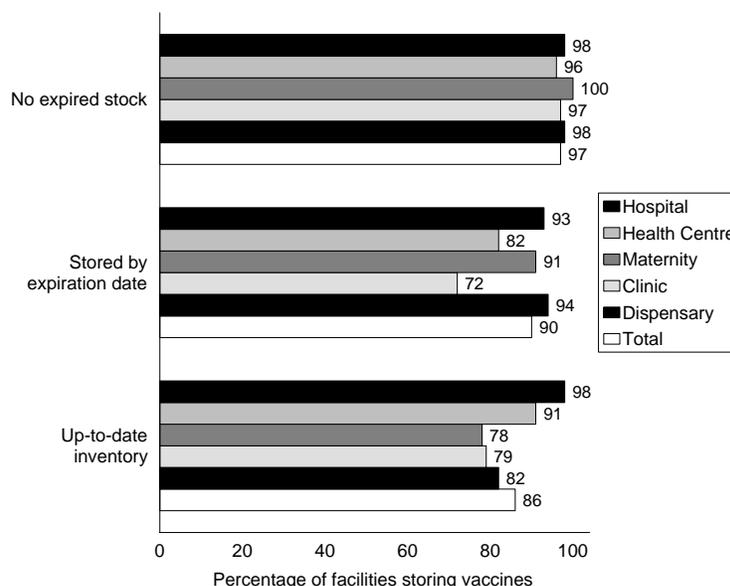

#### Storage Conditions

In general, storage conditions for contraceptives are adequate in 92 percent of facilities (Table 3.10 and Figure 3.10) and for medicines in 86 percent of facilities (Table 3.10 and Figure 3.11). Five percent and 10 percent of the facilities do not ensure that contraceptives and medicines, respectively, are off the floor and protected from water (Table A-3.14).

#### Stock Monitoring Systems

The KSPA assessed stock monitoring practices for selected contraceptive methods (combined oral pill, IUDs, three-month injectables, and condoms) and selected medicines (antibiotics and Ringers lactate

Figure 3.9 Elements for monitoring vaccine stock (N=320)

intravenous solution). While 62 percent of facilities have all the assessed stock monitoring components for contraceptive methods, only 38 percent meet the KSPA criteria for monitoring medicine stocks (Table 3.10). In both cases, maternities and clinics are least likely to meet the KSPA stock monitoring criteria (Table 3.10). Similarly, NGO and private for-profit facilities have weaker stock monitoring systems than the other managing authorities.

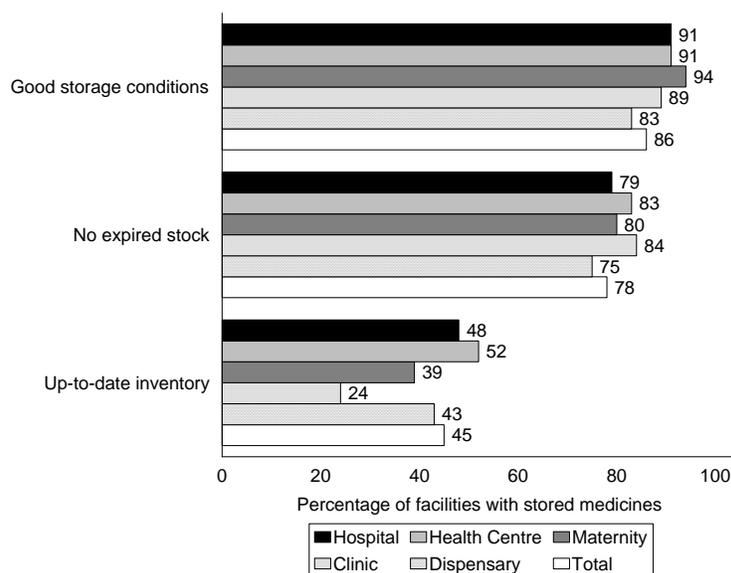

One percent of facilities had expired contraceptive methods on the day of the survey (Figure 3.10), and 22 percent had expired medicines (Figure 3.11). All facility types had some expired medicines, but dispensaries and hospitals (25 and 21 percent, respectively) were more likely to have expired medicines than other facility types. More than 80 percent of facilities store their vaccines and contraceptive methods by expiration date (Figure 3.9 and 3.10). Up-to-date inventories are maintained for contraceptive methods in 72 percent of facilities and for medicines in 45 percent of facilities (Figures 3.10 and 3.11).

Figure 3.10 Elements for storing and monitoring stock for contraceptives (N=298)

Kenya SPA 2004

Figure 3.11 Elements for storing and monitoring stock for medicines (N=429)

Kenya SPA 2004

## Key Findings

Three-fourths of facilities that store vaccines have all the necessary components for adequately monitoring storage temperature. This implies that problems in monitoring and maintaining a safe temperature for storing vaccines still exist in all types of facilities. Monitoring and maintenance of cold chain is weakest in private for-profit facilities.

Systems for stock monitoring for vaccines and contraceptives are adequate in 77 and 62 percent, respectively, of all facilities.

Systems for stock monitoring of vaccines are weakest in Nairobi province (49 percent) and strongest in Central province (98 percent). Similarly, the system for stock monitoring of contraceptives is weak in Nairobi province (35 percent) and strong in Coast province (87 percent).

Management of stock for vaccines and contraceptives is relatively good; more than 70 percent of facilities store these commodities by expiration date and maintain an up-to-date inventory. However, maintenance of an up-to-date inventory for medicines is sub-standard (45 percent of all facilities).

About 2 in 10 facilities have expired medicines in stock.

## 3.4 Systems for Infection Control

“Universal precautions” is a term applied to infection control measures used to prevent cross-infection from blood and body fluids. These universal precautions should be exercised by all health workers who may come into contact with contaminated fluids, under the assumption that anyone may have an infectious condition (CDC, 1987; JHPIEGO, 2003).

Conditions for infection control were assessed in service delivery areas included in the KSPA 2004. These include conditions under which hand-washing by the health care provider between seeing different

clients, could be reasonably expected, and presence of a secure box in which sharp items such as disposable needles—which may be contaminated with HIV or hepatitis or other blood-borne infections—can be securely disposed.

Summary information on facilities' capacity to process equipment for reuse is presented in Table 3.11, and aggregate information is presented in Table 3.12 on equipment processing capacity and infection control measures available in service delivery areas. Details are presented in Figures 3.12 through 3.14 on the individual elements that the KSPA defined as necessary for processing equipment and maintaining infection control in the service delivery areas. Further details are available in Appendix Tables A-3.22 through A-3.25.

**Table 3.11 Capacity for quality processing of equipment for sterilisation or high-level disinfection**

<sup>1</sup> Processing area has functioning equipment and power source for method and reports the correct processing time (or the equipment automatically sets the time) and processing temperature (if applicable) for at least one method. Definitions for capacity for each method assessed were functioning equipment and processing conditions of the following:

- Dry heat sterilisation: Temperature 160° to 169° C and processed for at least 120 minutes or temperature at least 170° C and processed for at least 60 minutes
- Autoclave: process wrapped items at least 30 minutes, unwrapped items at least 20 minutes
- Boiling or steaming: process at least 10 minutes
- Chemical disinfection: with chlorine base or glutaraldehyde solution and soaked for at least 20 minutes.

<sup>2</sup> This refers to a passive timer that can be set to indicate when a set time has passed. This may be a part of the sterilisation or HLD equipment.

### 3.4.1 Capacity for Adherence to Standards for Quality Sterilisation or High-Level Disinfection Processes

For syringes and most examination equipment, either sterilisation or high-level disinfection (HLD) procedures are sufficient to prevent the spread of infection. However, to effectively kill the spores that cause illnesses such as tetanus, either dry-heat sterilisation or an autoclave system (or the less frequently used chemical sterilisation<sup>2</sup>) is required. These systems are necessary for processing gloves or surgical equipment that will be reused, including for example blades and scissors used to cut an umbilical cord.

Table 3.12 Infection control and hazardous waste control

Note: Refer to Table 1.1 for the actual number of facilities included in survey and analysis. Weighting results in small numbers for some categories of facilities.

<sup>1</sup> Items are wrapped and sealed with time-steam-temperature-sensitive (TST) tape, or items are in sterile or HLD-processed container that clasps shut, and processing time is written.

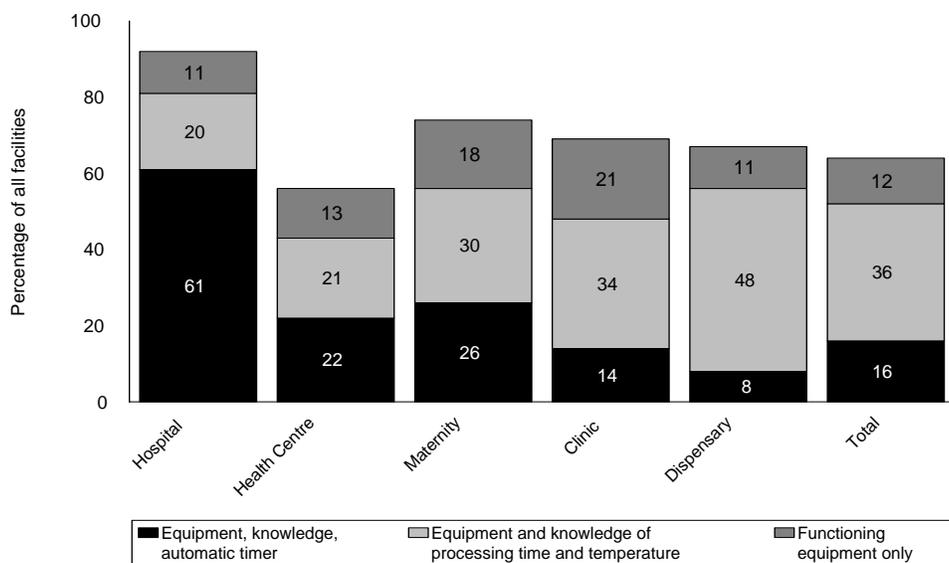

<sup>2</sup> Soap and water in all areas, sharps box in all areas (except consultation for sick child), disinfecting solution and latex gloves in family planning, antenatal care, delivery, and STI client examination areas

<sup>3</sup> Final disposal of contaminated waste is to incinerate, bury, or remove off site, and waste is not visible or is kept under protected conditions on day of survey.

<sup>2</sup> Formaldehyde or glutaraldehyde (Cydex)

Depending on the size of the facility, different types of equipment may be processed using different methods or in more than one site in the facility. The information presented in this chapter refers to the primary site in the facility where equipment is processed. Sixty percent of facilities have functioning equipment (or chemicals for sterilisation or HLD processing) for the processing method used, and 52 percent have the functional equipment and correct knowledge of the processing time (and temperature, for dry heat sterilisation) for the method used. When an automatic timer is added to the assessment (where applicable), the proportion drops dramatically (to 16 percent). The great majority of hospitals (92 percent) and about three-fourths of health centres have functioning equipment. NGO-managed facilities have a slight edge over other facilities in this area. The availability of functional equipment varies from 31 percent in North Eastern province to 94 percent of facilities in Western province (Figure 3.12 and Table 3.11). Written guidelines for sterilisation/HLD processing (in any service area) were found in only 12 percent of facilities.

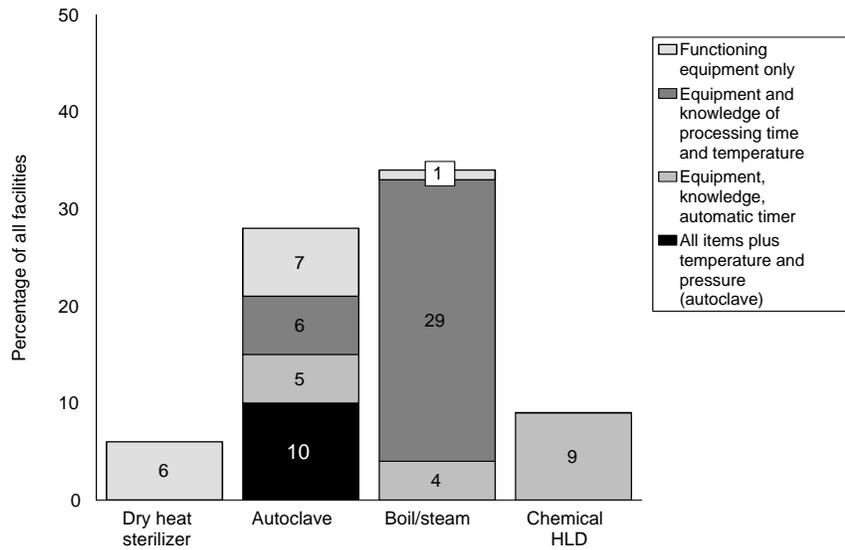

Figure 3.12 Capacity to sterilise or HLD process equipment (any process) (N=440)

Kenya SPA 2004

Among the various methods for processing equipment, boiling/steaming is the most commonly used method and the one for which KSPA observers most often found functioning equipment and knowledge of the correct processing time (33 percent of facilities) (Figure 3.13). However, only 9 percent also had an automatic timer. The next most common processing method is autoclaving; 10 percent of facilities had a functioning autoclave, an automatic timer, and staff who could report the correct processing time, temperature, and pressure for correct utilisation.

Figure 3.13 Facilities with indicated elements for processing equipment using indicated method (N=440)

Note: Facility may have more than one method

Kenya SPA 2004

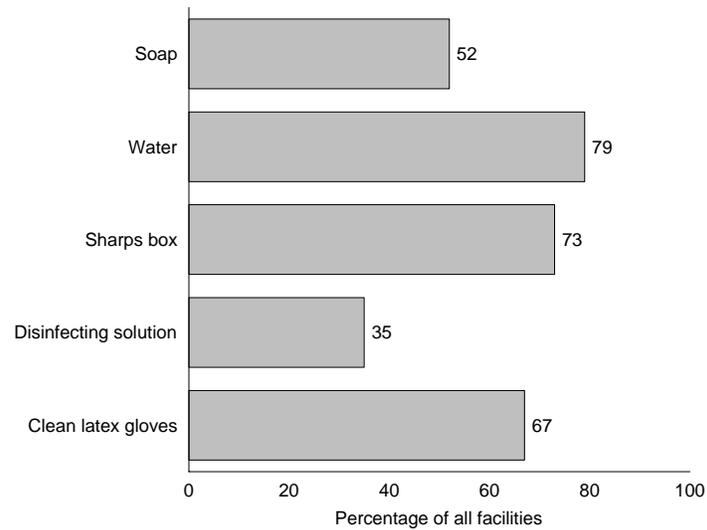

### 3.4.2 Appropriate Storage Conditions for Processed Items

After sterilising equipment, facilities must be able to store it under sterile conditions. The storage conditions that must be observed to maintain sterility or HLD status are: 1) storing items in a dry location; 2) either wrapping them in sterile dry cloth, or placing them in a sterile or HLD-processed container that can clasp shut; and 3) writing the processing date on the item, because the sterile/HLD status cannot be ensured after one week unless the item is also sealed in plastic. Other common storage procedures that may be accepted in some settings (such as keeping unwrapped items in an autoclave or keeping them on a tray covered with a clean cloth) do not ensure sterile/HLD status. Among facilities that store processed items, only 20 percent do so under sterile conditions and with processing dates on processed items. Hospitals and facilities in Nairobi (62 and 66 percent, respectively), and private for-profit facilities to some extent (49 percent), are most likely to store processed items under appropriate conditions (Table 3.12).

### 3.4.3 Infection Control in Service Delivery Area

Nosocomial infections (infections that are contracted from the health facility) are always possible and complicate care giving for any health system. Control measures and constant vigilance are necessary to prevent infections. Only 14 percent of facilities had all relevant infection control items available in all assessed service delivery areas (Table 3.12). Figure 3.14 presents a summary of which specific infection control items were available in all the assessed and relevant service delivery areas in a facility. Soap and clean latex gloves were available in 52 and 67 percent, respectively, of service delivery areas.

Figure 3.14 Availability of specific infection control items in all assessed and relevant service delivery areas in a facility (N=440)

Kenya SPA 2004

### 3.4.4 Adequate Disposal of Hazardous Waste

Hazardous waste includes items that may be contaminated by blood or other biological waste and may be infectious if touched (such as bandages, used cotton balls, needles, and syringes). The most effective means for disposal is incineration and subsequent burial of the remains. Burying items in deep pits is also an effective means of disposal. When assessing whether facilities have adequate systems for disposing of hazardous waste, the most important issue is verifying that there is, in fact, a process for disposal that eliminates the possibility of contamination through contact. If the waste is visible and not protected from animals or people, either before or after being removed, burned, or buried, there is an increased chance that people might inadvertently come in contact with it, risking subsequent infection. Details on waste disposal systems are provided in Appendix Table A-3.25.

Data collectors were asked to determine which system each facility used, and then to go to the location where waste is stored prior to disposal, or to the disposal site itself, to assess if there were non-processed wastes that were not protected. Only 38 percent (Table 3.12) of the assessed facilities have an adequate waste disposal system. A larger proportion of hospitals, maternities, and stand-alone VCT facilities (63, 60, and 54 percent, respectively) are equipped to handle waste safely. Unfortunately, government-managed facilities are least likely to have an adequate waste disposal system (29 percent); NGO-managed facilities were most likely (75 percent) (Table 3.12). At the provincial level, only one-fourth of all facilities in Rift Valley province have adequate waste disposal systems, compared to 64 percent in Nairobi province.

## Key Findings

Sixty percent of facilities have functional equipment for the processing method they use for infection control. However, only 16 percent also have an automatic timer and staff who know the correct processing time.

Boiling/steaming is the most commonly used method for sterilising/disinfecting equipment; facilities are also most likely to have functioning equipment and staff who know the correct processing temperature and time for boiling/steaming.

Among facilities that store sterile or HLD items, only 20 percent store them according to the defined standards.

Only 38 percent of facilities had an adequate disposal system; this percentage varies from 29 percent for health centres to 63 percent for hospitals.

Government-managed facilities are least likely to have an adequate waste disposal system (29 percent); NGO facilities are much more likely to have an adequate system (75 percent).

Only one-fourth of all facilities in Rift Valley province have an adequate waste disposal system, compared with 64 percent in Nairobi province.

## 4.1 Background

### 4.1.1 KSPA Approach to Collecting Child Health Information

The World Health Organisation (WHO) estimates that over 10 million children under 5 years of age die annually from preventable diseases. According to WHO, many sick children who are brought to see a health provider do not receive adequate assessment and treatment (WHO, 1999b). It is not uncommon for a provider to treat the symptom that is most evident, without conducting a full assessment of the child's health status and acting to prevent further diseases. For this reason, WHO and other agencies developed the Integrated Management of Childhood Illnesses (IMCI) strategy. This strategy promotes using every visit to a health care provider as an opportunity not only to conduct a full assessment of the child's current health and possible underlying problems, but also to provide preventive interventions such as immunisation and growth monitoring (for early detection of faltering growth) to prevent or minimize progression to illness.

The IMCI strategy aims to reduce morbidity and mortality among children less than five years of age, through implementation of three components:

1. Improving health workers' skills through training and supportive supervision;
2. Improving health systems to include equipment, supplies, organisation of work, and referral systems, among others;
3. Improving childcare at the community and household level in line with key family practices.

The first component helps first-level health workers assess and appropriately treat the five major childhood illnesses in a holistic approach. Kenya is in the expansion phase of implementation of the IMCI strategy, having started in three districts, Embu, Kajiado, and Vihiga. The programme is currently being rolled out to districts not included in the early implementation phase, as well as to areas not yet covered in the districts already implementing IMCI. At the time of the survey, only 24 out of 71 districts were implementing IMCI at the health facility level, and even then, only in some areas; an estimated 7 percent of all health facilities implement the IMCI strategy. Therefore, most Kenyan health workers are not expected to be using the IMCI approach. However, many of the elements in the IMCI protocol are already part of Kenya's standards and policy on the delivery of child health services. WHO recommends that 60 percent of health workers seeing children under five in health facilities be trained in IMCI case management to ensure a critical mass for quality management of sick children's health.

The utilisation of the IMCI framework in this assessment is expected to provide useful baseline IMCI measures which can be used later to judge progress in implementing the strategy across Kenyan health facilities. Therefore, the IMCI protocol is used whenever possible in looking at the delivery of child health services at the health facility level.

This chapter uses information obtained in the KSPA 2004 to address the following four central questions:

- What is the availability of outpatient services relevant to child health?
- To what extent do facilities offering immunisation services for children have the capacity to support quality vaccination services?
- To what extent do the health facilities providing outpatient care for sick children have the capacity to support quality services in adherence to IMCI guidelines?

- To what extent is there evidence that health service providers involved in providing outpatient care for sick children are adhering to standards for quality service provision?

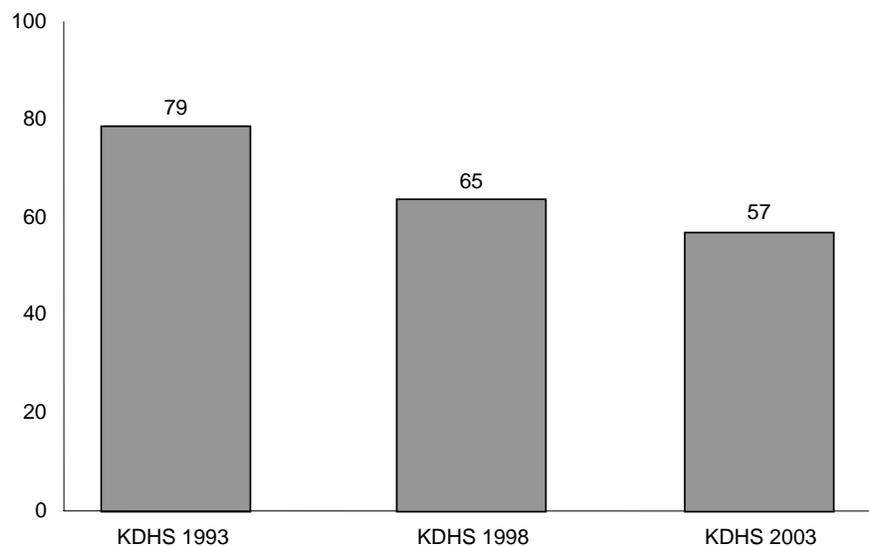

#### 4.1.2 Health Situation of Children in Kenya

##### *Vaccine Coverage*

Immunisation against vaccine-preventable diseases is key in reducing child morbidity and mortality levels. The Kenya Expanded Programme of Immunisation (KEPI) under the Ministry of Health is aimed at ensuring that all children are fully immunised by their first birthday. Children should receive one dose of tuberculosis vaccine (BCG); three doses of the vaccine against diphtheria, pertussis, tetanus, Hepatitis B, and Haemophilus influenza b (DPT-HepB-Hib, or pentavalent); three doses of polio vaccine (OPV), and one dose of measles vaccine. However, only 57 percent of children age 12-23 months have received all these immunisations, compared with the KEPI target of 80 percent (KDHS 2003). Moreover, immunisation coverage rates have decreased between 1993 and 2003 (Figure 4.1). Community coverage figures are expected to improve as the country implements the Reach Every District (RED) strategy.

Recent findings show that fewer detected measles cases test positive for the wild measles virus, while rubella cases are on the increase (service statistics). This may be an indication to consider adding mumps and rubella to the measles vaccine (i.e. using the measles-mumps-rubella, or MMR, vaccine) to protect more children. The yellow fever vaccine is indicated in only four districts in the Rift Valley province (Koibatek, Keiyo, Baringo, and Marakwet).

Figure 4.1 Percentage of children age 12-23 months immunised against the eight KEPI target illnesses, Kenya DHS 1993, 1998 and 2003

##### *Nutritional Status and Care Seeking*

Malnutrition is an underlying factor in about 70 percent of the illnesses that cause death among children under five. The KDHS 2003 found that about a third of children under five in Kenya are stunted or too short for their age. Specifically, 30 percent were stunted, 11 percent were severely stunted, and 20 percent were underweight. The findings further show that of all children suffering from fever and/or symptoms of acute respiratory infections, 46 percent were taken to health facility/provider for treatment. However, a

significant percentage were not taken for treatment, showing the need to improve on care-seeking behaviour among Kenyan communities.

### ***Childhood Mortality and Morbidity***

The 2003 KDHS provides household-based child mortality data, as well as information on what illnesses children experienced and whether they received health care during the two weeks preceding the household survey visit. Key findings include the following:

- The infant mortality rate was estimated at 77 deaths per 1,000 live births in the five years preceding the survey.
- The under-five mortality rate was estimated at 115 deaths per 1,000 live births.
- Forty-six percent of children with reported acute respiratory infections (ARI) and/or fever during the two weeks before the survey were reported by their caretaker to have been seen by a health professional.
- Antibiotics were reported to have been given to 18 percent of children whose caretaker said they had symptoms of cough and short, rapid breathing during the two weeks before the survey.
- Sixteen percent of children under five were reported by their caretaker to have had diarrhoea in the two weeks preceding the survey.
- When asked about providing fluids during the child's diarrhoeal illness, 34 percent of caretakers reported that they had given the child more fluids.
- The recommended treatment for diarrhoeal diseases (other than dysentery, where antibiotics are recommended) is fluid replacement. Twenty-nine percent of children with diarrhoea were reported to have received oral rehydration therapy, either with oral rehydration salts or recommended home solutions. Altogether, some form of oral rehydration therapy was used to treat 51 percent of diarrhoea episodes; 22 percent received syrups or tablets of some sort. A significant proportion of children with diarrhoea were reported to have been treated with medicines bought directly from the pharmacy or with home remedies.
- Fifteen percent of children under five slept under mosquito nets the night before the survey, while only five percent slept under insecticide-treated nets.
- Forty-two percent of children under five years of age were reported as having had fever and/or convulsions in the two weeks preceding the survey. Of those, 27 percent took anti-malarial drugs; however, only 11 percent received antimalarial medicines within one day of symptoms.
- Eleven percent of children under 15 do not live with either of their parents and are therefore considered fostered. Nine percent and four percent had lost their fathers and mothers, respectively, while 2 percent had lost both parents.

## **4.2 Availability of Child Health Services**

Among the essential preventive and curative child health services, the KSPA assessed the availability of outpatient curative care for sick children, routine childhood immunisation services (under the Expanded Programme of Immunisation, or EPI), and routine growth monitoring services. Table 4.1 provides information on the availability of these services. Appendix Tables A-4.1 and A-4.2 provide further details on frequency of service and community outreach services.<sup>1</sup>

Health services in Kenyan facilities are relatively integrated; about 8 in 10 facilities offer all three of the above basic child health services. Childhood immunisation is provided in 83 percent of facilities (com-

---

<sup>1</sup> Community outreach refers to any services provided outside of the facility. For immunisations, this might include activities related to campaigns, such as the polio eradication campaign.

pared with 86 percent in 1999), growth monitoring in 81 percent (compared with 90 percent in 1999), and outpatient curative care for sick children in 97 percent (compared to 88 percent in 1999). Hospitals and FBO-managed facilities are more likely than other facility types to provide all the basic services. Facilities in Nairobi and Eastern province are least likely to offer all these services.

Outpatient curative care is the most commonly provided of the three basic services. It is almost universally available across all types of facilities, managing authorities and provinces, apart from Nairobi province, where a slightly smaller proportion of facilities offer this service for sick children.

<b>Table 4.1 Availability of child health services</b>					
Percentage of facilities offering the indicated child health services at the facility, by type of facility, managing authority and province, Kenya SPA 2004					
Background characteristics	Percentage of facilities that provide:				Number of facilities (weighted)
	Outpatient care for sick children	Growth monitoring	Childhood immunisation	All basic child health services	
<b>Type of facility</b>					
Hospital	98	93	96	92	28

<b>Managing authority</b>					
Government	97	81	85	79	245
NGO	100	89	89	89	16
Private (for-profit)	94	63	50	49	61
Faith-based organisation	100	92	95	91	109
<b>Province</b>					
Nairobi	88	69	69	66	37
Central	95	79	83	78	50
Coast	100	91	79	79	49
Eastern	95	62	73	56	81
North Eastern	99	89	94	88	8
Nyanza	100	94	94	94	54
Rift Valley	100	85	87	84	124
Western	98	94	94	94	29
<b>Total</b>	<b>97</b>	<b>81</b>	<b>83</b>	<b>78</b>	<b>430</b>

Note: Refer to Table 1.1 for the actual number of facilities included in survey and analysis. Weighting results in small numbers for some categories of facilities.

Maternities and clinics are least likely to offer childhood immunisation services (70 and 42 percent, respectively); private for-profit facilities and facilities in Nairobi province are also relatively unlikely to provide childhood immunisation. Facilities in Western, Nyanza and North Eastern provinces (94 percent each) are most likely to provide this service. The low proportion of facilities offering immunisation services in Nairobi may be explained by the fact that most facilities in Nairobi are referral facilities; many are also privately owned and do not offer basic routine services.

Routine growth monitoring is offered at similar or slightly lower levels than child immunisation, especially at dispensaries and in the Eastern province. Given the documented levels of malnutrition in the country (KDHS 2003), increasing the availability of growth monitoring services for early identification of nutrition problems and interventions to address the causes of malnutrition should be considered. Moreover, the absence of immunisation services in some health facilities results in unacceptably high missed opportunities for immunisation and vitamin A supplementation.

## Key Findings

Eight in ten facilities offer all three basic child health services (outpatient curative care for sick children, immunisations, and growth monitoring). Outpatient curative care for sick children is the most commonly offered child health service (97 percent of facilities), and growth monitoring the least offered service (81 percent). There has been a small decrease in the availability of preventive services for children since 1999.

Childhood immunisation services are least available in Nairobi health facilities (69 percent) compared to Western, Nyanza and North Eastern (94 percent). This is a decline from 1999, when 88 percent of facilities in Nairobi and 100 percent in Western province offered childhood immunisation.

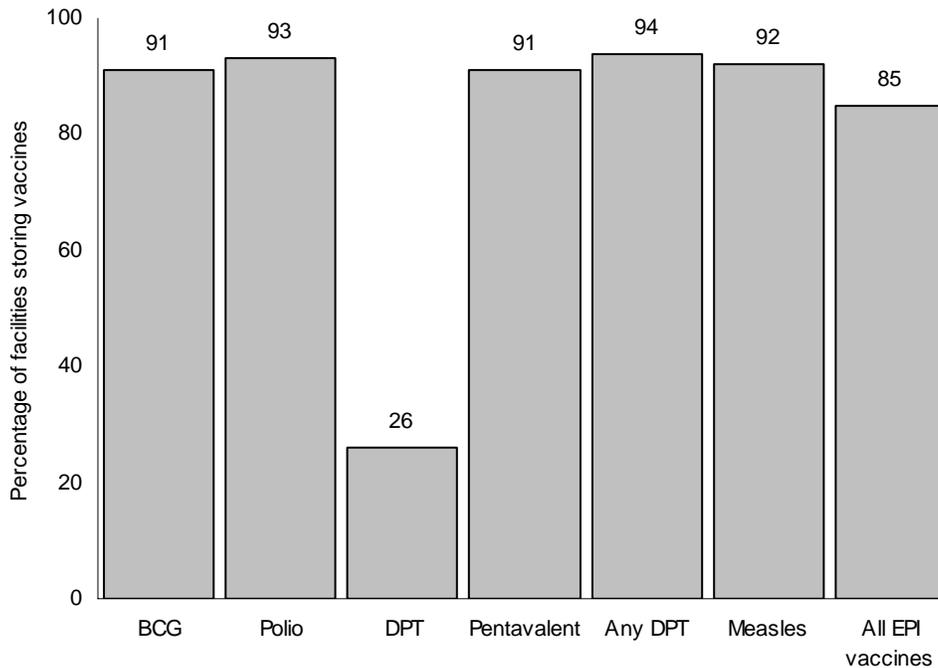

Private for-profit facilities are least likely to offer immunisation services (50 percent), compared with 95 percent of faith-based organisations.

### 4.3 Capacity to Provide Quality Immunisation Services

The following section addresses elements that are important for quality immunisation services:

- capacity to maintain the quality of vaccines;
- availability of vaccines and vitamin A;
- availability of equipment and supplies for vaccination sessions; and
- availability of administrative components for monitoring immunisation activities.

Figure 4.2 Availability of vaccines among facilities offering child vaccination services and storing vaccines (N=331)

Kenya SPA 2004

#### 4.3.1 Capacity to Maintain the Quality of Vaccines

Lack of electricity or other fuel to maintain the cold chain is a common reason facilities cannot, or do not, store vaccines. If a facility cannot store vaccines, it must collect them from a central location and maintain their temperature using ice packs and mobile vaccine carriers on the days of service. The logistic considerations for maintaining the cold chain when vaccines cannot be stored frequently result in limited availability of vaccination services. Information on vaccine storage conditions is provided in Chapter 3, with details on elements assessed provided in Table 3.9.

In general, of all facilities with stored vaccines observed, 73 percent have an adequate system for monitoring storage temperature, while 77 percent adequately monitor stocks. Regarding monitoring storage temperature, private for-profit facilities and facilities in Nyanza province (56 and 26 percent, respectively) are least likely to have an adequate system. Just over half of facilities in Nairobi province do not have adequate vaccine stock monitoring systems (Table 3.9).

#### 4.3.2 Availability of Vaccines and Vitamin A

Availability of child vaccines was assessed at eligible facilities (those that store vaccines and provide child immunisation services). These results are summarized in Figures 4.2 and 4.3. Additional detail on vaccine availability by facility type and province is found in Appendix Table A-4.3.

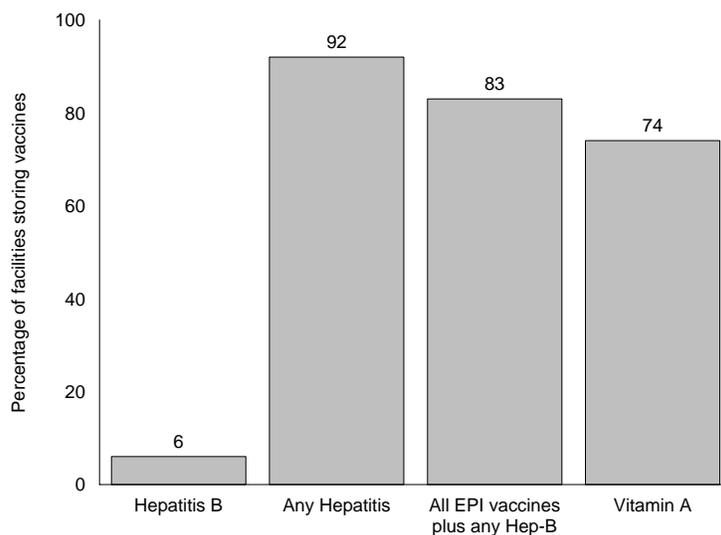

All basic EPI vaccines for the eight major childhood diseases are available in 85 percent of eligible facilities (Figure 4.2, Table A-4.3). The individual vaccines are consistently available in most eligible health facilities (at over 90 percent). Most facilities are replacing DPT only (available in 26 percent of facilities) with the pentavalent vaccine (DPT-HepB-Hib), which is available in 91 percent of facilities.

Forty percent of facilities had all components for providing quality child immunisation, including vaccines, in stock on the day of the survey (Table 4.2). Among the different categories of eligible health facilities, there is notable variation in the percentage that have all vaccines; maternities are highest, at 91 percent, and clinics are lowest, at 77 percent. Each type of vaccine is missing in 6 to 9 percent of facilities (Figure 4.2). Data on availability of the vaccines for the six basic immunisations plus hepatitis B and Hib are similarly available (91 percent of eligible facilities) in Appendix Table A-4.3.

Yellow fever vaccine is indicated in only four districts in Rift Valley province (Baringo, Koibatek, Keiyo and Marakwet) and is therefore not expected to be available in most facilities. Only half of eligible facilities in these four districts actually have the yellow fever vaccine available (data not shown). Availability of hepatitis B vaccine is high (92 percent), as it is a component of the widely available pentavalent vaccine (Figure 4.3).

It is a recommended WHO policy to routinely distribute high-dose vitamin A capsules to children. Vitamin A is essential for the functioning of the immune system and for healthy growth and development. Vitamin A also provides protection from respiratory infections (as well as night blindness); these conditions are more common when children are deficient in vitamin A. Vitamin A supplementation has been added to the EPI programme in many countries. In Kenya, the policy is to provide high-dose vitamin A starting at 6 months of age and then every 6 months up to the age of 5 years. Seventy-four percent of facilities offering sick child services have vitamin A available in the facility (Figure 4.3).<sup>2</sup>

Figure 4.3 Availability of additional child vaccines among facilities offering child vaccination services and storing vaccines (N=331)

Kenya SPA 2004

### 4.3.3 Availability of Equipment and Supplies for Vaccination Sessions

Information on the availability of all the components assessed for quality immunisation services is provided in Table 4.2 and Figure 4.4. Details on item availability by facility type are available Appendix Table A-4.4.

<sup>2</sup> Vitamin A was assessed in the pharmacy but not in the child health service delivery area.

### ***Equipment***

All equipment for vaccination sessions—blank immunisation cards, syringes and needles, and cold box with ice pack—is available at 81 percent of facilities that offer child immunisation services and store vaccines. Fewer government facilities and facilities in Nyanza have all these basic items (71 percent and 60 percent, respectively) (Table 4.2). Blank immunisation cards were missing in a few facilities but were available in 83 percent of eligible health facilities, while syringes, needles, and cold boxes with ice packs were more readily available (99 and 98 percent, respectively). The availability of cold boxes and ice packs in almost all the facilities offering child immunisation services supports the maintenance of cold chain during transportation and vaccination sessions (Table A-4.4).

### ***Infection Control***

Infection control is critical to providing quality care, including immunisation services. Among eligible facilities, 75 percent had all three infection control items (soap, water, and sharps box) (Table 4.2). Hospitals have a slight edge over other facility types in this area. Similarly, facilities in Nairobi and Central provinces were most likely to have all infection control items (92 percent each) and facilities in North Eastern province were the least likely (37 percent). Water and sharps boxes are the most commonly available of the three infection control items, available at 91 percent and 95 percent of facilities, respectively (Appendix Table A-4.4).

Table 4.2 Health system components required for childhood immunisation services

<sup>2</sup> Soap, water (any source), and sharps container.

<sup>3</sup> Tally sheet or register where vaccines provided are recorded and documentation of either DPT dropout rate or measles coverage.

<sup>4</sup> All facilities offered immunisations at the facility. Some facilities also offer immunisations through village outreach activities.

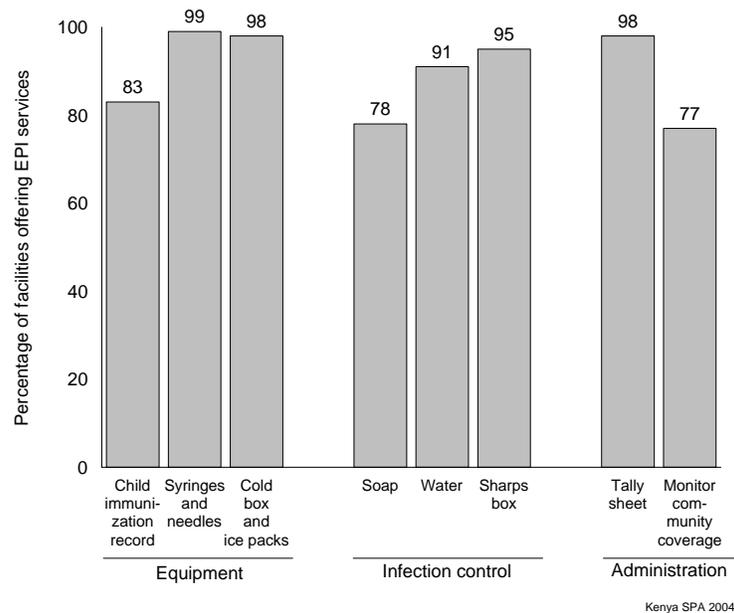

<sup>5</sup> Basic child vaccines are BCG, any DPT, polio, and measles.

#### 4.3.4 Availability of Administrative Components for Monitoring Immunisation Activities

The KSPA 2004 looked for evidence that facilities were keeping records that could provide information for monitoring immunisation activities.

Measures often used for monitoring immunisation coverage include the DPT dropout rate (the difference between the number of children who receive the first dose of DPT and the number who complete all three doses) and vaccine coverage rates. Measures of immunisation coverage require an estimate of a target population. The KSPA 2004 specifically assessed whether DPT dropout rates or measles coverage information was available. Almost all facilities have registers (or tally sheets) for documenting immunisations provided, whereas a smaller proportion have documentation of monitoring community coverage (either measles coverage or DPT dropout rates) (Appendix Table A-4.4, Figure 4.5). NGO-managed facilities and facilities in Nairobi, Nyanza, and Western provinces have better immunisation monitoring information than other facilities.

Figure 4.4 Availability of equipment and supplies for immunisation services (N=356)

### Key Findings

Eighty-three percent of facilities offering child immunisation services and storing vaccines have all basic (EPI) child vaccines in stock, plus hepatitis B vaccine.

Each type of vaccine is missing from 6-9 percent of facilities.

Use of disposable syringes and needles for immunisation is universal in Kenya.

All items for infection control are available in the immunisation service delivery area in three-fourths of facilities. Soap for hand-washing is the item least often found (78 percent), and five percent of facilities do not have a sharps box in the immunisation area.

Two in five facilities have all the components needed to support quality immunisation services, according to the KSPA definition.

Availability of all KSPA-assessed immunisation items varies among categories of health facilities. All three components for high quality immunisation, equipment, items for infection control, and evidence of record-keeping were found in 60 percent of hospitals, but in only 29 percent of clinics; they were present in 64 percent of FBO facilities, but in only 40 percent of government facilities.

## 4.4 Capacity to Provide Quality Outpatient Care for Sick Children

To improve the diagnosis of illnesses and to minimize missed opportunities to provide preventive interventions, IMCI standards recommend that the following be part of any consultation for a sick child:

- Assessing immunisation status and providing vaccines that are due;
- Assessing nutritional status and counselling caretakers on identified problems;
- Assessing overall health status;
- Ensuring that the child receives the first dose of any prescribed drugs, including antibiotics, at the facility, and leaves the facility with the necessary medications;

- Ensuring that the caretaker knows how to administer the necessary medications or treatments, knows about appropriate foods, and knows how much the child needs both during this sickness and when not sick;
- Ensuring that the caretaker knows signs of when to return the child immediately and for the scheduled follow-up.

The KSPA 2004 assessed the availability of equipment, supplies, and health system components necessary to adhere to IMCI guidelines and to support quality outpatient care for sick children (WHO, 1999b; WHO, 2002). Assessed elements are as follows:

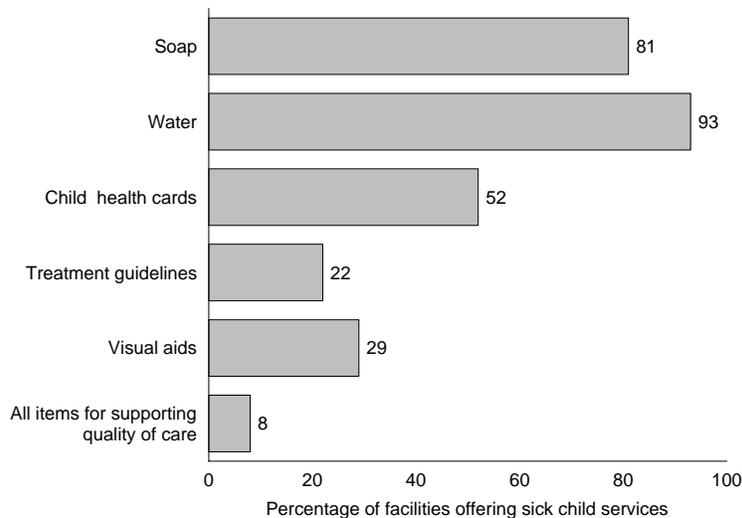

- Infrastructure and resources to support quality assessment and counselling;
- Equipment and supplies for adhering to IMCI guidelines for assessment of the sick child;
- Essential medicines for treating sick children, in adherence to IMCI guidelines;
- IMCI job aids (chart booklet, recording form, and mother’s/caretaker’s cards).

#### 4.4.1 Infrastructure and Resources to Support Quality Assessment and Counselling for the Sick Child

To support quality assessment and counselling, the following should be readily available in areas where sick children receive services: soap and water for infection control, individual child health cards, treatment protocols, and visual aids. Figure 4.5 provides information on the availability of these items, with further details in Appendix Tables A-4.5 and A-4.6.

All of the above items are available in only 8 percent of eligible facilities (Figure 4.5, Appendix Table A-4.5). Treatment guidelines (necessary for quick reference) are available in only 22 percent of the facilities, and hospitals are more likely to have them (33 percent) than other facility types. Individual child health cards or records, important for continuity of care, are available in just over half of facilities; visual aids are available in approximately three in ten facilities.

Figure 4.5 Availability of items to support quality of care for sick children (N=417)

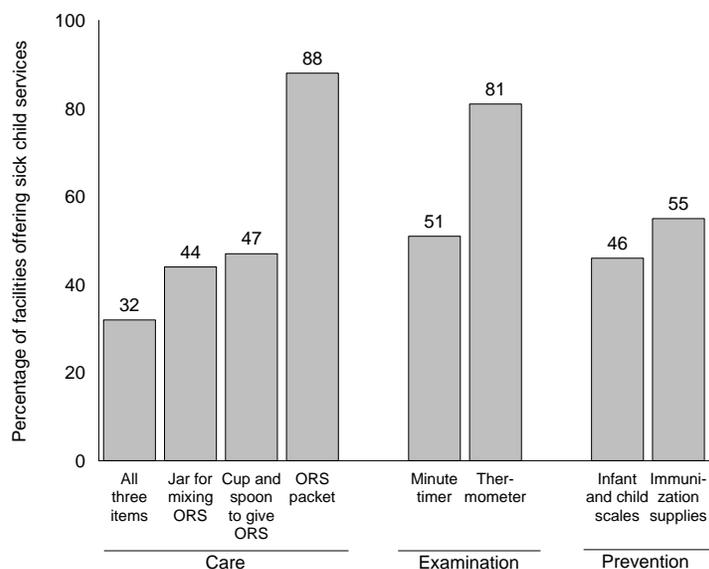

Kenya SPA 2004

Because the government is promoting IMCI, one might expect items related to IMCI (such as IMCI charts and booklets, IMCI counselling cards for providers, and IMCI caretaker cards) to be widely available in facilities. Surprisingly, only 11 percent of facilities offering curative care for sick children have IMCI charts or booklets, and only 5 percent have IMCI counselling cards for providers and for caretakers (Appendix Table A-4.6).

#### 4.4.2 Equipment and Supplies for Assessing and Providing Preventive Care for the Sick Child

The KSPA also assessed the availability of the equipment and supplies necessary for evaluating the status of sick children and for providing preventive interventions for adherence to IMCI guidelines. Figure 4.6 summarizes information on these items. Appendix Table A-4.5 provides details by facility type, and Appendix Table A-4.7 provides information on the availability of sick child and EPI services on the same day in the same facility.

Figure 4.6 Availability of equipment and supplies for assessing health status of the sick child (N=417)

Kenya SPA 2004

Among facilities offering sick child services, 55 percent had all items for quality immunisation services (basic vaccines, syringes, cold boxes, items for infection control in the EPI service area, and child immunisation cards) (Figure 4.6, Appendix Table A-4.5). This means about half of facilities have the service delivery pattern or the capacity to adhere to the IMCI guidelines of using every contact with the facility to provide needed immunisations. Thirty-four percent of facilities report providing immunisation services every day sick child services are offered; however, 58 percent were actually providing both services on the day of the survey (Appendix Table A-4.7). Differentials by management authority show that government facilities are more likely to offer the two services together (43 percent) than facilities managed by other authorities.

While 72 percent of eligible facilities have a scale appropriate for weighing an infant (100 gram graduation), and 58 percent have a scale appropriate for weighing older children (maximum 250 gram graduation), only 46 percent have both infant and child weighing scales (Figure 4.6, Appendix Table A-4.5).

Items for providing oral rehydration therapy on site are similarly lacking, with only 32 percent of facilities having all three necessary items (a cup and spoon, a jar for mixing, and packets of oral rehydration salts [ORS]). However, ORS packets are available in 88 percent of facilities.

Although a sick child can be assessed with little equipment, certain minimum standards are considered to be necessary for quality care. The KSPA 2004 assessed whether facilities had a thermometer and some type of minute timer for counting respirations. Thermometers are available in 8 in 10 facilities, and facility-provided timers are available in about half of the facilities.

