Jamshoro Power Station Project

The Jamshoro Power Station Project funds the repair and maintenance of the Jamshoro Thermal Power Station, located near the city of Hyderabad in Sindh. The project will regain lost capacity at the station by at least 150 megawatts and increase the availability and reliability of electricity supply to the national grid by an additional 598 million kilowatt hours per year--enough power to supply electricity to about 215,000 households.

OBJECTIVES

The main objective of the Jamshoro Power Station Project is to restore 150 megawatts to Pakistan's national power grid by funding the modernization of the thermal power station at Jamshoro.

MAIN ACTIVITIES

- Perform initial assessment of facilities for technical and commercial feasibility
- Replace major pieces of the equipment, such as super heaters, economizers, and air pre-heaters
- Perform quality control of rehabilitation work, work schedule, and invoicing

RESULTS TO DATE

- 25 megawatts in power generation capacity restored to the national grid