#### 4.4.3 Essential Medicines for Treating Sick Children

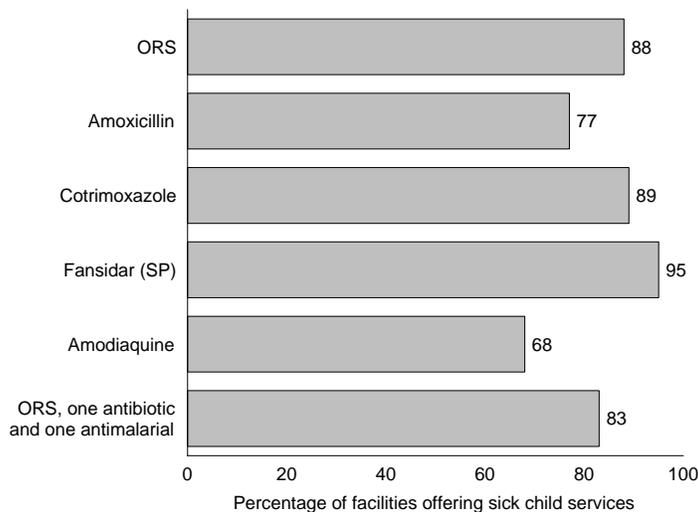

The KSPA 2004 also assessed the availability of the essential medicines defined in the IMCI guidelines. Summary information on the availability of medicines for sick children is provided in Figures 4.7 through 4.9 and in Table 4.3. Appendix Table A-4.8 provides details on available medicines by type of facility.

IMCI guidelines have defined first-line, pre-referral, and other important medications for treating the sick child. First-line medicines include packets of oral rehydration salts for diarrhoeal diseases, oral antibiotics such as amoxicillin or cotrimoxazole for respiratory infections, and antimalarial medicines such as SP (fansidar) and amodiaquine.

##### *First-line Medicines*

All the first-line medicines (ORS, at least one antimalarial, and at least one antibiotic) are available in 83 percent of facilities, with hospitals, health centres, and dispensaries more likely than others to have all first-line medicines (Appendix Table A-4.8, Figure 4.7). Cotrimoxazole is more widely available as a first-line antibiotic in Kenyan facilities than amoxicillin. Similarly, Fansidar (sulfadoxine-pyrimethamine) is more readily available as a first-line antimalarial than amodiaquine.

Figure 4.7 Availability of first-line medicines for treating sick children (N=417)

Kenya SPA 2004

**Table 4.3 Selected essential components to support quality care for sick children**

Percentage of facilities that have all indicated items, by type of facility, managing authority and province, Kenya SPA 2004

<b>Total</b>	<b>83</b>	<b>23</b>	<b>33</b>	<b>417</b>

Note: Refer to Table 1.1 for the actual number of facilities included in survey and analysis. Weighting results in small numbers for some categories of facilities.

<sup>1</sup> ORS, at least one oral antibiotic (amoxicillin or cotrimoxazole) and at least one antimalarial (Fansidar or amodiaquine).

<sup>2</sup> At least one first-line injectable antibiotic (ampicillin or penicillin) and one second-line injectable antibiotic (ceftriaxone or gentamycin), or injectable chloramphenicol, an intravenous solution (normal saline, Ringers lactate, or dextrose and saline 0.9 percent) with perfusion set and injection quinine.

<sup>3</sup> Aspirin, vitamin A, iron tablets, mebendazole, and an antibiotic eye ointment.

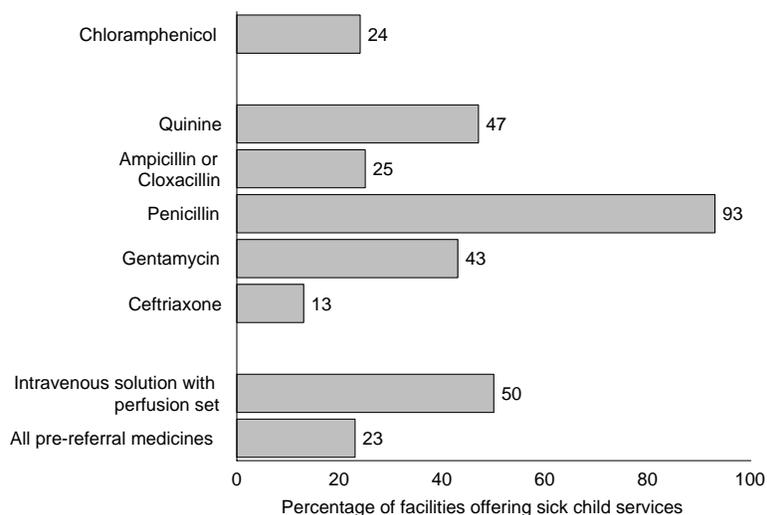

### *Pre-referral Medicines*

Pre-referral medicines are emergency injectable medications and intravenous solution (with perfusion set) for providing urgent treatment and rehydration before admitting the sick child or referring to another facility, if necessary. It should be noted that according to Ministry of Health policies, hospitals, health centres, and dispensaries are authorized to provide rapid rehydration for severely dehydrated children using intravenous solutions if they have facilities and skills.

In Kenya, a facility is defined as having all pre-referral medicines if it satisfies the following criteria: at least one first-line injectable antibiotic (ampicillin or penicillin) and at least one second-line injectable antibiotic (ceftriaxone or gentamycin), or injectable chloramphenicol, injectable quinine, and an intravenous solution (normal saline, Ringers lactate, or dextrose and saline 0.9 percent) with perfusion set. According to the KSPA 2004 findings, less than 3 in 10 facilities offering outpatient care for sick children have all these pre-referral medicines (Figure 4.8, Table 4.3). They are available mostly in hospitals and maternities (56 and 59 percent, respectively). NGO and private for-profit facilities are also more likely

than other facilities to have all pre-referral medicines (54 and 45 percent, respectively), and facilities in Western province are slightly more likely to have them than those in other provinces. Government facilities are the least likely to have all pre-referral medicines for sick children. Chloramphenicol is available in just a quarter of facilities, and quinine is available in less than half of facilities. Penicillin is almost universally available (Figure 4.8). Only half of all eligible facilities have intravenous solutions with perfusion sets.

Figure 4.8 Availability of pre-referral and other emergency treatment medicines (injectables) (N=417)

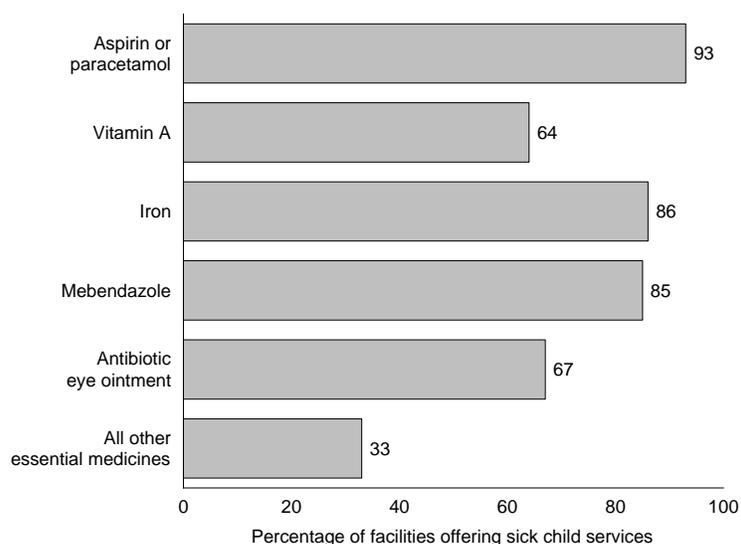

Kenya SPA 2004

### ***Other Essential Medicines and Vitamin A***

In addition to first-line and pre-referral medicines, the KSPA assessed the availability of a few other essential medicines, less critical for treating serious illness, but important for treating common symptoms and illnesses of sick children. These include an antipyretic (paracetamol or aspirin), vitamin A, iron tablets or supplements, de-worming medicines (anthelmintic), and antibiotic eye ointment. All these other essential medicines are available in 33 percent of health facilities (Table 4.3, Figure 4.9). Aspirin or paracetamol is almost universally available, whereas vitamin A was found in two-thirds of facilities.

Figure 4.9 Availability of other essential medicines (N=417)

Kenya SPA 2004

## Key Findings

IMCI treatment guidelines for sick children are available in 22 percent of facilities offering sick child services, while treatment protocols are found in only 1 in 5 facilities

One-third of facilities offer child immunisation services every day that sick child services are offered.

Soap for hand washing is absent in one in five facilities, and visual aids for instructing caretakers are missing from seven in ten facilities.

All first-line treatment medicines are available in 8 out of 10 facilities, but pre-referral medicines are only available in one-third of facilities—mostly NGO-managed facilities, private for-profit facilities, and facilities in Nairobi province.

## 4.5 Management Practices Supportive of Quality Sick Child Services

Management practices for supporting quality curative care for sick children include documentation and records, practices related to user fees, and staff supervision and development.

Summary information on the availability of these items is presented in Table 4.4. Appendix Table A-4.9 provides sick child client utilisation statistics, and Appendix Tables A-4.10 through A-4.12 provide more details on fees and other payment systems. Figure 4.10 summarizes information on in-service training received by child health service providers, and Appendix Tables A-4.13 through A-4.15 provide details on in-service training and supervision from the perspective of the child health service provider.

### 4.5.1 Facility Documentation and Records

An up-to-date register is defined as a register that has an entry within the past seven days and that indicates the child's age and diagnosis or symptom. About nine in ten facilities providing outpatient curative care for sick children have an up-to-date register (Table 4.4). Clinics were somewhat less likely to have

up-to-date registers, but otherwise, there is not much variation by facility type. NGO-managed facilities are more likely to have up-to-date registers than facilities under other managing authorities. At the provincial level, facilities in Central province are less likely to have an up-to-date register (76 percent, compared with 98 percent in Western province).

#### **4.5.2 Practices Related to User Fees**

In Kenya, the Ministry of Health policy on user fees is to offer free services for all children under five years of age, in order to make these services accessible. User fees may have either a positive effect on utilisation of health facilities (by increasing the funds available to the facility) or a negative effect (by deterring poor clients from using services). In any case, posting of user fees is an element of quality of care, since it increases accountability and makes clients aware of costs associated with services. In spite of the recent policy on free health services for children under five, 4 in 10 facilities charge some form of user fee for sick child services (Table 4.4), including 15 percent of government-managed facilities. Of those that charge any user fees, 14 percent charge for client charts or records, 21 percent charge for actual consultations by resident providers, and 14 percent charge user fees for consultations by consultants (Appendix Table A-4.10). Maternities and clinics, private for-profit and FBO facilities, and facilities in Nairobi are most likely to charge for client consultations. Government facilities are less likely to charge for client consultations than facilities under other managing authorities.

Table 4.4 Management practices supportive of quality child health services

Percentage of facilities with the indicated records, percentage with any user fees for consultation services for the sick child (SC), and percentage where interviewed providers of child health services received the indicated supportive management practice, by type of facility, managing authority and province, Kenya SPA 2004

Total	87	42	417	23	84	414

Note: Refer to Table 1.1 for the actual number of facilities included in survey and analysis. Weighting results in small numbers for some categories of facilities.

<sup>1</sup> Register has entry within past seven days that indicates child's age and diagnosis or symptom.

<sup>2</sup> This refers to structured in-service sessions, and does not include individual instruction received during routine supervision.

<sup>3</sup> Includes only providers of child health services in facilities offering child health services.

### 4.5.3 Staff Development and Supervision

#### *Staff Development*

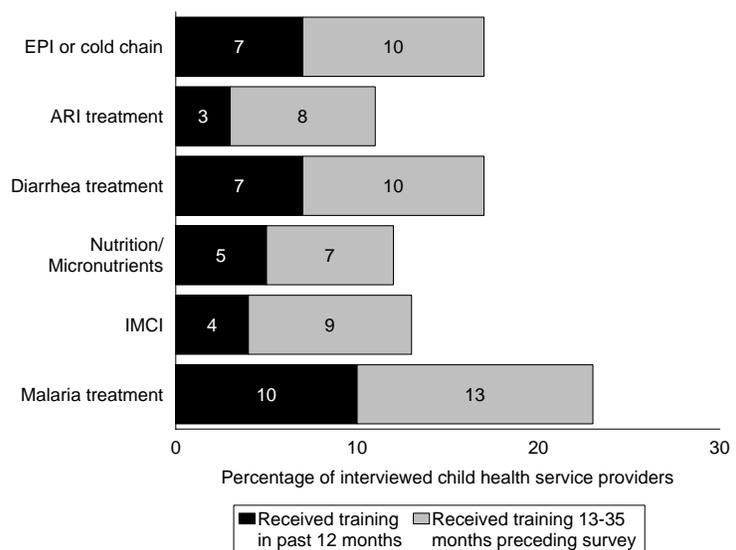

In facilities offering any child health services, whether preventive or curative, child health service providers were interviewed on training received (excluding on-the-job training). If at least half of the interviewed providers at a facility had received any structured in-service training on child health issues in the past 12 months, the facility is considered to be providing routine staff development activities.

Among facilities with interviewed child health service providers, only 23 percent are considered to be providing routine staff development activities, under the KSPA definition. Hospitals and health centres (9 percent and 12 percent, respectively) and NGO-managed and government facilities (4 percent and 15 percent, respectively) provide fewer routine staff development activities than other types of facilities (Table

4.4). At the provincial level, facilities in the North Eastern province stand out, with 44 percent providing routine staff development activities.

Overall, only 15 percent of interviewed child health providers had received structured in-service training in the 12 months preceding the survey (Appendix Table A-4.12). Interestingly, providers in dispensaries (31 percent) and those in the North Eastern province (37 percent) are more likely than others to have received some in-service training. Training was mostly on the treatment of malaria (10 percent of providers), with only 4 percent receiving training related to IMCI in the 12 months preceding the survey, though an additional 9 percent had received this training more than a year before the survey (Figure 4.10, Appendix Table A-4.13).

Figure 4.10 In-service training received by interviewed child health service providers, by topic and timing of most recent education (N=1,410)

### Supervision

If at least half of the interviewed child health service providers at a facility had been personally supervised in the past six months, the facility is considered to be providing routine staff supervision. Overall, 84 percent of facilities meet the KSPA criteria for providing routine staff supervision (Table 4.4). A smaller proportion of hospitals, maternities, and clinics meet the criteria (70, 69 and 68 percent, respectively) whereas, contrary to the findings for routine staff development activities, routine staff supervision is strongest and almost universal in government and NGO-managed facilities (90 and 99 percent, respectively), and weaker in private for-profit facilities (69 percent).

On individual supervision, 65 percent of interviewed child health service providers report having been personally supervised in the six months preceding the survey (Appendix Table A-4.12), with staff reporting that they were supervised an average of four times during that period (Appendix Table A-4.14). Although the number of times staff was supervised varies minimally by province, it was highest for providers in Nairobi province (12 times) and lowest in Nyanza and Rift Valley (3 times)

## Key Findings

Up-to-date registers for service statistics are found in 87 percent of facilities; almost all facilities in Western province had registers for service statistics.

Structured in-service training related to child health topics is not routinely provided. Only 23 percent of facilities had provided such training in the past 12 months to at least half of their interviewed providers.

Four in ten facilities charge some form of user fees for sick child services. Two in 10 charge for actual consultations by resident providers, and just over 1 in 10 facilities charge for consultations by consultants. Few government facilities charge user fees for consultations.

Only 4 percent of providers have received in-service training related to IMCI during the 12 months preceding the survey.

Routine supervision for child health service providers was reported in 84 percent of facilities, with most providers supervised 4 times during the past 6 months. It was less common in private for-profit facilities (69 percent) and facilities in Coast province (71 percent).

### 4.6 Adherence to Guidelines for Sick Child Service Provision

To assess whether providers adhere to standards for providing quality service, trained KSPA personnel observed sick child consultations. The observation checklists they used are based on IMCI guidelines.

The observers noted what information the provider shared and whether recommended procedures were carried out. They did not assess whether the information shared was correct, or whether findings were appropriately interpreted. Figures 4.11 through 4.15 show what practices were observed during sick child consultations. Table 4.5 summarizes the providers' assessments, examinations, and subsequent treatments, by provider classification of diagnosis or major symptoms. Appendix Tables A-4.16 through A-4.20 provide details on observed practices and information reported by interviewed caretakers of observed sick children.

#### 4.6.1 Full Assessment of Illnesses

When there are not enough qualified curative care providers, less qualified persons can be trained to provide EPI and growth monitoring services, as well as initial consultation services for sick children. For curative care, however, this assumes that seriously ill children, with illnesses beyond the training scope of staff, will be appropriately identified and referred to a better qualified provider. When reviewing factors that influence quality of care, it is important to know how many facilities depend on referral for the management of severe illnesses. Almost all facilities in Kenya have at least one qualified health provider, as shown in Figure 3.1 (Chapter 3).

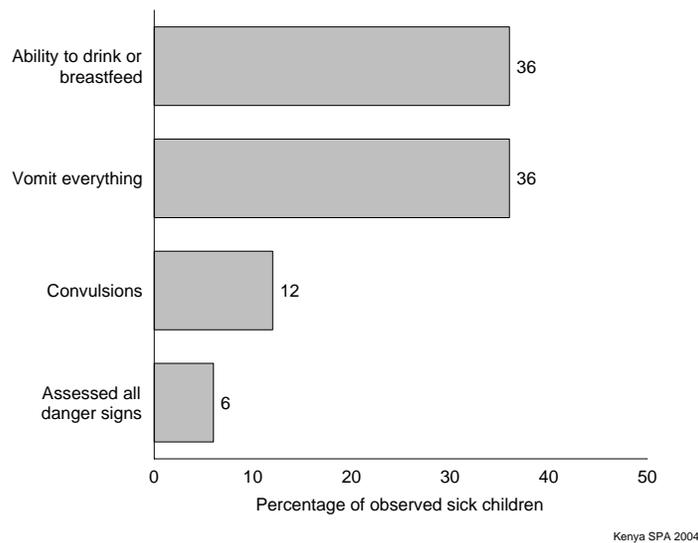

The IMCI programme in Kenya is being expanded and now covers approximately 7 percent of primary health care facilities (Wamae, 2005). The IMCI components for assessing a sick child provide valid guidelines for quality of care, regardless of whether a provider has been trained in the IMCI strategy or not. When interpreting the findings, it is important to recognize that, even when following the IMCI guidelines, providers should use their judgment, based on the child's signs and symptoms.

#### *General Danger Signs*

According to the IMCI guidelines, a provider should check for the following general danger signs: whether the child is able to drink or breastfeed, whether the child vomits everything, whether the child

has had convulsions at home or a convulsion is observed in the facility, and whether the child is lethargic or unconscious<sup>3</sup>. If there is any doubt about the child's ability to drink, the provider should attempt to give the child something orally. In general, 36 percent of the children were assessed for whether they could drink or breastfeed (compared with 51 percent in 1999), and 36 percent for whether they vomited everything (compared with 44 percent in 1999) (Appendix Table A-4.15). An additional 12 percent were assessed for convulsions (compared with 24 percent in 1999). Overall, 6 percent of children were assessed for all three danger signs, as compared to 20 percent in 1999. Comparing findings within facility types, it is clear that apart from maternities, where a larger proportion of facilities than in 1999 assessed whether a child vomits everything, every other assessment in all facility types showed a downward trend. These findings suggest a decline in the quality of sick child assessment in the last five years.

Figure 4.11 General danger signs assessed during observed sick child consultations (N=1,378)

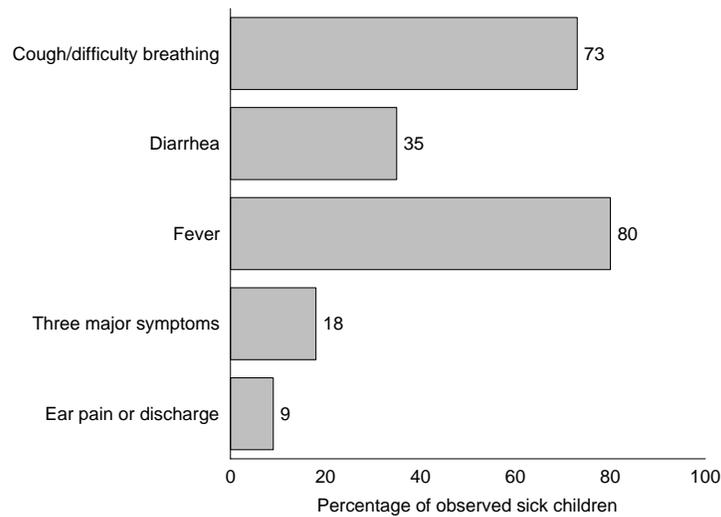

### Major Signs and Symptoms

Regardless of the reason for the consultation, IMCI guidelines call for each child to be evaluated for the major symptoms of cough or respiratory difficulty, diarrhoea, and fever. Information may be shared either when the caretaker of the sick child discusses the reason for the visit, or, if not spontaneously mentioned, when the provider specifically probes for symptoms.

Providers checked for all three major symptoms in about 20 percent of consultations (Figure 4.12). Fever was the symptom most commonly assessed; providers checked for fever in 80 percent of consultations, compared to 76 percent in 1999. They checked for respiratory symptoms in 73 percent of consultations, and diarrhoea in 35 percent. Only 9 percent of consultations included an assessment of ear problems, a common childhood illness.

<sup>3</sup> Assessment for lethargy is not a part of the observation checklist as there is often not an observable component for this assessment.

Figure 4.12 Major symptoms assessed during observed sick child consultations (N=1,378)

Kenya SPA 2004

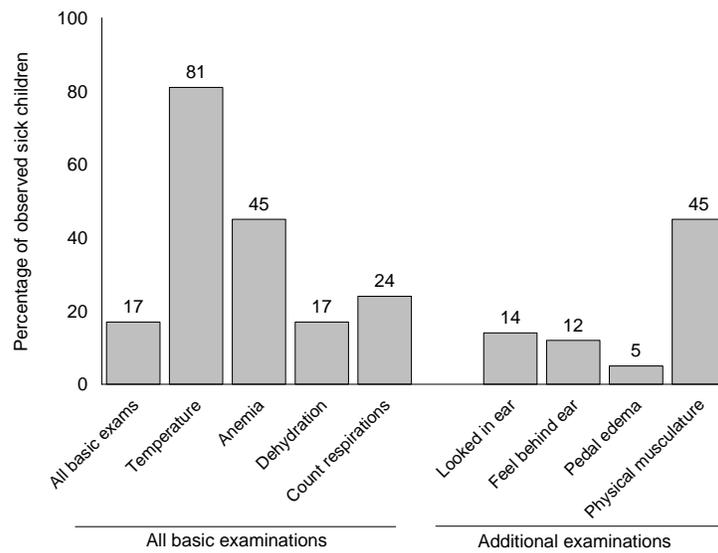

### ***Physical Examination***

After obtaining information on the various signs and symptoms of illness, the provider should conduct a physical examination. This should include a hands-on evaluation of the child to verify the presence of fever (by touch or by taking the temperature), to measure the state of dehydration (pinching the abdominal skin), to check visually if the child has anaemia, and to count the rate of respirations if a respiratory problem is suspected.

There has been only minimal improvement in sick child examination practices since 1999, with all the key physical examinations (counting respiratory rate and assessing for fever, dehydration, and anaemia) being conducted during only 17 percent of observed consultations (Figure 4.13, Appendix Table A-4.15). Providers in maternities are more likely to conduct all the recommended examinations than providers in other types of facilities. The most commonly observed examination practice was the assessment of fever (81 percent) (Figure 4.13), observed mostly in consultations in clinics and maternities (91 and 94 percent, respectively). Providers checked for anaemia much more often in 2004 (45 percent of consultations) than they did in 1999 (18 percent) (Appendix Table A-4.15). Anaemia assessment was mostly observed in hospitals (63 percent) and maternities (81 percent). This apparently remarkable improvement may be partially explained by the fact that the 1999 KSPA only considered providers as having checked for anaemia if they examined the palms and nail beds. In 2004, checking the conjunctiva also counted as an anaemia assessment.

Providers checked for dehydration in 17 percent of consultations and counted the child's respiratory rate in 24 percent. They looked inside the ear and felt behind it in 14 percent and 12 percent of consultations, respectively, and they assessed for pedal oedema in 5 percent of consultations (compared with 13 percent in 1999). Providers checked the sick child's muscular and general nutritional and physical status in 45 percent of consultations. More information on complete physical examinations, including all basic and additional examinations, is available in Appendix Table A-4.15. There were no consistent differences among facility types in the elements of the assessment and physical examination of the child.

Figure 4.13 Elements of physical examination conducted during observed sick child consultations (N=1,378)

Kenya SPA 2004

### ***Assessment of Feeding during Illness***

There is a direct relationship between nutritional status and health. It is not uncommon for a child to be caught in a cycle of malnutrition and illness, where malnutrition makes a child more susceptible to illness, and the illness contributes to further malnutrition. Aggravating this cycle is the tendency for sick children to eat and drink less and the not uncommon practice of caretakers to limit the sick child's consumption of food and liquids.

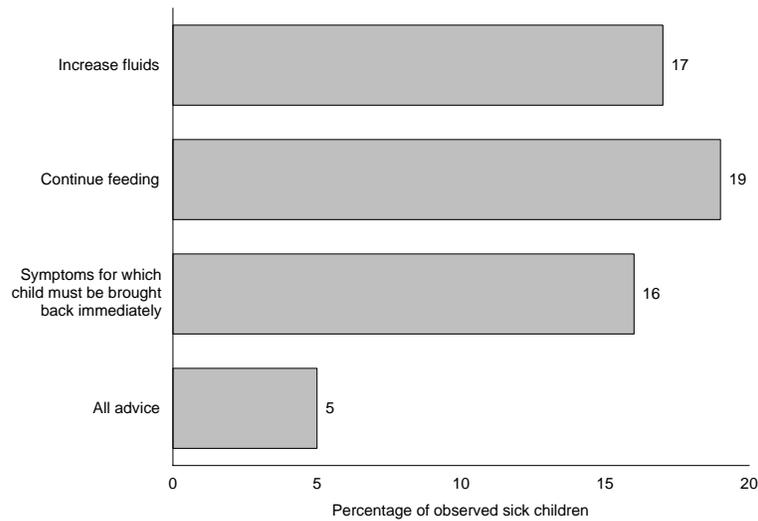

During observed sick child consultations, providers asked about normal feeding practices during illness 34 percent of the time, regardless of age of the child (Table A-4.17). This was more common in hospitals and maternities than in other facility types.

### ***Essential Advice***

The IMCI strategy identifies essential advice that the child's caretaker should receive before leaving the health facility. This includes encouraging the caretaker to 1) give the child extra fluids during the illness, 2) continue to feed the child, and 3) watch for signs and symptoms for which the child should immediately be brought back to a health care provider.

Providers advised caretakers to increase the quantity of liquids in 17 percent of the observed consultations, and in 19 percent of consultations, they advised caretakers to give the child at least the same amount of food or breast milk as usual (Figure 4.14). They provided information on signs and symptoms for which the sick child should be immediately returned to the facility during 16 percent of the consultations. Only 5 percent of sick child consultations included all three pieces of advice.

Figure 4.14 Essential advice provided to caretakers of observed sick children (N=1,378)

Kenya SPA 2004

#### 4.6.2 Diagnosis-Specific Assessments

After the sick child consultation, the observer asked the provider about the child’s diagnosis, major symptoms, and prescribed treatment. This information provides a context for assessing whether the examination and treatment were appropriate according to IMCI guidelines. IMCI guidelines indicate specific symptoms or diagnoses for which antibiotics should be prescribed and when children should be admitted to the facility or referred for a higher level of care.

Although a simple observation does not provide enough information to determine the appropriateness of diagnosis and treatment, certain interventions can reasonably be expected for a given diagnosis. The KSPA 2004 does not evaluate the appropriateness of specific actions of providers.

##### *Respiratory Illness*

Children with severe respiratory illnesses should be thoroughly examined by a provider and hospitalized if indicated. In most of these cases, recourse to antibiotics is warranted. Among children diagnosed with pneumonia or other severe respiratory illnesses, the provider checked temperature in 85 percent of cases and counted respiratory rate in 46 percent (Table 4.5). Overall, providers referred or hospitalized 15 percent of these children, and put 93 percent of them on some form of antibiotic (41 percent received an injectable and 73 percent an oral antibiotic).

Among children diagnosed with bronchitis, providers checked temperature in 75 percent of cases, and as many as 98 percent were put on antibiotics—more than among children diagnosed with pneumonia. When children were diagnosed with cough or other respiratory problems, without another serious symptom such as fever or difficult/short breathing, providers were very likely to prescribe antibiotics (87 percent), even those such cases are most often viral in nature. This may mean that providers in Kenya prescribe antibiotics even when it is not medically indicated. With growing antibiotic resistance worldwide, rational use of antibiotics should be encouraged to ensure that these drugs are not overused.

Table 4.5 Assessments, examinations, and treatment for children classified by diagnosis or major symptom

Among observed children diagnosed by the provider with the indicated illness or symptom, percentage for whom the indicated assessment, examination, and/or treatment was provided, Kenya SPA 2004

Item	Among children with indicated diagnosis, percentage for whom indicated assessment, examination, and/or treatment was observed									
	Respiratory illness			Febrile illness			Intestinal illness		Other	
	Pneumonia or other severe respiratory infection <sup>1</sup>	Bronchitis (mild to moderate)	Cough or other respiratory problem without other severe diagnosis	Severe fever	Fever without severe diagnosis or cough	Malaria	Severe or persistent diarrhoea or dysentery or any dehydration w/diarrhoea	Other diarrhoea without other severe diagnosis	All other definitive diagnosis	All observed children

<sup>1</sup> Pneumonia, bronchopneumonia, or severe bronchitis

<sup>2</sup> This may be antipyretic, cough medicine, or other general treatment for symptoms.

<sup>3</sup> Child may be classified with more than one diagnosis.

## Fever

For children with severe febrile illness, IMCI guidelines recommend the use of antimalarials and antipyretics (especially in high malaria risk areas), followed by referral to appropriate facilities for further treatment. All children diagnosed with severe fever had their temperature taken, compared with about 85 percent of children who were diagnosed with malaria-related fever or who had a fever with no accompanying serious symptoms (Table 4.5). About 1 in 10 children diagnosed with severe fever were either re-

ferred or admitted, and 66 percent received some form of antibiotics (23 percent received injectable antibiotics and 57 percent oral antibiotics). Approximately 4 in 5 of the children received oral medication for symptomatic treatment (an antipyretic, cough medicine, or other general treatments for symptoms).

### ***Malaria***

Examination and treatment for children diagnosed with malaria appears to have improved since 1999. Temperature was assessed for 85 percent of malaria cases, and anaemia was assessed in 52 percent. Overall, 94 percent of children diagnosed with malaria received some form of antimalarial (Table 4.5). About 2 in 10 received injectable quinine, Fansidar, or artemether; about 8 in 10 were put on an oral antimalarial; and only 1 percent received injected chloroquine (table not shown). About one-third received an antibiotic, while 8 in 10 received oral medication for symptomatic treatment.

### ***Diarrhoea***

Observers recorded the physical assessment and treatment of children diagnosed with intestinal illnesses. There were two categories of diagnoses: 1) severe or persistent diarrhoea or dysentery, or any dehydration with diarrhoea, and 2) other diarrhoea without another severe diagnosis (Table 4.5). Providers assessed dehydration in 46 percent of children in the first category, whereas only 22 percent of children in the second category were checked for dehydration. In the 1999 KSPA, all diarrhoea was combined into one category, and 45 percent of the observed children were assessed for dehydration. Twenty percent of children with the first, more severe, type of diarrhoea were either admitted or referred to a higher-level facility, compared with 9 percent of children in the second category.

Antibiotics are rarely indicated for non-dysentery-related diarrhoea, since using antibiotics inappropriately can prolong the episode. As many as 80 percent of children with severe diarrhoea (just over half of whom had dysentery or amoebiasis) were prescribed antibiotics; among children in the second category, 88 percent received antibiotics. These findings further indicate that antibiotics may be over-prescribed in Kenya. ORS was prescribed for 76 percent of children with severe diarrhoea, and 2 percent received intravenous fluids, while 44 percent of children with less severe diarrhoea were put on ORS.

### ***Overall Adherence to Standards***

From this brief review it appears that the type of physical examination conducted and treatment provided, including referrals, tend to vary reasonably according to the assessed severity and type of illness. Assessments of symptoms, danger signs, and advice regarding eating and drinking during illness, however, do not vary accordingly by severity of illness (Table 4.5).

#### **4.6.3 Other Observed Practices**

IMCI guidelines recommend that the first dose of any prescribed medicine, particularly antibiotics, should be provided at the facility so that treatment can begin immediately. This practice also provides an opportunity to reinforce the dosage to the caretaker and to ensure that the child is able to take the medicine. Among children who received prescriptions, 14 percent were observed receiving the first dose of the prescribed medicine at the facility. This practice was least common in hospitals (9 percent) than in other facility types (Appendix Table A-4.16).

Providers educated caretakers about medicines in 54 percent of cases, although caretakers were not often asked to repeat the instructions back to providers to verify that they understood (11 percent). During exit interviews, however, a much larger proportion of interviewed caretakers reported being told how to give the medicine (96 percent) and said they felt that they knew how to provide the medicine (98 percent) (Ap-

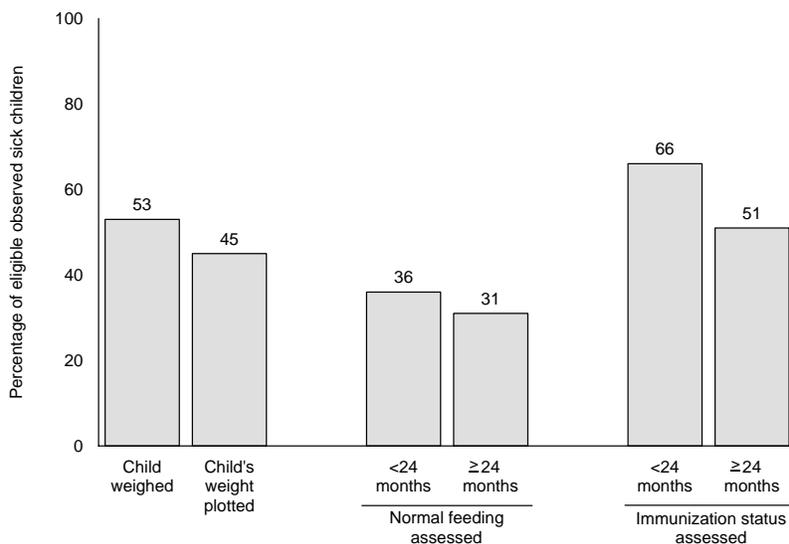

pendix Table A-4.16). It is also possible they received instructions at the pharmacy when collecting medicines.

#### 4.6.4 Reducing Missed Opportunities for Promoting Child Health Care

The IMCI approach recommends evaluating children’s growth, to provide an objective assessment of their current nutritional status and to detect any chronic latent nutritional problems. Growth monitoring includes comparing the child’s current weight with a standard (based on either height or age), eliciting information on feeding patterns to determine whether the diet is adequate for the child’s age, and determining whether the current feeding patterns pose any additional risk to the child’s current health status. The provider should take advantage of the consultation with the sick child and the caretaker to provide advice if there appears to be any nutritional problem and to offer encouragement for continuing good practices if the evaluation shows that the growth of the child is proceeding well. IMCI guidelines for feeding practices call for exclusive breastfeeding until six months of age, followed by the introduction of locally available foods based on a balanced nutritional plan, with continued breastfeeding until two years of age.

About half of sick children were weighed. However, providers only plotted the weight against a standard in 45 percent of cases (Figure 4.15). They assessed normal feeding practices in 34 percent of all consultations, 36 percent of consultations for children under 24 months, and 31 percent of consultations for older children.

Figure 4.15 Observed preventive assessments (N=1,360)  
(<24 months N=844)

Kenya SPA 2004

Assessment of immunisation status for sick children was low; providers checked immunisation status for 66 percent of children under 24 months of age and 51 percent of older children.

## Key Findings

Assessment for general danger signs in sick children is poor. Providers assessed whether children could drink or breastfeed in 36 percent of cases, and asked whether they were vomiting everything in 36 percent of cases. Twelve percent were assessed for convulsions. Only 6 percent were assessed for all three danger signs.

Ninety-three percent of children diagnosed with severe respiratory illness received an antibiotic; 41 percent received injectable antibiotics. However, 87 percent of children with non-severe respiratory conditions also received antibiotics, contrary to current recommendations.

Providers seldom provided caretakers with essential information. Only 5 percent of caretakers received all of the three IMCI-recommended counsels (increased fluids, increased food intake, and list of symptoms for which the child must be brought back immediately).

Children rarely received the first dose of oral medication at the facility (14 percent).

Fifty-four percent of caretakers were observed being told how to administer medicines at home, though only 11 percent were asked to repeat the instructions to the provider to check their understanding. Ninety-six percent, however, reported that they had received the information, with most reporting they understood how to give medicines to the child.

Opportunities to promote preventive health interventions each time a child is brought to a facility for a consultation are being missed. Assessments of immunisation, weight, and feeding practices for children under 24 months occurred in 66 percent, 53 percent and 36 percent of cases, respectively. This is particularly important given the decrease in overall immunisation coverage and existing levels of chronic malnutrition documented in the KDHS 2003.

### 4.6.5 Counselling on Child Health Issues and Supporting Continuity of Care

The use of visual aids during consultations was almost nonexistent, at 2 percent (Table 4.6). This is not surprising, considering the fact that only 29 percent of facilities have any visual aids available for use for child health services (Figure 4.5).

#### *Supporting Continuity of Care*

Frequently, health services are organised in such a way that a client's temperature and weight are measured, other routine services are provided, and the information is recorded on a client card or record, before the provider responsible for the consultation sees the client. Although it was noted that one in three facilities collect some of this relevant information outside the consultation room (data not shown), the provider referred to the sick child's health card during 73 percent of the observed consultations (Table 4.6). Thus, 27 percent of the providers might not have used information from measurements taken by others in their assessment of the child. Providers in Western province facilities were most likely to refer to a client card during consultation. Most providers did write notes on the sick child's health card at the end of the consultation (Table 4.6).

**Table 4.6 Provider practices related to continuity of health education and care**

Percent of observations where visual aids were used when providing health education to the caretaker of observed sick children, percentage of observations where the provider referred to the child's health card, and percentage of observations where the provider wrote on the child's health card, by type of facility, managing authority and province, Kenya SPA 2004

Background characteristics	Percentage of observations where visual aids were used for health education	Use of individual health card		Number of observed sick children (weighted)
		Percentage of observations where provider referred to card during consultation	Percentage of observations where provider wrote on card after consultation

<b>Total</b>	<b>2</b>	<b>73</b>	<b>97</b>	<b>1,378</b>

Note: Refer to Table 1.1 for the actual number of facilities included in survey and analysis. Weighting results in small numbers for some categories of facilities.

## Key Findings

Providers almost never used visual aids during consultations (2 percent), although visual aids for caretaker education are available in 29 percent of facilities.

Use of individual child health cards to provide continuity of care was relatively high, with 73 percent of providers referring to the card during the consultation and 97 percent writing a note on the card after the consultation. This increases accountability of health care, as well as the likelihood that the provider will have all relevant information for continuity of care, both during the current visit and on subsequent visits.

## 4.7 Caretaker Opinion from Exit Interviews

Before leaving the facility, KSPA interviewers asked observed caretakers of sick children for their opinions on the consultation process, the quality of the providers' services, and the principal problems en-

countered on the day of the visit. The interviewer read the caretakers a list of specific issues commonly related to client satisfaction and asked them to rate each issue as a big problem, a small problem, or no problem.

Caretakers' responses to these interviews indicate that most were told how to administer prescribed medicines at home (96 percent) and felt comfortable giving the medicine (98 percent). As expected, some were dissatisfied enough with aspects of their experience in the facility that they considered them to be big problems, though usually in small percentages. For example, 20 percent considered the time they waited to see the provider to be a big problem, and 17 percent considered lack of availability of medicines to be a big problem (Appendix Table A-4.19). Only 7 percent of the caretakers felt they did not receive sufficient explanation about their child's illness.

When asked about their choice of health facility, 25 percent of interviewed caretakers indicated that the facility they visited was not closest to their home. The most common reasons cited for not visiting the nearest facility to their home were that the nearest facility was more expensive (27 percent), had a bad reputation (12 percent), or lacked medicines (12 percent). Appendix Tables A-4.19-A-4.21 provide additional information on caretakers' opinions and personal characteristics.

### **Key Findings**

The major complaints from caretakers were the waiting time to see a provider (20 percent) and lack of medicines (17 percent).

Only a small proportion considered it to be a big problem that they had not received enough information about their child's illness (7 percent) and that the facility's operating hours were inconvenient (8 percent).

Twenty-five percent of the children were not taken to the facility nearest to their home, with cost (27 percent), a bad reputation (12 percent), and lack of medicines (12 percent) the most commonly cited reasons.

*Samuel Ogola, Karugu Ngatia and Dr. Marsden Solomon*

## 5.1 Background

The Kenya Service Provision Assessment 2004 (KSPA 2004) collected information on the availability of family planning (FP) services, on clients' perceptions of their experience in the facility, and on services received. This chapter provides detailed information gathered from family planning clients as they left the service facility, on their knowledge of a variety of topics related to their encounter with the provider, and on the family planning method they were prescribed or are currently using. It also looks at the components supporting quality family planning services, management practices supportive of quality services, and providers' adherence to standards for quality service provision. This information is also useful in assessing how family planning services are delivered and can be used to improve programmes to meet the needs revealed by the 2003 Kenya Demographic and Health Survey (KDHS 2003).

### 5.1.1 KSPA Approach to Collection of Family Planning Service Information

The use of contraceptive methods to plan families may be desirable for many reasons, including the following:

- Couples may wish to limit family size or delay a desired pregnancy.
- Appropriate spacing of births benefits maternal and child health. Studies have shown that spacing births at least two to three years apart contributes significantly to decreasing infant mortality (Govindasamy et al., 1993; Rutstein, 2000). Although there are fewer studies on the effects of spacing births on maternal health, it is generally accepted that too frequent births result in maternal depletion of essential minerals and vitamins.
- Preventing pregnancies that may worsen chronic or acute illnesses, including HIV/AIDS, benefits women's health.

Key factors contributing to the appropriate, efficient, and continuous use of contraceptive methods (Murphy and Steele, 2000) include the following:

- The availability of a variety of contraception methods to address client preferences and client-specific suitability of method (from the point of view of society and health);
- Counselling and screening of clients for appropriateness of methods;
- Client education, using visual aids to increase information retention regarding options, side effects, and appropriate use of the method;
- Availability of infrastructure and resources necessary for providing quality family planning services: equipment for client examinations, guidelines and protocols, trained staff, a service delivery setting that allows client privacy, and procedures for preventing infections; and
- Availability of other health services relevant for family planning clients. These include education and services for sexually transmitted infections (STIs) and programmes geared toward groups with special needs to improve access and appropriate utilisation of family planning services.

Wherever maternal health, reproductive health, or child health services are provided, they should strive to increase the appropriate use of family planning and contraceptive services, including counselling.

This chapter uses information obtained in the KSPA 2004 to address the following central questions about the delivery of family planning services:

- What is the availability of family planning services?
- To what extent do the facilities offering family planning services have the infrastructure, resources, and supportive management required to support quality services?

### 5.1.2 Family Planning Services in Kenya

The Kenya family planning programme was launched in 1967. The programme has made substantial progress in expanding the use of modern contraception in Kenya in the more than 30 years since family planning was integrated into the maternal and child health services of the Ministry of Health, whose facilities offer most family planning services in Kenya. Family planning services are integrated into the MCH/FP clinics at dispensaries, health centres, and district and provincial hospitals. There are also family planning clinics in referral hospitals and mobile units.

Use of modern contraceptive methods by currently married women age 15-49 increased from 27 percent in 1993 to 33 percent in 1998 (KDHS 1993 and 1998). The injection is the most widely used method, followed by the combined oral contraceptive pill (15 percent and 10 percent, respectively). Pill users obtain their methods from either public sources (48 percent) or private medical sources (46 percent); very few get them from other private outlets such as shops and friends or relatives. More than 60 percent of all injection users get their injections at public sector facilities.

The family planning programme in Kenya has been relatively effective over time. The proportion of women using public sources has declined steadily from 68 percent in 1993 to 53 percent in 2003, while the proportion getting methods from private medical sources has similarly increased, from 25 percent to 41 percent in the same period (KDHS 1993 and 2003). As more sources are now available for users to obtain their services and methods, maintaining quality of care is increasingly important. Discontinuation is still an important problem in Kenya; nearly 40 percent of users discontinue their family planning method within 12 months. Pill users are most likely to stop using their method, with 46 percent discontinuing in the first year (KDHS 2003). Another issue related to quality of care is informed choice. Less than half of all users were informed about the side effects of their current method and of other methods they could use (KDHS 2003).

## 5.2 Availability of Family Planning Services

Methods of family planning differ in how they function, their effectiveness, their side effects, the ease with which they can be administered, and, in view of these issues, their acceptability and desirability to users. To meet the varying needs and demands for contraception, a variety of methods should be available at a frequency that meets common needs (Curtis and Bright, 1997).

According to the KDHS 2003, the modern methods most commonly used in Kenya are contraceptive injections, contraceptive pills, and female sterilisation. Other, less commonly used methods include implants, condoms, male sterilisation, intrauterine devices (IUDs), periodic abstinence (natural family planning), the diaphragm, spermicides, and emergency contraception (KDHS, 2003). In an effort to understand the context in which modern methods of contraception are used in the country, the KSPA asked facilities about the availability of family planning services.

Table 5.1 summarizes information on the availability of family planning services in Kenyan health facilities, and Table 5.2 shows how frequently these services are offered. Figure 5.1 provides details on the availability of different methods of contraception, and Appendix Tables A-5.1 through A-5.3 provide further details on method availability by type of facility and region.

**Table 5.1 Availability of family planning services**

Percentage of all eligible facilities offering the indicated methods of family planning, by type of facility, managing authority and province, Kenya SPA 2004

Note: Refer to Table 1.1 for the actual number of facilities included in survey and analysis. Weighting results in small numbers for some categories of facilities.

<sup>1</sup> Any of the following: contraceptive pills (combined or progestin-only), injections (combined or progestin-only), implants, intrauterine devices (IUDs), male condoms, spermicides, diaphragm, or emergency contraceptive.

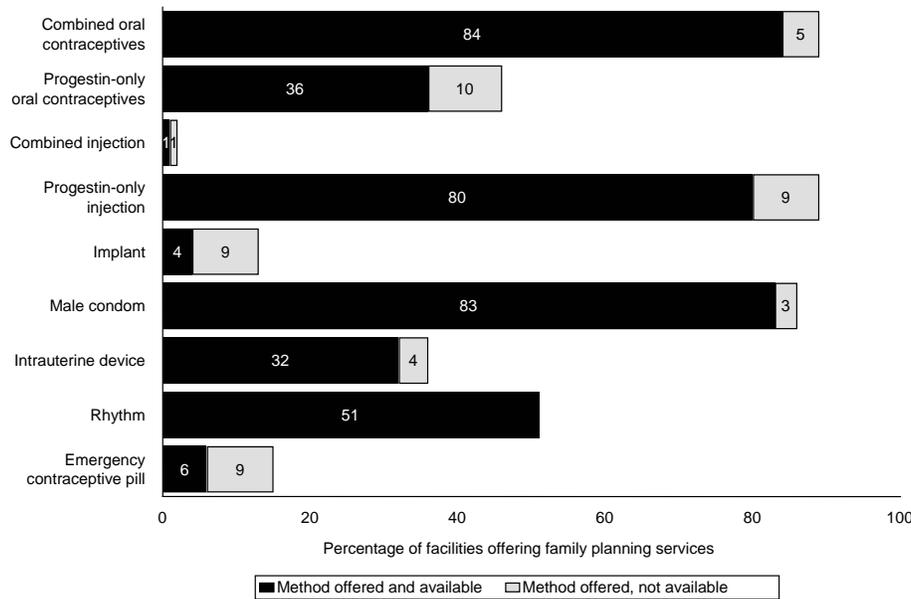

### ***Contraceptive Method Mix and Method Availability***

A facility that offers all methods of family planning is best able to meet the needs of clients. However, some variation is expected in which methods facilities offer, because of differences in provider qualifications and training, as well as the infrastructure required to provide the methods safely. Methods that can be provided safely with minimal training are pills, injections, and condoms, as well as counselling on periodic abstinence. Providing implants and IUDs safely, however, requires a higher level of skill and a more developed infrastructure.

Over the last five years, the proportion of eligible facilities offering any modern method of family planning has declined from 88 percent to 75 percent. The proportion of facilities offering counselling on the rhythm method, however, remained stable at 38 percent. Hospitals, maternities and health centres, and government and NGO facilities, are more likely to offer at least one temporary modern method of family planning. Facilities in Nyanza and Central provinces are also more likely to offer family planning methods than facilities in other provinces (Table 5.1).

The most commonly offered family planning methods in Kenyan facilities are the combined oral contraceptive, progestin-only injections, and the male condom, offered by almost 9 in 10 facilities (Figure 5.1). Most facilities that offer these methods had them available on the day of the survey. Surgical sterilisation as a family planning method is not commonly offered; only 5 percent of facilities (including 46 percent of hospitals) reported that they offer either male or female sterilisation. About 7 in 10 facilities offer at least four temporary family planning methods (Appendix Table A-5.1); dispensaries are less likely to offer a wide range of methods, with 59 percent offering at least four methods.

Figure 5.1 Temporary methods of contraception offered and availability of method on the day of the survey (N=322)

The proportion of facilities offering the implant method has increased slightly, from 8 percent in 1999 to 13 percent in 2004, although, as in 1999, supply remains a problem; only half of the facilities offering implants actually had them available on the day of the survey (Figure 5.1).

Emergency contraception is not technically considered a family planning method, but rather is considered a backup for unprotected sexual intercourse. Just 11 percent of facilities offer emergency contraceptive pills, and almost half of these did not have an emergency contraceptive method available on the day of the survey. Progestin-only pills, which can be used for emergency contraception, are also offered in 46 percent of facilities (a decrease from 77 percent in 1999), but there are supply problems with this method as well. The combined injectable method continues to be offered rarely (2 percent of facilities) and primarily by hospitals (10 percent). However, the progestin-only injection is available in 90 percent of facilities (Table A-5.1).

### *Frequency of Services*

In addition to providing a range of methods, it is important that facilities offer family planning services regularly enough to meet client needs. As in 1999, almost all facilities that provide family planning services offer them five or more days per week (Table 5.2). Faith-based facilities and those in the Eastern Province offer family planning services less frequently than other facilities.

**Table 5.2 Frequency of availability of family planning services**

Percentage of facilities where any temporary methods of family planning (FP) are offered the indicated number of days per week, by type of facility, managing authority and province, Kenya SPA 2004

Background characteristics	Percentage of facilities where family planning services are offered: <sup>1</sup>			Number of facilities offering family planning services (weighted)
	1-2 days per week	3-4 days per week	5 or more days per week

<b>Total<sup>2</sup></b>	<b>5</b>	<b>0</b>	<b>91</b>	<b>322</b>

Note: Refer to Table 1.1 for the actual number of facilities included in survey and analysis. Weighting results in small numbers for some categories of facilities.

<sup>1</sup> Any of the following methods: oral contraceptives (combined or progestin-only), injections (combined or progestin-only), implants, intrauterine devices (IUDs), condoms, spermicides, diaphragm, emergency contraceptive or rhythm.

<sup>2</sup> Percentages may not add up to 100 percent since some facilities offer family planning services less frequently than once a week

## Key Findings

Ninety-one percent of facilities offer temporary modern methods of contraception at least five days per week. They are most likely to offer progestin-only injections, pills, and the male condom.

The proportion of health facilities offering any temporary modern methods of family planning declined to 75 percent in 2004 from 88 percent in 1999.

About 7 in 10 facilities offer at least four commonly used family planning methods (such as combined oral contraceptives, progestin-only injection, male condom, and progestin-only oral contraceptives). Dispensaries are less likely to have such a wide range of methods; only 59 percent offer at least four methods.

## 5.3 Components Supporting Quality Family Planning Services

In order to provide family planning services, facilities must have adequate infrastructure and resources available to support quality counselling and examination of family planning clients; they should also have the equipment and supplies needed to provide each family planning method they offer. In addition, because family planning clients are sexually active, it is important to have STI services available to them.

### 5.3.1 Infrastructure and Resources to Support Quality Assessment and Counselling of Family Planning Clients

To provide quality counselling to family planning clients, facilities should be able to provide some level of privacy, individual client health cards or records, written family planning guidelines or protocols, and family planning-related visual aids. Since counselling about family planning often takes place in a location different from where procedures (such as pelvic examinations and IUD insertions) are conducted, the conditions for counselling are assessed separately from those for procedures. Table 5.3 provides aggregate information on items to support quality counselling; information on the availability of each specific item needed for counselling is provided in Figure 5.2. Appendix Table A-5.4 gives details on the items assessed for each of the components for counselling, and Appendix Table A-5.5 provides details on available visual aids and guidelines, by type of facility.

Only 22 percent of facilities have all four of the above items (Table 5.3, Figure 5.2); this is principally because many facilities do not have written family planning guidelines. These items are almost unavailable in all facilities in Central and North Eastern provinces (Table 5.3).

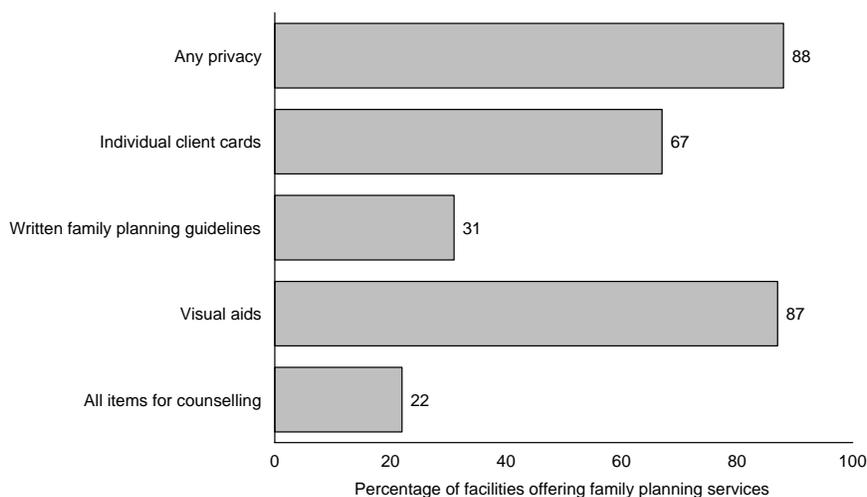

Family planning is often a sensitive issue for discussion. Providing counselling under conditions where clients can be reasonably assured that the conversation cannot be overheard improves communication and ultimately the likelihood that the method provided is suitable for the client. Privacy for counselling is almost universally available, with 88 percent of facilities (Figure 5.2, Table A-5.4) counselling family planning clients under conditions where both visual and auditory privacy are possible. Clinics are least likely to assure this kind of privacy (74 percent).

Individual cards or records for family planning clients are important for monitoring a client over time and for ensuring continuity of care. Because facilities often do not store client records, but rather give them to the clients to keep, the KSPA assessed the availability of blank cards for new family planning clients. Blank individual client cards were found at 67 percent of facilities (Figure 5.2). Maternities were least likely to have blank client cards (53 percent) (Table A-5.4).

The KSPA assessed whether facilities had written family planning guidelines or protocols, with information on eligibility screening and correct procedures for different methods. The guidelines were only considered available for use if they were in the family planning service delivery area or an immediately adjacent area. Only 3 in 10 facilities had family planning guidelines or protocols available (Figure 5.2).

Visual aids, which are important elements for good family planning counselling, are available in the service delivery area in 87 percent of facilities (Figure 5.2).

Figure 5.2 Items to support quality counselling for family planning (N=322)

Kenya SPA 2004

### 5.3.2 Infrastructure and Resources for Examinations

Frequently a physical examination, sometimes including a pelvic examination, is necessary to determine whether a method is suitable, to insert a method, or to evaluate problems with a method. This requires an adequate level of infection control, as well as infrastructure and items needed for examining the client.

Table 5.3 provides aggregate information on items for infection control and pelvic examinations; Figure 5.3 gives information on the availability of each specific item needed for infection control and pelvic examinations. Details on the specific items assessed are provided, by type of facility, in Appendix Table A-5.4, and details on processing equipment are available in Appendix Tables A-5.6 through A-5.9.

#### *Infection Control*

The KSPA 2004 assessed the presence of items for infection control in areas where family planning examinations (such as pelvic examinations) and provision of methods (the implant, IUD, and injection) most often take place. Items assessed for infection control were hand-washing supplies, clean or sterile latex gloves, disinfecting solution, and a sharps box; all these items are available in the family planning service area in about 4 in 10 facilities. More facilities in Eastern province have all these items available (69 percent); as do about half of hospitals and dispensaries. However, only 5 percent of NGO-managed facilities have all the items needed for infection control (Table 5.3).

Facilities most often lack disinfecting solution and soap; these items are missing in 48 percent and 28 percent of facilities, respectively (Figure 5.3).

Table 5.3 Availability of infrastructure and resources to support quality services for temporary methods of family planning

<sup>2</sup> Soap, water, clean latex gloves, disinfecting solution, and sharps box

<sup>3</sup> In location where family planning equipment is processed, equipment and knowledge of minimum processing time for sterilising or HLD processing and an automatic timing device were available.

<sup>4</sup> Private room (visual and auditory privacy), examination bed, examination light, and vaginal speculum

Figure 5.3 Conditions for quality examination of family planning clients (N=322)

Kenya SPA 2004

Equipment for family planning services often requires sterilisation or high-level disinfection (HLD) so that it can be reused. According to Kenya standards, this means facilities must have functioning equipment, knowledge of the minimum processing time for sterilising (or HLD processing), and an automatic timer, available in the location where family planning equipment is processed. Overall, only 16 percent of the facilities meet these criteria (Table 5.3). These are mainly hospitals, NGO-managed facilities, and, to some extent, facilities in Nairobi province (Table 5.3). Seventy-eight percent of facilities send equipment to the main processing area in the facility for processing, and 17 percent process items in the family planning service delivery area (Table A-5.6). As noted in Figure 3.13, the most common weakness in processing capacity in facilities' central processing location is the lack of an automatic timer for boiling, which is the most commonly used HLD method.

### Examination

The KSPA 2004 assessed items needed for conducting quality pelvic examination for family planning clients. The items assessed are a private room (for both visual and auditory privacy), an examination bed and spotlight, and the availability of a vaginal speculum. Fewer than 1 in 10 facilities in Kenya have all these items (Table 5.3). Hospitals, private for-profit facilities, and facilities in Nairobi province were most likely to have these items. The weak areas are lack of a vaginal speculum (73 percent) and lack of a spotlight (78 percent) (Figure 5.3).

### 5.3.3 Provision of STI Treatment for Family Planning Clients

Family planning clients, because they are sexually active, may be at increased risk of contracting STIs. Consequently, counselling for STI prevention, as well as diagnosis and treatment, are essential components of quality family planning care. It is particularly important to diagnose and treat STIs and other vaginal infections for women who use the IUD. Figure 5.4 provides information on items needed to provide STI services to family planning clients. Table A-5.9 provides details, by type of facility, on the STI service items, including medicines for treating specific STIs.

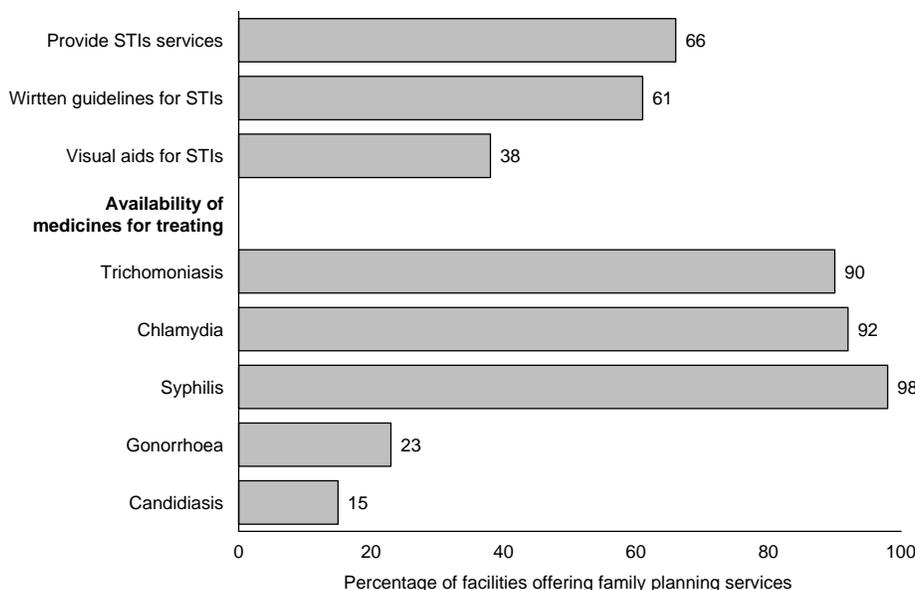

In two-thirds of facilities where family planning services are provided, providers diagnose and treat STIs (Table 5.3, Figure 5.4). Hospitals and facilities in Nairobi province are the least likely to have family planning providers diagnosing and treating STIs. This may be due to the fact that STI services in these facilities are considered more specialized and are organised separately, with different providers than for family planning.

Written guidelines for diagnosing and treating STIs are available in the family planning service area in 61 percent of facilities (Figure 5.4), with the World Health Organisation (WHO) syndromic approach guidelines found in 60 percent of facilities (Appendix Table A-5.5). Among the different facility types, dispensaries are the most likely to have these guidelines (70 percent).

Only 20 percent of facilities have STI-related visual aids for client education, (Table A-5.5), with hospitals most likely to have them available (33 percent).

Medicines for treating trichomoniasis, chlamydia, and syphilis are almost universally available in facilities offering family planning services (Figure 5.4), while medicines for gonorrhoea and candidiasis (a more common infection) are available in only 23 percent and 15 percent of facilities, respectively (Figure 5.4).

Figure 5.4 Conditions to support quality STI services for family planning clients (N=322)

Kenya SPA 2004

## Key Findings

Privacy for family planning counselling services and visual aids are commonly available (about 9 in 10 facilities). Guidelines and protocols for family planning, however, are not available in almost two-thirds of facilities.

All assessed items for infection control are available in the family planning service area in 41 percent of facilities, with disinfecting solution the most commonly missing item (missing in 48 percent of facilities)

Only 16 percent of facilities have the capacity for quality sterilisation or HLD processing of family planning equipment.

All the furnishings and equipment needed for quality pelvic examinations are available in only 8 percent of facilities.

Medicines for treating trichomoniasis, chlamydia, and syphilis are universally available in facilities offering family planning services (about 9 in 10), while medicines for candidiasis and gonorrhoea are less available (15 and 23 percent, respectively).

### 5.3.4 Availability of Equipment and Supplies for Specific Methods

To provide different contraceptive methods safely, and to monitor the client, facilities need a variety of equipment. Figure 5.5 shows what items facilities have available for providing IUDs. Appendix Tables A-5.10 through 5.12 provide additional detail on the availability of equipment and supplies for specific methods, including the IUD and implant methods.

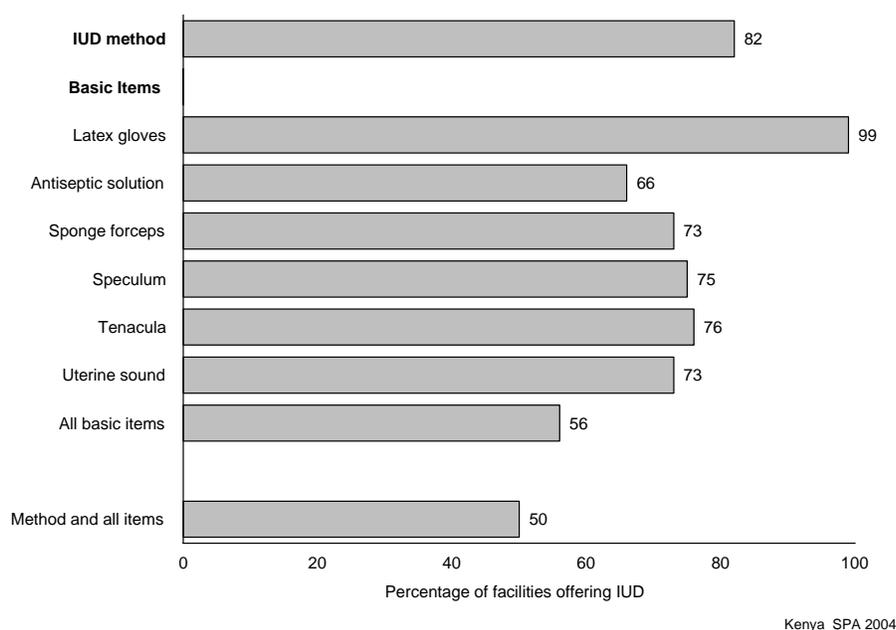

Among facilities offering IUDs, 82 percent have the IUDs themselves, 56 percent have all the basic equipment necessary for insertion and removal, and only 50 percent have both the IUD itself and all the basic items (Figure 5.5). Only 11 percent of the facilities have IUDs and all basic items, and also satisfy all KSPA-defined conditions<sup>1</sup> for quality insertion and removal of IUDs (Table A-5.10). Latex gloves, one of the basic items, are universally available in all facilities offering IUDs (Figure 5.5, Table A-5.10).

Women receiving oestrogen-containing family planning methods benefit from blood pressure and weight monitoring. Among facilities providing methods containing oestrogen, 80 percent have a blood pressure apparatus and 92 percent have an adult weighing scale (Table A-5.10). Almost all maternities and clinics have a blood pressure apparatus, but many health centres do not. Among facilities providing injectable contraceptives, 96 percent have sterile needles and syringes (Appendix Table A-5.10). It should be noted that in Kenya, each progestin injection vial is supplied with a syringe; so it is possible that the 4 percent of facilities without sterile needles and syringes were facilities that did not have progestin injections available the day of the survey (Figure 5.1).

---

<sup>1</sup> Conditions here refer to all infection control items, visual privacy, an examination bed, an examination light and the method

Figure 5.5 Equipment for IUD insertion and removal (N=117)

### Key Findings

Blood pressure equipment is available in 80 percent of facilities offering family planning methods containing oestrogen, and 92 percent of such facilities have a weighing scale.

Sterile needle and syringes were available in almost all the facilities offering injectable contraceptive methods.

Fifty percent of the facilities that report offering IUDs have the method and all the basic items needed for IUD insertion. However, only 11 percent have the method, all the basic items, and all the conditions necessary for quality IUD insertion and removal.

Latex gloves are universally available in facilities offering IUDs.

## 5.4 Management Practices That Support Quality Family Planning Services

Management practices for supporting quality family planning services include documentation and records, practices related to user fees, and staff supervision and development.

Summary information on management practices is provided in Table 5.4. Figure 5.6 shows topics for in-service training and when providers received training. Utilisation statistics for family planning services are provided in Appendix Table A-5.13. Information on user fees charged for family planning services is provided in Appendix Tables A-5.14 through A-5.16. Details on in-service training and supervisory activities from the provider's perspective are provided in Appendix Tables A-5.17 to A-5.19.

### 5.4.1 Facility Documentation and Records

The KSPA assessed whether facilities had up-to-date family planning client registers; such registers are most often the source of data for health information systems. A register was defined as up-to-date if there was an entry within the past seven days, and the latest entry reported the method or service provided and

the client's status (first visit or follow-up visit). Seventy-six percent of family planning facilities had an up-to-date register (Table 5.4); these were most commonly government and NGO-managed facilities (88 percent and 98 percent, respectively). Registers were less commonly found in private for-profit facilities (38 percent). Facilities in North Eastern province were also unlikely to keep up-to-date client registers, which were available in only half of facilities.

**Table 5.4 Management practices to support quality services for temporary methods of family planning**

Percentage of facilities with up-to-date family planning (FP) registers, percentage where there are some user fees for family planning services, percentage with the indicated supportive management practices, by type of facility, managing authority and province, Kenya SPA 2004

Note: Refer to Table 1.1 for the actual number of facilities included in survey and analysis. Weighting results in small numbers for some categories of facilities.

<sup>1</sup> Register has entry within past seven days and indicates visit status (first or follow-up) and service provided.

<sup>2</sup> This refers to structured in-service sessions and does not include individual instruction received during routine supervision.

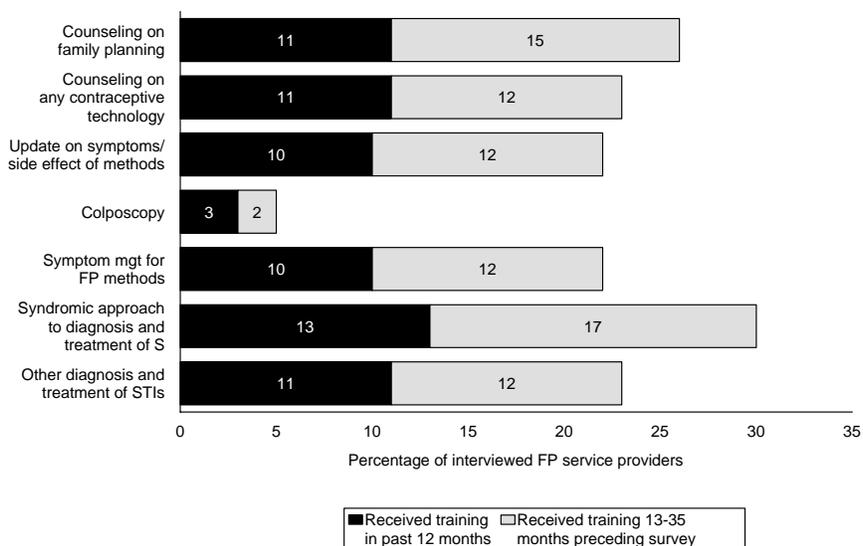

<sup>3</sup> Includes only providers of family planning services in facilities offering family planning services.

#### 5.4.2 Practices Related to User Fees

According to government policy, family planning services in government facilities should be free. However, government facilities can and do charge a registration fee for the client card, while private facilities usually charge a consultation fee. There should be no charge for any government-supplied contraceptive method administered, whether in government or private facilities. The KSPA found that about half of facilities offering family planning charge some type of user fee for family planning services. This is com-

mon in maternities and clinics (94 percent and 93 percent, respectively), and, not surprisingly, in private for-profit facilities (95 percent). It is also common in facilities in Nairobi province (72 percent) (Table 5.4). When offering family planning counselling sessions, approximately 2 in 10 facilities charge fees, with hospitals, maternities and clinics most likely to do so (36 percent, 40 percent, and 46 percent, respectively). Twelve percent of government facilities charge for family planning counselling, and, rather surprisingly, less than half of private for-profit facilities do (Table A-5.14). A rather small proportion of government and NGO-managed facilities (8 and 6 percent, respectively) charge for the actual methods; however, this varies by facility type, with maternities, clinics, and private for-profit and FBO facilities more likely to charge clients for family planning methods.

Figure 5.6 In-service training received by interviewed family planning service providers, by topic and timing of most recent training (N=853)

Kenya SPA 2004

### 5.4.3 Staff Development and Supervision

#### *Staff Development*

The types of contraceptive methods that are available change over time, as does knowledge of the benefits and side effects of different methods. In-service training for providers aims to improve the quality of counselling, management of complications or side effects, and providers' judgment and skills in assessing which contraceptive methods are most suitable for clients' needs.

A facility is defined as having routine staff development activities if at least half of the interviewed family planning service providers at a facility have received any structured in-service training (excluding on-the-job training that may be received during discussions with supervisors) relevant to family planning during the past 12 months. Overall, 34 percent of facilities meet these criteria for providing routine staff development activities. Staff in primary-level facilities and maternities, in facilities in Nairobi province, and in FBO-managed facilities are more likely to receive this training (Table 5.4). The most common in-service training topics covered are counselling on family planning and on any contraceptive technology, updates on symptoms/side effects, and the syndromic approach to diagnosis and treatment (Figure 5.6). More details can be found in Table A-5.17.

## *Supervision*

Supervision of individual staff members helps to promote adherence to standards and to identify problems that contribute to poor quality services. If at least half of the interviewed family planning service providers in a facility have been personally supervised in the past six months, the facility is defined as providing routine staff supervision. Similar to the findings for other services, supervision of family planning providers is common, with 87 percent of facilities meeting the criteria for providing routine staff supervision (Table 5.4). Family planning providers who were supervised in the six months prior to the survey reported that their supervisors universally checked records, observed their work, discussed problems, provided feedback, and gave verbal praises. The supervisors rarely delivered supplies or gave written praises during the visits.

### **Key Findings**

Up-to-date registers are available in three-fourths of facilities, commonly in government and NGO-managed facilities, and rarely in private for-profit facilities.

Only a third of facilities provide routine staff training for family planning providers, but approximately 9 in 10 facilities provide routine staff supervision.

## **5.5 Adherence to Standards for Quality Service Provision**

To assess whether providers adhere to standards for quality service, KSPA personnel observed family planning client-provider consultations. The observation checklists used are based on commonly accepted guidelines for screening, counselling, and conducting procedures for family planning clients; they collected information on whether the consultation process answered the following questions:

- Did providers discuss essential topics relevant to determining the appropriateness of the various methods discussed, and did providers conduct the physical examinations needed to screen clients for method appropriateness?
- Did the conditions and procedures followed for provision of specific methods meet the criteria defined for quality?

The observers noted what information the provider shared and whether an examination was conducted. They did not assess whether the information was correct, or whether findings were appropriately interpreted.

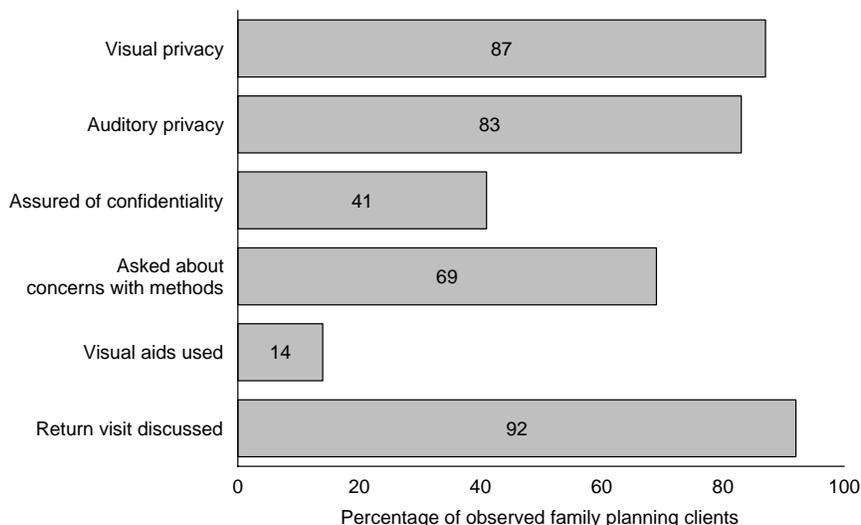

A total of 537 female clients were observed at 322 facilities. This was the first visit for 29 percent of the women; 71 percent were follow-up clients. Five percent of clients had never been pregnant (Appendix Table A-5.20). Exit interviews were conducted with all observed family planning clients. When two methods were prescribed or received, the client was assessed for knowledge about both. Clients who left the facility with no method, but had prescriptions for a method, were also assessed for their knowledge about the prescribed method.

Further details on clients' status and their principal reason for visiting the clinic are provided in Appendix Table A-5.21. Appendix Table A-5.22 gives details on the primary method provided, prescribed or discussed during this visit.

### 5.5.1 Assessment of Relevant History, Examination, and Counselling

Figure 5.7 provides information on components related to counselling, Figure 5.8 provides information on what client history elements the provider assessed for first-visit family planning clients, and Figure 5.9 gives information on consultations where clients received hormonal methods or procedures. Details on consultations for first-visit clients are provided in Appendix Tables A-5.24 through A-5.26. Information from observations related to specific methods or examinations is provided in Appendix Tables A-5.27 and A-5.28.

Figure 5.7 Observed conditions and content for family planning counselling (N=537)

Kenya SPA 2004

### 5.5.2 Counselling and Client Assessment

Privacy is very important for quality family planning counselling. Eighty-seven percent of observed family planning counselling sessions were conducted under conditions where there was visual privacy; 83 percent of clients had auditory privacy (Figure 5.7). In only 41 percent of counselling sessions were clients explicitly assured that the information they shared was confidential. Providers explicitly asked clients about concerns with their methods in about 7 in 10 sessions. Return visits were discussed during 92 percent of sessions. Providers rarely used visual aids during family planning consultations (14 percent).

Individual client cards are necessary to monitor a family planning client over time and to document relevant history so that it does not need to be collected multiple times. Frequently, health services are organised in such a way that measurements of blood pressure, weight, and other components of a consultation take place before the provider responsible for the consultation sees the client, and the information is recorded on a client card. This means an individual client card or chart is also important for ensuring that information collected before the consultation is available to the provider. During the observed family planning consultations, the provider reviewed the client card for 81 percent of clients and wrote on the card after the consultation for 95 percent of clients (Appendix Table A-5.23). These practices are less frequent in maternities than in other facility types.

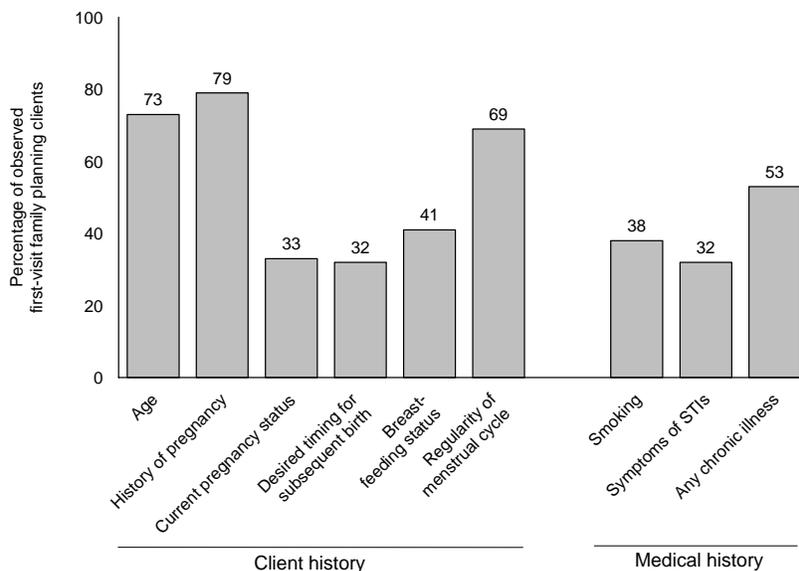

During a client's first visit, providers are expected to elicit relevant personal and health history that will provide the information they need to make an informed recommendation on contraceptive methods; they should also screen clients for the appropriateness of specific methods. Providers asked the client's age and

prior pregnancy history during 70 percent of first visits (Figure 5.8). They were least likely to check on current pregnancy status (either by asking the client or through laboratory testing) and desired timing for the next pregnancy (33 percent and 32 percent, respectively). Knowing a client's breastfeeding status is essential when determining the suitability of different methods of contraception, but providers only asked 41 percent of clients whether they were breastfeeding (Figure 5.8). Relatively few providers assessed clients' medical history to determine their risk status for different family planning methods. About 4 in 10 of the observed first-visit clients were asked whether they smoke, and about 3 in 10 were asked whether they had symptoms of STIs. A little over half were assessed for chronic illnesses. Traditionally, smoking has not been common for women in Kenya, so assessment may not have been stressed in provider training, but smoking is a particularly important risk factor for certain methods.

Providers asked only 35 percent of first-visit clients about their husband's attitude toward family planning or about other factors related to the husband that might affect the client's STI risk or method choice (Appendix Table A-5.25). Providers discussed condom use to prevent STIs with 34 percent of first-visit clients, and they discussed condoms as a dual family planning method during 11 percent of first visits. Considering the current drive toward reducing HIV/AIDS rates, these percentages are rather low.

Use of visual aids during first visits is rare; it was most common in hospitals (56 percent) (Appendix Table A-5.25).

Figure 5.8 Observed elements of client history for first-visit family planning clients (N=154)

Kenya SPA 2004

## Key Findings

Visual and auditory privacy during family planning counselling existed in 87 percent and 83 percent of counselling sessions, respectively; however, providers verbally assured clients of the confidentiality of their consultations less than half the time.

Providers do not thoroughly assess relevant client history that might influence whether a family planning method is appropriate. Less than half of first-visit clients were assessed for current pregnancy or breastfeeding status, chronic illnesses, and risk factors such as STI symptoms or smoking.

Visual aids, though available in 87 percent of facilities, are rarely used during family planning counselling sessions.

### 5.5.3 Method-Specific Assessments and Examinations

For clients receiving methods with oestrogen, whether oral or injectable, monitoring for hypertension should be a component of care, as should weight monitoring; gaining weight may be an indicator of fluid retention and a factor in hypertension. Among these clients, 71 percent had their blood pressure measured<sup>2</sup> and 87 percent had their weight measured (Appendix Table A-5.26).

### 5.5.4 Counselling of Clients

Whether they are new contraceptive users or continuing users, clients should receive certain information during consultations. The provider should explain or review with the client how to use the method, the possible side effects, what to do for problems, and when the client should return for a follow-up visit.

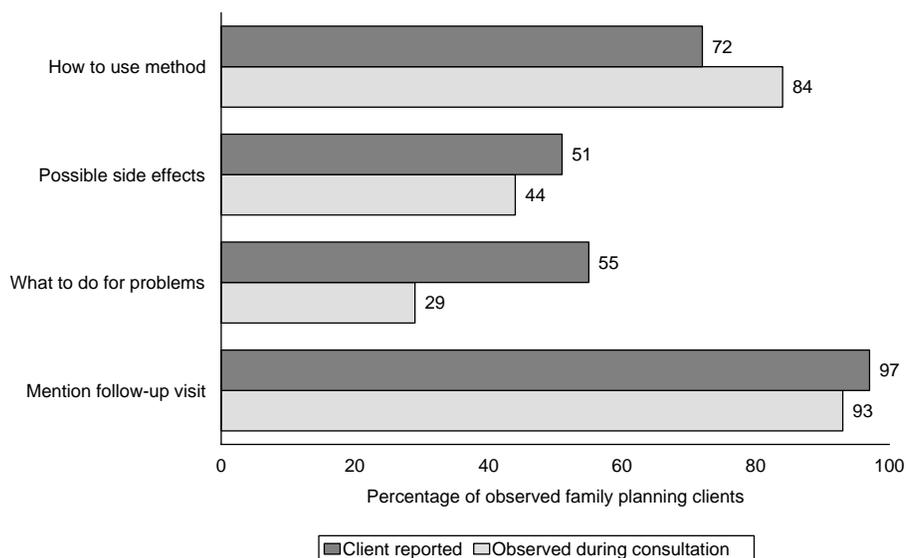

Details on components of counselling that were observed and reported by clients are presented in Appendix Tables A-5.27 and A-5.28.

KSPA data can be used to compare what was observed during a consultation to the client's exit interview about the same consultation (Figure 5.9). Client reports were most likely to agree with the observed data on whether the provider mentioned possible side effects of the method and discussed a follow-up visit. Data on other areas was more inconsistent. For example, whereas 84 percent of providers were observed discussing with clients how to use their method, a smaller percentage (72 percent) of clients reported that this happened during the consultation. On the contrary, as opposed to 29 percent of cases when the provider was observed discussing what to do in case of problems, 55 percent of clients actually reported this to have taken place. Clients may have received this information during prior visits or at the pharmacy when receiving their methods.

---

<sup>2</sup> If the client was observed in a facility where blood pressure is measured systematically prior to the consultation, the client was assumed to have her blood pressure measured, even if this was not observed for the particular client.

Figure 5.9 Information provided to hormonal method users, by client report and by observation (N=516)

Kenya SPA 2004

## Key Findings

Among all clients receiving methods with oestrogen, where monitoring for hypertension should be a component of care, 71 percent had their blood pressure measured.

There were some inconsistencies between client reports and observation of the information provided to hormonal method users; however, at most half of clients either reported or were observed being counselled about possible side effects or what to do for problems.

## 5.6 Client Opinion from Exit Interviews

After the observed consultation, the client was asked to participate in an exit interview during which the interviewer asked for her opinions on issues commonly related to client satisfaction. Specifically, clients were asked if they had a problem with their method upon their arrival at the facility and whether the provider discussed the problem with them. The client was first asked to identify issues without prompting. Then the client was asked to comment on whether specific issues were a big problem, a small problem, or not a problem at all for them.

Few issues were considered big problems, and usually only by a small proportion of interviewed clients. Long waiting time to see the provider was a big problem for 23 percent of clients. Fewer clients (6 percent) considered lack of medicines or supplies to be a big problem, while only 4 percent considered the operating hours of the facility to be a problem (Appendix Table A-5.29).

Further details on client opinion are provided in Appendix Tables A-5.29 and A-5.30. Appendix Table A-5.31 provides information on the educational backgrounds of observed and interviewed clients.

When asked if this was the nearest facility to their home, about 2 in 10 of the interviewed clients said that it was not. These were more likely to be clients at maternities (69 percent) and those who were attending private for-profit facilities (53 percent). Similarly, clients in facilities in Nairobi province (49 percent) are more likely to visit facilities not nearest to them. The main reasons clients gave for not attending the nearest facilities to where they live were that those facilities were more expensive (23 percent) and lacked medicine (15 percent) (Appendix Table A-5.30).

## 6.1 Background on Maternal Health Care in Kenya

This chapter provides an overview of the Kenyan maternal and newborn health services environment. Maternal health data are primarily derived from four modules of the KSPA: the facility inventory, the health worker interview, the antenatal care observation, and the antenatal care client exit interview. Additional information was also derived from the maternal health provider knowledge questionnaire, the normal delivery record review questionnaire, and the maternity statistics form. The chapter highlights the key aspects of maternal and newborn care, including the availability of staff and services for antenatal care, safe delivery, post-partum care, and obstetric complications.

### *Maternal Health Status and Health Care Utilisation*

Complications related to pregnancy and childbirth are among the leading causes of morbidity and mortality among Kenyan women. Recent estimates suggest that there are 414 maternal deaths per 100,000 live births, representing a 1 in 25 lifetime risk of dying from a maternal-related cause (KDHS 2003). Hospital-based studies suggest that the majority of these deaths are due to obstetric complications, including haemorrhage, sepsis, eclampsia, obstructed labour, and unsafe abortion. Unsafe abortion practices alone are thought to cause at least a third of all maternal deaths.

Kenyan women's use of maternal health services is higher than in other African countries. The KDHS 2003 found that 88 percent of women make at least one antenatal care visit, 31 percent make two or three visits, and more than 52 percent make four or more visits. However, the majority of these women seek antenatal care relatively late in pregnancy; the median gestation at first visit is 5.9 months.

The 2003 KDHS also showed that 52 percent of mothers received two or more doses of tetanus toxoid vaccine during pregnancy, while 34 percent received one dose. The remaining 14 percent of mothers did not receive any tetanus immunisation.

Delivery within a health facility or with a skilled attendant is much less common than antenatal care. Only 42 percent of women have a skilled attendant present at delivery, while 28 percent of women deliver with a traditional birth attendant (TBA); slightly over one-fifth deliver with a relative, and nearly one-tenth of women deliver entirely alone. The majority of the deliveries with a skilled attendant occur in health facilities. Overall, 26 percent of all deliveries occur in public health facilities, and three out of five births occur at home.

These aggregate figures conceal wide provincial disparities, however. Delivery at home, for example, is more than twice as common in rural as in urban areas, and the proportion of births with a skilled attendant ranges from only 29 percent in Western province to 79 percent in Nairobi (KDHS 2003).

### *Maternal Health Policy Framework*

Maternal health services in Kenya began as part of an integrated MCH programme in 1972, but it was not until the inauguration of the Safe Motherhood Initiative in Nairobi in 1987 that specific programmes to reduce maternal mortality and improve maternal health were established. Early efforts focused on training TBAs to screen high-risk pregnancies for complications; efforts are now directed towards providing women with access to skilled care during pregnancy and delivery.

The National Reproductive Health Strategy for 1997 (Ministry of Health, 1996) has two principal maternal health objectives: to reduce maternal mortality to 170 per 100,000 live births by the year 2010, and to increase professionally attended deliveries to 90 percent in the same time period. The objective is to help health facilities in various areas manage pregnancy-related complications, unsafe abortion, and newborn care, and to establish a functional referral system.

### ***Organisation of Maternal Health Services***

Maternal health services are provided by facilities at every level of the Kenyan healthcare system. Dispensaries, the lowest-level facilities in the public health sector, are staffed by enrolled nurses and public health technicians. They provide antenatal care, treat simple medical problems in pregnancy such as anaemia, and occasionally conduct normal deliveries. Health centres provide the next level of services. They are staffed by midwives/nurses and clinical officers, and provide a wider range of services, including deliveries. Health centres should be able to provide basic first aid for obstetric complications but are not equipped for surgery or for managing delivery complications such as obstructed labour. District hospitals (and some sub-district hospitals) are the lowest level of health facility equipped to carry out caesarean sections.

Clinics and maternities also provide a wide range of maternal health services. Although there are some public-sector clinics and maternities, most are private establishments, and the types of services they provide vary widely. Some clinics provide only antenatal care, while others, particularly the larger establishments or polyclinics, also provide delivery care and surgery. Most maternities provide normal delivery care, and some are equipped to carry out caesarean sections.

Doctors, clinical officers, and registered and enrolled midwives and nurses make up the professional labour force of skilled attendants. Although clinical officers have less obstetric training than doctors, some of them provide obstetric care on a regular basis. Registered nurses and midwives (KRN/M, KRCN) have three years of pre-service training and form the senior level of the nursing cadre. In general, they fill a teaching, administrative, or supervisory role. Enrolled nurses and midwives (KEN/M, KECN) have two years of pre-service training and comprise the majority of the labour force in all facilities.

Although providing women with access to a skilled attendant at birth is a key element in the National Reproductive Health Strategy, there are major problems with the availability and distribution of health sector manpower. There are recognized shortages of doctors, clinical officers and nurses across the country, particularly in rural areas and at facilities below the hospital level. More than half of all health personnel and four-fifths of doctors are based at urban facilities (Ministry of Health, 1996). The National Health Sector Strategic Plan (NHSSP) of 2005-2010 has specific action strategies that will be undertaken to address these persistent staff shortages. Efforts are currently being made to address the shortfall.

#### **6.1.1 KSPA Approach to Collecting Maternal Health Information**

Maternal health is not just a women's issue; the mother's health has a direct bearing on the health of her newborn. About 15 percent of all pregnant women experience life-threatening complications as a result of their pregnancy. Many complications and subsequent poor outcomes for women and infants can be prevented or minimized by early detection of problems and appropriate interventions.

With an international focus on decreasing maternal morbidity and mortality, some of the traditional maternal health interventions have been re-examined in recent years, with subsequent changes in programme emphasis.

**Antenatal care (ANC):** All pregnant women are at risk of developing complications, many of which are unpredictable. It is therefore important to ensure that all pregnant women have access to preventive inter-

ventions, early diagnosis and treatment, and emergency care when needed. It is now emphasized that ANC should focus on birth preparedness, early detection of complications, and skilled and timely interventions to avoid adverse maternal and neonatal outcomes.

**Delivery care:** Every delivery may have complications; therefore emphasis should be towards the use of skilled and trained delivery care providers and ensuring that all women have access to life-saving emergency interventions at the time of labour and delivery. In many countries, deliveries occur at home attended by traditional birth attendants (TBAs). Previously, there were extensive efforts and funds expended toward upgrading the skills of TBAs, but safe motherhood programme initiatives have shown that in almost all cases, the level of skill among ‘skilled traditional birth attendants’ is lower than is considered ‘safe’ for safe motherhood. In-service training for TBAs cannot improve their skills to the level of competency needed.

A skilled attendant, as defined by the World Health Organisation (WHO) and other international bodies, is a ‘health professional—such as a midwife, doctor, clinical officer, or nurse—who has been educated and trained to proficiency in the skills needed to manage normal pregnancies, childbirth, and the immediate postnatal period, and in the identification, management and referral of complications in women and newborns’.

**Postnatal care (PNC):** There is an increasing emphasis on ensuring that women receive PNC within 48 hours of delivery for early diagnosis of postpartum complications. PNC also provides an opportunity to counsel the new mother on family planning and on caring for herself and her newborn, as well as to assess the newborn for any problems.

**Newborn care:** More attention has also been given recently to newborn care, with an increased awareness of the need to discourage some common practices that are detrimental to newborn health and to promote those practices that contribute to improved newborn health.

Internationally accepted guidelines define the maternal health services necessary for safe delivery and improved maternal and newborn outcomes as follows:

**Basic essential obstetric care (BEOC)** includes preventive services as well as medical interventions and procedures that can be provided to pregnant women by well-trained primary care physicians and non-physician providers. This includes ANC with early detection and treatment of common problems of pregnancy, as well as first aid for complications of pregnancy and labour.

**Comprehensive essential obstetric care (CEOC)** includes basic essential obstetric care services, together with blood transfusions and caesarean sections.

**Emergency obstetric care** involves a set of interventions called ‘signal functions’ that should be available in a facility that provides emergency care for women with pregnancy-related complications. These signal functions must be performed at a facility in order for that facility to be recognized as an emergency obstetric care (EmOC) facility. A facility can either be classified as a basic EmOC or a comprehensive EmOC facility.

The **basic EmOC signal functions** are administration of parenteral antibiotics, oxytocic drugs and anti-convulsants; manual removal of placenta; manual vacuum aspiration of retained products of conception; and assisted vaginal delivery.

**Comprehensive emergency obstetric care (comprehensive EmOC)** includes the six basic signal functions, plus performing caesarean section and blood transfusion. Comprehensive EmOC has been adopted by the Ministry of Health and forms part of the strategy of programmes to improve maternal health.

Maternal and newborn health services represent a wide range of interventions, depending on whether the mother and newborn are healthy or experiencing problems. The KSPA 2004 draws on the findings and recommendations of Safe Motherhood initiatives such as the Maternal and Neonatal Health Project, promoted by WHO and other international organisations to determine which aspects of maternal health to assess.

This chapter uses information obtained in the KSPA 2004 to address the following central questions about maternal health services:

- What is the availability of ANC?
- To what extent do facilities have the capacity to support quality ANC services?
- To what extent is there evidence that health service providers adhere to standards for provision of quality ANC services?
- To what extent is PNC<sup>1</sup> available where ANC is offered, and to what extent do facilities have the capacity to support quality PNC services?
- What is the availability of delivery services, and to what extent do facilities have the capacity to support quality delivery services?
- What are the common newborn care practices in facilities providing delivery services?
- What is the maternal health provider knowledge on signs and basic interventions of common maternal complications?

### **6.1.2 Maternal Health and the Utilisation of Services in Kenya**

The Ministry of Health (MOH) and the National Coordinating Agency for Population and Development (NCAPD) have identified maternal health as a priority health issue and have developed a strategy based on CEOC to reduce maternal morbidity and mortality. Through the Health Sector Strategic Plan, the MOH has developed interventions to reduce maternal morbidity and mortality from these causes. Essential obstetric care protocols have been developed, and there is a focus on competency-based training for physicians and nurses on the new essential obstetric care protocols and standards of care. The MOH has also been expanding midwifery training for nurses. The objective is to increase the skills of primary care physicians and nurses trained in midwifery so that they can become “skilled birth attendants” by acquiring proficiency in the skills necessary to manage normal deliveries and to diagnose and manage or refer complicated cases.

Some improvement in maternal health is being achieved. According to the 2003 KDHS, the national maternal mortality rate has declined from 590 maternal deaths per 100,000 live births in 1998 to 414 maternal deaths per 100,000 live births in 2003. However, Millennium Development Goal (MDG) No. 5 is to reduce maternal mortality rate to 175 maternal deaths per 100,000 live births or less. Much still needs to be done to achieve the MDG target.

## **6.2 Availability of Antenatal and Postnatal Care and Capacity to Provide Quality Services**

ANC is designed to promote healthy behaviours and preparedness during pregnancy, childbirth, and after delivery, and also to provide early detection and treatment for complications.

---

<sup>1</sup> For the KSPA, any report of offering routine outpatient postnatal examination and services was accepted as PNC. Details on the content of PNC were not collected. Capacity was assessed by whether the facility could identify and manage postpartum infections and whether the newborn weight could be measured.

## 6.2.1 Availability of Antenatal and Postnatal Care Services

Information on the availability of ANC, PNC, and tetanus toxoid (TT) vaccine is provided in Table 6.1. Appendix Table A-6.1 provides information on whether facilities offer various family health services on the same day they offer ANC, and Appendix Table A-6.2 gives more details on the availability of ANC and TT vaccines.

Background characteristics	Percentage of facilities offering the indicated services				Number of facilities (weighted)
	ANC	PNC	TT vaccine	ANC, PNC and TT	
<b>Type of facility</b>					
Hospital	84	53	96	50	28
Health centre	86	51	94	47	125
Maternity	76	44	82	41	20
Clinic	53	21	52	18	8
Dispensary	77	24	79	24	249
<b>Managing authority</b>					
Government	81	40	86	38	245
NGO	88	74	89	74	16
Private (for-profit)	59	23	66	22	61
Faith-based organisation	87	24	88	24	109
<b>Province</b>					
Nairobi	68	31	70	31	37
Central	79	46	84	46	50
Coast	78	19	84	18	49
Eastern	81	45	83	44	81
North Eastern	82	41	89	41	8
Nyanza	96	30	96	29	54
Rift Valley	75	28	81	26	124
Western	82	53	94	48	29
<b>Total</b>	<b>79</b>	<b>35</b>	<b>84</b>	<b>33</b>	<b>430</b>

Note: Refer to Table 1.1 for the actual number of facilities included in survey and analysis. Weighting results in small numbers for some categories of facilities.

Seventy-nine percent of facilities offer ANC services; one-third offer PNC, and eighty-four percent provide TT vaccine. One-third of facilities provide all three services (Table 6.1). There has been a decline in availability of ANC since 1999, when 86 percent of facilities offered the service. Approximately three-fourths of facilities offer ANC services five or more days per week, and 26 percent offer these services one or two days per week (Table A-6.2). Similarly, TT services are usually offered five or more days a week, and almost all facilities offer TT every day ANC is offered.

The provincial differentials show that nearly all the facilities in Nyanza province provide ANC services, followed by North Eastern and Western provinces (82 percent). Nairobi province has the lowest proportion of facilities providing ANC services. Seventy-four percent of NGO facilities provide all the three services, compared with 22 percent of private for-profit facilities (Table 6.1); private facilities most often lack ANC.

## Key Findings

ANC is offered in four out of five facilities and in nearly all facilities in Nyanza province.

All the three services (ANC, PNC, tetanus toxoid vaccine) are available in only one-third of the facilities.

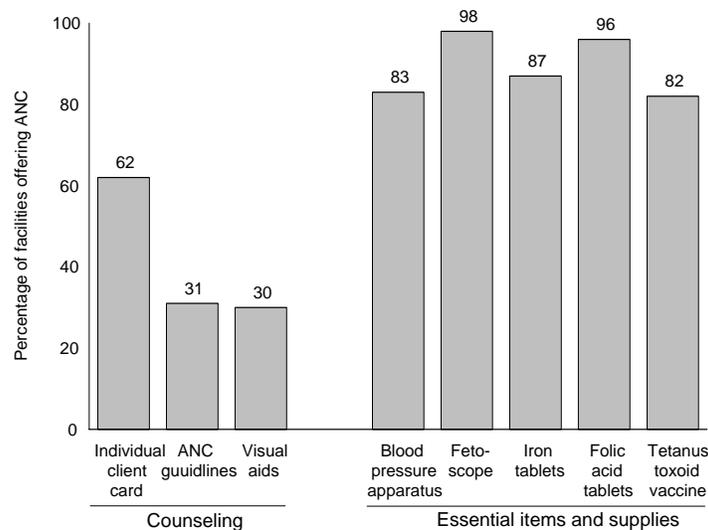

### 6.2.2 Infrastructure and Resources to Support Quality Assessment and Counselling of ANC Clients

To support quality assessment and counselling of ANC clients, facilities should have individual client cards, guidelines or protocols for ANC, and visual aids for client education. Table 6.2 and Figure 6.1 present information on the availability of these items. More details are available, including a breakdown by facility type, in Appendix Table A-6.3.

An individual ANC card is used for monitoring maternal and foetal condition during pregnancy and for keeping track of the type of care/treatment given. It is important for identifying risk factors for referral, assessing quality of care, ensuring standardisation of antenatal care, and helping in planning purposes (Population Council, 2002a). Individual client cards are available in 62 percent of facilities (Figure 6.1).

Written ANC guidelines or protocols which include details pertaining to the management of common problems during pregnancy are available in 31 percent of facilities; visual aids for ANC client counselling are available in just 30 percent.

Figure 6.1 Availability of items to support basic ANC services (N=347)

Kenya SPA 2004

Overall, only 1 in 10 facilities have all three items for supporting quality ANC (individual client cards, ANC guidelines, and visual aids), with facilities in Rift Valley, North Eastern and Central provinces least likely to have all the items (Table 6.2).

**Table 6.2 Availability of antenatal care and resources to support quality counselling and examinations for ANC/PNC**

<b>Total</b>	<b>10</b>	<b>37</b>	<b>20</b>	<b>57</b>	<b>347</b>

Note: Refer to Table 1.1 for the actual number of facilities included in survey and analysis. Weighting results in small numbers for some categories of facilities.

<sup>1</sup> Visual aids for health education, guidelines for ANC, and individual client card or record.

<sup>2</sup> Soap and water, clean latex gloves, disinfecting solution, and sharps box.

<sup>3</sup> Visual and auditory privacy (private room), examination table, and examination light.

<sup>4</sup> Iron and folic acid tablets, tetanus toxoid vaccine, blood pressure apparatus, and foetoscope (Pinard).

### 6.2.3 Infrastructure and Resources for Examinations

The KSPA 2004 assessed whether facilities had the necessary supplies, equipment, and conditions for infection control and for conducting client examinations in the ANC service area.

Aggregate information on these elements is provided in Table 6.2, and summary information on specific equipment and supplies is given in Figure 6.1. Appendix Table A-6.3 provides details on each of the items assessed.

#### *Infection Control*

All items necessary for infection control (soap and water for hand washing, clean latex gloves, disinfecting solution, and a sharps box) are available in the ANC service delivery area in 37 percent of facilities offering ANC (Table 6.2). Facilities in North Eastern, Western, and Rift Valley provinces are less likely to have all items for infection control than those in other provinces. Water and sharps boxes are available in the ANC service areas in about 9 in 10 facilities (90 and 93 percent, respectively) (Table A-6.3).

## *Client Examinations*

The common physical examinations for ANC include palpating the abdomen, breast examination and, when indicated, a pelvic examination.<sup>2</sup> The basic components for examining ANC clients are visual and auditory privacy, a bed or examination table, and an examination light. Eighty-eight percent of facilities that offer ANC are able to ensure clients both visual and auditory privacy, and all facilities (99 percent) have either a bed or an examination table. However, only about 2 in 10 facilities have an examination light (Appendix Table A-6.3). All three items are available in 20 percent of facilities, mostly in NGO-managed facilities (60 percent) and in facilities in Nairobi province (38 percent) (Table 6.2). Facilities in North Eastern and Western provinces are the least likely to have all three items. Government-managed facilities are less likely than other facilities to have all three items for quality client examination (5 percent). The item most often missing in all facilities is an examination light.

### **6.2.4 Essential Equipment and Supplies for Basic ANC**

A functioning blood pressure apparatus and a foetoscope are essential equipment that should be available in the ANC service delivery area; essential ANC supplies that should be available in the facility are iron tablets, folic acid tablets, and TT vaccine. All the essential equipment and supplies are available in only 6 in 10 facilities (Table 6.2); however, each individual item is available in over 80 percent of facilities (Figure 6.1). Provinces where facilities are most likely to have all the essential supplies and items are Western (75 percent), North Eastern (92 percent) and Coast (65 percent). Facilities in Central (47 percent) and Eastern (49 percent) province are the least likely to have them (Table 6.2).

#### **Key Findings**

Elements to support quality ANC are commonly lacking; only 1 out of 10 facilities has all the items needed for counselling, 37 percent have all items for infection control, and 57 percent have all the items essential for providing basic ANC.

ANC guidelines and visual aids are available in 31 percent and 30 percent of facilities respectively; 4 in 10 facilities did not have client ANC cards available

Four out of five facilities have a functioning blood pressure apparatus in the ANC service delivery area, and 4 percent and 13 percent of facilities lack folic acid and iron tablets, respectively.

### **6.2.5 Additional Equipment and Supplies for Quality ANC and PNC Services**

Other elements that support quality ANC and PNC include diagnostic capacity and medicines to treat common infections. Figures 6.2 and 6.3 provide summary information on the medicines and laboratory tests available in facilities, with aggregate information available in Table 6.3. Appendix Tables A-6.4 through A-6.9 provide details on each item assessed, by type of facility.

---

<sup>2</sup> Pelvic examination is not a routine component of ANC in Kenya.

**Table 6.3 Facility practices and resources for diagnosis and management of common problems and complications of pregnancy**

Percentage of facilities where ANC/PNC service providers can diagnose and treat STIs for ANC/PNC clients, percentage with all medicines to manage common complications of pregnancy, percentage with the indicated diagnostic testing capacity, by type of facility, managing authority and province, Kenya SPA 2004

Background characteristics	Percentage where STI treatment is provided by ANC providers	Percentage with all medicines for treating pregnancy complications <sup>1</sup>	Percentage with capacity for conducting the indicated diagnostic test				Number of facilities offering ANC (weighted)

<b>Total</b>	<b>75</b>	<b>4</b>	<b>36</b>	<b>38</b>	<b>39</b>	<b>44</b>	<b>347</b>

Note: Refer to Table 1.1 for the actual number of facilities included in survey and analysis. Weighting results in small numbers for some categories of facilities.

<sup>1</sup> At least one broad-spectrum antibiotic (amoxicillin or cotrimoxazole); at least one medicine for treating trichomoniasis, gonorrhoea, chlamydia infection, and syphilis; mebendazole or albendazole (for deworming); aldomet for hypertension; nystatin suppository; and antimalarials all present.

<sup>2</sup> Includes any test (haemoglobinometer or calorimeter or centrifuge with capillary tubes, or filter paper methods).

<sup>3</sup> Clinistix (Campus 3 or Campus 9 sticks) or flame, acetic acid, and test tube for testing urine albumin.

<sup>4</sup> Clinistix (Campus 3 or Campus 9 sticks).

<sup>5</sup> Venereal disease research lab (VDRL) test with functioning microscope or rapid plasma reagin (RPR)

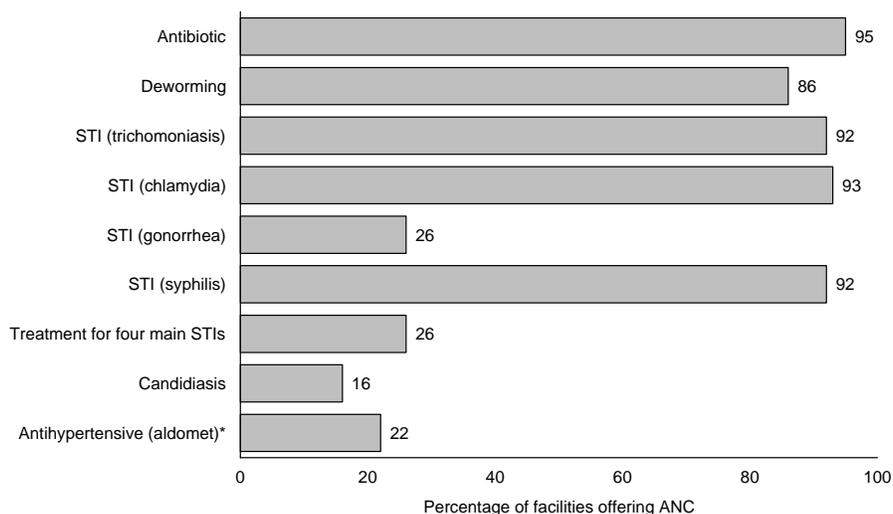

Pre-eclampsia (a hypertensive disorder of pregnancy), anaemia, sexually transmitted infections (STIs), and vaginal infections can directly affect both maternal and newborn health. Basic Essential Obstetric Care (BEOC) requires that a facility provide early treatment for complications of pregnancy to prevent progression to more serious conditions. The standard for treatment may vary depending on ANC guidelines and policies and the qualifications of the service provider.

In three-fourths of facilities offering ANC, STI treatment is offered to ANC clients (Table 6.3). Rather surprisingly, hospitals and government-managed facilities (46 and 68 percent, respectively) are the least likely to have ANC providers treat STIs, and similarly, ANC service providers in facilities in Nairobi are least likely to treat STIs. Only 26 percent of facilities have at least one medicine to treat each of the four major STIs (trichomoniasis, chlamydia, syphilis, and gonorrhoea), with medicine for gonorrhoea most often lacking (Figure 6.2 and Appendix Table A-6.4). Only one out of four facilities has at least one

medication for gonorrhoea. Nearly all facilities have at least one medication to treat chlamydia (93 percent) and syphilis (92 percent). However, only 16 percent of facilities have medicine for candidiasis, a common vaginal or sexually transmitted infection.

About 1 in 5 ANC facilities have methyldopa (Aldomet) for managing hypertension during pregnancy<sup>3</sup> (Appendix Table A-6.4). A mere four percent of facilities have all medicines expected to be available for managing basic infections and health problems during pregnancy: at least one broad-spectrum antibiotic (amoxicillin or cotrimoxazole); at least one medicine for treating trichomoniasis, gonorrhoea, chlamydia infection, and syphilis; mebendazole or albendazole (for deworming); methyldopa (Aldomet) for hypertension; nystatin suppositories and antimalarials (Table 6.3).

Figure 6.2 Medicines for managing common problems and complications of pregnancy (N=347)

\* Only specialist can prescribe Aldomet for ANC clients in Kenya

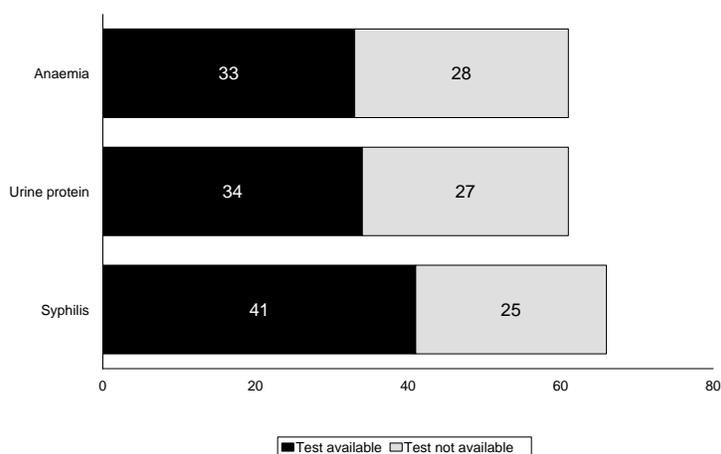

Kenya SPA 2004

The KSPA 2004 also assessed whether facilities have the capacity to test ANC/PNC clients for anaemia, urine protein, and urine glucose, and to diagnose and treat syphilis.

Among facilities providing ANC/PNC services, only thirty-six percent have the capacity to test for anaemia, 38 percent for urine protein and 39 percent for urine glucose (Tables 6.3, A-6.5-A-6.8). Hospitals and maternities (as expected), private-for-profit facilities, and facilities in Nairobi are more likely than others to have the capacity to conduct these tests. Figure 6.3 shows how many facilities routinely screening ANC clients for these conditions, and which ones actually have the capacity to conduct the necessary tests. About 4 in 10 facilities routinely screen ANC clients for syphilis and have the capacity to conduct a syphilis testing; these are mostly hospitals, private-for-profit facilities, and facilities in Nairobi (Table A-6.8). All facilities offering ANC had antimalarials available, and of those, 84 percent routinely provide preventive antimalarials as a component of ANC services (Table A-6.4).

<sup>3</sup> In Kenya, methyldopa (Aldomet), for managing hypertension, is to be used for ANC clients only by specialists, and facilities without specialists are expected to refer these cases.

Figure 6.3 Availability of ANC tests in facilities where tests are reported to be routine components of ANC (N=347)

Kenya SPA 2004

### Key Findings

The lack of all medicines for managing common pregnancy-related conditions is notable in all types of facilities. However, commonly recommended antibiotics are available in 95 percent of facilities.

Three out of four facilities diagnose and prescribe treatment for STIs in the ANC service area; however, only 26 percent of these facilities have medicines to treat each of the four main STIs (syphilis, gonorrhoea, chlamydia, and trichomoniasis). The recommended treatment for gonorrhoea is most often lacking.

Thirty-eight percent of facilities have the capacity to routinely check urine protein, and 2 out of 5 facilities have the capacity to measure urine glucose.

## 6.3 Management Practices Supportive of Quality ANC and PNC Services

Management practices for supporting quality ANC and PNC services include documentation and records, posting user fees, and staff supervision and development.

Table 6.4 provides information on management practices, and Figure 6.4 provides summary information on in-service training on ANC. Appendix Tables A-6.9 through A-6.11 provide details on utilisation, user fees, and out-of-pocket payments for ANC services, and Appendix Table A-6.12 provides information on supportive management for providers of ANC. Appendix Tables A-6.13 and A-6.14 provide detailed information on in-service training and supervision.

### 6.3.1 Facility Documentation and Records

Among facilities offering ANC, 82 percent have up-to-date registers that include an entry in the past seven days and indicate whether the client was visiting for the first time (Table 6.4). Only 5 percent of facilities offering ANC have an up-to-date register for PNC clients. This low percentage can be explained by the fact that PNC as a component of maternal and child care has received very little attention in Kenya, especially the maternal component, which affects both maternal and child morbidity and mortality (Population Council et al., 1999). Women do not always receive early postpartum care in Kenyan facilities; health care providers appear reluctant to provide this care, especially in busy units. Most men are not even aware that women need postpartum care and believe it is only for the baby (Warren and Liambila, 2004).

Table 6.4 Management practices supportive of quality maternal health services

Rift Valley	82	0	17	52	96	45	84	88
Western	90	5	1	57	25	63	95	25
<b>Total</b>	<b>82</b>	<b>5</b>	<b>13</b>	<b>67</b>	<b>347</b>	<b>51</b>	<b>86</b>	<b>339</b>

Note: Refer to Table 1.1 for the actual number of facilities included in survey and analysis. Weighting results in small numbers for some categories of facilities.

<sup>1</sup> Register has entry within past seven days and indicates, at minimum, whether this was the first or a follow-up visit for ANC and number of days postpartum for PNC register.

<sup>2</sup> This refers to structured in-service sessions and does not include individual instruction received during routine supervision.

<sup>3</sup> Includes only providers of ANC in facilities offering ANC services.

Of the facilities offering ANC services, 13 percent have documentation indicating that they monitor their ANC coverage rate (the proportion of eligible women in their catchment area who receive ANC services). While about 6 in 10 NGO-managed facilities monitor ANC coverage, only 1 in 10 government-managed facilities do so, and barely any facilities in Nairobi, Nyanza, and Western provinces have documentation showing that they monitor coverage rates (2, 3 and 1 percent, respectively).

### 6.3.2 Practices Related to User Fees

User fees may have either a positive effect on utilisation of health facilities (by increasing the funds available to the facility) or a negative effect (by deterring poor clients from using services). Posting user fees is a good standard for quality of care, since clients are able to know exactly the cost of services. Approximately two-thirds of facilities charge some form of user fees for ANC. All maternities and clinics charge user fees, and facilities in Nairobi and Nyanza provinces are more likely than facilities in other provinces

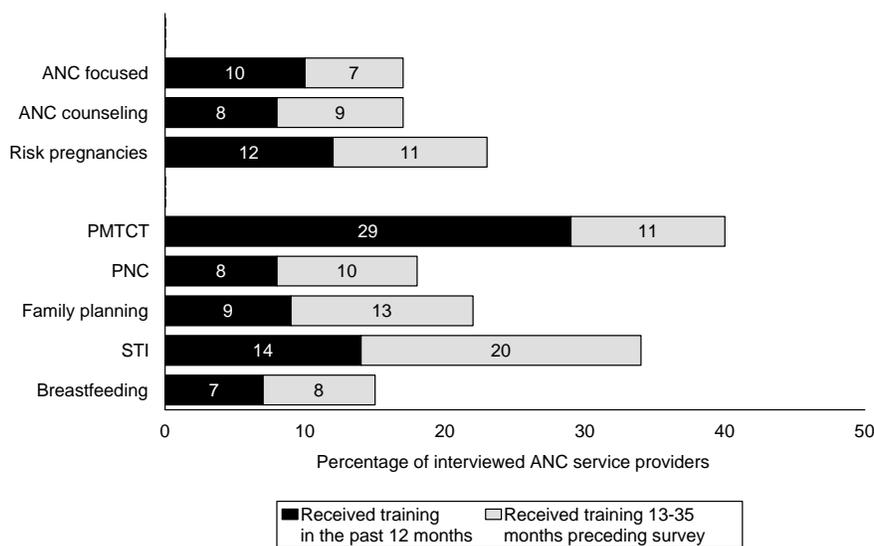

to charge fees for ANC services (87 and 84 percent, respectively). Only 20 percent of facilities in North Eastern province charge some user fees, despite the fact that fewer facilities in this province offer ANC services (Table 6.4). Approximately 2 in 10 facilities charge user fees specifically for client consultations by resident providers; these are mostly private for-profit facilities, FBO-managed facilities, and facilities in Nairobi province (Table A-6.11). A very small proportion of facilities (mostly private for-profit and FBO-managed) charge for client consultations by consultants, and about one-fourth charge user fees for laboratory tests and iron tablets. About 4 in 10 facilities have fixed fees for all ANC services.

### 6.3.3 Staff Development and Supervision

The KSPA defines a facility as providing routine staff development activities if at least half of the interviewed ANC providers said they had received structured in-service training relevant to ANC during the past 12 months (excluding on-the-job training that may be received during discussions with supervisors). Half (51 percent) of all facilities meet these criteria for providing routine staff development activities (Table 6.4). The facilities most likely to have routine staff development activities are hospitals and maternities (61 and 62 percent, respectively). NGO-managed facilities and facilities in Nairobi and North Eastern provinces are least likely to provide routine staff development.

The most frequently reported in-service training topics are STIs and prevention of mother-to-child HIV transmission (PMTCT) (29 and 14 percent, respectively) (Figure 6.4).

Figure 6.4 In-service training received by interviewed ANC service providers, by topic and timing of most recent training (N=1,041)

Kenya SPA 2004

Supervising individual staff members helps promote adherence to standards and also helps identify problems that contribute to poor quality services. As found with other services, supervision of ANC providers is common; 86 percent of facilities met the KSPA criteria for routine staff supervision (at least half of the interviewed ANC providers had been personally supervised during the past six months) (Table 6.4).<sup>4</sup> Rou-

<sup>4</sup> The assessment is not able to determine how complete or supportive the supervision is, and whether it is only for administrative matters or includes any coaching/learning component.

tine supervision for ANC providers is less frequent in hospitals and clinics (71 percent and 65 percent, respectively) and in facilities in Nairobi, Coast and Central provinces (71, 72 and 74 percent, respectively).

### Key Findings

While 82 percent of facilities have up-to-date ANC registers, only 5 percent have PNC registers; 13 percent have documentation indicating they monitor ANC coverage rates.

Half of the facilities assessed have routine staff development activities, and about nine out of ten facilities have routine staff supervision, including nearly all facilities in Eastern province.

## 6.4 Adherence to Standards for Quality ANC Service Provision

To assess whether providers adhere to standards for providing quality service, KSPA personnel observed ANC client-provider consultations. The observation checklists used are based on elements of focused ANC. The observers noted whether providers shared information on a topic and whether an examination was conducted. They did not assess whether the information was correct or whether findings were appropriately interpreted.

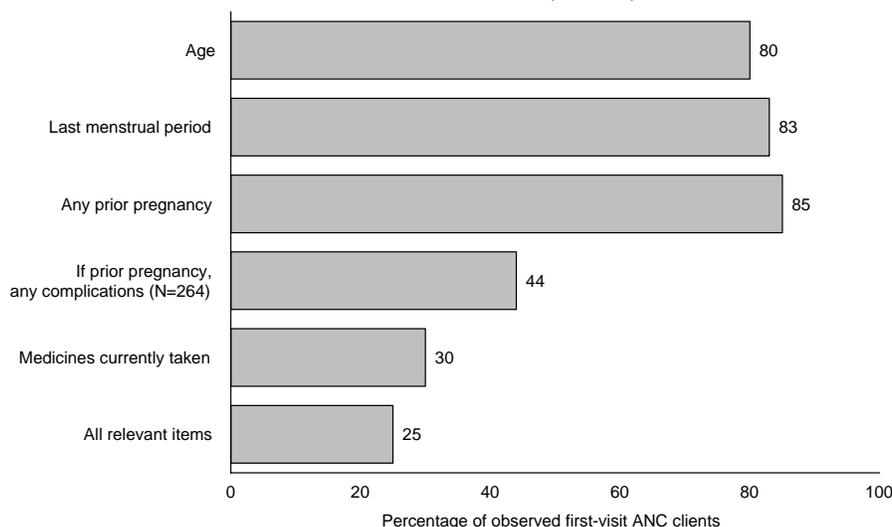

### 6.4.1 Appropriate Assessment and Examination for ANC clients

Summary information on components of ANC is provided in Figures 6.5, 6.6 and 6.7. Appendix Tables A-6.17 to A-6.21 provide details on assessments and examinations conducted for ANC clients.

#### Client History

At a first ANC visit, the provider should elicit a basic medical history to assess pre-existing risk factors. The information most often elicited by providers was age, date of last menstrual period, and information about any prior pregnancies. These questions were asked of 80 percent, 83 percent, and 85 percent, respectively, of first-visit ANC clients (Figure 6.5). These findings are similar to those from the 1999 KSPA. All the relevant client history items were assessed in only 1 out of 4 of first-visit consultations.

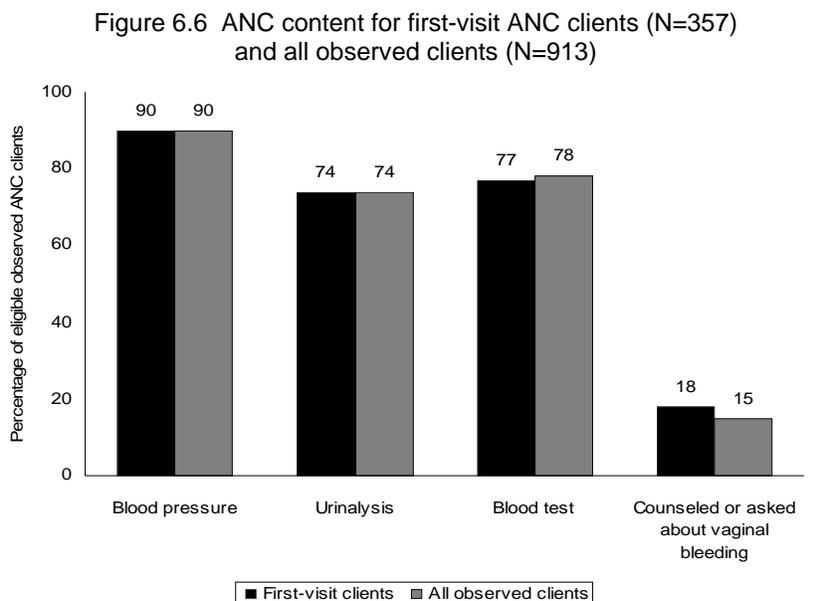

Figure 6.5 Content of client history assessed for first-visit ANC clients (N=357)

Kenya SPA 2004

## Monitoring Progress of Pregnancy

All ANC clients should receive periodic assessments to monitor the progress of their pregnancy and to identify risk factors. These include assessments of vaginal bleeding, blood pressure, and foetal condition. Figure 6.6 provides information on the percentage of observed ANC clients (whether first or follow-up visits) who received these elements as part of their visit. Appendix Tables A-6.17 and A-6.18 provide this information by facility type.

Kenya SPA 2004

## Laboratory Testing and Provision of Iron Tablets

Laboratory facilities and cold chain maintenance capability are required for facilities to be able to provide certain screening and preventive interventions. If a facility does not have the capacity to provide the service itself, it should have a referral site that will provide the service to the ANC client.

To meet defined minimum standards for ANC, each ANC visit should include the following components: counselling on vaginal bleeding as a risk factor for which help should be sought, measuring blood pressure, and urinalysis to check for urine protein and glucose. First-visit clients should also have their blood checked for anaemia.

Counselling on vaginal bleeding (defined as either being counselled about vaginal bleeding as a risk or asked about vaginal bleeding during the examination) was provided to 18 percent of all first-visit clients (compared to 15 percent of all clients) (Figure 6.6). This is an improvement over the findings from 1999, when only 1 out of 10 clients was counselled about vaginal bleeding; however, these rates are still highly insufficient, given the life-threatening potential of the complication. Blood pressure was measured during 90 percent of consultations, for both first-visit and follow-up clients. Three-fourths of first-visit clients receive a blood test for anaemia. Providers were more likely to measure blood pressure, conduct urinalysis, and provide blood tests than they were to counsel clients about vaginal bleeding (Figure 6.6).

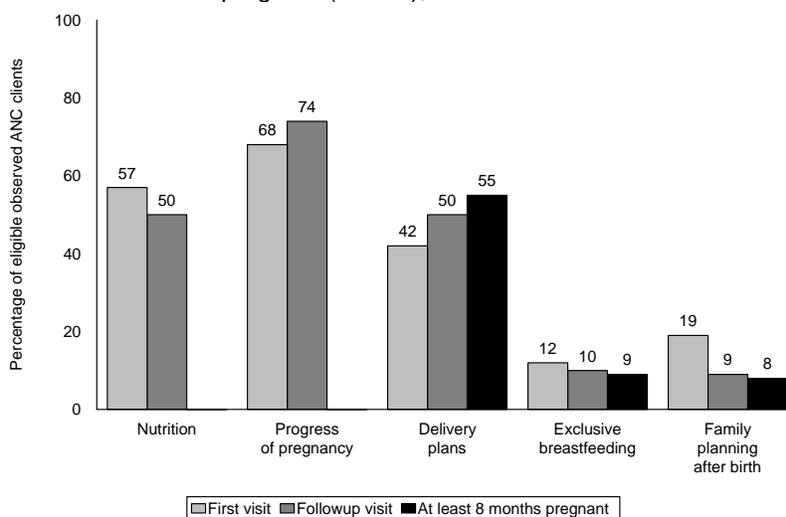

## Key Findings

Only one-fourth of first-visit ANC clients were assessed for all of the relevant medical history items (age, last menstrual period, any prior pregnancy, complications in prior pregnancy, and medications currently taken).

### 6.4.2 Counselling to Promote a Healthy Outcome

Observed and reported components of client counselling are presented in Figures 6.7 and 6.8. Details on counselling and client knowledge about risk signs are available in Appendix Tables A-6.21 and A-6.22. Details on client plans for delivery are provided in Appendix Table A-6.23.

Figure 6.7 Counselling topics discussed during first visit (N=357) and follow-up visit (N=556) and with ANC clients at least 8 months pregnant (N=432), when relevant

Kenya SPA 2004

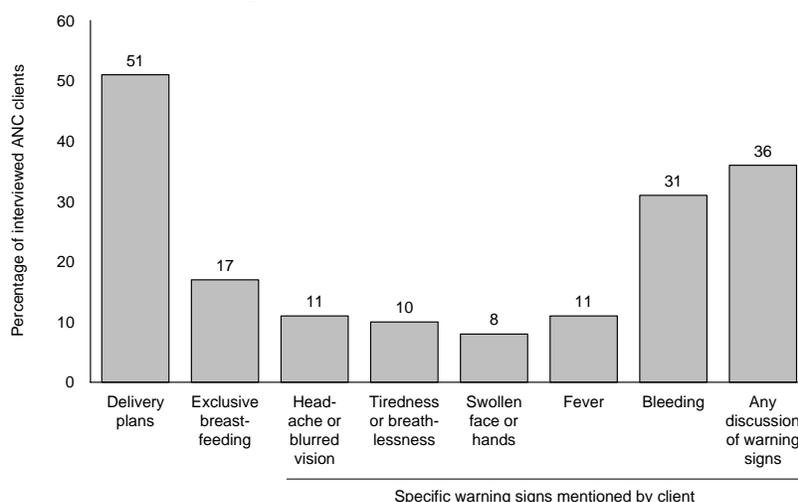

ANC providers are expected to routinely counsel their clients about special nutritional needs during pregnancy and about signs and symptoms that may indicate a problem. It is not unreasonable, however, to assume that all components of counselling may not be discussed during each visit, when a woman makes multiple ANC visits. Thus, the content of counselling for first and follow-up visits is assessed separately.

Nutritional issues were discussed during the observed consultation in 57 percent of first visits and in 50 percent of follow-up visits. Discussions on the progress of the pregnancy were held with 68 percent of first-visit clients and with 74 percent of follow-up clients (Figure 6.7). This is an improvement from 1999, when nutritional issues during pregnancy were discussed with only 34 percent of first-visit clients and with 42 percent of follow-up clients.

#### *The Client Perspective*

All interviewed ANC clients were asked about topics that the provider discussed with them, either during the current visit to the facility, or during a previous visit. Half of the interviewed clients said they had discussed plans for delivery with their provider (Figure 6.8). However, only 17 percent said they had discussed exclusive breastfeeding.

Figure 6.8 Topics reported by interviewed clients as having been discussed during either this or a previous ANC visit (N=900)

Kenya SPA 2004

Interviewed clients were also asked to mention specific warning signs that the provider had discussed with them during the current visit or any prior visit. While 36 percent said they had been told about warning/danger signs or symptoms, when asked to name any of these danger signs, few could mention the most important ones (Figure 6.8): just 3 in 10 mentioned vaginal bleeding, 8 percent mentioned swollen face or hands, and 11 percent mentioned headache or blurred vision.

### Key Findings

Counselling on nutrition during pregnancy and progress of the pregnancy was observed during 57 percent of first visits and half of follow-up visits.

Thirty-six percent of interviewed ANC clients reported that they had been counselled on warning signs during pregnancy. Few clients could spontaneously mention these signs.

There is a general lack of counselling on exclusive breastfeeding and family planning, except for women near delivery.

### 6.4.3 Supporting Continuity of Care

For quality ANC, it is important to provide continuity of care, including monitoring changes between visits. One of the more reliable ways to achieving this is to maintain a record of relevant history and findings, as well as interventions or treatments provided. Frequently, health services are organised in such a way that a client's blood pressure and weight are measured and the information is recorded on the client's record before the ANC provider sees the client. Approximately 7 in 10 first-visit ANC clients were weighed and 9 in 10 had their blood pressure measured before or during the consultation (Table A-6.16). For such information to be available to the provider for use, an individual client card must be used. Details on the use of individual client cards are provided in Appendix Table A-6.24.

During 94 percent of first visits and 97 percent of follow-up consultations, the provider was observed to look at the individual client card during the consultation. By the end of all first-visit consultations, providers had written on the client's card. This was also the case in 98 percent of follow-up visits (Appendix

Table A-6.24). It is, of course, not possible to know through these observations whether the notes taken were relevant or accurate.

About 8 in 10 observed ANC clients went home after their consultation, and 14 percent were referred elsewhere in the same facility. None were admitted to the facility; 3 percent were referred to another facility.

## **6.5 Client Opinion of Service Provision**

Before leaving the facility, observed ANC clients were asked their opinion of the services they received and about any problems they encountered on the day of the visit. The most common concern was the long waiting time, but only 2 in 10 clients considered this a big problem (Appendix Table 6.26). Another area of concern was lack of privacy, both visual and auditory.

Interviewed clients who reported that the facility was not the closest to their home were asked if specific factors were important in determining why they did not visit the facility closest to their home. Some reasons cited were that the closest facility was more expensive (17 percent) and that the closest facility had a bad reputation (12 percent). Six percent of interviewed clients had been referred and therefore had had to bypass the closest facility (Appendix Table A-6.27).

## **6.6 Availability of Delivery Services and Capacity to Provide Quality Delivery Care**

The KSPA assessed the availability of emergency obstetric care and the presence of standards, equipment and supplies, and health system components to support quality delivery services. Specific items that were assessed include the following:

- Availability of delivery services;
- Home delivery care practices;
- Infrastructure and resources to support quality delivery services;
- Practices related to signal functions; and
- Documentation of delivery procedures and outcomes.

### **6.6.1 Availability of Delivery Services**

Table 6.5 provides information on the availability of maternal health services, as well as details on the availability of emergency transport and services supporting safe home delivery (domiciliary care). Information on median travel time using the most common transport system is provided in Appendix Table A-6.29.

Although about 8 in 10 facilities offer ANC, only about 38 percent of facilities offer normal delivery services; one-third offer both ANC and normal delivery services (Table 6.5). Hospitals are, as expected, most likely to offer delivery services; NGO-managed facilities are more likely than others to offer delivery services. FBO- and government-managed facilities, and facilities in Central province, are least likely to offer these services. The percentage of facilities offering normal delivery services remains relatively similar to that observed in 1999.

Caesarean sections are offered by only 7 percent of eligible facilities, logically provided mostly by hospitals (76 percent). Rather surprisingly, only 3 percent of government-managed facilities offer caesarean sections (a decline from 15 percent in 1999), compared with 23 percent of private for-profit facilities. Among eligible hospitals, 67 percent of those providing caesarean sections are government-managed, 78 percent are NGO-managed, and 86 percent are private for-profit facilities (data not shown).

Table 6.5 Availability of maternal health services

<b>Total<sup>4</sup></b>	<b>79</b>	<b>38</b>	<b>7</b>	<b>33</b>	<b>6</b>	<b>27</b>	<b>5</b>	<b>5</b>	<b>430</b>

Note: Refer to Table 1.1 for the actual number of facilities included in survey and analysis. Weighting results in small numbers for some categories of facilities.

<sup>1</sup> Any system where the facility provides some support for emergency transportation to referral site, or the facility is the referral site.

<sup>2</sup> This may be either a routine service or service only for emergency cases.

<sup>3</sup> Any official activity with TBAs for which the facility has any documentation.

<sup>4</sup> Totals include one clinic (weighted)

One way of increasing access to emergency obstetric care is to offer rapid transport to a facility where the needed service is available. Without a facility-supported emergency transportation system, the expectant mother and family are forced to use their own means of transport during an emergency. Even when a facility does not offer delivery services, but does offer ANC, it is desirable to have emergency transport available. For many home deliveries, the facility where a woman receives ANC may be the nearest formal health sector site from which emergency help can be sought.

Among all facilities, only 27 percent have a system of emergency transportation<sup>5</sup> to another facility for obstetric emergencies (Table 6.5). Hospitals are more likely (91 percent) than other facility types to have

<sup>5</sup> Facilities that are referral facilities are counted as having an emergency transportation system, since they can provide all relevant services.

an emergency transportation support for maternity emergencies, as are NGO-managed facilities (87 percent). Approximately 4 in 10 maternities do not have emergency transport services available. Among those facilities supporting emergency obstetric transport, 62 percent have an ambulance or other facility-based vehicle, 19 percent have other arrangements to support cost, and 5 percent are themselves referral sites (Table A-6.29)

Among facilities offering delivery services, however, 52 percent have an emergency transportation system in place for obstetric emergencies (data not shown). This is a modest improvement since 1999, when 47 percent of facilities providing delivery services had a driver and vehicle.

### 6.6.2 Domiciliary Care Practices

In countries where a large proportion of deliveries take place at home, frequently with the assistance of traditional birth attendants (TBAs), a support system from a health facility may increase a woman's chances of having a safe delivery. Research has also shown that every pregnancy is risky, and therefore every pregnant woman should receive skilled care during delivery. The concept of domiciliary care operates on the understanding that skilled care can be provided at the community level. The common support systems are for facility staff to attend home births, either routinely or for emergencies only. Retired midwives in the community can also be used to provide skilled care to women during delivery and have formal systems for working with the health system and other community resource persons including TBAs.

The KSPA 2004 findings indicate that only 5 percent of facilities have services supporting safe home delivery; these are mostly NGO-managed facilities (Table 6.5). No maternity offers this outreach service. Finally, a very small proportion of facilities have documentation of official support for traditional birth attendants (5 percent).

#### Key Findings

Although ANC is offered in four out of five facilities, only half of them offer normal delivery services, and about 1 in 10 (including 76 percent of hospitals) offer caesarean sections.

All three maternal health services (ANC, normal delivery, and caesarean section) are offered in only 6 percent of facilities, although they are offered in two-thirds of hospitals.

Normal delivery services are most widely available in Western province facilities (69 percent) and least available in the Central province (18 percent).

About one-fourth of all facilities and 52 percent of facilities offering delivery services provide support for emergency transportation of maternity emergencies to referral facilities.

Only 5 percent of all facilities assessed provide any home delivery service, but half of NGO facilities do provide it.

### 6.6.3 Infrastructure and Resources to Support Quality Delivery Services

In addition to a basic infrastructure that provides privacy and supports infection control, several types of equipment and medicines are needed to support safe deliveries.

Tables 6.6 and 6.7 provide aggregate information on infrastructure, equipment, and supplies for basic delivery services, including emergency medicines. Figures 6.10 through 6.12 summarize the individual items available, and Appendix Tables A-6.34 through A-6.41 provide details on elements assessed for delivery services, with Tables A-6.35 through A-6.38 providing details on sterilisation/high-level disin-

fecting (HLD) procedures for delivery equipment. Figure 6.12 provides information on equipment for emergency obstetric care, with further details in Appendix Tables A-6.42 and A-6.43.

<sup>5</sup> Totals include one clinic (weighted)					

## ***Infection Control***

Infection is one of the most common causes of maternal and neonatal morbidity and mortality. Infection control practices are therefore essential for quality delivery care. Among facilities offering delivery services, 4 in 10 had all the items assessed for infection control available in the delivery service area (hand-washing supplies, clean or sterile latex gloves, disinfecting solution, and a sharps box) (Table 6.6). Hospitals are more likely than other facilities to have all infection control items, although this proportion is still low at only 54 percent. NGO-managed facilities are least likely to have infection control items (16 percent). Central province facilities are more likely than facilities in other provinces to have these infection control items (78 percent). The items most often lacking in all these facilities were disinfecting solution (missing in 33 percent of facilities) and hand-washing soap (missing in 41 percent of facilities) (Appendix Table A-6.30). Over 90 percent of facilities, however, have clean latex gloves.

Among facilities offering delivery services, only one-third have the capacity for sterilisation/HLD processing (Table 6.6); the remainder either lack equipment or knowledge, or the facility simply does not sterilise/disinfect delivery equipment (Table A-6.32). As expected, it is mostly hospitals (56 percent) and NGO-managed facilities (72 percent) that have the capacity for sterilisation/HLD processing (Table 6.6).

The procedure used for sterilising/HLD processing equipment used for deliveries was also assessed.<sup>6</sup> Among the 34 percent of facilities with the capacity for sterilisation/HLD processing, 31 percent use dry heat or autoclave, and 3 percent either boil/steam or use chemical HLD (Appendix Table A-6.32). Only 12 percent of facilities process delivery equipment specifically in the delivery service area, and the remaining 86 percent send equipment to the main processing area in the facility (Appendix Table A-6.31).

Only 1 in 4 facilities have written guidelines for sterilisation or HLD processing available in the area where delivery equipment is processed (Appendix Table A-6.32). Guidelines are most often found in Coast province facilities (84 percent), compared with just 2 percent of facilities in Rift Valley province.

### *Infrastructure for Delivery*

Items to support quality delivery services were also assessed (Table 6.6 and Figure 6.9). A bed, an examination light, and privacy (both visual and auditory) are considered the basic delivery room infrastructure and equipment. Overall, only 29 percent of facilities have all these basic items (Table 6.6). The best equipped facilities are hospitals and maternities (62 percent and 50 percent, respectively) and private for-profit facilities (60 percent). Similarly, facilities in Nairobi are more likely to have all the basic infrastructure and equipment. The delivery area in most facilities (91 percent) provides both visual and auditory privacy (Figure 6.9). Almost all facilities (98 percent) have a delivery bed; however, only 31 percent have an examination light.

### *Elements to Support Quality Delivery Services*

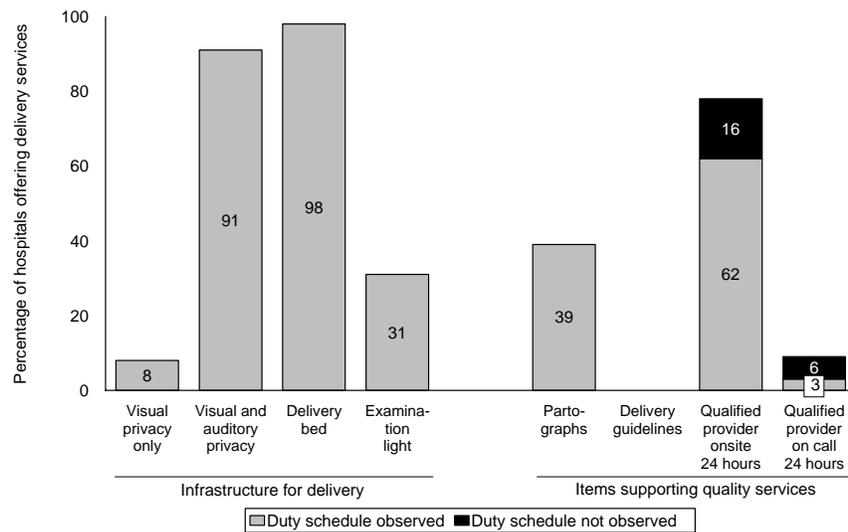

The partograph—a document used to monitor an individual woman’s labour—is promoted internationally as a means for improving quality of care by helping providers take appropriate and timely decisions, based on the progress of labour at every stage. It provides guidelines for the early identification of complications. Only 4 in 10 eligible facilities have blank partographs available (Figure 6.9); this finding is similar to data from 1999. Regarding actual use of the partograph, only 38 percent of interviewed providers offering delivery services had used a partograph within the month preceding the interview. Eleven percent had never used a partograph to monitor labour (data not shown).

Delivery guidelines, necessary for managing delivery complications, are also not commonly available; only 7 percent of facilities offering delivery services had guidelines available in the delivery service area (Figure 6.9). In Kenya, general practitioners, obstetricians, and nurses/midwives are the principal facility-based delivery service providers. Although about 8 in 10 facilities report that there is a delivery service provider on site 24 hours a day, 16 percent did not have a duty schedule to document that claim. A much smaller percentage of facilities (9 percent) report a qualified provider on call 24 hours a day, and 3 percent have a duty schedule to document that a provider is on call (Figure 6.9).

---

<sup>6</sup> Chapter 3, sections 3.4.1 and 3.4.2 provide details on the definitions for adequate sterilisation or HLD procedures and storage practices.

Figure 6.9 Items to support quality delivery services (N=164)

Kenya SPA 2004

## Key Findings

Infection control measures for delivery services are weak, with only 4 out of 10 facilities having all the five internationally recommended items.

About 3 in 10 facilities have all the elements needed to support quality sterilisation of delivery equipment.

Partographs and protocols to support quality delivery standards are available in only 39 percent and 7 percent of facilities, respectively.

Two out of three facilities have a qualified trained provider available 24 hours a day (on site or on call), with an observed duty schedule.

### Monitoring of Normal Deliveries

It is very important to monitor all deliveries in order to ensure the well-being of both the foetus and the mother. Table 6.7 provides information on critical practices for monitoring normal facility-based deliveries. The recommended standard practice is to monitor foetal heart rate, maternal pulse rate, and uterine contractions every 30 minutes, and to check maternal blood pressure every 4 hours.

Information gathered from clients' delivery records or charts showed that foetal heart rate and uterine contractions were monitored or checked every 30 minutes for only 1 in 5 normal deliveries, while blood pressure measurement was recorded every 4 hours in only 14 percent of cases. Pulse rate measurements every 30 minutes were least likely to be recorded (8 percent). Overall, all four critical practices were documented for only 5 percent of all reviewed normal delivery records. Only 17 percent of hospitals and 10 percent of maternities had documentation of all four critical practices (Table 6.7). Interestingly, no other facilities (health centres, clinics or dispensaries) had any records indicating that all four critical practices were carried out.

Table 6.7 Documentation of critical practices for monitoring normal deliveries

### *Essential Supplies for Delivery Services*

All basic supplies for conducting a normal delivery (scissor or blade, cord clamps or ties, a suction apparatus, antibiotic eye ointment for the newborn, and a disinfectant for cleaning the perineum) are available in the delivery area in only 36 percent of facilities (Table 6.8). Hospitals and maternities (63 percent and 56 percent, respectively), and also private for-profit facilities (59 percent) and facilities in Nairobi province (56 percent) are more likely to have all the supplies compared to others. These findings indicate that cord ties/clamps are less widely available; availability has decreased from 72 percent in 1999 to 64 percent in 2004. Availability of different individual items in the delivery area varies from 77 percent for skin disinfectant to 56 percent for antibiotic eye ointment to (Figure 6.10).

Kenya SPA 2004

### *Medicines and Supplies for Complications*

Table 6.8 provides information on the availability of essential supplies for normal delivery and additional medicines and supplies to handle common and serious delivery complications. Figure 6.11 provides detailed information on these additional medicines and supplies.

All items for managing common delivery complications are available in one out of every four facilities offering delivery services (Table 6.8), primarily in hospitals and maternities (59 percent and 36 percent, respectively) and in private for-profit facilities (48 percent). These items are most widely available in facilities in the Central province (81 percent) and least available in facilities in Rift Valley province (9 percent).

Figure 6.11 Additional medicines and supplies for managing complications of delivery (N=164)

Kenya SPA 2004

The KSPA also assessed whether facilities offering delivery services had selected medicines and supplies for managing serious complications. The standards for maternal care in Kenya indicate that every pregnant woman or woman in puerperium seeking health care should be attended to by a skilled health care provider within 30 minutes of arrival at a health facility. This implies that all the supplies needed for emergencies should be readily available. The Kenyan maternal care standards call for EmOC facilities to have an emergency tray of drugs available, with anticonvulsants, anti-hypertensives, and oxytocics, among others (Population Council, 2002b).

These additional medicines and supplies for managing serious complications were available in 13 percent of facilities offering delivery services. FBO-managed facilities are most likely to have these medicines and supplies (Table 6.8). Injectable anticonvulsants, used to treat severe pre-eclampsia and eclampsia, are available in the delivery service area in 13 percent of facilities, though an additional 78 percent have them elsewhere in the facility (Figure 6.11).

Injectable antibiotics for treating sepsis are available in two-thirds of facilities, but none had them in the delivery area. Hydralazine, commonly used to manage hypertension during labour, is found in the delivery area of only 32 percent of facilities.

### ***Provider Knowledge of Signs of Postpartum Haemorrhage***

KSPA interviewers spoke with the most experienced maternal health provider present on the day of the survey in each facility that offered maternal health services. They used the maternal health provider questionnaire to assess the provider's knowledge of common signs of postpartum haemorrhage and obstructed labour. Interviewed providers were expected to spontaneously name signs they should look for to assess the severity of any postpartum haemorrhage. The expected responses included signs of shock (dizziness or low blood pressure), amount of external bleeding, un-contracted uterus, and retained products of conception/placenta. Table 6.9 provides information on providers' knowledge of these signs and of immediate intervention steps to alleviate the problem.

Only 6 percent of interviewed midwives spontaneously named all four categories of signs of postpartum haemorrhage. More midwives in maternities (23 percent), private for-profit facilities (13 percent) and facilities in Nairobi province (31 percent) were able to name all four signs and symptoms spontaneously. Sixty percent of interviewed midwives spontaneously named signs of shock, 55 percent named uncontracted uterus, and 53 percent named the amount of external bleeding as signs for assessing the severity of the haemorrhage. Forty-one percent spontaneously named retained products/placenta.

### ***Provider Knowledge of Interventions for Postpartum Haemorrhage***

When asked to name interventions for postpartum haemorrhage, 70 percent of midwives spontaneously mentioned massaging the uterus, and 76 mentioned giving an injection of ergometrine intramuscularly or intravenously. They were less likely to mention emptying the patient's urinary bladder (46 percent) and giving intravenous fluids (44 percent). In all, only 12 percent of all interviewed midwives were able to spontaneously name all four expected interventions for postpartum haemorrhage. Unlike naming signs and symptoms for assessing the severity of postpartum haemorrhage, more midwives in hospitals than in other types of facilities were able to name all expected interventions. However, more midwives in Nairobi than in other provinces were still able to name all four interventions compared to midwives in other provinces. Not a single midwife interviewed in dispensaries, NGO facilities, or the North Eastern province was able to mention all four interventions.

Table 6.9 Knowledge of signs of postpartum haemorrhage and of immediate interventions

Percentage of interviewed midwives who spontaneously described the indicated signs of postpartum haemorrhage and interventions for postpartum haemorrhage, Kenya SPA 2004

<sup>1</sup> Postpartum haemorrhage resulting from an atonic or un-contracted uterus

<sup>2</sup> Dizziness or low blood pressure

<sup>3</sup> Ergometrine is commonly used for the management of post-partum haemorrhage, and is either given intramuscularly or intravenously

## Key Findings

Basic equipment and supplies that should be available for any normal delivery are available in 1 of 3 facilities offering delivery services, with minimal provincial variation.

Capacity to manage common or serious complications of labour and delivery is weak in all facilities, including hospitals.

Thirty-nine percent of facilities offering delivery services have blank partographs, and thirty-eight percent of providers offering delivery services had used a partograph within one month of the survey.

Three out of five hospitals have all the basic medicines and supplies for managing common complications of labour and delivery, whereas only 1 in 4 has medicines for managing serious complications.

An injectable oxytocic medicine is available in the delivery area in only one-third of all facilities assessed.

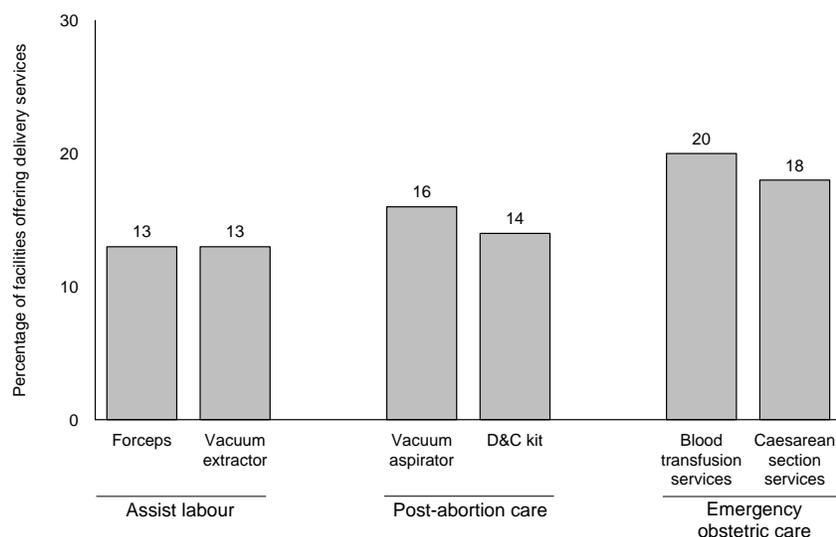

Only 6 percent of providers mentioned all four signs of postpartum haemorrhage; 12 percent mentioned all four interventions to manage postpartum haemorrhage.

## Emergency Equipment

In addition to the previously mentioned equipment and supplies, a facility that manages complicated deliveries should have the capacity to offer comprehensive essential obstetric care. In Kenya, support for complicated deliveries is authorized primarily in hospitals and maternities that can perform a caesarean section. Facilities that do not have the capacity to provide the service are expected to refer the clients.

In cases where life-saving emergency obstetric care is required, the capacity to provide a caesarean section (CS) and to transfuse blood is essential. Overall, among facilities offering delivery services, only around 2 in 10 provide CS or blood transfusion services (Figure 6.12). Among eligible hospitals, 8 in 10 provide caesarean section and around 9 in 10 provide blood transfusion services (Table A-6.36); this is very similar to the findings in 1999, when 79 percent of hospitals offering delivery services provided caesarean section and 86 percent provided blood transfusion services. The number of maternities providing these services has declined since 1999; only 26 percent provide CS (compared with 50 percent in 1999) and 46 percent provide blood transfusion services (compared with 65 percent in 1999). Among government-managed facilities, only 1 in 10 can provide caesarean section or blood transfusion services.

Figure 6.12 Emergency equipment and services available in facilities providing delivery services (N=164)

Kenya SPA 2004

### Key Findings

Among government-managed facilities, less than one in ten has the capacity to perform assisted vaginal delivery.

Only one in ten government facilities offering delivery services can provide caesarean section or blood transfusion services, whereas almost half of private for-profit facilities offering delivery services can provide caesarean section or blood transfusion services.

### *Assisted Vaginal Delivery*

Assisted vaginal delivery in Kenya is a procedure performed only by obstetricians, and therefore not frequently performed. If required, it should involve as little trauma as possible (for example, by using a plastic cap vacuum extractor at low pressure). The practice is not banned (MOH/KOGS, 2001).

Among facilities offering delivery services, 13 percent have the capacity to provide assisted vaginal delivery by means of forceps, and another 13 percent by means of vacuum extraction (Figure 6.12). Rather surprisingly, 31 percent of dispensaries have the capacity to provide forceps delivery (Table A-6.36). FBO-managed facilities and facilities in Nyanza are more likely than other facilities to provide this service. In the case of vacuum extraction, hospitals and FBO-managed facilities are most likely to provide this service.

### *Post-abortion Care*

The ability to provide care to a woman after an abortion is vital to prevent any further complications. To remove any retained products of conception, facilities should be able to provide manual vacuum aspiration or dilatation and curettage (D&C). Information on the availability of these services is found in Figure 6.12 and Appendix Table A-6.36. Among facilities offering delivery services, only 16 percent have a vacuum aspirator, and 14 percent have a D&C kit. As expected, hospitals and maternities are most likely to have this equipment. Private for-profit facilities are more likely to have a vacuum aspirator (32 percent), while NGO facilities are least likely to have either a vacuum aspirator (4 percent) or D&C kit (5 percent). Facilities in Coast province are most likely to have a vacuum aspirator (59 percent), compared with facilities in Rift Valley and Eastern provinces (6 percent and 5 percent, respectively).

## **6.7 Newborn Care Practices**

The perinatal mortality rate (PNMR) in Kenya is 40 deaths per 1,000 births (KDHS 2003), with the Coast province having the highest rate and Western province the lowest. The KSPA 2004 assessed newborn care practices and the availability of equipment and supplies for newborn care. Facilities sometimes need special equipment to support the newborn. KSPA observers noted whether facilities had a emergency respiratory support unit (resuscitaire or Ambu bag) and an external heat source to maintain the infant's body heat, especially in a premature newborn (incubator, heat lamp, or other device). Details on emergency support for newborns and on newborn care practices (excluding care of the umbilical cord) are provided in Figure 6.13 and Appendix Tables A-6.36 and A-6.38.

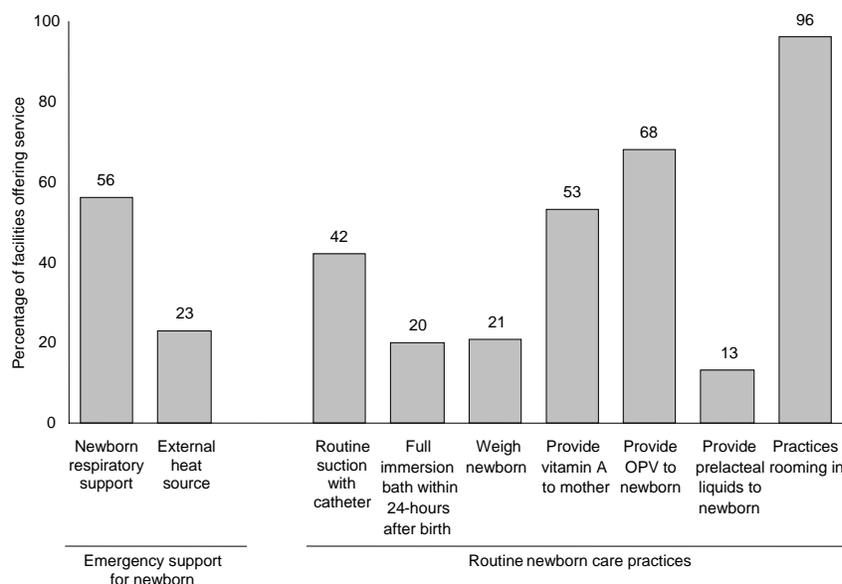

Only 39 percent of eligible facilities had an Ambu bag for newborn respiratory support in 1999, but close to 6 in 10 facilities had this support for newborns in 2004 (Figure 6.13). Hospitals are most likely to have this emergency respiratory support available, and NGO-managed facilities were most unlikely to have it. Almost all facilities in the Central province (93 percent) have a respiratory support system for the newborn (Table A-6.36).

Figure are very similar for an external heat source for newborns. On average, only 23 percent of all facilities have an external heat source; most hospitals (72 percent) and facilities in the Central province (78 percent) have an external heat source for newborns. NGO-managed facilities, again, are the least likely to have this equipment (Appendix Table A-6.36)

Using catheter suction to stimulate respiration in newborns who are not breathing is a common practice in many facilities. However, this should not be a routine practice, as it may cause injury to the newborn and risk mother-to-child transmission of HIV. Approximately 4 in 10 facilities report routinely using catheter suction (Figure 6.13, Appendix Table A-6.38).

Hypothermia contributes to increased morbidity and mortality of newborns. This can be prevented by avoiding a full-immersion bath the first few hours after birth and, instead, drying the newborn and either immediately giving the infant to the mother for skin-to-skin contact or wrapping the newborn in a warm blanket. Full-immersion bathing is relatively uncommon, with 20 percent of facilities indicating that this practice is routine. The practice is more common in hospitals and in maternities (33 percent and 42 percent, respectively) than in other facility types (Figure 6.13, Appendix Table A-6.38).

Figure 6.13 Emergency support and routine practices for newborns (N=164)

Weighing the newborn provides health information for monitoring postnatal care, as low birth weight is a risk indicator of infant death. Although 9 out of 10 facilities indicate that they routinely weigh the newborn, only 8 out of 10 have a functioning infant weighing scale in the delivery service area (Figure 6.13, Appendix Table A-6.38).

Vitamin A supplementation in poorly nourished children has been shown to decrease the risk of infection and death. Newborns can receive a healthy amount of vitamin A through breast milk; however, pregnant women are also at risk of developing vitamin A deficiency, and therefore need vitamin A supplementation after delivery. About half of facilities indicate that they routinely provide vitamin A to new mothers, and half have it available in the delivery area of the facility. Eighty percent of facilities have vitamin A available either in the delivery room or in the pharmacy.

Oral polio virus (OPV) vaccination is provided to newborns in 68 percent of the assessed facilities, and BCG vaccine is provided in 66 percent of the facilities.

Internationally, exclusive breastfeeding is promoted for the first six months of age, and providing pre-lacteal liquids is discouraged. As noted in the section in Chapter 6 on antenatal care (Figure 6.7), pregnant women are not routinely counselled on exclusive breastfeeding. Prelacteal liquids are routinely provided in 13 percent of facilities.

“Rooming in,” where the infant routinely stays with the mother (a practice that supports exclusive breastfeeding and mother-child bonding), is routinely practiced in most facilities (96 percent).

## Key Findings

Emergency support for newborns is lacking in most facilities. Hospitals and facilities in Central province are most likely to have emergency newborn support capacity, and NGO-managed facilities are least likely to have this capacity

Weighing the infant, providing vitamin A to the mother, and rooming in are practices that are common in Kenya and are considered supportive of newborn health.

Routine suctioning with a catheter is a practice that is being carried out routinely in some facilities, especially maternities (53 percent) and hospitals (46 percent); this should be re-assessed and discouraged as a routine practice.

One out of five hospitals report routinely providing prelacteal liquids to newborns.

## 6.8 Management Practices Supportive of Quality Delivery Services

Tables 6.4 and 6.10 provide information on management practices related to childbirth that were assessed by the KSPA 2004. Appendix Table A-6.42 provides information on supportive management for providers of delivery services. Appendix Table A-6.34 provides information on availability of delivery service providers, Appendix Table A-6.41 provides information on routine charging practices for delivery services, and Appendix Tables A-6.42 through A-6.44 provide information on supervision and staff development from the provider's perspective.

### 6.8.1 Facility Documentation and Records

A delivery register is defined as being up-to-date if there is an entry in the past 30 days (assuming there should be at least one birth per month in facilities that provide the service) and if the entry, at a minimum, provides the birth outcome. Seventy-six percent of facilities offering delivery services have an up-to-date delivery register available (Table 6.10). Hospitals and facilities in the Central province (92 percent each) are most likely to have up-to-date registers. NGO-managed facilities are least likely (44 percent) to have up-to-date registers.

Facilities frequently have catchment populations for whom they are responsible for providing services. The KSPA 2004 assessed whether facilities have any documentation indicating that they monitor the proportion of deliveries that occur in their catchment area under skilled care (or, for some programme strategies, deliveries that are attended by skilled providers affiliated with the facility). Only 14 percent of facilities offering delivery services have documentation on monitoring delivery coverage in their catchment areas (Table 6.10). Despite the low overall percentages, facilities in Coast, Central, and Eastern provinces are much more likely to monitor delivery coverage (49, 47, and 31 percent, respectively).

Table 6.10 Facility-based supportive management practices in relation to childbirth

Percentage of facilities with the indicated documentation, percentage with user fees, and percentage that provide the indicated supportive management, by type of facility, managing authority and province, Kenya SPA 2004

Background characteristics	Percentage of facilities offering delivery services with:				Number of facilities offering delivery services (weighted)	Percentage of facilities where at least half of the interviewed delivery service providers:		Number of facilities with interviewed providers of delivery services (weighted) <sup>3,4</sup>

Note: Refer to Table 1.1 for the actual number of facilities included in survey and analysis. Weighting results in small numbers for some categories of facilities.

<sup>1</sup> Register has an entry in the past 30 days; entry indicates delivery outcome.

<sup>2</sup> This refers to structured, in-service sessions and does not include individual instruction received during routine supervision. Topics are birth or delivery services related.

<sup>3</sup> Includes only providers of delivery services in facilities offering delivery services.

<sup>4</sup> Totals include one clinic (weighted)

## 6.8.2 Systems for Quality Assurance, Including Maternal Death Reviews

One measure of quality assurance for delivery services is to systematically review all maternal and newborn deaths or near-misses, in order to identify avoidable factors leading to these deaths. This helps to develop interventions that prevent the occurrence of future deaths. The KSPA 2004 did not assess the quality of these review programmes, but did enquire whether facilities implemented the process or not. Overall, only 27 percent of facilities providing delivery services indicated that they conduct reviews of maternal or newborn deaths or near-misses (Table 6.10). The practice is most common in hospitals (60 percent) and in FBO-managed facilities (54 percent). Facilities in Eastern and North Eastern provinces are less likely to conduct these reviews.

## 6.8.3 Practices Related to User Fees

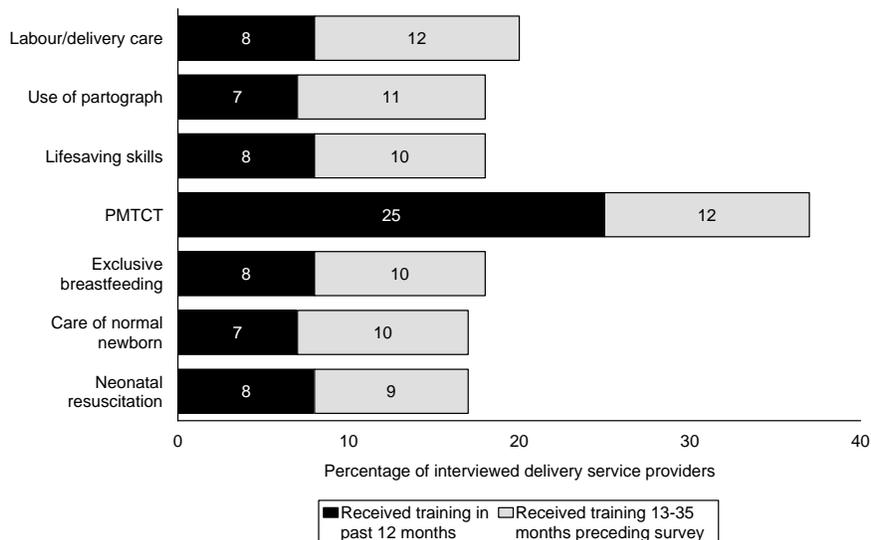

The KSPA 2004 documented the percentage of facilities that collect user fees for delivery-related services. Seventy-four percent of all facilities offering delivery services charge some form of user fee (Table 6.10), with almost all hospitals and maternities, and all private for-profit and FBO-managed facilities, doing so. Similarly, all facilities in Central province charge user fees, while only a quarter of facilities in

North Eastern province do. While 73 percent of facilities charge user fees specifically for normal delivery services, 19 percent charge a fixed fee covering both ANC and normal delivery services (Appendix Table A-6.41). About one-third have specific fees for medicines, and one-fourth charge for laboratory tests.

#### 6.8.4 Staff Development and Supervision

A facility is defined as providing routine staff development activities when at least half of the interviewed delivery service providers at that facility have received any structured in-service training relevant to delivery services during the past 12 months (excluding on-the-job training/coaching that may be received during discussions with supervisors). Just 3 in 10 facilities meet these criteria for providing routine staff development activities (Table 6.10). Hospitals and maternities are slightly more likely than other types of facilities to provide routine staff development (43 percent and 49 percent, respectively); the same is true of government and private for-profit facilities (36 percent). Figure 6.14 shows what topics were covered in the most recent in-service training received, and when it was offered. Staff members were more likely to be trained in PMTCT than in any other topic.

Figure 6.14 In-service training received by interviewed delivery service providers, by topic and timing of most recent training (N=881)

Kenya SPA 2004

A facility is defined as providing routine staff supervision when at least half of the interviewed delivery service providers have been personally supervised in the past six months. Eighty-five percent of facilities meet these criteria for provide routine staff supervision (Table 6.10).

## Key Findings

Three out of four facilities have up-to-date delivery registers.

One out of ten facilities have documents showing they monitor community coverage of delivery services.

Almost three out of ten facilities offering delivery services conduct reviews of maternal or newborn deaths or near-misses.

Routine supervision of delivery service providers is almost universal (85 percent of facilities), but routine in-service training is not common (32 percent of facilities).

### 6.8.5 Youth-friendly Services

Most youth who need sexual and reproductive health care are not comfortable accessing existing services, because these services are not "youth-friendly" and may not meet their need. In addition, providers are often biased and untrained, and do not feel comfortable serving sexually active youth. There has been a recent effort to sensitize all staff at health care facilities on the provision of "youth-friendly" services (YFS) that are geared towards making youth feel comfortable and welcome to seek health care. More information on the availability of YFS is provided elsewhere in this report; however, it bears mentioning in this section that only 2 percent of facilities in Kenya provide any youth-friendly services related to ANC (data not shown).

## 6.9 Availability of Emergency Obstetric Care

### 6.9.1 The Signal Functions for EmOC

Outcome indicators of maternal health, such as the maternal mortality ratio, require large numbers of observations in the denominator, and are amenable to change only in the long term (4-5 years). In recognition of this fact, Columbia University and UNICEF developed a series of tools to measure "process indicators" that are easier to collect and interpret, and susceptible to changes in a shorter period (UNICEF et al., 1997). The indicators developed were called the UN Process Indicators for Emergency Obstetric Care (EmOC) and measured certain types of obstetric services that were understood to have a direct bearing on maternal outcomes, including mortality and morbidity. The assessment of UN process indicators for EmOC follows two main steps. The first step is based on a set of certain critical services or "signal functions" proven to significantly reduce maternal deaths and improve birth outcomes for the newborn. These signal functions include:

1. Administration of parenteral antibiotics
2. Administration of parenteral oxytocic drugs
3. Administration of parenteral anticonvulsants for pre-eclampsia/eclampsia
4. Manual removal of placenta
5. Removal of retained products of conception
6. Assisted vaginal delivery
7. Blood transfusions
8. Surgery (caesarean delivery)

The second main step for assessing the UN process indicators of EmOC involves categorising health facilities on the basis of their EmOC signal function status as Basic Emergency Obstetric Care (BEmOC) facilities or Comprehensive Emergency Obstetric (CEmOC) facilities. Internationally, if a health facility provides the first six functions described above, it qualifies as a Basic EmOC facility (BEmOC). If a fa-

cility provides all eight functions, it qualifies as a Comprehensive EmOC facility (CEmOC). For purposes of the KSPA, a facility providing the first five of six signal functions qualifies as a BEmOC facility (known as BEmOC “minus one”). Further, a facility that qualifies as BEmOC and performs Caesarean delivery and blood transfusions qualifies as a CEmOC facility (or CEmOC “minus one”).

The KSPA used the proportion of facilities that provided normal delivery (38 percent in total) as the subset with which to examine the availability of EmOC services. This amounted to 164 facilities. However, since clinics and dispensaries are not really expected to provide emergency obstetric services, these facilities are left out for subsequent analysis.

Table 6.11 shows the percentage of facilities in the KSPA sample (among those offering delivery services) that reported having carried out the “signal functions” for EmOC in the three months preceding the survey.

**Table 6.11 Signal functions for emergency obstetric care**

Among facilities offering delivery services (excluding dispensaries and clinics), percentage reporting the indicated procedure/intervention was carried out at least once during the past 3 months, Kenya SPA 2004

Background characteristics	Percentage who applied/carried out										
	Parenteral antibiotics	Parenteral oxytocics	Parenteral anticonvulsants/sedatives	Manual removal of placenta	Removal of retained products	Assisted vaginal delivery (AVD)	Blood transfusion	Caesarean section	Basic EmOC-1 (minus AVD) <sup>1</sup>	Comprehensive EmOC-1 (minus AVD) <sup>2</sup>	Number of facilities (weighted)
<b>Type of facility</b>											
Hospital	85	81	61	69	48	24	63	76	32	26	27
Health Centre	18	12	10	19	8	0	0	0	0	0	80
Maternity	42	33	26	41	29	10	14	22	16	0	18
<b>Managing authority</b>											
Government	24	16	17	30	18	2	11	12	6	5	69
NGO	72	66	12	67	14	7	12	8	5	2	6
Private (for-profit)	45	38	26	37	26	16	19	32	14	4	28

<b>Province</b>											
Nairobi	25	25	21	21	13	9	15	24	7	1	11
Central	41	45	29	42	26	3	31	41	17	14	9
Coast	50	52	42	42	65	5	17	19	16	9	13
Eastern	17	17	11	13	8	6	13	14	6	6	22
North Eastern	38	23	35	35	16	13	23	13	16	10	3
Nyanza	23	14	12	21	21	7	14	14	8	5	22
Rift Valley	43	33	16	48	9	8	14	23	7	3	32
Western	59	42	56	42	25	2	12	11	10	7	13
<b>Total</b>	<b>36</b>	<b>30</b>	<b>23</b>	<b>33</b>	<b>20</b>	<b>7</b>	<b>16</b>	<b>19</b>	<b>9</b>	<b>6</b>	<b>125</b>

<sup>1</sup> Facility applied the first six procedures (left-to-right) in the three months preceding the survey.

<sup>2</sup> Facility applied all Basic EmOC procedures, plus blood transfusion and caesarean section, in the three months preceding the survey.

Almost four in ten facilities report having the capacity to administer parenteral antibiotics, 33 percent report having the capacity for manual removal of the placenta, and 30 percent report administering parenteral oxytocics. Facilities are less likely to use parenteral anticonvulsants/sedatives (23 percent) and perform removal of retained products, caesarean sections and blood transfusions (between 16 and 20 percent). The function least often performed is assisted vaginal delivery (AVD). As noted above, AVD is a procedure performed only by specialists and is therefore not carried out in many facilities.

As expected, health centres are least able to provide critical emergency obstetric services, in particular removal of retained products. Regionally, there are differentials worth noting in the Eastern province and in some cases in the Nyanza and Rift Valley provinces.

Overall, fewer than one in ten facilities in Kenya is able to offer Basic Emergency Obstetric Care “minus one”, and even fewer (6 percent) offer Comprehensive Emergency Obstetric Care “minus 1”. When analyzed by type of facility, only one-third of hospitals and 16 percent of maternities provide BEmOC-1; no health centre qualifies for BEmOC-1. Further, only slightly more than one-fourth of hospitals are able to provide CEmOC-1, and no other type of facility in Kenya is capable of this level of service. These results demonstrate the urgent need to upgrade facilities to offer these critical services to women.

## 6.9.2 Assessment of the UN Process Indicators for EmOc

Once the proportion of facilities that offer basic or comprehensive EmOC is known, then a simple calculation can be made to apply the proportions to the total number of facilities within each region, in order to arrive at the number of facilities that offer EmOC<sup>7</sup> (Table 6.12).

**Table 6.12 Coverage rates for emergency obstetric care**

Number of hospitals, maternities, and health centres in Kenya offering Basic and Comprehensive Emergency Obstetric Care (“minus 1”), derived from the proportions of BEmOC-1 and CEmOC-1 facilities surveyed, by province, Kenya SPA 2004

Province	Population	Number of hospitals, maternities, and health centres	Percentage providing BEmOC-1	Number providing BEmOC-1 <sup>1</sup>	Coverage of BEmOC-1 (per 500,000 population) <sup>2</sup>	Percentage providing CEmOC-1 <sup>1</sup>	Number providing CEmOC-1	Coverage of CEmOC-1 (per 500,000 population) <sup>2</sup>
Nairobi	2,656,997	224	7	16	3.0	1	2	0.4
Central	4,012,433	183	17	31	3.9	14	26	3.2
Coast	2,866,931	239	16	38	6.7	9	22	3.8
Eastern	5,070,098	326	6	20	1.9	6	20	1.9

Rift Valley	8,169,849	425	7	30	1.8	3	13	0.8
Western	3,816,448	161	10	16	2.1	7	11	1.5
Total	32,808,267	1,882	9	179	2.7	6	111	1.7

<sup>1</sup> Number of facilities in country × percentage found to be offering service ÷ 100

<sup>2</sup> Number of facilities in country calculated to be offering service ÷ population × 500,000

Nationally, coverage rates for basic and comprehensive EmOC are 2.7 and 1.7 facilities per 500,000 population, respectively. Overall coverage for basic EmOC is below the recommended level of 4 per 500,000 people in most provinces. The Coast (6.7 per 500,000) and Central (3.9 per 500,000) provinces achieve or surpass the recommended level. The overall coverage for comprehensive EmOC is nearly 2 facilities per 500,000 population, more than the recommended level of 1 per 500,000 people. However, when examining the data by region, large differentials are apparent, such as a rate of nearly 4 facilities per 500,000 in Coast province, compared with 0.4 in Nairobi province.

<sup>7</sup> Because the KSPA uses a random sample of facilities, covering 55 percent of hospitals, 21 percent of maternities, and 4 percent of health centres, an assumption is made that the capacity found in the sampled facilities will also exist in the remaining non-sampled facilities.

The rates obtained here may be considered crude, since they are calculated for large areas and may hide greater gaps in smaller geopolitical areas. For example, within the Coast province, facilities may be concentrated in a small area (such as the tourist area) leaving relatively large pockets of population without coverage. Still, these differences speak of the need to upgrade facilities in several regions of the country, in particular in the Rift, Eastern, and North Eastern provinces.

It is important to highlight that this is the first time a nationwide facility survey has been used to derive signal functions and the UN indicators. Other indicators will be available as further analysis of data is conducted.

*Dr. Robert K. Ayisi, Mr. Robert C. B. Buluma, and Mr. Boaz Cheluget*

## **7.1 Background**

### **7.1.1 KSPA Approach to Collection of Information on STI Services**

Sexually transmitted infections (STIs) and reproductive tract infections (RTIs) other than HIV/AIDS are a major public health problem throughout the world. They affect millions of men, women, and children, and lead to infertility, serious illness, and even death in some cases. STIs have also been shown to increase the risk of transmission of HIV, the virus that causes AIDS (AIDSCAP/FHI, 1996). Some 80 percent of women and 10 percent of men infected with STIs are asymptomatic, but they can still transmit the disease to their sexual partners. Pregnant women with STIs are more likely to have low birth weight babies, premature babies, and stillbirths (Cotch et al., 1997; AIDSCAP/FHI, 1996). Sexually transmitted infections in Kenya declined after the introduction and training of clinicians and the supply of free STI drugs between 1995 and 2001 (Cheluget et al., 2004); however, since then, the country has been experiencing an increase in STIs.

The consequences of STIs and RTIs on reproductive health can be severe and life-threatening. They include pelvic inflammatory disease (PID), infertility in both women and men, ectopic pregnancy, and adverse pregnancy outcomes including miscarriage, stillbirth, preterm birth, and congenital infection. STIs and RTIs are also known to increase the risk of HIV transmission. Although most STIs and RTIs can affect both men and women, the consequences in women are more common and more severe than in men. In fact, STIs and RTIs and their complications are among the most important causes of illness and death among women in poor regions of the world (MOH, 2005a).

According to the UNAIDS/WHO global report of 2004 on HIV/AIDS, about 40 million people are infected with HIV/AIDS globally. Of these, 70 percent live in sub-Saharan Africa, and more than 40 percent—17.1 million—are women. The report indicates that about 20 million of those infected have died since the first case of AIDS was detected about 20 years ago. With the advent of HIV/AIDS, tuberculosis (TB), especially multi drug-resistant tuberculosis (MDR-TB), is re-emerging as a communicable disease of public health significance. This is because TB is also one of the most common opportunistic infections for AIDS patients. There are more than 6.5 million new cases of tuberculosis worldwide and more than 2 million deaths from the disease each year.

Although sexual contact is not the only means of transmission of HIV/AIDS, it is the most common (UNAIDS/WHO, 2000); therefore, preventive measures for STIs are equally relevant to the control of HIV/AIDS.

It is therefore of the utmost importance that the health care system in a country diagnose and treat the most common STIs. This chapter uses data from the KSPA 2004 to address the following six central questions:

- To what extent are STI services available?
- To what extent do facilities offering STI services have the capacity to support quality STI and HIV/AIDS services?
- To what extent is there evidence that health service providers adhere to standards for provision of quality STI and HIV/AIDS services?

- Do facilities have management practices supportive of quality STI and HIV/AIDS services?
- What do clients feel about the STI and HIV/AIDS services offered?
- Does the facility have resources for diagnosing and managing tuberculosis?

### 7.1.2 The Health Situation Related to STIs, RTIs, and HIV/AIDS in Kenya

“Reproductive tract infection” (RTI) is a broad term that includes sexually transmitted infections (STIs) as well as other infections that are not transmitted through sexual contact. WHO estimates that over 340 million new cases of four curable STIs (gonorrhoea, chlamydia, syphilis, and trichomoniasis) occurred in 1999. The epidemiology of STIs and RTIs in Kenya is poorly understood because of inadequate reporting and poor data management in health institutions. Data available from the Kenya National AIDS Control Programme for the period 1990-2001 indicates that the prevalence of genital discharge was between 11 and 28 percent, and the prevalence of genital ulcer diseases was 20-37 percent.

The prevalence of STIs was believed to be low in Kenya in the 1970s, and as a result, until recently, health services related to STIs have not been a priority area of development. STI surveillance and statistics on STI prevalence are weak, with most published studies on STIs focusing on select populations. With increased awareness of the risks for HIV/AIDS and the relationship between STIs and HIV/AIDS, the National AIDS and STI Control Programme (NASCOP) has developed national guidelines for the control of STIs and HIV/AIDS, to strengthen the pre-service and in-service training for health service providers.

The first AIDS case in Kenya was diagnosed in 1984 (MOH and NACC, 2001); a National AIDS Programme and a National AIDS Committee were subsequently established. Since 1986, HIV/AIDS has been classified as a notifiable disease, and blood for transfusion has been screened for HIV/AIDS since 1987. The prevalence of HIV in Kenya peaked at about 10 percent in the late 1990s (data from National AIDS Control Council, reconciled with DHS data). HIV prevalence in Kenya is currently estimated at 6.7 percent among the general population and at 8.7 percent among high-risk populations (KDHS 2003). At the beginning of the HIV/AIDS epidemic, there was a limited range of services available for testing and treatment, with virtually no organised care and support system for the infected and the affected. Currently, the National AIDS Control Programme of Kenya in the Ministry of Health has rolled out more than 600 voluntary counselling and testing (VCT) centres and about 755 sites for the prevention of mother-to-child HIV transmission (PMTCT), and there are currently over 200 centres in the country offering anti-retroviral therapy (ART). Treatment for STIs should be available in all health facilities in Kenya, down to the health centre level. Health facilities are providing more and more HIV/AIDS services, which increases the need to monitor the availability and quality of the services being offered. The increased workload that this causes was not anticipated (Kinoti and Picazo, 2003) and thus remains a challenge.

Kenya has a National AIDS Strategic Plan (KNASP) for the years 2000-2005 and 2005-2010 (NACC, 2005). There is also a National Health Sector-specific strategy for the period 1999-2004, and plans for 2005-2010 are advanced.

The KNASP 2005-2010 has identified three priority areas in response to the HIV/AIDS epidemic in the country:

- Preventing new infections;
- Improving quality of life; and
- Mitigating the socio-economic impact of HIV/AIDS.

These strategic plans provide a roadmap on prevention to continue reducing the incidence of new HIV infections. They also provides a strategy for expanded ARV treatment. It is estimated that HIV prevalence

will decrease from 7 percent in 2003 to 5.5 percent by 2009-10. Goals for the STI programme area include ensuring that 90 percent of patients diagnosed with STIs are offered HIV testing, ensuring that 90 percent are offered appropriate symptomatic treatment, and making treatment of STIs an important entry point for the ART programme.

### **7.1.3 Health Situation Related to Tuberculosis in Kenya**

Each year, there are more than 6.5 million new cases of tuberculosis and more than 2 million deaths from tuberculosis worldwide. Tuberculosis is the seventh most important cause of global premature mortality and disability, and is projected to remain one of the ten leading causes of disease burden even in the year 2020. Because of a powerful interaction between tuberculosis and HIV, the tuberculosis incidence rate is rising in sub-Saharan Africa and may rise in Asia. Increasing drug resistance, which could lead to worse treatment outcomes, has also been reported. Using the directly observed therapy, short-course (DOTS) strategy, cure rates of 80 percent to 90 percent have been achieved for passively diagnosed cases of smear-positive pulmonary tuberculosis. Analyses of national programmes in Malawi, Tanzania, and Mozambique and in ten provinces of China have shown that this strategy is both effective and cost-effective. Based on the successes of these programmes, the World Health Organisation (WHO) adopted DOTS as its strategy for global tuberculosis control. Since WHO championed the DOTS strategy, uptake by national programmes has unfortunately been slow; WHO reports that only 11 percent of people with new smear-positive pulmonary tuberculosis cases are enrolled in DOTS programmes worldwide (Murray and Salomon, 1998).

WHO tuberculosis monitoring and evaluation has shown a dramatic resurgence of TB in much of Southern and East Africa since 1980. This is primarily because of the HIV epidemic, and it affects other countries, not only those in sub-Saharan Africa. People who are infected with HIV are much more likely to develop active tuberculosis than those who are not. Because sub-Saharan Africa has the highest rates of HIV in the world, HIV-related tuberculosis has its greatest impact in this region.

In Kenya, as elsewhere, HIV began to spread in the early 1980s. The notification rate of TB in Nairobi remained fairly constant into the late 1980s, at about 65 per 100,000 per year. By 1995, the HIV prevalence among women receiving antenatal care in Nairobi had reached 17 percent, and the tuberculosis notification rate had increased fourfold to 250 per 100,000 per year. Since then, HIV prevalence has remained steady, while the tuberculosis notification rate has continued to increase to its current alarming level of about 773 per 100,000 per year (National Leprosy and TB Control Programme).

Finally, it is worth noting that the prevalence of HIV/AIDS depends strongly on both gender and age, and this has important implications for tuberculosis. Data from the Kisii District in Kenya show a substantial increase in HIV prevalence among both men and women, especially in the 25-34 age group, precisely those who are most likely to be infected with HIV. A study in Kisumu shows that the tuberculosis notification rates peak about 6 years after the age at which HIV prevalence peaks (WHO, 2005).

This chapter presents KSPA data on STI and TB services offered throughout the country, which will help programme planners and policymakers understand where the need for quality services is greatest.

## **7.2 Availability of STI Services**

Integrating STI diagnosis and treatment into relevant health services increases opportunities for case detection and follow-up on treatment. The KSPA assessed STI service availability and service delivery conditions. Most commonly, clients seeking health care specifically for symptoms of STIs are seen in a general outpatient department (OPD). Less commonly, there are specific STI clinics or service areas. Clients, particularly women, seeking services for ANC or family planning may also require STI services. Including STI screening and treatment as a component of these services may therefore increase early detection

and improve follow-through on treatment, because women may be more comfortable discussing symptoms of STIs during the course of a regular ANC or family planning visit with a provider with whom she is familiar. If she must go elsewhere for STI services, there is a greater chance that she may decide not to seek follow-up care.

Table 7.1 provides information on the availability of STI services. Appendix Table A-7.1 provides information on whether facilities have the indicated systems and items needed to support quality counselling and examination.

**Table 7.1 Availability of services for sexually transmitted infections**

Percentage of facilities offering services for sexually transmitted infections (STIs), among these percentage where STI services are provided in the indicated service area and STI services offered five or more days per week, by type of facility, managing authority and province, Kenya SPA 2004

Rift Valley	91	126	98	2	54	65	44	93	115
Western	99	29	93	7	71	89	70	100	29
Total <sup>3</sup>	92	440	96	4	53	67	44	96	403

Note: Refer to Table 1.1 for the actual number of facilities included in survey and analysis. Weighting results in small numbers for some categories of facilities.

<sup>1</sup> STI services at the public and NGO facilities are utilized primarily by females, so in almost all cases the special clinic is the gynaecologic clinic. Males might receive STI services in urology clinic.

<sup>3</sup> Totals include one stand-alone VCT (weighted)

STI services may include counselling only, testing only, or diagnosis and treatment. Availability of STI services is reported in 92 percent of health facilities (Table 7.1). Among facilities offering STI services, 96 percent offer them as part of the general outpatient curative services, and 4 percent have special STI clinics. Almost all facilities offer STI services at least five days per week (Table 7.1). STI services are also integrated within family planning services in 53 percent of facilities, and within ANC services in 67 percent of facilities. Among facilities that offer STI services, 44 percent report that the service is available

to clients in all three relevant service areas (general outpatient, family planning, and ANC). In small facilities such as dispensaries and health centres, the only provider available sees all patients for all services and also provides STI services to those clients that need them.

NGO-managed facilities (76 percent) and facilities in Nairobi (83 percent) are less likely than other facilities to offer STI services.

### **Key Findings**

STI services are offered in 9 of 10 facilities and are integrated within ANC, family planning, and general curative care services in around half of these. Specialized STI services are rare.

NGO-managed facilities and facilities in Nairobi are slightly less likely to offer STI services than other facilities.

## **7.3 Capacity to Provide Quality STI Services**

The KSPA 2004 assessed systems, infrastructure, equipment, and supplies for supporting quality STI services. Although STI services are provided in multiple sites in large facilities, information on whether facilities have the capacity to provide quality STI services comes from the general OPD, which is the main STI service area.

Table 7.2 provides information on whether facilities have the infrastructure and resources to support counselling and examinations for STI services. Figures 7.1, 7.2 and 7.3 summarize information on items to support quality STI services, diagnosis, and utilization and availability of diagnostic tests for STIs. Appendix Tables A-7.1 to A-7.3 provide details on system components, infrastructure and resources, specific tests and medicines for diagnosis and treatment, user fees, and supportive management services for STIs. Appendix Table A-7.5 provides details on in-service training for providers of STIs, and Appendix Table A-7.6 gives information on supportive supervision for providers of STIs.

### **7.3.1 System Components to Support Utilization of Services**

As a result of the stigma that is frequently associated with having an STI, as well as the lack of symptoms in many people having STIs, special efforts are needed to promote early diagnosis and to encourage clients to seek modern medical help for STI symptoms. The KSPA 2004 assessed the existence of programme strategies and service delivery components that contribute to the availability and improved utilization of STI services.

To effectively interrupt STI transmission, partners of clients with STIs must also be tested, and treated if they are found to be infected. The client should be asked to notify the partner and ask him or her to be examined; this process is referred to as passive follow-up. Under certain circumstances, the local health authorities may take the initiative to contact the partner and inform him or her about the possibility of being infected with an STI and recommending the appropriate course of action. This is known as active follow-up. Passive follow-up is the most widely used system of client notification, with 67 percent of facilities reporting that they use it, compared to 18 percent of facilities using active follow-up. Fifteen percent of facilities have no follow-up system in place (Appendix Table A-7.1).

### **7.3.2 Infrastructure and Resources to Support Quality Assessment and Counselling**

To support quality counselling for STIs, complete privacy is needed, in order to facilitate open communication between the provider and the client. This is expected to encourage the use of services by the client,

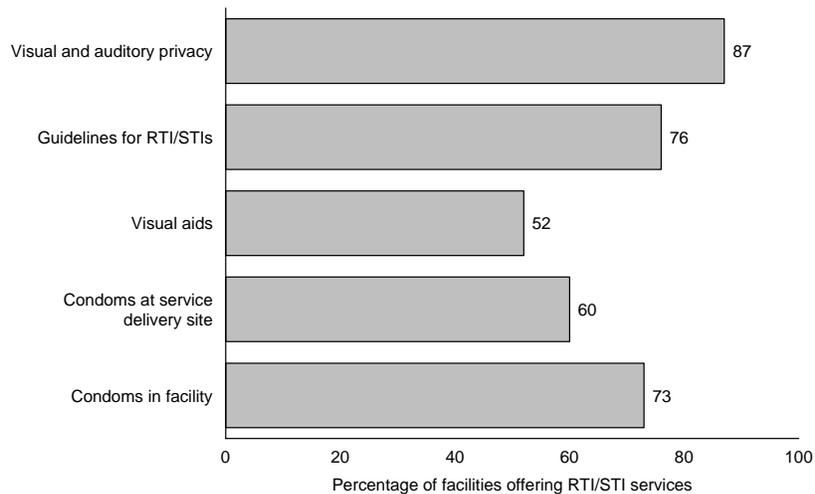

and also the adherence to protocols and standards by the provider. Without these conditions, the provider may not ask the appropriate questions or make the appropriate examinations. Since counselling for diagnosis and prevention of STIs often takes place in a different location than the physical examination, the conditions for counselling are assessed separately from those for physical examinations.

Approximately 9 in 10 facilities provide counselling for STIs under conditions that allow both visual and auditory privacy (Figure 7.1). Another 9 percent have conditions assuring visual privacy but not auditory privacy, and 3 percent do not assure privacy of any kind (Appendix Table A-7.1).

Seventy-six percent of facilities have STI guidelines in the STI service delivery areas (Figure 7.1), and 72 percent specifically have the WHO guidelines for syndromic STI diagnosis and management (Appendix Table A-7.1). The syndromic approach is a systematic method for assessing symptoms in a client, and a specific protocol for which medicines should be prescribed, based on the symptoms observed (WHO, 2001). The syndromic approach was widely implemented in Kenya in the early 1990s with support from the World Bank. It involved training care providers, printing and distributing IEC material, purchasing and distributing STI drugs and test kits, and distributing advocacy materials and condoms. The guidelines for syndromic STI diagnosis and management can be found in a variety of general materials and may have been part of other general guidelines for reproductive health in the facilities where they were found. Health centres are most likely to have the WHO guidelines compared with other types of facilities.

Only about half of facilities have visual aids for client education related to STIs, and an even smaller proportion (31 percent) have any educational materials specific to HIV/AIDS (Appendix Table A-7.1).

Figure 7.1 Items to support quality STI/RTI services (N=403)

Kenya SPA 2004

Having condoms available at the service delivery site allows the provider to readily demonstrate how to use them, and to ensure that the client leaves with them. Condoms are not universally available in STI service delivery areas; only about 6 in 10 facilities have condoms in the service delivery area, whereas approximately 7 in 10 have them somewhere in the facility (Figure 7.1).

Overall, about one-third of eligible facilities have all items to support quality counselling (Table 7.2). These items include all the items described above: privacy (both visual and auditory), availability of STI guidelines, and visual aids for client education. There is not much variation by facility type, but NGO-managed facilities and facilities in Nairobi province are less likely to have these items.

Table 7.2 Availability of infrastructure and resources to support quality counselling and examinations for sexually transmitted infections

<sup>1</sup> Visual and auditory privacy, any guidelines and any visual aids or educational materials

<sup>2</sup> All infection control items (soap, water, latex gloves, disinfecting solution, and sharps box), visual privacy, examination bed, and examination light

<sup>3</sup> This refers specifically to following the WHO syndromic approach algorithms.

<sup>4</sup> Capacity to conduct a test does not mean the facility routinely utilizes the test

<sup>5</sup> Either venereal disease research laboratory (VDRL) test and functioning microscope, or rapid plasma reagin (RPR) test kit

<sup>6</sup> Gram stain reagents and functioning microscope or culture capacity

<sup>7</sup> Functioning microscope and slides

<sup>8</sup> Giemsa stain for Chlamydia, with functioning microscope and slides

<sup>9</sup> ELISA, Western Blot, or Rapid test

<sup>10</sup> At least one medicine to treat syphilis, gonorrhoea, trichomoniasis, and Chlamydia

<sup>11</sup> Totals include one stand-alone VCT (weighted)

## Key Findings

Only 3 in 10 facilities have all items to support quality STI counselling.

Most facilities provide STI counselling under conditions that ensure both visual and auditory privacy, and STI guidelines are available in three-fourths of service delivery areas.

Visual aids and educational materials for STIs and HIV/AIDS are not widely available in STI service delivery sites.

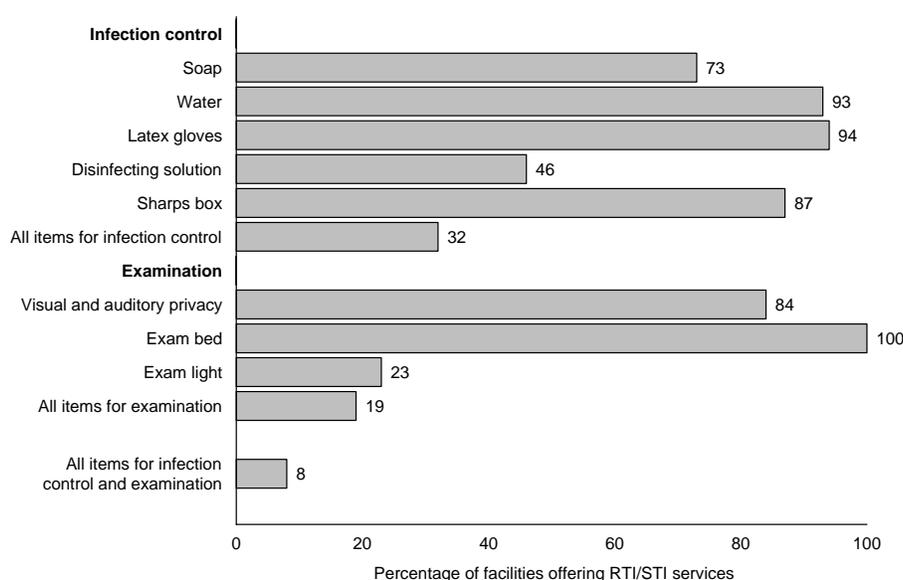

More than one-fourth of facilities providing STI services do not have condoms available, either in the service delivery area or anywhere in the facility.

### 7.3.3 Infrastructure and Resources for Examinations and treatment

Facilities can better diagnose and treat STIs when they have an adequate infrastructure for physical examination, laboratory diagnostic support, and medicines for treating specific STIs.

Quality physical examination requires infection control measures and adequate infrastructure and basic equipment for client examinations.

Figure 7.2 Items to support quality examination for STIs/RTIs (N=403)

Kenya SPA 2004

#### *Infection Control*

All items for infection control are available in the STI service area in only 32 percent of facilities (Figure 7.2). Water and latex gloves are almost universally available, whereas soap and sharps boxes are found less frequently. The item missing in most facilities is disinfecting solution, available in less than half of facilities. Maternities are more likely to have all items for infection control (48 percent) than other types of facilities (Table A-7.1).

Waste receptacles are available in only one-third of facilities. In general, a mere 14 percent of facilities offering STI services have the necessary items for infection control as well as waste receptacles.

#### *Physical Examinations*

For providers to conduct a quality physical examination, necessary items and conditions include privacy (both visual and auditory) and the availability of an examination bed and examination light. All the items and conditions necessary to provide quality physical examinations are available in only 2 in 10 facilities. Hospitals (51 percent) are more likely than other types of facilities to have all these items and conditions (Figure 7.2, Table A-7.1). Eighty-four percent of facilities are able to provide client examination under conditions of both visual and auditory privacy, while examination beds are universally available. The item most commonly missing is an examination light, available in only 23 percent of facilities; this brings down the composite indicator (Figure 7.2).

In general, just 8 percent of facilities have all the needed items for infection control and quality physical examinations.

### **Key Findings**

All items for infection control in the STI service area are rarely available; maternities seem best prepared for infection control. Facilities are most often missing disinfecting solution.

One in five facilities have all items for physical examination, with hospitals most commonly having all items.

Only about one of every ten facilities has all items for both infection control and for quality physical examinations for STIs.

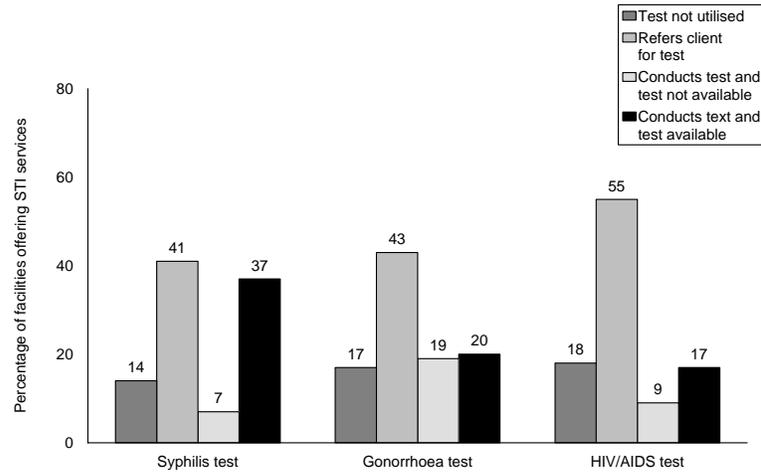

### ***STI Diagnosis***

The World Health Organisation (WHO) recommends the use of two approaches in diagnosing and providing STI services at the primary care facility level: the etiologic approach and the syndromic approach (WHO, 2001). The etiologic approach uses laboratory tests for diagnosing STIs and is obviously more accurate than syndromic diagnosis. However, laboratory facilities are often unavailable. The syndromic approach is recommended for facilities with no laboratory. This approach assesses the presence of specific symptoms and then uses an algorithm to determine treatments to be provided. When neither an etiologic nor a syndromic approach is used, providers often diagnose and prescribe medication based on their clinical judgment and client symptoms (often referred to as clinical diagnosis). Studies have shown that when providers do not have a specific protocol (such as the syndromic approach) or laboratory results to use when diagnosing and prescribing for STIs, wrong treatment is commonly given (Lande, 1993).

Health facilities in Kenya use various methods for diagnosing STIs. About 8 in 10 facilities use the syndromic method and 6 in 10 use the clinical method for diagnosing STIs (Table 7.2). Approximately half of facilities report using the etiologic method to diagnose STIs, mostly in private facilities and in Nairobi; the etiologic method is least common in government facilities and dispensaries and in the North Eastern province. Only 1 percent of facilities have the capacity to test for chlamydia, compared with 41 percent that can test for syphilis, 25 percent for gonorrhoea, and 19 percent for HIV/AIDS.

The most reliable means for ensuring that clients receive a desired laboratory test is for the facility to conduct the test in house. Another alternative is to take the specimen and send it to another facility for testing. The least reliable means is to refer the client to another facility to receive the laboratory test, because the client may decide not to take the test at all. Figure 7.3 provides information on the testing status for each condition, indicating if facilities never test for the condition, or if they refer clients elsewhere, send a specimen elsewhere, or conduct the test themselves.

Figure 7.3 Utilisation and availability of diagnostic tests for STIs (N=403)

Note: One percent take specimen and send elsewhere for STI tests.

Kenya SPA 2004

Having the capacity to conduct a test does not mean a facility routinely utilizes the test. As evident from Figure 7.3, syphilis testing is more commonly offered than other tests. Although 44 percent of facilities report conducting the test in house, only 37 percent had tests available on the day of the survey. Gonorrhoea and HIV/AIDS testing is less common. Although 26 percent of facilities report conducting HIV/AIDS testing in-house, only 17 percent had the test available on the day of the survey. Occasions where facilities report they conduct a test but tests were not available on the day of the survey (for example, 9 percent in the case of HIV testing, and 19 percent for gonorrhoea) may reflect stock-outs of test equipment or reagents, or a lack of precise knowledge on the part of the respondents on the availability of such specific testing equipment.

### ***STI Treatment***

Only 24 percent of facilities have at least one medicine for treating each of the four major STIs (syphilis, gonorrhoea, trichomoniasis, and chlamydia). Hospitals and maternities, private for-profit facilities, and facilities in Nairobi are more likely than others to have this capacity (Table 7.2); NGO-managed facilities, dispensaries, and facilities in the Central province are much less likely. The medicines most widely available are metronidazole for treating trichomoniasis (available in 88 percent of facilities), benzathine penicillin for treating syphilis (in 86 percent of facilities), and doxycycline for treating chlamydia and syphilis (in 85 percent of facilities) (Appendix Table A-7.2). Medicines for treating gonorrhoea and candidiasis are available in less than 20 percent of facilities.

## Key Findings

The syndromic diagnostic approach for STIs is the most widely used method in most facilities in Kenya, followed by the clinical and etiological methods.

About 4 in 10 facilities have the capacity for syphilis testing, with test materials available on the day of the survey.

Only one-fourth of facilities in Kenya have medicines to treat each of the four major sexually transmitted infections.

## 7.4 Management Practices Supportive of Quality Services

Management practices to support quality STI services include documentation practices related to user fees and staff supervision and development.

Table 7.3 summarizes information on management practices that support quality STI services. Summary information on topics of in-service training received by STI service providers is provided in Figure 7.4. Appendix Tables A-7.5 through A-7.9 provide details on service statistics, charging practices for STI services, supervision, and in-service training.

### 7.4.1 Facility Documentation and Records

WHO considers recordkeeping and reporting on STIs and STI service utilization to be key elements in STI surveillance, necessary for improving STI programme management (WHO, 1999a). A register for STI services is considered up-to-date if there is an entry during the past seven days, and if symptoms or a diagnosis consistent with STI is recorded. Because most STI services are provided in outpatient departments, these records were checked for entries on clients with STI symptoms or diagnoses.

Only about half of facilities have an up-to-date register: mostly health centres, NGO-managed facilities, and facilities in Western province (Table 7.3). Facilities in North Eastern and Nairobi provinces are least likely to have updated registers. Approximately one-fourth of facilities providing STI services have records with entries more than seven days old. This is more frequent among dispensaries and FBO-managed facilities, which might also indicate that these facilities provide STI services less frequently.

Table 7.3 Management practices supportive of quality services for sexually transmitted infections

Percentage of facilities with the indicated records, percentage that have any user fees for STI services, and percentage with the indicated supportive management practices, by type of facility, managing authority and province, Kenya SPA 2004

Note: Refer to Table 1.1 for the actual number of facilities included in survey and analysis. Weighting results in small numbers for some categories of facilities.

<sup>1</sup> This refers to structured in-service sessions and does not include individual instruction received during routine supervision.

<sup>2</sup> Includes providers offering STI services in facilities offering STI services in any clinic assessed in survey (e.g., outpatient, ANC, family planning)

<sup>3</sup> Totals include one stand-alone VCT (weighted)

#### 7.4.2 Practices Related to User Fees

User fees may have either a positive effect (because free services can be perceived as inferior to items that are paid for) or a negative effect (by deterring poor clients from using services). Sixty-five percent of facilities indicate they routinely charge some form of user fees for STI services (Table 7.3). Maternities and clinics (86 percent and 90 percent, respectively), private for-profit and FBO facilities (79 percent and 89 percent, respectively) and facilities in Nairobi and Eastern provinces (81 percent each) are more likely to charge some form of user fee.

As indicated in Appendix Table A-7.3, 27 percent of facilities charge specifically for client consultations, whereas 31 percent charge only for medicines, and 28 percent charge only for tests (Table A-7.3). Mater-

nities (61 percent) and clinics (57 percent) are more likely to charge for consultations. Similarly, private and FBO-managed facilities, and facilities in Nairobi, are more likely to charge for client consultations than other facilities.

### 7.4.3 Staff Development and Supervision

#### *Staff Development*

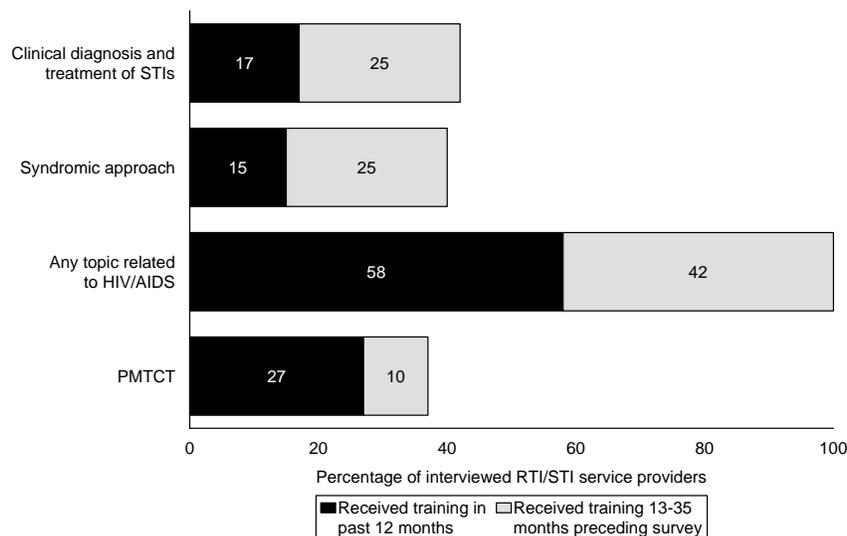

A facility is considered to provide routine staff development activities if at least half of its interviewed STI providers have received in-service training related to STI services in the past 12 months. Seventy percent of the facilities meet this criterion (Table 7.3). Maternities, NGO-managed facilities, and facilities in Coast province are most likely to have routine staff development activities.

Fifty-eight percent of interviewed STI service providers received some form of HIV/AIDS-related training in the 12 months preceding the survey, while 15 percent received training related to the syndromic approach (Figure 7.4).

#### *Supervision*

If at least half of the STI service providers in a facility have been personally supervised during the past six months, the facility is defined as providing routine supervision. Supervising individual staff helps to promote adherence to standards and to identify problems that contribute to poor quality services. Routine supervision is offered in 83 percent of facilities (Table 7.3). All NGO-managed facilities meet this criterion, compared to 69 percent of private for-profit facilities. Facilities in Nairobi are the least likely to routinely supervise STI service providers. Providers were supervised an average of four times in the six months preceding the survey (Appendix Table A-7.6).

Figure 7.4 In-service training received by interviewed STI/RTI service providers, by topic and timing of most recent training (N=957)

Kenya SPA 2004

## Key Findings

Just about half of facilities offering STI services have up-to-date client registers.

Seven in 10 facilities provide routine staff training, and about 8 in 10 facilities provide routine staff supervision. Supervision is weakest in Nairobi province.

About two-thirds of facilities charge some form of user fees for STI services, but only about one-fourth charge specifically for client consultations. Government facilities rarely charge for consultation, medicine, or tests.

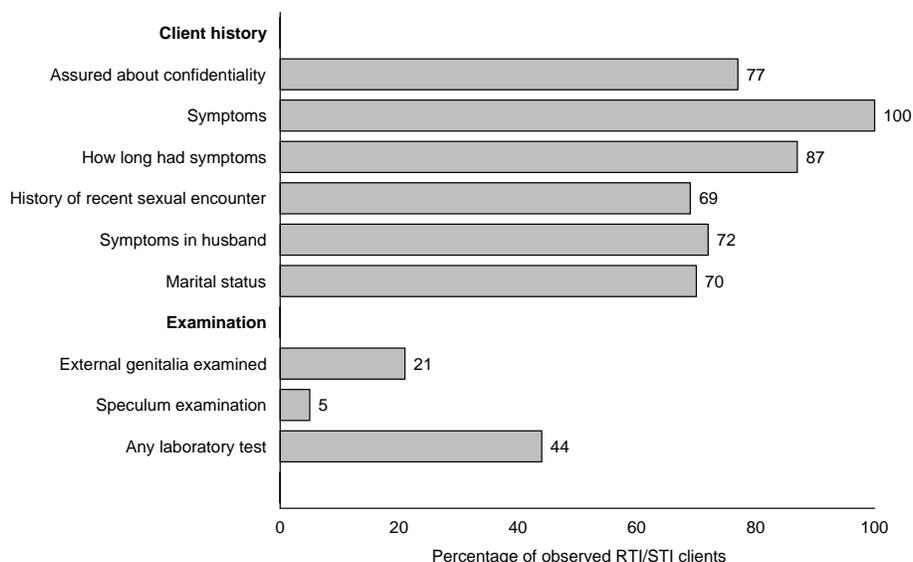

## 7.5 Adherence to Standards for Quality Service Provision

To assess whether providers adhere to standards for quality service, KSPA personnel observed STI client-provider consultations. The observation checklists they used are based on generally accepted standards for STI services (WHO, 2001; AIDSCAP/FHI, 1996). The observers noted what information was shared on a topic or if an examination was actually conducted. They did not assess whether the information was correct or whether findings were appropriately interpreted.

A total of 166 STI clients (38 males and 78 females) were observed being assessed for symptoms that might be STIs. Of all observed STI clients, 80 percent were assured of confidentiality; providers asked all of them about their symptoms. Additional information on client history, types of laboratory tests, and examination is available in Appendix Table A-7.8.

Figure 7.5 summarizes what information was shared during the consultation and which types of examinations were conducted for female clients. Appendix Tables A-7.9 through A-7.14 provide details on the content of the observed assessment, physical examinations, and counselling.

Figure 7.5 Components of the assessment of women with symptoms of STIs/RTIs (N=78)

Kenya SPA 2004

### 7.5.1 Assessment of Relevant History

Any client with a possible STI should be assessed for signs and symptoms, as well as social factors that relate to the risk of contracting an STI. Providers explicitly assured 77 percent of female clients that the shared information was confidential (Figure 7.5).

Client symptoms were elicited during all observed female client consultations; providers were slightly less likely to ask about the duration of symptoms (87 percent) (Figure 7.5). Among the observed female clients, most were asked about a recent sexual encounter, their marital status, and about symptoms in their husbands (nearly 70 percent each).

### 7.5.2 Physical Examinations and Laboratory Tests

In addition to assessing the symptoms and social history relevant for diagnosing and treating STIs, a physical examination provides more objective information to improve the probability of an accurate diagnosis. Providers only examined the external genitalia of about 1 in 5 female clients, and a speculum examination was conducted for a mere 5 percent of clients. Providers relied much more often on laboratory tests (44 percent) (Figure 7.5).

#### *Infection Control*

Appendix Table A-7.9 gives details on infection control procedures followed by providers performing a pelvic examination on female STI clients. Almost all providers wore clean gloves while performing a pelvic examination. Similarly, 93 percent of the providers washed their hands after removing the gloves. However, only 36 percent of the providers washed their hands with soap prior to conducting an examination.

#### *Client Examination*

Conditions and practices for quality pelvic examinations are almost universal in health facilities. During pelvic examinations, all providers assured clients of visual privacy. Similarly, auditory privacy was assured in 98 percent of client examinations. Ninety-seven percent of providers explained procedures to their clients before starting the pelvic examination (Appendix Table A-7.9).

Use of sterilised or high-level disinfected (HLD) equipment for the pelvic examination was observed in only 32 percent of examinations. Only 23 percent of examinations were conducted with instruments that had been properly prepared beforehand (sterilised, placed on a tray, and covered). Similarly, only 26 percent of used equipment was placed in decontaminating solution after pelvic examinations. Worse still, in only 24 percent of examinations were contaminated surfaces wiped with disinfectant after the examination (Appendix Table A-7.9)..

#### **Key Findings**

Almost all providers wear clean gloves to perform pelvic examination and 93 percent washed hands after removing gloves. However, only 36 percent of providers wash their hands with soap before the examination.

Pelvic examinations are performed under visual and auditory privacy in almost all facilities.

Use of sterilised equipments for pelvic examination is low.

### **7.5.3 Client Counselling**

Providers mentioned or discussed the relationship between an STI and sexual activity during 89 percent of all observed STI consultations (Appendix Table A-7.10). Almost all observed STI clients received either medication or a prescription, but only 12 percent were given medication or a prescription for their sexual partner. Hospitals are more likely than other facility types to provide medicine or prescriptions for sexual partners; other facilities rarely do this (Appendix Table A-7.10). Ninety-one percent of clients were observed being told how to take the medicine, and a follow-up appointment was discussed with 85 percent clients. Unfortunately, only 3 out of 5 STI clients were counselled on the risk of HIV/AIDS.

Discussions of any kind about condoms or HIV/AIDS were observed in 70 percent of all STI consultations. Using condoms for prevention was discussed in about half of consultations, but condoms were then offered to only 21 percent of clients, and only 17 percent were instructed on how to use condoms (Appendix Table A-7.10).

Using an individual client health card is important for ensuring that information is available for follow-up and continuity of care. Providers recorded information on the individual client health card for almost all observed clients (Appendix Table A-7.10).

### **7.5.4 Client Opinion from Exit Interviews**

During client exit interviews, clients whose consultations were observed were asked about their experiences on that day with the provider. When asked whether they had ever used a condom, 38 percent said they and their partner had used condoms in the past (Appendix Table A-7.11).

Only 7 percent of clients reported that the provider talked about condoms during the visit, and only 13 percent said they had received condoms during the visit (Appendix Table A-7.11). These percentages are even lower than those reported from observations. It is possible that some clients were embarrassed and thus denied having been counselled about condoms.

When asked about issues that may contribute to lack of condom use in general, 47 percent identified possible items. Of those, 22 percent said a major contributing factor is that condoms are embarrassing to purchase. Other factors identified by clients are shown in Appendix Table A-7.11. These include problems with disposal (7 percent) and embarrassment about discussing them with their partner (18 percent). Among clients who reported any of the above items as contributing to lack of condom use, about 59 percent said they had discussed those issues with the provider.

During the exit interview, clients were also asked their opinion on issues commonly related to client satisfaction. The client was first asked to identify issues without prompting, and then specific issues were probed, with the client asked to comment if these were big problems, small problems, or not a problem for them. Few items were identified as big problems, and by relatively few clients. Among identified problems, 26 percent felt that the waiting time was a big problem, and 13 percent said the operating hours of the facility were a big problem (Appendix Table A-7.12). Only 3 percent of clients mentioned lack of medicines or supplies. A few interviewed clients mentioned insufficient visual and auditory privacy (5 and 7 percent, respectively) as big problems.

Clients were also asked whether the facility was the nearest to them, and if not, why they did not visit the nearest facility. Interestingly, almost half of the STI clients said that this was not the closest facility to their home. The main reasons why they did not go to the nearest facility were that they did not like the personnel (17 percent), that medicines were unavailable (22 percent), and that the other facility is more expensive (29 percent). Fourteen percent had been referred to the facility and therefore had had to bypass the nearest facility to their home (Appendix Table A-7.13).

## Key Findings

The relationship between STIs and sexual activities is commonly mentioned during STI consultations, but only slightly over half of STI clients are counselled on the risks of HIV/AIDS.

Discussion of using condoms for protection was observed in just over half of STI client consultations. While just over 20 percent of clients were offered condoms by the provider, fewer than 20 percent were instructed on how to use them.

## 7.6 Availability of HIV/AIDS Services

Acquired immunodeficiency syndrome (AIDS) is caused by the human immunodeficiency virus (HIV), which weakens the immune system, making the body susceptible to and unable to recover from other opportunistic diseases that lead to death. This is a serious public health and socioeconomic problem in many countries around the world.

The principal mode of transmission of HIV in Kenya is through heterosexual contact (MOH and NACC, Kenya 2001). This is followed in importance by perinatal transmission, whereby the mother passes the HIV virus to the child during pregnancy, at the time of birth, or through breastfeeding. Health personnel are at an increased risk of acquiring the HIV infection if they inadvertently come in contact with bodily fluids while they are providing services. Therefore, they should not only know how to prevent this exposure but also how to get immediate attention if such potentially harmful contact were to occur.

In general, it is of the utmost importance that the health system in a country provides services for the situations described above. Table 7.4 shows the availability of HIV/AIDS-related services in health facilities throughout the country. The services described in this section are: voluntary counselling and testing (VCT), prevention of mother-to-child transmission of HIV (PMTCT), antiretroviral therapy (ART), and post-exposure prophylaxis (PEP).

In general, 35 percent of facilities offer both HIV counselling and testing (VCT) as a package at least one day a week, making VCT the most widely available HIV/AIDS service in health facilities in Kenya (Table 7.4). Not surprisingly, 9 in 10 hospitals and all stand-alone VCT facilities offer the service. Facilities in Nairobi province are most likely to offer this service, and NGO-managed and private for-profit facilities are more likely than government and FBO-managed facilities to offer VCT services.

Prevention of mother-to-child transmission (PMTCT) services are offered in only 24 percent of facilities. One might expect a greater proportion of maternities to offer PMTCT services, but surprisingly, only 35 percent do; by comparison, 74 percent of hospitals offer PMTCT.

The HIV/AIDS-related services least offered in Kenyan facilities are ART and PEP, offered in 7 percent and 13 percent of facilities, respectively. PEP is available in 4 percent of facilities, and 9 percent of facilities use referral sites to offer the service (Table 7.4).

Table 7.4 Availability of HIV/AIDS services

<sup>1</sup> ART is Anti-Retroviral Therapy (for AIDS); PEP is post exposure prophylaxis

<sup>2</sup> PEP available to staff of facility anywhere in the facility

<sup>3</sup> Staff referred to another facility to receive PEP

### 7.6.1 Systems for Testing and Providing HIV Test Results

Voluntary counselling and testing (VCT) is now acknowledged as an effective and essential strategy for both HIV prevention and AIDS care. The need for VCT is partly driven by the high prevalence rates reported in Kenya. Scientific evidence has shown that high quality counselling and knowledge of HIV status helps individuals assess their level of risk, develop realistic plans to reduce risk, and increase safer sex practices. HIV-negative persons become more empowered to remain disease-free, while those who are HIV-infected assess their options for treatment and positive living with HIV/AIDS. One of the major strategies in the battle against HIV/AIDS is to encourage people to get tested for the HIV virus so that those who test positive can take precautions to reduce its spread.

The KSPA 2004 assessed facilities to determine what systems were in place for testing and providing results for HIV tests to clients. Table 7.5 shows the percentage of facilities with an HIV testing system, and which systems facilities use for providing clients with their results.

Table 7.5 System for testing and for providing results for HIV test, Kenya SPA 2004

Percentage of facilities with an HIV testing system and, among these, the percentage using the indicated system for providing HIV test results, and with the indicated documents, Kenya SPA 2004

Western	43	29	62	78	35	73	68	32	13	22
Total	37	440	95	96	50	77	69	28	164	383

Note: Refer to Table 1.1 for the actual number of facilities included in survey and analysis. Weighting results in small numbers for some categories of facilities.

<sup>1</sup> The facility either conducts the test (any type of HIV test anywhere in the facility, including ANC clinics), has an affiliated external laboratory where tests are conducted, or has an agreement with an external testing site from where the test results are expected to be returned to the facility.

<sup>2</sup> The facility has rapid test anywhere in the facility (including VCT and PMTCT service sites), has functioning ELISA equipment with all items necessary to conduct a test, or has all items for Western Blot or PCR tests available.

<sup>3</sup> Availability of national guidelines for VCT at a service site counts as having informed consent policy for HIV testing.

<sup>4</sup> Facility has testing capability on or offsite and has all documentation available

<sup>5</sup> There may be several locations within the same facility where the same service is offered. Each such location is defined as a service site.

Just 37 percent of facilities have an HIV testing system, meaning the facility either conducts the test (any type of HIV test anywhere in the facility, including ANC clinics), has an affiliated external laboratory where tests are conducted, or has an agreement with an external testing site from which the test results are expected to be returned to the facility. The vast majority of hospitals have a testing system, whereas only a little over half of maternities have such a system. Further, private for-profit facilities and facilities in Nairobi are more likely to have an HIV testing system.

Of the facilities with a testing system, 95 percent have the HIV test available in the facility or affiliated laboratory, and only 1 percent of facilities with a testing system rely on an external non-affiliated testing site (Table 7.5). Among facilities with an HIV testing system, all VCT facilities and almost all hospitals and health centres conduct the HIV test on site; facilities in North Eastern province are least likely to test

on site. Among facilities with an HIV testing system, all NGO-managed facilities and all facilities in Nairobi, Coast, North Eastern, and Rift Valley provinces have the HIV test available on site.

The weakest components of HIV testing systems are recordkeeping and having protocols and guidelines available. Only 50 percent of facilities have an informed consent policy for HIV testing in all relevant service sites. Further, 77 percent have registers with HIV test results, and only 69 percent have records for clients receiving HIV test results. Overall, only 28 percent of facilities with a testing system have all necessary documentation available. VCT facilities and NGO-managed facilities are more likely to have the necessary informed consent policy documents and other documentation compared to others. Facilities in Nairobi province are more likely than facilities elsewhere to have registers recording test results and showing that clients received test results (Table 7.5)

### **7.6.2 Availability of PMTCT Services**

Current strategies on HIV/AIDS in Kenya are geared towards improving the health of the HIV-infected mother and reducing the rate of transmission to children during pregnancy, labour, delivery, and breastfeeding, as outlined in the National HIV/AIDS Strategic Plan of 2000 (MOH, 1999b).

To achieve these goals, it is critical to increase the level of general knowledge of transmission of the virus from mother to child and reduce the risk of transmission by use of anti-retroviral drugs (2003 KDHS). The four components of PMTCT are 1) counselling and testing, 2) ARV prophylaxis to prevent transmission, 3) counselling on infant feeding, and 4) family planning counselling and/or referral. Table 7.6 shows the availability of PMTCT services in health facilities across the country.

Overall, only 24 percent of health facilities offer any PMTCT services, with hospitals and facilities in Nairobi more likely to offer the service. Among facilities offering PMTCT, 87 percent offer HIV counselling and testing services, with almost all hospitals, private for-profit, FBO-managed facilities, and all eligible facilities in Nairobi and Eastern provinces offering counselling and testing services.

Antiretroviral (ARV) prophylaxis for preventing mother-to-child transmission of HIV is offered in 58 percent of facilities offering PMTCT services. Hospitals, private for-profit facilities, and facilities in Central province are most likely to provide this component of PMTCT. Counselling on infant feeding is available in more PMTCT facilities (85 percent) than ARV prophylaxis. One might expect these components to be widely available in maternities, but only 70 percent of maternities offer ARV prophylaxis, and about two-thirds offer counselling on infant feeding (Table 7.6). Eighty-eight percent of PMTCT facilities offer family planning counselling and/or referral.

In addition to the four basic components of PMTCT, if a facility also offers antiretroviral therapy (ART) to HIV-positive women and their families, that facility is considered to offer “PMTCT+” services. Only 15 percent of PMTCT facilities offer ARV therapy for HIV-positive women and family members, and only 14 percent of PMTCT facilities meet the criteria for providing PMTCT+ services.

Table 7.6 Availability of PMTCT and PMTCT+ services

Percentage of facilities offering PMTCT services, and among facilities offering PMTCT, percentage offering the indicated component of PMTCT services, Kenya SPA 2004

Note: Refer to Table 1.1 for the actual number of facilities included in survey and analysis. Weighting results in small numbers for some categories of facilities.

<sup>1</sup> PMTCT is the Prevention of Mother-To-Child Transmission of HIV. Indicated services offered in the facility either as an outpatient or inpatient service

<sup>2</sup> Group (or individual) pre-test information or counselling, or individual post-test counselling, and testing services

<sup>3</sup> Antiretroviral prophylaxis for HIV positive women and newborns

<sup>4</sup> The objective is to assess the mother's personal circumstances in order to help her select the best feeding option for her baby

<sup>5</sup> Counselling and referral on family planning offered to HIV positive women

<sup>6</sup> Antiretroviral therapy offered to HIV positive women and their eligible HIV positive family members

<sup>7</sup> PMTCT + refers to provision of the minimum package of PMTCT services plus ARV therapy (sum of all previous columns)

<sup>8</sup> There may be several locations within the same facility where PMTCT services are offered. Each such location is defined as a service site

<sup>9</sup> Totals include one stand-alone VCT (weighted)

## Key Findings

Just over one-third of facilities offer VCT services at least one day per week; other HIV/AIDS services (including PMTCT, ART, and PEP) are less widely available.

One-third of facilities have an HIV testing system, almost all of which offer the test in the facility or in an affiliated laboratory.

Hospitals and facilities in Nairobi province are most likely to have an HIV testing system.

One-fourth of facilities offer PMTCT services, ART services are available in only 7 percent of facilities, and PEP services for health personnel are available in 13 percent of health facilities.

Hospitals, private for-profit facilities, and facilities in Nairobi province are most likely to offer PMTCT services. The KSPA-defined minimum package of services is offered in slightly more than half of facilities offering PMTCT.

Highlighting the scarcity of antiretroviral therapy in Kenya, only 14 percent of facilities offer “PMTCT+” services (primarily hospitals).

## 7.7 Resources for Diagnosis and Management of Tuberculosis

Tuberculosis (TB), especially multi drug-resistant tuberculosis (MDR-TB), is a re-emerging communicable disease of public health significance. In order to control TB infection and to prevent its most severe complications, universal BCG vaccination at birth is mandatory in many developing countries, including Kenya. Tuberculosis is also one of the most common opportunistic infections for AIDS patients. The directly observed treatment, short-course (DOTS) approach is the WHO-recommended treatment strategy for TB. The KSPA 2004 assessed TB services provided at all facilities, the capacity to conduct a sputum test, and the availability of medications for short-course, standard, and prophylactic treatments.

TB services are available in 44 percent of facilities; more hospitals (91 percent) than other facilities offer TB services (Table 7.7). About half of private and government facilities offer TB services, and facilities in Western province (81 percent) are more likely than facilities elsewhere to offer these services. Of all facilities, 27 percent offer TB treatment using the DOTS strategy, and an additional 17 percent offer alternative TB regimes.

### 7.7.1 TB Diagnosis

Among facilities offering any TB services, 63 percent have a functioning microscope and glass slides for conducting microscopic sputum examinations, and 55 percent have the capacity to stain sputum for diagnosis (Appendix Table A-7.15)

### 7.7.2 Availability of TB medicines

Among facilities providing any TB services, 73 percent have first-line medicines available (any combination of pyrazinamide, rifampin, ethambutol, and isoniazid) (Appendix Table A-7.15). Only 26 percent have first-line and second-line medicines (first-line medicines plus streptomycin). Of all facilities providing TB treatment using the DOTS strategy, 89 percent have all first-line treatment medicines in stock.

<sup>1</sup> Directly observed treatment, short-course (WHO's strategy for TB control)

## Key Findings

Less than half of all facilities in the country offer TB services (mostly hospitals and health centres).

Twenty-seven percent of facilities use the DOTS strategy, and an additional 17 percent provide an alternative TB treatment strategy.

Approximately three-fourths of facilities providing TB services have first-line medicines available, but only one-fourth have first-line medicines plus streptomycin available.

Nine in ten facilities utilizing the DOTS strategy have all first-line medicines in stock.

## 7.8 Facility-level Implementation of Universal Precautions

Because many HIV-infected persons are not aware of their status, the risk of transmission of HIV/AIDS is possible wherever someone might come into contact with infected blood or body fluids, regardless of whether services related to HIV/AIDS are being provided or not. In a high-risk environment such as a health facility, it is critical to ensure that no one is unintentionally exposed to the virus. An essential step

in preventing transmission of HIV/AIDS (as well as hepatitis B and C) is to ensure that any potentially contaminated items are appropriately disinfected, which eliminates this avenue for transmission. Therefore, it is recommended that universal precautions be applied throughout all service delivery areas in all health facilities. Use of sharps containers and procedures for immediately disinfecting used equipment are two of the most critical components for preventing inadvertent transmission.

Although asepsis (absence of infection-causing microorganisms) is a basic concept in medical and paramedical schools, experience indicates that providers who do not work in an environment that actively promotes universal precautions are frequently lax in implementation (Pittet et al., 1999; Williams et al., 1994). Thus, a facility-level strategy to promote adherence to universal precautions is an important factor in improving infection control.

A few related indicators from Chapter 3 are presented here. Among all assessed facilities, water (either running or in a bucket) was available in all relevant service sites in less than 79 percent of facilities (see Appendix Table A-3.22). Chlorine solution was found in MCH and STI sites in a much smaller proportion of facilities (35 percent). The most widely available infection control items are latex gloves (found in 67 percent of all relevant service areas), sharps boxes (73 percent), and soap (52 percent). Only 14 percent of facilities have all the indicated items for infection control present in all relevant service sites; dispensaries and clinics are most likely to have all the items (Table 3.12).

Overall, 60 percent of facilities have functioning equipment for sterilisation or high-level disinfection (HLD) (see Table 3.11). VCT facilities are the least likely to have these items, most probably because they use disposable equipment such as disposable needles and syringes.

When selecting a sample, very frequently there is interest in having data on specific types of services or facilities where a nationally representative sample alone will not provide sufficient numbers for meaningful analysis. In designing a sample selection to provide sufficient numbers of subsets of the data, these facilities or services may be over- or under-represented in the sample in relation to the proportion that exist in the nation as a whole. To compensate for over- or under-sampling, when presenting statistics that are meant to be nationally representative, the data are weighted. The weights ensure that such actual proportions of facilities and services as exist in reality appear in the data. Thus, if a type of facility or service is over-sampled, so that twice as many were included in the sample as should be, for nationally representative results, the results for the over-sampled services or facilities will be weighted down by 50 percent. In this particular survey, the number of hospitals actually assessed (172) corresponds to 39 percent of the total sample. However, the real proportion of hospitals to all facilities as per the national list of facilities—i.e., the sampling frame for the Service Provision Assessment—is 6 percent. Thus, the number of hospitals was weighted down to 28, which reflects the actual percentage.

The weighted numbers are provided in the tables in the report and give information on what proportion of the total comes from this particular type of facility or province. It is important to know, however, that all facilities in the sample are used during analyses and in calculating percentages. So, if a weighted number looks too small to be meaningful, it is important to review the unweighted number to know how many actual facilities/interviews contribute to the particular percentage. For example, in a sample of 100 facilities, if clinics represent 3 percent of all facilities, the weighted number of facilities shown will be “3”. If, in fact, 20 clinics were sampled so that data could be provided for clinics alone, the data from these 20 clinics would be used to calculate the percentage that is shown for the “3” weighted clinics.

## Chapter 1

Table A-1.1.1 Distribution of facility sample frame and final sample selection by province

Number of facilities of each type that were in the sample frame, number selected for the survey sample, and percentage of eligible facilities of each type that were included in the sample, by type of facility and province, Kenya SPA 2004

Type of facility <sup>1</sup>	Province															
	Nairobi		Central		Coast		Eastern		North Eastern		Nyanza		Rift Valley		Western	
	Sample frame	SPA sample	Sample frame	SPA sample	Sample frame	SPA sample	Sample frame	SPA sample	Sample frame	SPA sample

Total	439	61	545	62	530	57	895	60	88	29	590	57	1,361	62	314	52

<sup>1</sup> Not uncommonly, facility classifications may change due to service upgrades or downgrades. Often, such changes are not reflected in official facility databases in a timely manner. The survey identified several facilities with a classification that was different from that provided in the sample frame, which resulted in some numbers in the sample being greater than some numbers in the frame. Whenever the number of facilities in the SPA sample was more than the number in the sample frame, the frame was adjusted to be equal to the number of facilities in the sample, implying all these facilities in the sample frame were selected for the survey. The number of facilities in the sample frame shown in this table reflects numbers after accounting for any discrepancies. A total of 20 such discrepancies were corrected in 5 provinces.

Table A-1.1.2 Distribution of facility sample frame and final sample selection by managing authority

**Table A-3.19 System for ordering commodities where order is placed by authorities external to facility**

Among facilities providing commodities where stock orders are placed by authorities external to the facility, percentage in which the basis for determining the amount ordered is activity level, a fixed supply is provided, or the basis for deciding how much to order is not known, by type of commodity, Kenya SPA 2004

Commodity	Percentage of facilities in which amount provided is based on:			Number of facilities where decision for how much to order is made external to facility (weighted)
	Activity level	Fixed supply	Don't know/missing	
Vaccines	78	22	0	26
Contraception	73	19	8	10
Medicines	31	69	0	145 <sup>a</sup>

Note: Numbers too small to show by background characteristics.

<sup>a</sup> Facilities were government managed (primarily health centres and dispensaries).

**Table A-3.20 Knowledge and capacity for autoclave processing of equipment**

Among facilities with a functioning autoclave machine, percentage where the informant provided the indicated response concerning processing temperature and pressure used for autoclaving, Kenya SPA 2004

Background characteristics	Percentage of facilities providing indicated response
<b>Temperature</b>	
Excellent <sup>1</sup>	74
Good <sup>2</sup>	4
Don't know/invalid	23
<b>Pressure</b>	
Excellent <sup>3</sup>	49
Good <sup>4</sup>	8
Don't know/invalid	43
<b>Temperature and pressure</b>	
Both excellent	46
Both at least good	8
Don't know/invalid response for temperature or pressure	46
Total number of facilities with functioning autoclave (weighted)	118

<sup>1</sup> Autoclave had automatic temperature control, or response was 120 to 130° C.

<sup>2</sup> Response was more than 130° C but was less than 361° C (high cutoff point was selected to include any response that appeared valid).

<sup>3</sup> Either automatic machine or response was PPI of 13-17 or ATM of 1 or 2.

<sup>4</sup> Response was PPI more than 17 and less than 61, or ATM more than 2 and less than 8 (high cutoff points were selected to include any response that appeared valid).

**Table A-3.21 Storage conditions for sterilised or high-level disinfected items**

Percentage of facilities with sterilised or disinfected instruments present and, among facilities where sterilised items are present, percentage with specific storage conditions for processed items, by type of facility, managing authority and province, Kenya SPA 2004

Background characteristics	Percentage of facilities with sterilised or disinfected items present	Number of facilities (weighted)	Among facilities with sterile/HLD equipment present, percentage in which indicated conditions were found <sup>1</sup>				Number of facilities with stored processed items (weighted)
			Sterile/HLD status storage conditions <sup>2</sup>	Clean, but not sterile, storage conditions <sup>3</sup>	Processing dates observed on processed and stored items	Sterile/HLD status storage conditions and processing dates on sterilised items

<b>Total</b>	<b>52</b>	<b>79</b>	<b>73</b>	<b>35</b>	<b>67</b>	<b>15</b>	<b>440</b>

<sup>1</sup> Survey criteria required that the item be available in the service delivery room or immediately adjacent, and the item must be observed. If the service was not being provided on the day of the survey, a report that an item was normally available when services were being offered was noted and included in this table. In most cases this added only 0-1 percent. Relevant services and items were: Immunisation area: soap, water, sharps box; Injection room: soap, water, sharps box; consultation area for sick children: soap, water; and consultation/examination area for STI services, family planning, antenatal care, and delivery services: soap, water, sharps box, disinfecting solution, clean latex, or sterile gloves.

<sup>2</sup> Waste receptacle with plastic liner and lid. This is not a component of the aggregate in Table 3.12 because, while important for infection control, and listed in guidelines and protocols, this is not an item that has been commonly introduced.

**Table A-3.23 Waste disposal methods for hazardous materials**

Percentage of facilities that dispose of hazardous materials through specific methods, by type of facility, managing authority and, province, Kenya SPA 2004

Background characteristics	Percentage of facilities in which hazardous material:							Number of facilities (weighted)
	Removed offsite	Burned in incinerator	Burned and buried	Burned and not buried or removed offsite	Buried/not burned or thrown in open pit latrine	Thrown in trash/open pit	Thrown in pit latrine

Percentage of interviewed caretakers of observed children who, when asked, reported that a provider discussed the indicated items, by type of facility, Kenya SPA 2004

Components of consultation	Percentage by type of facility					Total
	Hospital	Health centre	Maternity	Clinic	Dispensary	
Weight or nutritional status of the child	22	15	35	19	16	16
General feeding practices	18	15	29	25	16	16
Give food and liquid during the illness	8	7	24	13	9	9
Was told what the illness was	42	31	70	65	45	40
Number of interviewed caretakers (weighted)	95	529	26	14	696	1,360
Caretaker brought immunisation card to facility this visit	47	52	34	17	44	47
Caretaker reports child <24 month received immunisation	7	6	20	6	7	7
Number of caretakers of children < 24 months (weighted)	57	354	17	8	408	844

**Table A-4.19 Client feedback during exit interview**

Percentage of interviewed caretakers of observed children who said that they considered specific items as big problems for them the day of the visit, by type of facility, Kenya SPA 2004

Components of consultation	Percentage by type of facility					Total
	Hospital	Health centre	Maternity	Clinic	Dispensary	
Behavior/attitude of provider	3	5	0	1	3	4
Inability to discuss problem	4	2	3	2	2	2
Insufficient explanation about child's illness	5	10	3	2	5	7
Waiting time to see provider	31	20	4	20	19	20
Quality of examination and treatment	4	6	1	1	2	4
Availability of medicines	15	17	2	1	18	17
Days facility is open	4	6	0	1	6	6
Hours facility is open	8	7	0	2	10	8
Cleanliness of facility	4	3	0	1	1	2
Insufficient visual privacy	6	2	0	2	3	3
Insufficient auditory privacy	6	2	0	2	3	3
Number of interviewed caretakers (weighted)	95	529	26	14	696	1,360

**Table A-4.20 Caretaker choice of facility**

Among interviewed caretakers of observed children, percentage who reported this was not the closest health facility to their home, and among these, the main reasons they did not go to the nearest facility, by type of facility, managing authority and province, Kenya SPA 2004

Background characteristics	Percentage of interviewed caretakers who report this is not the closest facility to their home	Number of interviewed caretakers (weighted)	Percentage of caretakers mentioning the indicated item was a problem with the nearest facility							Was referred to this facility	Don't know/missing	Number of interviewed caretakers for whom this was not the closest facility (weighted)
			Inconvenient operating hours	Bad reputation	Don't like personnel	No medicines	Prefer anonymity	More expensive				
<b>Type of facility</b>												
Hospital	42	95	2	12	8	9	4	22	15	28	40

## Chapter 5

Table A-5.1 Offered methods of family planning

Percentage of facilities offering each of the indicated methods of family planning (FP), by type of facility, Kenya SPA 2004

Methods offered	Percentage by type of facility					Total
	Hospital	Health centre	Maternity	Clinic	Dispensary	
Combined oral contraception	87	92	94	90	86	89
Progestin-only oral pill	58	63	69	56	31	46
Progestin-only injectable (two or three monthly)	93	90	92	95	87	89
Combined injectable (one monthly)	10	0	3	9	0	1
Male condom	88	90	86	82	83	86
Female condom	61	43	41	27	34	39
Intrauterine device	70	47	67	37	21	36
Implant	59	12	39	20	4	13
Spermicide	7	7	7	9	4	6
Diaphragm	7	2	3	2	4	3
Emergency contraceptive pill	31	14	25	19	4	11
Rhythm method	58	59	46	56	46	51
Female sterilisation	53	4	20	5	0	6
Male sterilisation	25	0	3	4	0	2
At least two of any temporary modern methods	92	96	94	98	89	92
At least four of any temporary modern methods <sup>1</sup>	86	83	93	78	59	71
Number of facilities offering FP services (weighted)	24	107	18	5	169	322

<sup>1</sup> Among the following methods: contraceptive pills (combined or progestin-only), injections (combined or progestin-only), implants, intrauterine devices (IUD), condoms (male or female), spermicides, diaphragm, or emergency contraceptive. Permanent methods (sterilisation) and natural methods (rhythm) are not included.

**Table A-5.2 Availability of offered methods of family planning by type of facility**

Among facilities offering the indicated method, percentage where the method was available on the day of the survey, by type of facility, Kenya SPA 2004

Methods	Percentage by type of facility					Total
	Hospital	Health centre	Maternity	Clinic	Dispensary	
Combined oral contraception	96	91	85	91	94	93
Progestin-only oral pill	82	72	46	51	78	73
Progestin-only injectable (two or three monthly)	96	88	91	91	90	90
Combined injectable (one monthly)	52	-	50	81	0	48
Male condom	94	99	93	89	90	93
Female condom	81	81	61	76	77	78
Intrauterine device	94	75	76	78	88	82
Implant	50	0	34	38	62	34
Spermicide	26	0	19	61	0	5
Diaphragm	15	0	0	100	0	3
Emergency contraceptive pill	57	71	71	68	0	54
Each method offered by a facility was available the day of the survey	45	53	39	51	67	58

**Table A-5.3 Availability of offered methods of family planning by province**

Among facilities offering the indicated method, percentage where the method was available on the day of the survey, by province, Kenya SPA 2004

Methods	Percentage by province								Total
	Nairobi	Central	Coast	Eastern	North Eastern	Nyanza	Rift Valley	Western	
Combined oral contraception	100	99	100	82	88	82	99	90	93
Progestin-only oral pill	78	75	99	71	91	47	69	77	73
Progestin-only injectable (two or three monthly)	100	100	68	91	88	91	90	94	90
Combined injectable (one monthly)	100	85	43	-	0	0	45	0	48
Male condom	99	91	98	91	98	96	90	94	93
Female condom	95	82	97	83	100	47	74	27	78
Intrauterine device	99	73	99	84	89	66	80	81	82
Implant	29	18	58	77	33	37	28	15	34
Spermicide	100	61	63	0	0	3	0	3	5
Diaphragm	0	61	32	-	0	0	0	0	3
Emergency contraceptive pill	29	76	92	91	41	22	35	27	54
Each method offered by a facility was available the day of the survey	43	67	67	50	61	57	62	57	58

**Table A-5.4 Availability of infrastructure, resources, and systems for quality family planning services**

Percentage of facilities where there are items to support quality counseling and items for quality physical examination by type of facility, Kenya SPA 2004

Item	Percentage by type of facility					Total
	Hospital	Health centre	Maternity	Clinic	Dispensary	
<b>Items to support quality counseling</b>						
Visual and auditory privacy	85	87	85	74	89	88
Visual privacy only	10	3	11	20	7	6
No privacy	3	6	1	0	1	3
Individual client health cards	76	72	53	60	63	67
Written FP guidelines	39	28	24	43	32	31
Written STI guidelines	40	55	41	45	70	61
Visual aids for health education on family planning	88	90	76	72	87	87
Visual aids for health education on sexually transmitted infections (STIs)	49	37	23	35	38	38
All items to support quality counseling <sup>1</sup>	30	21	16	28	23	22
All items to support quality counseling for FP and for STI services and client education <sup>2</sup>	12	12	8	8	13	12
<b>Items for infection control</b>						
Soap	82	65	58	82	75	72
Water	91	88	79	97	94	91
Clean latex gloves	91	91	81	93	100	95
Disinfecting solution	57	42	44	49	59	52
Sharps box	92	93	80	71	97	94
All items for infection control <sup>3</sup>	48	31	32	42	48	41
Waste receptacles <sup>4</sup>	46	28	37	30	29	31
All items plus waste receptacle for infection control	27	11	10	16	21	18
<b>Items for pelvic examination</b>						
Visual and auditory privacy	90	85	85	77	85	85
Visual privacy only	7	6	15	23	11	9
No privacy	2	6	0	0	4	4
Examination bed <sup>5</sup>	97	96	99	97	100	98
Examination light <sup>6</sup>	58	15	48	44	19	22
Vaginal speculum	51	36	37	29	17	27
All furnishings and equipment for pelvic examination	30	10	20	23	2	8
All items for both infection control and pelvic examination <sup>7</sup>	18	3	11	15	0	3
Number of facilities offering FP services (weighted)	24	107	18	5	169	322

<sup>1</sup> Either private room or visual barrier, individual client health cards, written guidelines for FP, and any visual aids for FP

<sup>2</sup> All items to support quality counseling, written STI guidelines and visual aids for health education on STIs.

<sup>3</sup> Soap, water, clean latex gloves, disinfecting solution, and sharps box.

<sup>4</sup> While important for infection control, this is not an item that has been commonly introduced so was not included in the aggregate for infection control.

<sup>5</sup> Any bed where a woman can lie down flat.

<sup>6</sup> Examination light, flashlight, or other spotlight source.

<sup>7</sup> Visual and auditory privacy, examination bed, examination light, and vaginal speculum.

**Table A-5.5 Availability of specific teaching and visual aids**

Percentage of facilities where the indicated teaching tool or visual aid was available, by type of facility, Kenya SPA 2004

Item	Percentage by type of facility					Total
	Hospital	Health centre	Maternity	Clinic	Dispensary	
<b>Visual aids or teaching materials</b>						
Samples of different methods	76	68	55	46	66	66
Posters for general promotion of FP	66	61	49	56	59	60
Visual aids about sexually transmitted infections	33	19	13	16	20	20
Visual aids about HIV/AIDS	28	18	17	21	26	23
Model for demonstrating how to use condom	54	48	45	29	52	50
<b>Information for client to take home</b>						
On family planning	47	47	35	38	26	35
On sexually transmitted infections	10	18	7	8	11	13
On HIV/AIDS	19	26	5	18	9	15
<b>Service guidelines</b>						
Any family planning guidelines	39	28	24	43	32	31
WHO guidelines for syndromic approach	40	52	41	45	70	60
Other guidelines for diagnosis and treatment of STIs	11	12	11	11	11	11
Number of facilities offering FP services (weighted)	24	107	18	5	169	322

**Table A-5.6 Location in facility where equipment for family planning services is processed for reuse**

Percentage of facilities where FP equipment is processed for reuse in the indicated location, by type of facility, Kenya SPA 2004

Type of facility	Percentage of facilities where FP service equipment is processed in indicated area <sup>1</sup>				Number of facilities offering FP services (weighted)
	FP service area	Main facility area	Delivery service area	Outside facility/ no processing FP equipment	
Hospital	14	73	1	4	24
Health centre	28	55	0	2	107
Maternity	18	77	1	4	18
Clinic	9	60	0	13	5
Dispensary	4	63	1	4	169
Total	17	78	1	4	322

<sup>1</sup> Main facility area and FP service area may be one location in small facility

Table A-5.7 Level of sterilisation/disinfecting capacity available in location where family planning equipment is processed

Highest level of processing for which the facility has all items to support quality sterilisation/high level disinfecting (HLD) processing, and the percentage with written guidelines at the site where FP equipment is processed for reuse, by type of facility, managing authority, and province, Kenya SPA 2004

Background characteristics	Percentage of facilities where the indicated procedure is the highest level for which all conditions for quality sterilisation/HLD of FP equipment was available			Percentage of facilities with written guidelines for sterilisation or HLD procedures at processing site	Number of facilities offering FP services (weighted)
	Dry heat or autoclave <sup>1</sup>	Boil/steam or chemical HLD <sup>2</sup>	No procedure		
<b>Type of facility</b>					
Hospital	46	1	53	33	24
Health centre	26	0	74	12	107

Western	68	22	81	16	4	4	15
<b>Total</b>	<b>79</b>	<b>322</b>	<b>52</b>	<b>10</b>	<b>14</b>	<b>12</b>	<b>255</b>

<sup>1</sup> Items are wrapped and sealed with time-steam-temperature (TST) tape or are in a sterile/HLD box that clasps shut and storage area is dry and clean.

<sup>2</sup> Items may be wrapped but not sealed, unwrapped on a tray under a cloth, unwrapped on a tray in the steriliser or autoclave, or sitting in disinfecting solution, and storage area is dry and clean.

**Table A-5.9 Availability of medicines for treating sexually transmitted infections**

Percentage of facilities where the indicated medicine is available, and percentage with at least one treatment for each of the four sexually transmitted infections (STIs) by type of facility, Kenya SPA 2004

Medicines	Percentage by type of facility					Total
	Hospital	Health centre	Maternity	Clinic	Dispensary	
FP provides STI service	29	62	55	88	74	66
Metronidazole or tinidazole (trichomoniasis)	99	84	94	86	91	90
Ceftriaxone (gonorrhoea)	46	27	22	11	3	15
Ciprofloxacin (gonorrhoea)	37	14	42	34	6	13
Doxycycline (chlamydia, syphilis)	93	93	73	74	89	89
Tetracycline (chlamydia, syphilis)	34	16	58	48	11	18
Erythromycin (chlamydia, syphilis)	86	49	53	51	53	54
Any injectable or oral Penicillin (syphilis)	96	93	92	91	91	92
Nystatin or miconazole suppository (candidiasis)	27	24	19	32	9	16
At least one medication for gonorrhoea	54	34	50	34	9	23
At least one medication for chlamydia	97	96	81	79	90	92
At least one medication for syphilis	98	100	93	91	97	98
At least one medication for the four STIs assessed <sup>1</sup>	54	30	49	34	9	22
Number of facilities offering FP services (weighted)	24	107	18	5	169	322

<sup>1</sup> At least one medicine for treating trichomoniasis, gonorrhoea, chlamydia, and syphilis.

**Table A-5.10 Availability of equipment and infrastructure for providing specific methods of contraception**

Among facilities offering contraceptive methods containing estrogen, injectable methods, intrauterine devices (IUDs), or implants, percentage having the required equipment and infrastructure to provide the method safely, by type of facility, Kenya SPA 2004

Type of facility	Estrogen containing method			Injectables		IUD			Implants		
	Percentage with blood pressure apparatus <sup>1</sup>	Percentage with adult weight scale	Number of facilities offering method with estrogen (weighted)	Percentage with sterile needle and syringe	Number of facilities offering injectable method (weighted)	Percentage with basic items for IUD insertion <sup>2</sup>	Percentage with all items and conditions for quality IUD insertion <sup>3</sup>	Number of facilities offering IUD (weighted)	Percentage with items for implant insertion <sup>4</sup>	Percentage with all equipment, items for infection control, and infrastructure for implant insertion <sup>5</sup>	Number of facilities offering implants (weighted)
Hospital	88	95	21	96	22	55	35	17	24	19	14
Health centre	68	92	98	92	96	58	9	50	0	0	13
Maternity	94	89	17	91	16	28	15	12	21	21	7
Clinic	94	81	5	94	5	58	44	2	29	15	1
Dispensary	86	93	146	100	148	64	0	36	62	0	7
Total	80	92	286	96	287	56	11	117	22	10	41

<sup>1</sup> Stethoscope and sphygmomanometer.

<sup>2</sup> Clean latex gloves, iodine antiseptic, speculum, forceps for holding gauze to clean cervix, tenacula and uterine sound (or IUD kit that includes a tenacula and uterine sound).

<sup>3</sup> Basic items for IUD insertion, all infection control items (soap, water, clean latex gloves, disinfecting solution, and sharps box) and visual privacy, an examination bed and an examination light, and IUD method.

<sup>4</sup> Forceps for grasping Implant, local anesthetic (Xylocaine), scalpel with blade, sterile needle and syringe, sterile gloves and antiseptic for cleaning skin, and implant method plus insertion devices.

<sup>5</sup> Equipment for Implant, all infection control items (soap, water, disinfecting solution, and sharps box) and visual privacy, examination bed, and examination light.

**Table A-5.11 Availability of specific items for intrauterine device**

Among facilities that offer the intrauterine device (IUD), percentage that have each of the indicated supplies and pieces of equipment to support insertion and removal of IUD, by type of facility, Kenya SPA 2004

Item	Percentage by type of facility					Total
	Hospital	Health centre	Maternity	Clinic	Dispensary	
Clean or sterile latex gloves	99	100	94	95	100	99
Antiseptic solution	73	68	51	88	64	66
Sponge holding forceps	72	79	62	78	71	73
Speculum	73	78	54	78	78	75
Tenacula	65	84	49	65	78	76
Uterine sound	69	78	51	65	78	73
All basic items	55	58	28	58	64	56
IUD method available	94	75	76	78	88	82
All basic items plus method	55	51	28	49	52	50
Number of facilities offering IUD (weighted)	17	50	12	2	36	117

**Table A-5.12 Availability of specific items for implant**

Among facilities that offer the implant method, percentage that have each of the indicated supplies and pieces of equipment, by type of facility, Kenya SPA 2004

Item	Percentage by type of facility					Total
	Hospital	Health centre	Maternity	Clinic	Dispensary	
Sterile gloves	92	87	78	91	62	83
Antiseptic solution	71	13	50	91	62	49
Sponge holding forceps	71	57	49	74	62	62

Number of first-visit FP clients (weighted)	17	91	7	1	38	154

<sup>1</sup> Asked about other partners for self or partner, absence of partner  
<sup>2</sup> Both to prevent pregnancy and STIs  
<sup>3</sup> Risk of STIs discussed or use of condoms to prevent STIs or as dual method discussed.

**Table A-5.26 Observed assessments of client who received injections or oral contraceptives with estrogen**

Percentage of observed family planning (FP) clients who received a contraceptive with estrogen, who had their blood pressure measured, and percentage who had their weight measured, by type of facility, Kenya SPA 2004

Components of consultation	Percentage by type of facility				Total
	Hospital	Health centre	Maternity	Dispensary	
<b>Examination specific to estrogen-based contraceptive</b>					
Blood pressure measured	82	68	100	72	71
Weight measured	82	82	75	100	87
Number of clients receiving estrogen-based contraception (weighted)	3	31	2	15	51

**Table A-5.27 Observed and reported client counseling related to injectable or oral contraceptives**

Percentage of observed and interviewed family planning clients who received a hormonal contraceptive pill or injection where the indicated counseling item was observed being shared by the provider, or was reported by the client that they were told the information, by type of facility, Kenya SPA 2004

Components of consultation	Percentage by type of facility					Total
	Hospital	Health centre	Maternity	Clinic	Dispensary	
<b>Provider was observed to explain the item to the client</b>						
Explained how to use method	87	83	94	68	84	84
Menstrual changes (side-effects)	66	42	79	48	32	41
Non-menstrual side effects	56	31	76	47	28	33
Any side effects	69	44	81	58	35	44
Explained what to do for problems	47	29	77	34	22	29
Mentioned follow-up visit	97	92	100	83	92	93
<b>Client reported that the provider shared the indicated information</b>						
Explained how to use the method	77	76	72	50	65	72
Explained about possible side effects	62	45	43	53	55	51
Explained what to do for problems	68	53	61	65	54	55
Mentioned follow-up visit	96	97	86	100	97	97
<b>Among all pill and injection users:</b>						
Percentage knowing correct response for question	99	98	93	100	99	98
Number of observed and interviewed FP pill/injection clients (weighted)	57	251	9	2	196	516

Table A-5.28 Details on observed education provided and client knowledge regarding different methods of contraception other than pills or injections

Among clients who received condoms, IUD, or implants, the percentage who were observed being told critical information about the method, and percentage who, during the exit interview knew the correct responses to a critical question asked about using their method, percentage of clients receiving condoms, IUD, or implants who reported they were instructed by the provider on how to use their method, about side effects, what to do for problems, and when to return for follow-up, Kenya SPA 2004

Components of consultation	Percentage observed and interviewed clients
<b>Condom user: client was observed being told</b>	
Use one time	89
Can use a backup method	89
About dual protection	93
Interviewed client received condom and knows to use condom only once	89
Number of observed and interviewed clients receiving condom	3
Number of clients receiving IUD or prescription for IUD	4
<b>Implant user: client was observed being told</b>	
Implant is good for three/five years	89
Menstrual changes that might occur	71
Non-menstrual initial side effects that might occur	71
Interviewed client received implant and knows how long implant lasts	100
Number of clients receiving implants or prescription for implant	2
<b>Summary of interviewed client responses</b>	
Client knew the correct response for the survey question about their method	98
Client reported provider explained how to use the method	96
Client reported provider explained about possible side effects	81
Client reported provider explained what to do for problems	93
Client reported provider told about a follow-up visit	94
Number of other family planning clients (weighted) <sup>1</sup>	9

Note: Emergency contraception item is not included as no clients were observed using emergency contraception

<sup>1</sup> Other family planning clients are condom, IUD, and implant, users.

**Table A-5.29 Client feedback on services**

Percentage of observed and interviewed family planning (FP) clients who said that they considered specific items as major problems for them the day of the visit, by type of facility, Kenya SPA 2004

Client service issue	Percentage by type of facility					Total
	Hospital	Health centre	Maternity	Clinic	Dispensary	
Behavior/attitude of provider	3	3	0	0	1	2
Inability to discuss problem	2	1	0	0	1	1
Insufficient explanation about child's illness	3	2	6	0	2	2
Waiting time to see provider	23	24	0	6	15	20
Quality of examination and treatment	2	2	0	0	1	2
Availability of medicines	8	8	3	0	7	7
Days facility is open	2	4	0	0	0	2
Hours facility is open	4	6	3	6	2	4
Cleanliness of facility	2	3	0	0	0	1
Insufficient visual privacy	3	3	0	0	4	3
Insufficient auditory privacy	3	4	0	4	4	4
Number of interviewed FP clients (weighted)	62	255	13	3	196	529

**Table A-5.30 Client choice of facility**

Among interviewed family planning (FP) clients, percentage who reported this was not the closest health facility to their home, and among these, the main reasons they did not go to the nearest facility, by type of facility, managing authority and province, Kenya SPA 2004

Background characteristics	Percentage of interviewed FP clients who report this is not the closest facility to their home	Number of interviewed FP clients (weighted)	Percentage of family planning (FP) clients							Number of interviewed FP clients for whom this was not the closest facility (weighted)
			Inconvenient operating hours	Bad reputation	Don't like personnel	No medicines	Prefer anonymity	More expensive	Was referred to this facility	
<b>Type of facility</b>										
Hospital	29	62	5	7	7	9	10	29	5	18

<sup>1</sup> Some facilities offer the services less than one day per week.

Table A-6.3 Availability of items to support quality antenatal care services

Percentage of facilities where the indicated items are in the ANC/PNC service area or adjacent to the consultation or examination room and the indicated medications are in the facility, by type of facility, managing authority and province, Kenya SPA 2004

Item	Percentage by type of facility					Total
	Hospital	Health centre	Maternity	Clinic	Dispensary	
<b>Items to support quality counseling</b>						
Individual client health cards	72	57	89	61	62	62
Written ANC guidelines	31	36	15	22	30	31
Visual aids for health education	49	31	38	20	26	30
All items to support quality counseling <sup>1</sup>	16	19	13	7	4	10
<b>Items for infection control</b>						
Soap	86	70	62	84	72	72
Water	90	84	78	100	94	90
Clean latex gloves	91	92	79	91	100	96
Disinfecting solution	51	43	53	46	50	48
Sharps box	92	88	84	81	98	93
All items for infection control <sup>2</sup>	42	30	40	36	41	37
Covered waste receptacle with plastic liner <sup>3</sup>	45	45	42	26	28	35
All items for infection control plus waste receptacle	24	16	16	17	21	19
<b>Items for physical examination</b>						
Visual and auditory privacy	88	86	94	84	88	88
Visual privacy only	10	3	5	16	8	7
No privacy	2	5	2	0	3	4
Examination bed <sup>4</sup>	99	97	100	97	100	99
Examination light <sup>5</sup>	49	14	57	44	20	22
All elements for physical examination <sup>6</sup>	72	22	75	61	23	29
All elements for physical examination and specific components for infection control present <sup>7</sup>	26	9	25	20	5	9
<b>Essential supplies for basic ANC</b>						
Blood pressure apparatus	91	69	92	97	88	83
Foetoscope (Pinard)	99	97	88	96	100	98
Iron tablets <sup>8</sup>	87	89	75	69	87	87
Folic acid tablets <sup>8</sup>	94	97	86	64	97	96
Tetanus toxoid vaccine	90	78	73	70	84	82
All basic ANC equipment and medicines <sup>9</sup>	70	50	56	43	59	57
Number of facilities offering ANC (weighted)	25	111	16	4	191	347

<sup>1</sup> Individual client health cards, written ANC guidelines, and visual aids for health education.

<sup>2</sup> Soap, water, gloves, disinfecting solution for decontaminating reusable items, and sharps box

<sup>3</sup> While important for infection control this is not an item that has been commonly introduced and thus was not included in the aggregate for infection control.

<sup>4</sup> May be any type of bed where woman can lie down flat.

<sup>5</sup> May be examination light, flashlight or other spotlight source

<sup>6</sup> Visual and auditory privacy, examination light, bed.

<sup>7</sup> Visual and auditory privacy, examination light, bed, and all infection control items, excluding sharps box.

<sup>8</sup> Iron and folic acid may be separate tablets, or one combined tablet.

<sup>9</sup> Blood pressure apparatus, foetoscope, iron and folic acid, tetanus toxoid vaccine.

**Table A-6.4 Availability of specific medicines and guidelines for antenatal and postpartum services**

Percentage of facilities with indicated medicines for managing common complications during pregnancy, percentage that routinely provide the indicated medicine or test as a component of ANC, and percentage with items for postnatal care, by type of facility Kenya SPA 2004

Item	Percentage by type of facility					Total
	Hospital	Health centre	Maternity	Clinic	Dispensary	
<b>Medicines for managing common complications during pregnancy</b>						
Antibiotic <sup>1</sup>	99	95	98	89	94	95
Mebendazole (antihelminth)	83	84	72	83	88	86
Albendazole (antihelminth)	44	36	44	60	29	33
Metronidazole or tinidazole (trichomoniasis)	99	88	100	85	92	92
Antimalarial	99	100	100	92	100	100
<b>Medicines for STIs</b>						
Ceftriaxone (gonorrhoea)	44	27	24	19	2	14
Ciprofloxacin (gonorrhoea)	35	18	41	29	11	17
Doxycycline (chlamydia, syphilis)	93	92	77	82	89	89
Tetracycline (chlamydia, syphilis)	32	16	60	42	20	22
Erythromycin (chlamydia, syphilis)	87	53	55	60	59	59
Any injectable or oral penicillin (syphilis)	96	93	98	89	91	92
At least one medication for gonorrhoea	53	36	50	36	14	26
At least one medication for chlamydia	97	99	85	82	90	93
At least one medication for syphilis	99	100	99	89	96	98
At least one medication for the four STIs assessed <sup>2</sup>	53	36	49	36	14	26
Nystatin or miconazole suppository (candidiasis)	25	21	21	37	13	17
All medicines for ANC complications <sup>3</sup>	15	8	14	20	0	4
Additional medicine: Methyl dopa (aldomet)	70	17	53	51	15	22
<b>ANC service components</b>						
Preventive antimalarial	79	87	54	48	86	84
Treat STI by ANC providers (if needed)	46	68	80	90	82	75
Routine discussion about family planning	62	61	66	81	61	61
<b>Equipment related to postnatal care</b>						
Thermometer	58	51	84	82	70	64
Infant scale	77	68	81	84	82	77
Number of facilities offering ANC (weighted)	25	111	16	4	191	347

<sup>1</sup> Amoxicillin or cotrimoxazole

<sup>2</sup> At least one medicine for treating trichomoniasis, gonorrhoea, chlamydia, and syphilis

<sup>3</sup> At least one broad-spectrum antibiotic, metronidazole, an antimalarial, at least one medicine for treating trichomoniasis, gonorrhoea, chlamydia, and syphilis, mebendazole, and nystatin (or miconazole) suppository all present

**Table A-6.5 Facility capacity to provide anaemia screening with antenatal care**

Percentage of facilities with the capacity to test for anaemia, percentage where the facility has a standard to routinely screen ANC/PNC clients for anaemia, and percentage where the facility routinely tests ANC clients for anaemia and testing capacity for anaemia exists, by type of facility, managing authority and province, Kenya SPA 2004

Background characteristics	Percentage of facilities offering ANC services			Number of facilities offering ANC (weighted)
	Facility offers ANC and has capacity to conduct anaemia test <sup>1</sup>	Facility has standard to routinely screen ANC clients for anaemia	Facility has standard to routinely screen ANC clients for anaemia and facility has capacity to conduct anaemia test	
<b>Type of facility</b>

<b>Total</b>	<b>5</b>	<b>149</b>	<b>5</b>	<b>25</b>

<sup>1</sup> Data are from health information system monthly reports available at the facility the day of the survey. Data were collected for the 12 months preceding the survey; however, frequently some months were missing. Information from the number of months for which data were available was summed and an average monthly number of clients calculated for each facility. This number was then used to calculate the median number of clients per month.

Table A-6.41 Information on routine charging practices for delivery services

Percentage of facilities with routine charges for delivery services and percentage where each of the indicated fee systems is utilized, and among facilities with routine fees, percent distribution by type of fee posting, by type of facility, managing authority and province, Kenya SPA 2004

Background characteristics	Percentage of facilities charging for indicated item:					Number of facilities offering delivery services (weighted)	Number of facilities having any routine charges for delivery services (weighted)
	Normal delivery	Fixed fee for ANC plus delivery	Medicines	Tests	No charges/ don't know

All items for examination	51	17	39	38	14	19
All items for infection control and physical examination <sup>7</sup>	19	12	29	14	3	8
Number of facilities offering STI services (weighted) <sup>8</sup>	28	121	19	8	227	403

<sup>1</sup> Visual and auditory privacy (private room), any guidelines, any visual aids or educational materials, and condoms in STI service area.

<sup>2</sup> Soap, water, latex gloves, disinfecting solution, and sharps box.

<sup>3</sup> Private room.

<sup>4</sup> Private room or room with screen or curtain that can be pulled for visual privacy.

<sup>5</sup> Any type of bed where a woman can lie down flat.

<sup>6</sup> Examination light, flashlight or other spotlight source.

<sup>7</sup> All items for infection control, visual and auditory privacy, examination bed, and examination light.

<sup>8</sup> Totals include data from one stand-alone VCT centre (weighted).

Table A-7.2 Availability of specific tests and medicines for diagnosis and treatment of sexually transmitted infections

Percentage of facilities with indicated equipment and tests for etiological diagnosis of STIs, and percentage where indicated medicines for treating STIs are available, by type of facility, Kenya SPA 2004

Items and medicines	Percentage by type of facility					Total <sup>7</sup>
	Hospital	Health centre	Maternity	Clinic	Dispensary	
<b>Items for etiologic examination</b>						
Vaginal speculum	53	56	70	52	57	57
Swab stick for specimen	39	30	36	20	11	20
Syphilis test capacity <sup>1</sup>	90	46	75	60	29	41
Gonorrhoea test capacity <sup>2</sup>	81	23	53	43	16	25
Chlamydia test capacity <sup>3</sup>	15	0	1	0	0	1
Wet mounting test capacity <sup>4</sup>	96	61	77	71	37	51
HIV/AIDS testing capacity <sup>5</sup>	88	14	41	26	11	19
All five laboratory tests	15	0	0	0	0	1
<b>Medicines for treatment</b>						
Metronidazole (trichomoniasis)	98	86	96	86	87	88
Ceftriaxone (gonorrhoea)	48	25	23	13	2	13
Ciprofloxacin (gonorrhoea)	38	16	38	38	12	17
Doxycycline (chlamydia, syphilis)	94	88	76	74	85	85
Tetracycline (chlamydia, syphilis)	34	15	60	40	22	23
Erythromycin (chlamydia, syphilis)	87	53	58	54	62	61
Penicillin, benzathine (syphilis)	96	94	96	89	79	86
Penicillin, procaine (syphilis)	50	68	66	69	79	73
All medicines for sexually transmitted infections <sup>6</sup>	55	30	46	41	13	24
Nystatin or miconazole suppository (candidiasis)	30	24	18	32	13	18
Number of facilities offering STI services (weighted) <sup>7</sup>	28	121	19	8	227	403

<sup>1</sup> Either VDRL test and functioning microscope, or RPR (rapid plasma reagin) test kit.

<sup>2</sup> Gram stain reagents and functioning microscope and glass slides or culture capacity.

<sup>3</sup> Giemsa stain for Chlamydia and functioning microscope and glass slides

<sup>4</sup> Functioning microscope and glass slides.

<sup>5</sup> ELISA, Western Blot, or Rapid test.

<sup>6</sup> At least one medicine for treating trichomoniasis, gonorrhoea, chlamydia, and syphilis.

<sup>7</sup> Totals include data from one stand-alone VCT centre (weighted)

**Table A-7.3 Information on user fees for services for sexually transmitted infections**

Percentage of facilities with user fees for STI services and among those with user fees, percentage where each of the indicated fee systems is utilized, by type of facility, managing authority and province, Kenya SPA 2004

Background characteristics	Percentage of facilities charging for the indicated item:					Number of facilities offering STI services (weighted)	Number of facilities having any user fees for STI services (weighted)
	Client chart or record	Consultation	Medicines	Tests	No charges or don't know

<sup>1</sup> Data are from health information system monthly reports available at the facility the day of the survey. Data were asked for the 12 months preceding the survey; however, frequently some months were missing. Information from the number of months for which data were available was summed and an average monthly number of clients calculated for each facility. This number was then used to calculate the median number of clients per month.

<sup>2</sup> All facilities did not have data available.

**Table A-7.8 Observed consultation for clients with symptoms of sexually transmitted infections**

Among observed clients with symptoms of sexually transmitted infections (STIs), percentage who were reassured about confidentiality, percentage for whom the indicated information was asked during the consultation, percentage who had physical examination procedures, and percentage who had laboratory diagnostic tests, by type of facility, Kenya SPA 2004

Content of consultation	Percentage by type of facility			Total
	Hospital	Health centre	Dispensary

**1. General Information**

FIND THE MANAGER OR MOST SENIOR HEALTH WORKER RESPONSIBLE FOR SERVICES WHO IS PRESENT AT THE FACILITY. READ THE FOLLOWING GREETING:

Hello. My name is \_\_\_\_\_. We are here on behalf of the NCPD and the MOH carrying out a survey of health facilities that provide services to women and children, with the goal of finding ways to improve the delivery of services. In addition, we want to ask about services for specific infectious diseases, such as tuberculosis, sexually transmitted infections, and HIV/AIDS. Your facility was randomly selected to participate in this study. In addition to asking about maternal and child health services, we will be asking you questions about the types of HIV/AIDS-related care and support services provided in this facility.

We will ask to see patient registers however no patient names from the registers will be reviewed, recorded, or shared. You may decline to answer any question or choose to stop the interview at any time.

We are asking for your help to ensure that the information we collect is accurate. If there are any sections in which someone else is the most appropriate person to provide information, we would appreciate your introducing us to that person.

Please be assured that the information you give us will be completely confidential and will not be traced to you and will not be identified with the name of the facility.

Do you have any questions for me? May I continue?

Interviewer's signature \_\_\_\_\_ Date \_\_\_\_\_  
 (Indicates respondent's willingness to participate)

100	May I begin the interview?	YES ..... 1	NO ..... 2	→ STOP
-----	----------------------------	-------------	------------	--------

First I would like to ask you some general questions about how this facility is organized, and what infrastructure and resources are available. Then I will have some specific questions about HIV/AIDS services that may be provided from this facility.

101	In addition to regular healthcare services, does the facility ever provide services for clients who are known or suspected to be HIV/AIDS infected or to have HIV/AIDS related illnesses?	YES ..... 1	NO ..... 2	→ 103
-----	---	-------------	------------	-------

102	Is there one person who is responsible overall for services specifically related to HIV/AIDS services? IF YES, ASK THE NAME AND ASK IF THAT PERSON CAN BE CALLED TO PARTICIPATE IN THE GENERAL DISCUSSION. IF THERE IS A DIFFERENT PERSON FOR INPATIENT AND FOR OUTPATIENT SERVICES RELATED TO HIV/AIDS ASK FOR THE PERSON MOST KNOWLEDGABLE ABOUT OUTPATIENT SERVICES RELATED TO CARE AND SUPPORT FOR HIV/AIDS CLIENTS WHO IS AVAILABLE TODAY. WHILE THE HIV/AIDS PERSON IS BEING CALLED, CONTINUE WITH Q103.	YES, _____ ..... 1 NAME OF HIV/AIDS SERVICE PERSON RESPONSIBLE	NO ONE PERSON RESPONSIBLE FOR HIV/AIDS SERVICES ..... 2	
-----	--	--	--	--

2. Information About Services			
NO.	QUESTIONS	CODING CLASSIFICATION	GO TO
103	How many days each week is the facility routinely open for outpatient curative services?	NUMBER OF DAYS ..... <input type="text"/> DON'T KNOW ..... 8	
104	Is there a trained health provider assigned to and present at the facility at all times (24 hours a day) for emergencies?  IF YES, ASK TO SEE DUTY SCHEDULE.	YES, OBSERVED ..... 1 YES, REPORTED, NOT SEEN ..... 2 NO ..... 3	→ 107
105	Is there a trained health provider available away from the facility but officially on call, at all times, after hours?  IF YES, ASK TO SEE ON-CALL DUTY SCHEDULE.	YES, OBSERVED ..... 1 YES, REPORTED, NOT SEEN ..... 2 NO ..... 3	→ 107
106	Does a trained health provider live on the facility premises?	YES ..... 1 NO ..... 2 DON'T KNOW ..... 8	

NO.	QUESTIONS	CODING CLASSIFICATION			GO TO
107	<p>Now I have some questions about staffing for this facility. Please tell me how many staff with this qualification this facility is authorized to have, that is staffing norms, and then tell me how many staff with this qualification are actually in post and the additional number required.</p> <p>We want to know the highest technical qualification that any staff may hold (such as nurse or doctor) regardless of the person's administrative position or specialist studies after qualification or the actual work that they do. For example, if a nurse provides counseling, then the highest qualification is nurse, not counselor.</p>				
	<p>QUALIFICATION</p>	(a) STAFFING NORMS	(b) ACTUAL # IN POST	(c) ADDITIONAL REQUIRED	
01	Obstetrician/Gynecologist . . . . .	<input type="text"/>	<input type="text"/>	<input type="text"/>

#### 4. Observation of Sick-Child Consultation

NO.	QUESTIONS	CODING CLASSIFICATION	GO TO
	<p>BEFORE OBSERVING THE CONSULTATION, OBTAIN PERMISSION FROM BOTH THE SERVICE PROVIDER AND THE CHILD'S CARETAKER. MAKE SURE THAT THE PROVIDER KNOWS THAT YOU ARE NOT THERE TO EVALUATE HIM OR HER, AND THAT YOU ARE NOT AN "EXPERT" TO BE CONSULTED DURING THE SESSION.</p> <p>BE AS DISCREET AS POSSIBLE DURING THE ASSESSMENT. DO NOT TAKE PART IN THE INTERACTION BETWEEN THE PROVIDER AND THE CHILD'S CARETAKER. TRY TO SIT BEHIND THE CARETAKER AND CHILD BUT TO ONE SIDE, SO YOU WILL NOT BE SITTING DIRECTLY IN FRONT OF THE PROVIDER.</p> <p>FOR EACH OF THE ITEMS BELOW, CIRCLE THE ANSWER THAT BEST EXPRESSES YOUR ASSESSMENT OF WHAT HAPPENED DURING THE INTERACTION.</p> <p><b>READ TO PROVIDER:</b> Hello. I am representing the Ministry of Health. We are carrying out a survey of health facilities that provide services to women and children, with the goal of finding ways to improve the delivery of services. I would like to observe your consultation with this caretaker and child in order to better understand how health care is provided in this facility. Any information you give me will be completely confidential. If, at any point, you would prefer I leave, please feel free to tell me.</p> <p>Do you have any questions for me? Do I have your permission to be present at this consultation?</p> <p>_____ Date _____                      Interviewer's signature (Indicates respondent's willingness to participate)</p>		
101	RECORD WHETHER PERMISSION WAS RECEIVED FROM THE PROVIDER.	YES ..... 1 NO ..... 2	→ STOP
	<p><b>READ TO CARETAKER:</b> Hello. I am representing the Ministry of Health. We are carrying out a survey of health facilities that provide services to women and children. I would like to observe this consultation in order to better understand how health care is provided.</p> <p>Any information you give will be kept completely confidential and will not affect the level of care you receive here, now or in the future. If, at any point, you would prefer I leave, please feel free to tell me.</p> <p>After the consultation, my colleague would like to talk with you about your experience here today.</p> <p>Do you have any questions for me? Do I have your permission to be present at this consultation?</p> <p>_____ Date _____                      Interviewer's signature (Indicates respondent's willingness to participate)</p>		
102	RECORD WHETHER PERMISSION WAS RECEIVED FROM THE CARETAKER.	YES ..... 1 NO ..... 2	→ STOP
103	RECORD SEX OF THE CHILD.	MALE ..... 1 FEMALE ..... 2	
104	RECORD THE VISIT TYPE (THIS REFERS TO THIS SICKNESS).	FIRST VISIT ..... 1 FOLLOW-UP ..... 2 DON'T KNOW ..... 8	

### 5. Provider's Interaction With Caretaker and Child

NO.	QUESTIONS	CODING CLASSIFICATION			GO TO
105	RECORD WHETHER A PROVIDER ASKED ABOUT OR WHETHER THE CARETAKER MENTIONED THAT THE CHILD HAD ANY OF THE FOLLOWING <b>MAJOR SYMPTOMS</b> .	YES	NO	DK	
01	Cough or difficult breathing	1	2	8	
02	Diarrhea	1	2	8	
03	Fever or body hotness	1	2	8	
04	Ear problems	1	2	8	
106	RECORD WHETHER A PROVIDER ASKED ABOUT OR WHETHER THE CARETAKER MENTIONED ANY OF THE FOLLOWING.				
01	Whether the child is unable to drink or breastfeed at all	1	2	8	
02	Whether the child vomits everything	1	2	8	
03	Whether the child has had convulsions with this sickness	1	2	8	
107	RECORD WHETHER A PROVIDER PERFORMED ANY OF THE FOLLOWING <b>PHYSICAL EXAMINATIONS</b> .				
01	Take child's temperature by thermometer	1	2	8	
02	Feel the child for fever or body hotness	1	2	8	
03	Count respiration (breaths)	1	2	8	
04	Check skin turgor for dehydration (pinch abdominal skin)	1	2	8	
05	Check for pallor by looking at palms	1	2	8	
06	Check for pallor by looking at conjunctiva or mouth	1	2	8	
07	Look in child's ear	1	2	8	
08	Feel behind child's ear	1	2	8	
09	Undress child to examine	1	2	8	
10	Press both feet to check for edema	1	2	8	
11	Weigh the child IF YES:	1	2 ↘ 108	8 ↘ 108	
12	Plot weight on growth chart	1 ↘ 108	2	8	
13	Compare child's weight to standard weight	1	2	8	

NO.	QUESTIONS	CODING CLASSIFICATION				GO TO
108	RECORD WHETHER A PROVIDER ASKED ABOUT OR PERFORMED OTHER ASSESSMENTS OF THE CHILD'S HEALTH <b>BY DOING ANY OF THE FOLLOWING.</b>	YES	NO	DK		
01	Offer the child something to drink or ask the mother to put the child to the breast (TO FIND OUT WHETHER THE CHILD CAN DRINK)	1	2	8		
02	Ask about normal feeding practices when the child is not ill	1	2	8		
03	Ask about normal breastfeeding practices when the child is not ill	1	2	8		
04	Ask about feeding or breastfeeding practices for the child during this illness	1	2	8		
05	Mention the child's weight or growth to the caretaker, or discuss the growth chart with the caretaker	1	2	8		
06	Look at the child's immunization card or ask the caretaker about child's vaccination history	1	2	8		
07	Ask if child received Vitamin A	1	2	8		
08	Look at the child's health card either before beginning the consultation, or while collecting information from the caretaker, or when examining the child (THIS ITEM MAY BE EITHER THE VACCINATION CARD OR ANOTHER HEALTH CARD).	1	2	8		
109	RECORD WHETHER A PROVIDER DID ANY OF THE FOLLOWING WHEN COUNSELING THE CARETAKER.	YES	NO	DK	NA	
01	Provide general information about feeding or breast-feeding the child even when not sick	1	2	8		
02	Tell the caretaker to give extra fluids to the child during this sickness	1	2	8		
03	Tell the caretaker to continue feeding the child during this sickness	1	2	8		
04	Tell the caretaker what illness(es) the child has	1	2	8		
05	Describe signs or symptoms in the child for which the caretaker should immediately bring the child back	1	2	8		
110	RECORD WHETHER THE CHILD WAS REFERRED TO ANOTHER PROVIDER OR FOR A LABORATORY TEST. IF YES:	1	2 ↘ 111	8 ↘ 111		
01	RECORD WHETHER THE PROVIDER EXPLAINED WHY THE REFERRAL WAS MADE.	1	2	8	5	

NO.	QUESTIONS	CODING CLASSIFICATION				GO TO					
111	RECORD WHETHER ORAL MEDICATIONS WERE PRESCRIBED OR PROVIDED DURING THE CONSULTATION. THIS REFERS TO MEDICINES THE CARETAKER WILL GIVE TO THE CHILD AT HOME, AND DOES NOT INCLUDE PARACETAMOL OR ORS PROVIDED FOR IMMEDIATE TREATMENT BUT NOT PRESCRIBED FOR HOME TREATMENT. IF YES: RECORD WHETHER A PROVIDER DID ANY OF THE FOLLOWING.	YES	NO	DK	NA						
		1	2 ↘ 112	8 ↘ 112							
01	Explain how to administer oral treatment(s)	1	2	8	5						
02	Ask the caretaker to repeat the instructions for the medications	1	2	8	5						
03	Give the first dose of the oral treatment	1	2	8	5						
112	RECORD WHETHER A PROVIDER USED ANY VISUAL AIDS WHEN PROVIDING INDIVIDUAL HEALTH EDUCATION OR COUNSELING TO THE CARETAKER ABOUT THE CHILD.	1	2	8							
113	RECORD WHETHER THE MAIN PROVIDER WROTE ON THE CHILD'S HEALTH CARD/ BOOK.	YES .....	NO .....	NO HEALTH CARD/BOOK USED .....	DON'T KNOW .....	1 2 3 8					
114	RECORD THE OUTCOME OF THE CONSULTATION.  (THIS IS THE POINT WHEN THE OBSERVATION CONCLUDED)	CHILD SENT HOME .....	CHILD REFERRED TO PROVIDER AT SAME FACILITY .....	CHILD ADMITTED TO SAME FACILITY .....	CHILD SENT TO LAB .....	CHILD REFERRED TO OTHER FACILITY .....					
115	RECORD THE TIME WHEN THE CONSULTATION ENDED.	<table border="1" style="display: inline-table; border-collapse: collapse;"> <tr> <td style="width: 20px; height: 20px;"></td> <td style="width: 20px; height: 20px;"></td> <td style="width: 10px; text-align: center;">:</td> <td style="width: 20px; height: 20px;"></td> <td style="width: 20px; height: 20px;"></td> </tr> </table>						:			
		:									

### 6. Diagnosis and Classification and Treatment

ASK THE PROVIDER TO TELL YOU THE DIAGNOSIS. EXPLAIN THAT FOR ANY DIAGNOSIS OR SYMPTOM YOU WANT TO KNOW IF THE PROBLEM WAS SEVERE, MODERATE, OR MINOR. THEN ASK ABOUT THE TREATMENT PRESCRIBED OR PROVIDED.

DIAGNOSIS OR MAIN SYMPTOMS (IF NO DIAGNOSIS)		1	2	201 3	4	8
		SEVERE	MOD- ERATE	MINOR	NO	DON'T KNOW
RESPIRATORY SYSTEM	A) PNEUMONIA	1	2		4	8
	B) BRONCHO-PNEUMONIA	1	2		4	8
	C) BRONCHIAL SPASM/ASTHMA	1	2	3	4	8
	D) UPPER RESPIRATORY INFECTION (URI)	1	2	3	4	8
	E) RESPIRATORY ILLNESS, DIAGNOSIS UNCERTAIN	1	2	3	4	8
	F) COUGH, DIAGNOSIS UNCERTAIN	1	2	3	4	8
DIGESTIVE SYSTEM	G) PERSISTENT DIARRHEA	1	2	3	4	8
	H) DIARRHEA	1	2	3	4	8
	I) DYSENTERY	1	2	3	4	8
	J) AMEBIASIS	1	2	3	4	8
	K) OTHER DIARRHEA _____ (SPECIFY)	1	2	3	4	8
DEHY- DRA- TION	L) DEHYDRATION	1	2	3	4	8
MALARIA	M) MALARIA (CLINICAL DIAGNOSIS)	1	2	3	4	8
	N) MALARIA (BLOOD SMEAR)	1	2	3	4	8
	O) PROBABLE MALARIA (BY SYMPTOMS)	1	2	3	4	8
FEVER	P) FEVER	1	2	3	4	8
	Q) MEASLES	1	2	3	4	8
	R) MEASLES WITH COMPLICATIONS	1	2	3	4	8
EAR	S) MASTOIDITIS	1	2	3	4	8
	T) ACUTE EAR INFECTION	1	2	3	4	8
	U) CHRONIC EAR INFECTION	1	2	3	4	8
THROAT	V) STREPTOCOCCAL SORE THROAT	1	2	3	4	8
	W) NON-STREPTOCOCCAL SORE THROAT	1	2	3	4	8
	X) OTHER THROAT _____ OR EAR DIAGNOSIS (SPECIFY)	1	2	3	4	8
	Y) OTHER DIAGNOSIS _____ (SPECIFY)	1	2	3	4	8
202	CHECK RESPIRATORY ILLNESSES IN 201. IF ANY CATEGORIES ARE CIRCLED, CLARIFY WITH THE PROVIDER IF THERE WAS WHEEZING OR NOT.	YES, WHEEZING ..... 1 NO WHEEZING ..... 2 NOT APPLICABLE ..... 5 NOT CERTAIN ..... 8				

203	ASK ABOUT PRESCRIPTION, TREATMENT AND ACTIONS TAKEN FOR ILLNESS AND PROBE "ANYTHING ELSE?"	YES	NO	DK	
	01) TREATMENT	1	2	8	
TREATMENTS FOR VARIOUS ILLNESSES	02) BENZATHINE PENICILLIN INJECTION	1	2	8	
	03) OTHER ANTIBIOTIC INJECTION	1	2	8	
	04) OTHER INJECTION	1	2	8	
	05) CO-TRIMOXAZOLE/AMOXICILLIN	1	2	8	
	06) OTHER ANTIBIOTIC TABLET/SYRUP	1	2	8	
	07) PARACETAMOL	1	2	8	
	08) VITAMINS	1	2	8	
	09) COUGH SYRUPS/OTHER MEDICATION FOR SYMPTOMATIC TREATMENT	1	2	8	
RESPIRATORY	10) NEBULIZED OR INHALER	1	2	8	
	11) INJECTABLE BRONCHODILATOR (ADRENALINE)	1	2	8	
	12) ORAL BRONCHODILATOR	1	2	8	
	13) DRY EAR BY WICKING	1	2	8	
MALARIA	14) INJECTABLE QUININE, FANSIDAR OR ARTEMETHER	1	2	8	
	15) INJECTABLE CHLOROQUINE	1	2	8	
	16) OTHER INJECTABLE ANTIMALARIAL	1	2	8	
	17) ORAL ANTIMALARIAL	1	2	8	
DEHYDRATION	18) HOME ORT	1	2	8	
	19) INITIAL ORT IN FACILITY (4 HOURS)	1	2	8	
	20) INTRAVENOUS FLUIDS	1	2	8	
MEASLES	21) VITAMIN A	1	2	8	
	22) FEEDING SOLID FOODS	1	2	8	
	23) FEEDING EXTRA LIQUIDS	1	2	8	
	24) FEEDING BREAST MILK	1	2	8	
	25) OTHER TREATMENT _____ (SPECIFY)	1	2	8	
204	Did you give or refer the child for an immunization? IF NO: Why not?	PROVIDER GAVE ..... 01 PROVIDER REFERRED .... 02 NOT DUE FOR IMMUNIZATION ..... 03 VACCINE NOT AVAILABLE .. 04 CHILD TOO SICK ..... 05 NOT DAY FOR IMMUNIZATION ..... 06 DID NOT CHECK FOR IMMUNIZATION ..... 08 OTHER _____ 96 (SPECIFY)			

205	RECORD THE TIME WHEN THE OBSERVATION ENDED.	<table border="1"><tr><td data-bbox="1117 107 1166 170"></td><td data-bbox="1166 107 1214 170"></td><td data-bbox="1219 107 1235 170">.</td><td data-bbox="1235 107 1284 170"></td><td data-bbox="1284 107 1333 170"></td></tr></table>			.

### 3. Information About Visit

NO.	QUESTIONS	CODING CLASSIFICATION	GO TO												
	<p>Hello. In order to improve the services this facility offers, we would like to know about your experience here. All the information you give me will be kept strictly confidential, and the care that you receive at this facility in the future will not be affected by your participation or nonparticipation. You may refuse to answer any of the questions, and you may stop the interview anytime.</p> <p>Do you have any questions for me now? Do you agree to participate?</p> <p>_____</p> <p>Interviewer's signature _____ Date _____ (Indicates respondent's willingness to participate)</p>														
100	May I begin the interview?	CLIENT AGREES ..... 1 CLIENT REFUSES ..... 2	→ STOP												
101	What is the name of the sick child?	NAME _____													
102	What month and year was [NAME] born?	MONTH ..... <input type="text"/> <input type="text"/> DON'T KNOW MONTH ..... 98 YEAR ..... <input type="text"/> <input type="text"/> <input type="text"/> <input type="text"/> DON'T KNOW YEAR ..... 9998	→ 103												
103	IF CARETAKER DOES NOT KNOW [NAME]'S COMPLETE BIRTH DATE, PROBE:  How old is [NAME] in completed months?	AGE IN MONTHS ..... <input type="text"/> <input type="text"/>													
104	Did you bring [NAME] to the facility today because he or she had any of the following problems?	<table style="margin-left: auto; margin-right: auto;"> <tr> <td></td> <td style="text-align: center;"><u>YES</u></td> <td style="text-align: center;"><u>NO</u></td> </tr> <tr> <td>01</td> <td>Cough or difficult breathing</td> <td>COUGH/DIFF. BREATH. 1 2</td> </tr> <tr> <td>02</td> <td>Diarrhea</td> <td>DIARRHEA ..... 1 2</td> </tr> <tr> <td>03</td> <td>Fever/body hotness at home</td> <td>FEVER/BODY HOTNESS 1 2</td> </tr> </table>		<u>YES</u>	<u>NO</u>	01	Cough or difficult breathing	COUGH/DIFF. BREATH. 1 2	02	Diarrhea	DIARRHEA ..... 1 2	03	Fever/body hotness at home	FEVER/BODY HOTNESS 1 2	
	<u>YES</u>	<u>NO</u>													
01	Cough or difficult breathing	COUGH/DIFF. BREATH. 1 2													
02	Diarrhea	DIARRHEA ..... 1 2													
03	Fever/body hotness at home	FEVER/BODY HOTNESS 1 2													
105	For what other reason(s) did you bring [NAME] to this health facility today?  CIRCLE ALL ITEMS THE RESPONDENT MENTIONS.  PROBE: Anything else?	EYE PROBLEMS ..... A SKIN SORE ..... B INJURY ..... C OTHER _____ X (SPECIFY) NO OTHER REASON ..... Y													
106	Has [NAME] been brought to this facility before for this same sickness?	YES ..... 1 NO ..... 2 DON'T KNOW ..... 8	→ 108 → 108												
107	IF YES:  How long ago was that?	WITHIN THE PAST WEEK ..... 1 WITHIN THE PAST 2-4 WEEKS ..... 2 MORE THAN 4 WEEKS AGO ..... 3 DON'T KNOW ..... 8													

NO.	QUESTIONS	CODING CLASSIFICATION	GO TO
108	How many days ago did the illness for which you brought [NAME] here begin? IF LESS THAN 1 DAY, WRITE 00 IN THE BOXED CELLS.	DAYS AGO ..... <input type="text"/> <input type="text"/> DON'T KNOW ..... 98	
109	Did the provider tell you what illness [NAME] has?	YES ..... 1 NO ..... 2 DON'T KNOW ..... 8	
110	What will you do if [NAME] does not get completely better or becomes worse?	RETURN TO FACILITY ..... 1 GO TO OTHER FACILITY ... 2 GO TO OTHER HEALTH WORKER/PHARMACY .... 3 GO TO TRADITIONAL HEALER ..... 4 WAIT ..... 5 OTHER _____ 6 (SPECIFY) DON'T KNOW ..... 8	
111	Did the provider tell you about any signs or symptoms you may see for which you must immediately bring the child back?  IF NECESSARY, PROBE: Were there any serious symptoms or danger signs for which you were told to bring [NAME] back immediately?  CIRCLE THE SYMPTOM LISTED IF THE CARETAKER UNDERSTANDS THAT THE CHILD SHOULD BE BROUGHT BACK IF THE SYMPTOM EITHER FAILS TO GO AWAY OR BECOMES WORSE.	FEVER ..... A BREATHING PROBLEMS .... B BECOMES SICKER ..... C BLOOD IN STOOL ..... D VOMITING ..... E POOR/NOT EATING ..... F POOR/NOT DRINKING ..... G OTHER _____ X (SPECIFY) NO, NONE ..... Y DON'T KNOW ..... Z	
112	Did the provider tell you anything about bringing [NAME] back to the health facility for follow-up or non-emergency reasons?  IF YES: Why were you to return?	MORE MEDICINES ..... A IF SYMPTOMS INCREASE OR BECOME WORSE ..... B FOLLOW-UP APPOINTMENT C CHILD ADMITTED ..... D ROUTINE IMMUNIZATION .... E OTHER _____ X (SPECIFY) NO ..... Y DON'T KNOW ..... Z	
113	Did the provider give or prescribe any medicines for [NAME] to take at home?	YES, GAVE MEDS ..... 1 YES, GAVE PRESCRIPTION ... 2 GAVE MEDS AND PRESCRIPTION ..... 3 NO ..... 8	→ 118
114	ASK TO SEE ALL MEDICATIONS THAT THE CARETAKER RECEIVED AND ANY PRESCRIPTIONS THAT HAVE NOT BEEN FILLED  CIRCLE THE RESPONSE DESCRIBING THE MEDICATIONS AND PRESCRIPTIONS YOU SEE.	HAS ALL MEDS ..... 1 HAS SOME MEDS, SOME UNFILLED PRESCRIPTIONS .. 2 NO MEDICATIONS SEEN, HAS PRESCRIPTIONS ONLY .... 3	

NO.	QUESTIONS	CODING CLASSIFICATION	GO TO
115	Did a provider at the facility explain to you how to give these medicines to [NAME] at home? IF "2" OR "8" SEND CLIENT BACK TO PROVIDER	YES ..... 1 NO ..... 2 DON'T KNOW ..... 8

### 3. Information About Observation

<p>Date: _____</p> <p>Name of the observer: _____</p> <p>Time observation started: _____</p> <p>Client code: _____</p>	<p>DAY ..... <table border="1" style="display: inline-table; border-collapse: collapse;"><tr><td style="width: 20px; height: 20px;"></td><td style="width: 20px; height: 20px;"></td></tr></table></p> <p>MONTH ..... <table border="1" style="display: inline-table; border-collapse: collapse;"><tr><td style="width: 20px; height: 20px;"></td><td style="width: 20px; height: 20px;"></td></tr></table></p> <p>YEAR ..... <table border="1" style="display: inline-table; border-collapse: collapse;"><tr><td style="width: 20px; height: 20px;"></td><td style="width: 20px; height: 20px;"></td><td style="width: 20px; height: 20px;"></td><td style="width: 20px; height: 20px;"></td></tr></table></p> <p>OBSERVER CODE ..... <table border="1" style="display: inline-table; border-collapse: collapse;"><tr><td style="width: 20px; height: 20px;"></td><td style="width: 20px; height: 20px;"></td></tr></table></p> <p>HOUR ..... <table border="1" style="display: inline-table; border-collapse: collapse;"><tr><td style="width: 20px; height: 20px;"></td><td style="width: 20px; height: 20px;"></td></tr></table></p> <p>MINUTES ..... <table border="1" style="display: inline-table; border-collapse: collapse;"><tr><td style="width: 20px; height: 20px;"></td><td style="width: 20px; height: 20px;"></td></tr></table></p> <p>CLIENT CODE ..... <table border="1" style="display: inline-table; border-collapse: collapse;"><tr><td style="width: 20px; height: 20px;"></td><td style="width: 20px; height: 20px;"></td></tr></table></p>																

NO.	QUESTIONS	CODING CLASSIFICATION			GO TO
104	CLIENT STATUS. (OBSERVER TO COMPLETE)	YES	NO	DK	
01	INDICATE WHETHER THE CLIENT HAS HAD ANY PREVIOUS CONTACT WITH A PROVIDER AT THIS FAMILY PLANNING CLINIC.	1	2	8	
02	INDICATE WHETHER THE CLIENT HAS EVER BEEN PREGNANT.	1	2	8	
105	CLIENT'S PERSONAL INFORMATION AND REPRODUCTIVE HISTORY. INDICATE BELOW WHETHER THE PROVIDER ASKED ABOUT OR THE CLIENT VOLUNTEERED INFORMATION ON THE FOLLOWING ITEMS:				
01	Age of client	1	2	8	
02	Number of living children	1	2	8	
03	Last delivery date or age of youngest child	1	2	8	
04	History of complications with pregnancy	1	2	8	
05	Current pregnancy status	1	2	8	
06	Desire for a child or more children	1	2	8	
07	Desired timing for birth of next child	1	2	8	
08	Breastfeeding status	1	2	8	
09	Regularity of menstrual cycle	1	2	8	
106	RECORD WHETHER THE PROVIDER PERFORMED ANY OF THE FOLLOWING PHYSICAL EXAMINATIONS OR ASKED ANY OF THE FOLLOWING HEALTH QUESTIONS.				
01	Take the client's blood pressure	1	2	8	
02	Weigh the client	1	2	8	
03	Ask the client about smoking	1	2	8	
04	Ask the client about symptoms of STIs (e.g., abnormal discharge)	1	2	8	
05	Ask the client about chronic illnesses (heart disease, diabetes, hypertension, liver or jaundice problem, breast cancer)	1	2	8	
06	Look at the client's health card (either before beginning the consultation or while collecting information or examining the client)	1	2	8	

NO.	QUESTIONS	CODING CLASSIFICATION			GO TO
107	RECORD WHETHER THE PROVIDER TOOK ANY OF THE FOLLOWING STEPS TO ASSURE THE CLIENT OF PRIVACY.	YES	NO	DK	
01	Ensure visual privacy	1	2	8	
02	Ensure auditory privacy	1	2	8	
03	Assure the client orally of confidentiality	1	2	8	
04	Ask the client about questions or concerns regarding methods currently used	1	2	8	
108	RECORD WHETHER THE PROVIDER DISCUSSED ANY OF THESE ISSUES RELATED TO SEXUAL PARTNERS AND CHOICE OF FAMILY PLANNING METHOD.				
01	Partner's attitude toward family planning	1	2	8	
02	Partner status (number of partners for client or for client's partner; partner's absence)	1	2	8	
03	Risk of STIs	1	2	8	
04	Use of condoms to prevent STIs	1	2	8	
05	Using condoms as well as or along with another method (dual method) to attempt to prevent STIs	1	2	8	
109	<p>INDICATE WHICH METHOD(S) WERE PRESCRIBED DURING THIS VISIT. IF CONDOMS WERE PRESCRIBED FOR USE ALONG WITH ANOTHER METHOD, CIRCLE BOTH METHODS.</p> <p>[IF CLIENT IS CONTINUING CLIENT WHO RECEIVED REFILLS FOR PILLS, REPEAT INJECTION, OR REPLACEMENT FOR IUD DURING THIS VISIT, CIRCLE THE METHOD THAT WAS REPLENISHED]</p>	<p>ORAL PILL ..... A</p> <p>CONDOM ..... B</p> <p>IUD ..... C</p> <p>SPERMICIDE ..... D</p> <p>DIAPHRAGM ..... E</p> <p>INJECTABLE ..... F</p> <p>IMPLANT ..... G</p> <p>NATURAL METHODS (RHYTHM) ..... H</p> <p>BREASTFEEDING/LAM ..... I</p> <p>VASECTOMY ..... J</p> <p>FEMALE STERILIZATION ... K</p> <p>EMERGENCY CONTRACEPTION ..... L</p> <p>OTHER _____ X</p> <p>(SPECIFY)</p> <p>NO METHOD ..... Y</p>			→ 111

NO.	QUESTIONS	CODING CLASSIFICATION			GO TO
110	FOR THE METHOD(S) IN QUESTION 109, INDICATE WHETHER THE RELEVANT INFORMATION INDICATED WAS ASSESSED OR DISCUSSED.	YES	NO	DK	NA
	PILLS OR INJECTIONS				5 → 05
01	When to take (pill daily; injection either every month or every 3 months)	1	2	8	
02	Changes that may occur with menstruation (decreased flow, spotting)	1	2	8	
03	Initial side effects that may occur (such as nausea, weight gain, and breast tenderness)	1	2	8	
04	What to do if forget pill or do not get injection on time	1	2	8	
	IMPLANT				5 → 08
05	Good for 5 years	1	2	8	
06	Changes that may occur with menstruation (decreased flow, spotting)	1	2	8	
07	Initial side effects that may occur (such as nausea, weight gain, and breast tenderness)	1	2	8	
	EMERGENCY CONTRACEPTION				5 → 13
08	If vomit within 2 hours, need another dose	1	2	8	
09	If next period is unusually light or fails to occur within 4 weeks, return for pregnancy check	1	2	8	
10	First dose to be taken within 72 hours of contact	1	2	8	
11	Second dose should be taken 12 hours after first dose	1	2	8	
12	Regimen not to be repeated/taken more than three times in any one month	1	2	8	
	IUD				5 → 15
13	User should regularly check string after menstruation	1	2	8	
14	May cause heavy bleeding or spotting	1	2	8	
	STERILIZATION				5 → 18
15	Permanent: cannot impregnate or become pregnant again	1	2	8	
16	Slight discomfort at incision site may occur	1	2	8	
17	Male must use condom or some other method for the next 20 ejaculations or for 3 months	1	2	8	5

NO.	QUESTIONS	CODING CLASSIFICATION			GO TO
	CONDOMS				5 → 23
18	Client cannot use if allergic to latex	1	2	8	
19	Can be used only one time	1	2	8	
20	Some lubricants may be used (male condom—water soluble only; female condom—any lubricant)	1	2	8	
21	Use as backup if client fears other method will fail	1	2	8	
22	Dual protection (from pregnancy and against STI)	1	2	8	
	SPERMICIDE/FOAM				5 → 25
23	May cause irritation	1	2	8	
24	Insert before each occurrence of intercourse	1	2	8	
	RHYTHM METHOD or PERIODIC ABSTINENCE				5 → 27
25	How to identify a woman's fertile period	1	2	8	
26	No intercourse during woman's fertile period without alternative method (condom/spermicide)	1	2	8	
	LAM				5 → 111
27	Slight risk of pregnancy during the time shortly before menstruation resumes	1	2	8	
28	Most effective with exclusive breastfeeding without menstruation	1	2	8	
29	Not effective after menstruation begins again	1	2	8	
111	RECORD WHETHER THE PROVIDER WROTE ON THE CLIENT'S HEALTH CARD.	YES .....	1		
		NO .....	2		
		NO HEALTH CARD USED ...	3		
		DON'T KNOW .....	8		
112	RECORD WHETHER THE PROVIDER USED ANY VISUAL AIDS FOR HEALTH EDUCATION OR COUNSELING ABOUT FAMILY PLANNING METHODS.	YES .....	1		
		NO .....	2		
		DON'T KNOW .....	8		
113	RECORD WHETHER THE PROVIDER DISCUSSED A RETURN VISIT.	YES .....	1		
		NO .....	2		
		DON'T KNOW .....	8		
114	WAS THE CLIENT A TEENAGER, OR CONSIDERED A YOUTH?	YES .....	1		
		NO .....	2		→ 201
		DON'T KNOW .....	8		→ 201
115	DID YOU OBSERVE ANY YOUTH FRIENDLY ACTIVITIES OCCURRING? IF YES, CIRCLE ALL PRACTICES OBSERVED.	YES, EXPLAINED PELVIC BUT DEFERRED UNTIL NEXT VISIT .....	A		
		YES, EXPLAINED BLOOD TESTS BUT DEFERRED UNTIL NEXT VISIT .....	B		
		YES, FOCUS WAS ON YOUTH ISSUES .....	C		
		NO .....	Z		

### 5. Clinical Observation

NO.	QUESTIONS	CODING CLASSIFICATION	GO TO
201	INDICATE WHETHER ANY CLINICAL PROCEDURE WAS CONDUCTED DURING THIS VISIT. CLINICAL PROCEDURES INCLUDE PELVIC EXAMINATIONS, OR PROVIDING THE IUD, INJECTABLE METHOD, OR IMPLANT.	YES ..... 1 NO ..... 2	→ 301
202	INDICATE WHETHER CLINICAL PROVIDER IS PERSON WHO PROVIDED COUNSELING.	YES ..... 1 NO ..... 2	→ 206
<p><b>READ TO PROVIDER:</b> Hello. I am representing the Ministry of Health. We are carrying out a survey of health facilities, with the goal of finding ways to improve the delivery of services. I would like to observe the procedure you will conduct with this client. [Mrs. ____] has agreed that she has no objection to my presence. Observing all components of the services provided to [Mrs. ____] will help us to better understand how health services are provided.</p> <p>Any information relating to this procedure will be completely confidential. If, at any point, you would prefer I leave, please feel free to tell me.</p> <p>Do you have any questions for me? Do I have your permission to be present during this procedure?</p> <p>_____ Date _____ (Indicates respondent's willingness to participate)</p>			
203	RECORD WHETHER PERMISSION WAS RECEIVED FROM THE PROVIDER.	YES ..... 1 NO ..... 2	→ STOP
204	RECORD THE TYPE OF PROVIDER PERFORMING MOST OF THE CLINICAL EXAMINATION.	CONSULTANT ..... 01 MEDICAL DOCTOR ..... 02 CLINICAL OFFICER ..... 03 REGISTERED NURSE ..... 04 REGISTERED MIDWIFE ..... 05 ENROLLED NURSE ..... 06 ENROLLED MIDWIFE ..... 07 NURSE AID ..... 08 OTHER _____ 96 (SPECIFY)	
205	RECORD THE SEX OF THE PROVIDER CONDUCTING THE CLINICAL EXAMINATION.	FEMALE ..... 1 MALE ..... 2	
206	INDICATE CLINICAL PROCEDURE (S) CONDUCTED DURING THIS VISIT.	PELVIC EXAM ..... A IUD INSERTED/REMOVED/ INSPECTED ..... B INJECTABLE GIVEN ..... C IMPLANT INSERTED/ REMOVED ..... D	

6. Pelvic Examination			
NO.	QUESTIONS	CODING CLASSIFICATION	GO TO
	CHECK Q206: WAS A PELVIC EXAMINATION CONDUCTED?	YES ..... 1 NO ..... 2	→ 208
207	RECORD WHETHER THE PROVIDER DID THE FOLLOWING:		YES NO NA
01	Ensure that the client had visual privacy	VISUAL PRIVACY ..... 1	2
02	Ensure that the client had auditory privacy	AUDITORY PRIVACY .. 1	2
03	Explain the procedure before starting it	EXPLAIN PROCEDURE BEFOREHAND ..... 1	2
04	Prepare all instruments before the examination	PREPARED INSTRUMENTS ..... 1	2
05	Use sterilized or high-level disinfected instruments	STERILIZED/HLD INSTRUMENTS ..... 1	2
06	Wash his or her hands with soap, <i>before</i> the examination	WASHED HANDS ..... 1	2
07	Put on new or disinfected latex gloves <i>before</i> the examination	PUT ON GLOVES ..... 1	2
08	Ask the client to take slow, deep breaths and relax the muscles	ASK CLIENT TO RELAX MUSCLES .... 1	2
09	Inspect the external genitalia	INSPECT GENITALIA .. 1	2
10	(If used) Explain the speculum procedure	EXPLAIN SPECULUM .. 1	2 5
11	Inspect the cervix and vaginal mucosa (Aim light inside the inserted speculum)	INSPECT CERVIX .... 1	2 5
12	Perform a bimanual exam (one hand inside the vagina, the other palpating uterus through the abdomen)	BIMANUAL EXAM .... 1	2
13	Wash hands after removing gloves	WASH HANDS AFTER . 1	2
14	Wipe contaminated surfaces with disinfectant	DISINFECT AREA .... 1	2
15	Place reusable gloves and instruments in a chlorine solution immediately after completing the procedure	DECONTAMINATE GLOVES OR INSTRUMENTS ..... 1	2
	CHECK 206: WAS ANY OTHER CLINICAL PROCEDURE CONDUCTED?	YES ..... 1 NO ..... 2	→ 301

7. IUD Insertion and/or Removal			
NO.	QUESTIONS	CODING CLASSIFICATION	GO TO
	CHECK 206: WAS AN IUD EITHER INSERTED, REMOVED OR INSPECTED?	YES ..... 1 NO ..... 2	→ 210
208	INDICATE PROCEDURE CONDUCTED.	IUD INSERTION ..... A IUD REMOVAL ..... B IUD INSPECTION ..... C	
209	RECORD WHETHER THE PROVIDER DID THE FOLLOWING:	YES NO NA	
01	Ensure that the client had visual privacy	VISUAL PRIVACY ..... 1 2	
02	Ensure that the client had auditory privacy	AUDITORY PRIVACY .. 1 2	
03	Explain the procedure before starting it	EXPLAIN PROCEDURE BEFOREHAND ..... 1 2	
04	(With a <b>new client</b> ) Reconfirm the client's choice of method	RECONFIRM CHOICE ..... 1 2	
05	(With a <b>new client</b> ) Verify that client was not pregnant	CONFIRM CLIENT NOT PREGNANT ..... 1 2	
06	Prepare all instruments before the procedure	PREPARED INSTRUMENTS ..... 1 2	
07	Use sterilized or high-level disinfected instruments	STERILIZED/HLD INSTRUMENTS ..... 1 2	
08	Wash his or her hands with soap, <i>before</i> the procedure	WASHED HANDS ..... 1 2	
09	Put on new or disinfected latex gloves <i>before</i> the examination	PUT ON GLOVES ..... 1 2	
10	Perform a speculum examination for reproductive-tract infections or STIs before conducting the bimanual examination	SPECULUM EXAM .... 1 2 5	
11	Perform a bimanual exam (one hand inside the vagina, the other palpating uterus through the abdomen)	BIMANUAL EXAM ..... 1 2 5	
12	Visually inspect the cervix during cleaning (aim light inside the inserted speculum)	VISUALIZE CERVIX ... 1 2 5	
13	Use a tenaculum	USE TENACULUM .... 1 2 5	
14	Sound the uterus <i>before</i> inserting the IUD	SOUND UTERUS ..... 1 2 5	
15	Use the no-touch technique for inserting the IUD	NO-TOUCH TECHNIQUE 1 2 5	
16	Wash hands after removing gloves	WASH HANDS AFTER .. 1 2	
17	Ask client to wait and rest for 15 minutes after insertion of the IUD	ASK CLIENT TO WAIT .. 1 2	
18	Wipe contaminated surfaces with disinfectant	DISINFECT AREA ..... 1 2	
19	Place reusable gloves and instruments in a chlorine solution immediately after completing the procedure	DECONTAMINATE GLOVES OR INSTRUMENTS ..... 1 2	
	CHECK Q206: WAS ANY OTHER CLINICAL PROCEDURE CONDUCTED?	YES ..... 1 NO ..... 2	→ 301

8. Injectable Contraceptive			
NO.	QUESTIONS	CODING CLASSIFICATION	GO TO
	CHECK Q206: WAS A CONTRACEPTIVE INJECTION GIVEN?	YES ..... 1 NO ..... 2	→ 212
210	RECORD WHETHER THE PROVIDER DID THE FOLLOWING:	YES NO NA	
01	(With a <b>new client</b> ) Reconfirm the client's choice of method	RECONFIRM CHOICE ..... 1 2 5	
02	(With a <b>new client</b> ) Verify that client was not pregnant	CONFIRM CLIENT NOT PREGNANT ..... 1 2 5	
03	( <b>Continuing client</b> ) Check the client's card to ensure giving injection at correct time	ENSURE CORRECT TIMING ..... 1 2 5	
04	Wash his or her hands with soap before giving the injection	WASHED HANDS ..... 1 2	
05	( <b>If using reusables</b> ) Use newly reprocessed needle and syringe	USE NEW/CLEAN NEEDLE ..... 1 2 5	
06	Remove needle from multiple dose vial each time	REMOVE NEEDLE .... 1 2 5	
07	Stir or mix the bottle <i>before</i> drawing dose (DEPO)	STIR BOTTLE ..... 1 2 5	
08	Clean and air-dry the injection site <i>before</i> injection	CLEAN AND AIR-DRY THE SITE ..... 1 2	
09	Draw back plunger <i>before</i> giving injection	DRAW BACK PLUNGER 1 2	
10	Allow dose to self-disperse instead of massaging the site	NO MASSAGE ..... 1 2	
11	Dispose of sharps in puncture-resistant containers	DISPOSE OF SHARPS . 1 2	
211	INDICATE WHETHER THE NEEDLE AND SYRINGE WERE PROVIDED BY THE FACILITY OR PROVIDED BY THE CLIENT.	PROVIDED BY FACILITY .... 1 PROVIDED BY CLIENT ..... 2 DON'T KNOW ..... 8	
	CHECK Q206: WAS ANY OTHER CLINICAL PROCEDURE CONDUCTED?	YES ..... 1 NO ..... 2	→ 301

9. Implant Insertion or Removal			
NO.	QUESTIONS	CODING CLASSIFICATION	GO TO
	CHECK 206: WERE IMPLANTS EITHER INSERTED OR REMOVED?	YES ..... 1 NO ..... 2	→ 301
212	INDICATE PROCEDURE CONDUCTED.	INSERTION ..... A REMOVAL ..... B	
213	RECORD WHETHER THE PROVIDER DID THE FOLLOWING:		YES NO NA
01	Reconfirm the client's choice of method	RECONFIRM CHOICE ..... 1	2 5
02	Verify that client was not pregnant	CONFIRM CLIENT NOT PREGNANT ..... 1	2 5
03	Ensure that the client had visual privacy	VISUAL PRIVACY ..... 1	2
04	Ensure that the client had auditory privacy	AUDITORY PRIVACY ... 1	2
05	Explain the procedure before starting it	EXPLAIN PROCEDURE BEFOREHAND ..... 1	2
06	Prepare all instruments before the procedure	PREPARED INSTRUMENTS ..... 1	2
07	Use sterilized or high-level disinfected instruments	STERILIZED/HLD INSTRUMENTS ..... 1	2
08	Wash his or her hands with soap, <i>before</i> the procedure	WASHED HANDS .... 1	2
09	Put on sterile gloves and maintain sterility during insertion	GLOVES AND STERILITY ..... 1	2
10	Clean skin where incision will be made with antiseptic	USE ANTISEPTIC ..... 1	2
11	Use sterile towel to protect area	USE STERILE TOWEL . 1	2
12	Use new or sterilized needle and syringe for local anesthetic	USE STERILE NEEDLE 1	2
13	Allow time for local anesthetic to take effect prior to making incision	ALLOW TIME FOR ANESTHETIC TO WORK 1	2
14	Dispose of sharps in puncture-resistant containers	DISPOSE OF SHARPS . 1	2
15	Wipe contaminated surfaces with disinfectant	DISINFECT AREA .... 1	2
16	Place reusable gloves and instruments in a chlorine solution immediately after completing the procedure	DECONTAMINATE GLOVES OR INSTRUMENTS ..... 1	2
17	Wash hands <i>after</i> removing gloves	WASH HANDS AFTER . 1	2
18	Explain care of incision area and removal of the bandage	EXPLAIN INCISION CARE ..... 1	2
19	Discuss return visit to remove elastoplast	DISCUSS RETURN ... 1	2

NO.	QUESTIONS	CODING CLASSIFICATION	GO TO
20	Provide woman with card stating date implant was inserted and date when 5 years of implant would be completed	PROVIDE CARD ..... 1      2      5	
21	Reinforce expectations about side effects of implant	REINFORCE SIDE EFFECTS ..... 1      2      5	
214	Did the provider show each implant stick removed to the client and reassure her that all were removed?	SHOW REMOVED IMPLANT ..... 1      2      5	
215	INDICATE WHETHER THE NEEDLE AND SYRINGE WERE PROVIDED BY THE FACILITY OR PROVIDED BY THE CLIENT.	PROVIDED BY FACILITY ... 1 PROVIDED BY CLIENT ..... 2 DON'T KNOW ..... 8	

10. Client's Family Planning Status			
NO.	QUESTIONS	CODING CLASSIFICATION	GO TO
	AFTER THE CONSULTATION, COMPLETE THE FOLLOWING INFORMATION		
301	RECORD THE CLIENT'S FAMILY PLANNING STATUS AT THE BEGINNING OF THE CONSULTATION.	CURRENT USER ..... 1 NONUSER, USED IN PAST ... 2 NONUSER, NO PAST USE ... 3 NOT DETERMINED ..... 8	→ 304 → 306 → 306
302	RECORD THE CLIENT'S PRINCIPAL REASON FOR THE VISIT.	RESUPPLY/ROUTINE FOLLOW-UP ..... 1 DISCUSS PROBLEM WITH METHOD ..... 2 DESIRE TO CHANGE METHOD OR DISCONTINUE FAMILY PLANNING (NO PROBLEM), . . 3 DISCUSS OTHER PHYSICAL PROBLEM ..... 4	
303	RECORD THE OUTCOME OF THE VISIT.  (FOR CURRENT USER)	CONTINUED WITH CURRENT METHOD ..... 1 SWITCHED METHOD ..... 2 PLANNED METHOD SWITCH, NOT RECEIVED TODAY, CONTINUED USE OF CURRENT METHOD ..... 3 PLANNED METHOD SWITCH, NOT RECEIVED TODAY, DISCONTINUED CURRENT METHOD ..... 4 DECIDED TO STOP USING FAMILY PLANNING ..... 5	→ 307 → 307 → 307 → 307 → 308
304	RECORD THE CLIENT'S MOST RECENT USE OF CONTRACEPTION. (NON-USER, USED IN THE PAST)	WITHIN PAST 6 MONTHS ..... 1 SIX MONTHS OR MORE AGO .. 2 NOT DETERMINED ..... 8	
305	RECORD THE OUTCOME OF THE VISIT.  (NON-USER, USED IN THE PAST)	RESTARTED PRIOR METHOD 1 ADOPTED DIFFERENT METHOD ..... 2 PLANNED DIFFERENT METHOD, NOT RECEIVED TODAY ... 3 RECEIVED INFORMATION/ COUNSELING ONLY ..... 4 NOT DETERMINED ..... 8	→ 307 → 307 → 307 → 308 → 308
306	RECORD THE OUTCOME OF THE VISIT.  (NON-USER, NO PAST USE)	ACCEPTED TO START METHOD ..... 1 DID NOT DECIDE ON METHOD 2	→ 308
307	DID CLIENT LEAVE FACILITY WITH METHOD? IF NO: RECORD THE REASON THE CLIENT DID NOT RECEIVE METHOD.	YES, LEFT WITH METHOD ... 1 NO, METHOD NOT IN STOCK .. 2 NO, REQUIRES APPOINTMENT ..... 3 NO, DELAY RECEIVING DUE TO HEALTH PROBLEM ... 4 NO, PREGNANCY STATUS UNCERTAIN ..... 5 OTHER _____ 6  (SPECIFY)	

NO.	QUESTIONS	CODING CLASSIFICATION	GO TO
308	INDICATE WHETHER THE PROVIDER WROTE IN OR ON AN INDIVIDUAL CLIENT'S RECORD OR CARD AFTER THE CONSULTATION.	YES ..... 1 NO ..... 2 NO INDIVIDUAL CARD USED .. 3 DON'T KNOW ..... 8	
309	RECORD THE TIME WHEN THE INTERVIEW ENDED.	<div style="text-align: center;"> <input type="text"/> <input type="text"/> : <input type="text"/> <input type="text"/> </div>

3. Information About Visit			
NO.	QUESTIONS	CODING CLASSIFICATION	GO TO
	<p>INTRODUCE YOURSELF TO THE CLIENT.</p> <p>Hello. I am representing the Ministry of Health. We are carrying out a survey in order to improve the services offered by this facility. We would like to know about your experience here today.</p> <p>All the information you give me in this interview will be kept strictly confidential, and the care that you receive at this facility in the future will in no way be affected by your participation or nonparticipation. You may refuse to answer any question, and you may stop the interview at any time.</p> <p>Do you have any questions for me now? Do you agree to participate?</p> <p>_____ Interviewer's signature (Indicates respondent's willingness to participate)</p> <p>_____ Date</p>		
100	May I begin the interview?	CLIENT AGREES ..... 1 CLIENT REFUSES ..... 2	→ STOP
101	Were you doing anything to prevent pregnancy before seeing the provider today?	YES ..... 1 NO ..... 2	→ 103
102	Have you used a family planning method or taken any steps to prevent pregnancy at any time during the past 6 months?	YES ..... 1 NO ..... 2	→ 109
103	<p>What method were you (last) using?</p> <p>IF CONDOMS WERE PRESCRIBED FOR USE ALONG WITH ANOTHER METHOD, CIRCLE BOTH METHODS.</p>	COMBINED PILL ..... A PROGESTIN-ONLY PILL ..... B PILL (TYPE UNSPECIFIED) ..... C MALE CONDOM ..... D FEMALE CONDOM ..... E IUD ..... F SPERMICIDE ..... G DIAPHRAGM ..... H INJECTABLE DEPO-PROVERA ..... I INJECTABLE NORIGYNON ..... J IMPLANT ..... K NATURAL METHODS (RHYTHM/ PERIODIC ABSTINENCE) ..... L BREASTFEEDING/LAM ..... M VASECTOMY ..... N FEMALE STERILIZATION ..... O EMERGENCY CONTRACEPTION ..... P OTHER _____ X (SPECIFY)	
104	Did the provider ask you today whether you were having (or had had) a problem with the method?	YES ..... 1 NO ..... 2 DON'T KNOW ..... 8	
105	Have you been having (did you have) a problem with the method?	YES ..... 1 NO ..... 2 DON'T KNOW ..... 8	→ 107 → 107

NO.	QUESTIONS	CODING CLASSIFICATION	GO TO
106	Did the provider suggest any action(s) you should take to resolve the problem?	YES ..... 1 NO ..... 2 DON'T KNOW ..... 8	
107	What was the outcome of this visit—did you decide to continue (restart) the same method or to switch methods?	CONTINUE WITH OR RESTART SAME METHOD .. 1 SWITCH METHOD ..... 2 STOP USING METHOD (DUE TO PROBLEMS) ..... 3 STOP USING METHOD (ELECTIVE-NO PROBLEMS) 4	→ 201
108	Had you thought about switching methods, and which method to switch to, before you came here today?	YES ..... 1 NO ..... 2	→ 110 → 112
109	Had you thought about what family planning method you wanted to use before you came here today?	YES ..... 1 NO ..... 2	→ 112
110	What method was that?  IF CLIENT MENTIONS CONDOMS ALONG WITH ANOTHER METHOD, CIRCLE BOTH METHODS.	COMBINED PILL ..... A PROGESTIN-ONLY PILL ..... B PILL (TYPE UNSPECIFIED) .... ### 3. Information About Observation

<p>Date: _____</p> <p>Name of the observer: _____</p> <p>Time observation started: _____</p> <p>Client code: _____</p>	<p>DAY ..... <table border="1" style="display: inline-table; border-collapse: collapse;"><tr><td style="width: 20px; height: 20px;"></td><td style="width: 20px; height: 20px;"></td></tr></table></p> <p>MONTH ..... <table border="1" style="display: inline-table; border-collapse: collapse;"><tr><td style="width: 20px; height: 20px;"></td><td style="width: 20px; height: 20px;"></td></tr></table></p> <p>YEAR ..... <table border="1" style="display: inline-table; border-collapse: collapse;"><tr><td style="width: 20px; height: 20px;"></td><td style="width: 20px; height: 20px;"></td><td style="width: 20px; height: 20px;"></td><td style="width: 20px; height: 20px;"></td></tr></table></p> <p>OBSERVER CODE ..... <table border="1" style="display: inline-table; border-collapse: collapse;"><tr><td style="width: 20px; height: 20px;"></td><td style="width: 20px; height: 20px;"></td></tr></table></p> <p>TIME OBSERVATION STARTED <table border="1" style="display: inline-table; border-collapse: collapse;"><tr><td style="width: 20px; height: 20px;"></td><td style="width: 20px; height: 20px;"></td></tr></table> : <table border="1" style="display: inline-table; border-collapse: collapse;"><tr><td style="width: 20px; height: 20px;"></td><td style="width: 20px; height: 20px;"></td></tr></table></p> <p>CLIENT CODE ..... <table border="1" style="display: inline-table; border-collapse: collapse;"><tr><td style="width: 20px; height: 20px;"></td><td style="width: 20px; height: 20px;"></td></tr></table></p>																

4. Observation of Antenatal-Care Consultation			
NO.	QUESTIONS	CODING CLASSIFICATION	GO TO
	<p>BEFORE OBSERVING THE CONSULTATION, OBTAIN PERMISSION FROM BOTH THE SERVICE PROVIDER AND THE CLIENT. MAKE SURE THAT THE PROVIDER KNOWS THAT YOU ARE NOT THERE TO EVALUATE HIM OR HER, AND THAT YOU ARE NOT AN "EXPERT" TO BE CONSULTED DURING THE SESSION.</p> <p>BE AS DISCREET AS POSSIBLE DURING THE ASSESSMENT. DO NOT TAKE PART IN THE INTERACTION BETWEEN THE PROVIDER AND THE CLIENT. TRY TO SIT BEHIND THE CLIENT AND TO ONE SIDE, SO YOU WILL NOT BE SITTING DIRECTLY IN FRONT OF THE PROVIDER. FOR EACH OF THE ITEMS BELOW, CIRCLE THE ANSWER THAT BEST EXPRESSES YOUR ASSESSMENT OF WHAT HAPPENED DURING THE INTERACTION.</p> <p><b>READ TO PROVIDER:</b> Hello. I am representing the Ministry of Health. We are carrying out a survey of health facilities that provide services to women and children, with the goal of finding ways to improve the delivery of services. I would like to observe your consultation with this client in order to better understand how health care is provided in this facility.</p> <p>Any information you give me will be completely confidential. If, at any point, you would prefer I leave, please feel free to tell me.</p> <p>Do you have any questions for me? Do I have your permission to be present at this consultation?</p> <p>_____ Interviewer's signature (Indicates respondent's willingness to participate)</p> <p>_____ Date</p>		
101	RECORD WHETHER PERMISSION WAS RECEIVED FROM THE PROVIDER.	YES ..... 1 NO ..... 2	→ STOP
	<p><b>READ TO CLIENT:</b> Hello. I am representing the Ministry of Health. We are carrying out a survey of facilities that provide health services to women and children. I would like to observe your consultation with this provider in order to better understand how health care is provided.</p> <p>Any information you give will be kept completely confidential and will not affect the level of care you receive here, now or in the future. If, at any point, you would prefer I leave, please feel free to tell me.</p> <p>After the consultation, my colleague would like to talk with you about your experience here today.</p> <p>Do you have any questions for me? Do I have your permission to be present at this consultation?</p> <p>_____ Interviewer's signature (Indicates respondent's willingness to participate)</p> <p>_____ Date</p>		
102	RECORD WHETHER PERMISSION WAS RECEIVED FROM THE CLIENT.	YES ..... 1 NO ..... 2	→ STOP
103	CLIENT STATUS. (OBSERVER TO COMPLETE)	YES      NO      DK	
01	RECORD WHETHER THIS IS CLIENT'S FIRST VISIT FOR ANTENATAL CARE <b>AT THIS FACILITY</b> FOR THIS PREGNANCY.	1          2          8	
02	RECORD WHETHER THIS IS THE CLIENT'S FIRST PREGNANCY.	1          2          8	
104	RECORD WHETHER THE PROVIDER ASKED ABOUT OR THE CLIENT MENTIONED ANY OF THE FOLLOWING FACTS:		
01	Client's age	1          2          8	
02	Medications the client is taking	1          2          8	
03	Date client's last menstrual period began	1          2          8	
04	Number of prior pregnancies client has had	1          2          8	
05	Individual birth plan	1          2          8	

NO.	QUESTIONS	CODING CLASSIFICATION			GO TO
105	RECORD WHETHER THE PROVIDER OR THE CLIENT DISCUSSED ANY OF THE FOLLOWING ASPECTS OF THE CLIENT'S PRIOR PREGNANCIES:				
01	Prior stillbirth(s)	1	2	8	
02	Infant(s) who died in the first week of life	1	2	8	
03	Heavy bleeding, during or after delivery	1	2	8	
04	Previous assisted delivery (caesarean section, ventouse, or forceps)	1	2	8	
106	RECORD WHETHER THE PROVIDER ASKED ABOUT OR THE CLIENT MENTIONED ANY OF THE FOLLOWING FOR CURRENT PREGNANCY:				
01	Bleeding	1	2	8	
02	Fever	1	2	8	
03	Headache or blurred vision	1	2	8	
04	Swollen face or hands	1	2	8	
05	Tiredness or breathlessness	1	2	8	
06	Whether the client has felt the baby move	1	2	8	
07	Whether there are any other symptoms or problems the client thinks might be related to this pregnancy	1	2	8	
107	RECORD WHETHER THE PROVIDER PERFORMED THE FOLLOWING PROCEDURES:	YES	NO	DK	
01	Take the client's blood pressure	1	2	8	
02	Palpate the client's abdomen for fetal presentation	1	2	8	
03	Palpate the client's abdomen for uterine height	1	2	8	
04	Listen to the client's abdomen for fetal heartbeat	1	2	8	
05	Perform or refer for anemia test	1	2	8	
06	Perform or refer for urine test	1	2	8	
07	Perform or refer the client for a syphilis test	1	2	8	
08	Perform or refer for HIV test	1	2	8	
09	Provide or refer for counseling related to HIV test	1	2	8	
10	Look at the client's health card (either before beginning the consultation or while collecting information or examining the client)	1	2	8	

NO.	QUESTIONS	CODING CLASSIFICATION				GO TO
108	RECORD WHETHER THE PROVIDER GAVE THE CLIENT ANY OF THE FOLLOWING TREATMENTS OR COUNSELING:	YES	NO	DK	NA	
01	Prescribe or give iron tablets or folic acid (IFA) or both	1	2	8		
02	Explain the purpose of iron or folic acid	1	2	8	5	
03	Explain how to take iron or folic-acid tablets	1	2	8	5	
04	Explain side effects of iron tablets	1	2	8	5	
05	Prescribe or give a tetanus toxoid (TT) injection	1	2	8		
06	Explain the purpose of the TT injection	1	2	8	5	
07	Prescribe or give anti-malarial prophylaxis	1	2	8	5	
08	Explain the purpose of the preventive treatment with malaria medications	1	2	8		
09	Explain how to take the anti-malarial medications	1	2	8	5	
10	Explain possible side effects of malaria tablets	1	2	8	5	
109	RECORD WHETHER THE PROVIDER GAVE THE CLIENT ANY OF THE FOLLOWING ADVICE OR COUNSEL ABOUT PREPARATIONS:	YES	NO	DK		
01	Discuss quantity or quality of food to eat during pregnancy	1	2	8		
02	Mention the following signs and symptoms as risk factors for which the woman should return to the facility:	YES	NO	DK		
	A) Vaginal bleeding	1	2	8		
	B) Fever	1	2	8		
	C) Excessive tiredness or breathlessness	1	2	8		
	D) Swollen hands and face	1	2	8		
	E) Severe headache or blurred vision	1	2	8		
03	Inform the client about the progress of the pregnancy	1	2	8		

NO.	QUESTIONS	CODING CLASSIFICATION	GO TO
110	RECORD WHETHER THE PROVIDER ADVISED OR COUNSELED ABOUT DELIVERY IN ANY OF THE FOLLOWING WAYS:		
01	Ask the client where she will deliver	1 2 8	
02	Advise the client to use a skilled health worker during delivery	1 2 8	
03	Discuss with client what items to have on hand at home, for delivery at home, e.g., sterile blades	1 2 8	
04	Discussed importance of immunization for the newborn	1 2 8	
111	RECORD WHETHER THE PROVIDER ADVISED EXCLUSIVELY BREASTFEEDING THE INFANT FOR UP TO 6 MONTHS.	1 2 8	
112	RECORD WHETHER THE PROVIDER DISCUSSED FAMILY PLANNING (OR BIRTH CONTROL) FOR USE AFTER DELIVERY.	1 2 8	
113	RECORD WHETHER THE PROVIDER ASKED WHETHER THE CLIENT HAD ANY QUESTIONS AND ENCOURAGED QUESTIONS.	1 2 8	
114	RECORD WHETHER THE PROVIDER USED ANY VISUAL AIDS FOR HEALTH EDUCATION OR COUNSELING DURING THE CONSULTATION.	1 2 8	
115	RECORD WHETHER THE PROVIDER WROTE ON THE CLIENT'S HEALTH CARD.	YES ..... 1 NO ..... 2 NO HEALTH CARD USED ... 3 DON'T KNOW ..... 8	
116	ASK THE PROVIDER HOW MANY WEEKS PREGNANT THE CLIENT IS.	WEEK OF PREGNANCY ..... <input type="text"/> <input type="text"/> DON'T KNOW ..... 98	
117	RECORD THE OUTCOME OF THE CONSULTATION.  [RECORD THE OUTCOME AT THE TIME THE OBSERVATION CONCLUDED]	CLIENT SENT HOME ..... 1 CLIENT REFERRED (TO LABORATORY OR OTHER PROVIDER) AT SAME FACILITY ..... 2 CLIENT ADMITTED TO SAME FACILITY ..... 3 CLIENT REFERRED TO OTHER FACILITY ..... 4 DON'T KNOW ..... 8	
118	RECORD THE TIME WHEN THE INTERVIEW ENDED.	<input type="text"/> <input type="text"/> : <input type="text"/> <input type="text"/>

**MATERNAL HEALTH PROVIDER KNOWLEDGE QUESTIONNAIRE**

EXPLAIN TO THE HEALTH WORKER THAT HIS/HER NAME WAS PROVIDED AS THE MOST KNOWLEDGEABLE MATERNAL HEALTH PROVIDER AVAILABLE ON THAT DAY. VALIDATE WITH THE HEALTH WORKER THAT HE/SHE DOES PROVIDE SOME MATERNAL HEALTH SERVICES AND THAT THESE SERVICES ARE A COMPONENT OF THEIR WORK AT THIS FACILITY

Now I will read a statement explaining the survey and asking your consent for responding to survey questions

Hello. My name is \_\_\_\_\_ I am here on behalf of the Ministry of Health and the NCPD to assist the government in knowing more about the availability of maternal, child, and reproductive health services as well as specific infectious diseases such as HIV/AIDS and tuberculosis. Your facility was randomly selected to participate in this study. I will be asking you specific questions about your experiences with delivery services and then will ask about various situations related to labor, delivery, and the postpartum period.

You may decline to answer any question and may choose to stop the interview at any time. Please be assured that the information you give us will be completely confidential and will not be traced to you and will not be identified with the name of the facility.

Do you have any questions for me at this time?

100	Do I have your agreement to participate? Thank you. Let us begin now.	YES ..... 1 NO ..... 2	→ STOP
101	RECORD THE TIME AT BEGINNING OF INTERVIEW	<input type="text"/> : <input type="text"/>	

**PROVIDER KNOWLEDGE**

NO.	QUESTIONS	CODING CATEGORIES	GO TO																													
	Please answer the following questions to the best of your knowledge. Most of the questions I will be asking you will require multiple responses from you. Please provide all responses that come to mind. I will probe sometimes to help you remember some more information.																															
	<b>DELIVERY AND NEWBORN CARE</b>																															
102	Do you personally provide delivery care? By that I mean conducting the actual deliveries of newborns.	YES ..... 1 NO ..... 2	→ 105

NO.	QUESTIONS	CODING CATEGORIES	GO TO
201a	IS THERE ANY RECORD THAT THE WOMAN WAS IN ACTIVE LABOR UPON ADMISSION?	YES ..... 1 NO ..... 2	→ 201c
201b	HOW LONG HAD SHE BEEN IN LABOR PRIOR TO ADMISSION?	NUMBER OF HOURS <input style="width: 40px; height: 20px;" type="text"/>  INFORMATION NOT AVAILABLE ..... 98	
201c	HOW MANY HOURS IS PASSED, FROM THE TIME THAT ACTIVE LABOR IS DOCUMENTED (AT LEAST 3 CM DILATED OR CONTRACTIONS EVERY 2-3 MINUTES) TO THE TIME OF DELIVERY?	NUMBER OF HOURS <input style="width: 40px; height: 20px;" type="text"/>  INFORMATION NOT AVAILABLE ..... 98	
202	WHAT IS THE FREQUENCY WITH WHICH FETAL HEART RATE IS RECORDED?	AT LEAST EVERY 30 MINUTES ..... 1 EVERY 31-60 MINUTES ..... 2 MORE THAN HOURLY ..... 3 INFORMATION NOT AVAILABLE ..... 8	→ 204
203	WAS THE FETAL HEART RATE RECORDED ON A PARTOGRAPH?	YES ..... 1 NO ..... 2	
204	WHAT IS THE FREQUENCY WITH WHICH MATERNAL BLOOD PRESSURE IS RECORDED?	AT LEAST EVERY FOUR HOURS ..... 1 BETWEEN >4-8 HOURLY ..... 2 MORE THAN 8 HOURLY ..... 3 INFORMATION NOT AVAILABLE ..... 8	→ 206
205	WAS THE MATERNAL BLOOD PRESSURE RECORDED ON A PARTOGRAPH?	YES ..... 1 NO ..... 2	
206	WHAT IS THE FREQUENCY WITH WHICH MATERNAL PULSE RATE IS RECORDED?	AT LEAST EVERY 30 MINUTES ..... 1 EVERY 31-60 MINUTES ..... 2 MORE THAN HOURLY ..... 3 INFORMATION NOT AVAILABLE ..... 8	→ 208
207	WAS THE MATERNAL PULSE RATE RECORDED ON A PARTOGRAPH?	YES ..... 1 NO ..... 2	
208	HOW MANY VAGINAL EXAMINATIONS ARE RECORDED?	NUMBER OF VAGINAL EXAMINATIONS <input style="width: 40px; height: 20px;" type="text"/>  INFORMATION NOT AVAILABLE ..... 98	→ 211
209	WERE THE VAGINAL EXAMINATIONS RECORDED ON A PARTOGRAPH?	YES ..... 1 NO ..... 2	
210	WAS DEGREE OF CERVICAL DILATION RECORDED WITH MOST VAGINAL EXAMINATIONS?	YES ..... 1 NO ..... 2	
211	WHAT IS THE FREQUENCY WITH WHICH UTERINE CONTRACTIONS ARE RECORDED?	AT LEAST EVERY 30 MINUTES ..... 1 EVERY 31-60 MINUTES ..... 2 MORE THAN HOURLY ..... 3 INFORMATION NOT AVAILABLE ..... 8	
212	IS AMOUNT OF BLOOD LOSS ESTIMATED AND RECORDED IN ML?	YES ..... 1 NO ..... 2	
213	WAS THE NEWBORN APGAR SCORE RECORDED?	YES ..... 1 NO ..... 2	
214	IS THE BIRTH WEIGHT OF THE NEWBORN RECORDED ON THE DELIVERY RECORD?	YES ..... 1 NO ..... 2	
215	IS A MATERNAL BLOOD PRESSURE RECORDED WITHIN FOUR HOURS POSTPARTUM?	YES ..... 1 NO ..... 2
