Glossary

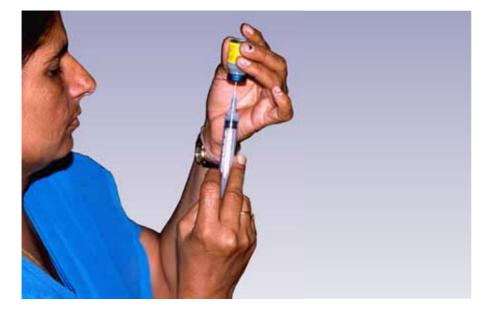

AEFI	A medical incident that takes place after an immunization, causes concern and is believed to be caused by immunization.							
Bundling	Supplying vaccines with diluents, droppers, AD syringes and reconstitu- tion syringes, in corresponding quantities.							
Case Fatality Rate	 The proportion of individuals contracting a specific VPD who die of that VPD. <u>The number of patients who die of a specific VPD</u> X 100 Total number of cases of the same VPD 							
Cold Chain	The system of storing and transporting the vaccines at recommended temperatures from the point of manufacture to the point of use. The proportion of cold chain equipment out of order at any point of time. It should be kept to the minimum acceptable level of less than 2%.							
Cold Chain Sickness Rate								
Completeness of reporting	The number of reports received divided by the number of reports expected, expressed a percentage. <u>Reports received</u> x 100 Reports expected							
Confirmed VPD	A VPD case that is laboratory confirmed or that meets the clinical case definition and is epidemiologically linked to a confirmed or probable case.							
Down time	The time between the breakdown of equipment and its repair or the period for which an equipment remains out of service							
Dropout RateProportion of children who receive one or more vaccinations but d return for subsequent doses.DPT1 cumulative total minus DPT3 cumulative totalx 100DPT1 cumulative totalx 100								
Dropouts	Children who receive one or more vaccination but do not return for subsequent immunization							
Excess Stock	Stock more than the requirement for one month, including the buffer stock (i.e. more than 125% for vaccines and 110% for syringes).							
Feedback	The process of routinely sending analysis and reports to the peripheral levels of the reporting system.							
Feed-forward	The reverse of feedback, it is the process of forwarding surveillance and other monitoring data to higher levels.							
Float assembly	The stock of spare units of cold chain equipment (at district/state							
Fully Immunized	An infant who has received BCG; three doses of DPT, OPV and Hepatitis B; and Measles before one year of age							
Holdover time	The time taken for increasing the cabinet/storage temperature of vaccines at the time of power failure from its minimum range to its maximum range, subject to the condition that the equipment is functioning well.							

Lead timeThe time between ordering of new stock and its receipt.Left-outsBeneficiaries who do not utilize the immunization services for reasons including lack of knowledge, trust in immunization services or geographic and other reasons.LogisticsThe cyclical process of demand estimation, indenting, receipt, storage and distribution of vaccines and other supplies to health facilities in a timely fashion and at an optimum cost.Maximum stock levelThe largest amount of stock that you should have, usually expressed as the number of weeks/months of supply.Minimum stock levelThe least amount that you should have in stock or the level which, when stock levelOutbreakThe occurrence of an illness in a community, clearly in excess of the expected numbers.Probable VPDDiagnosis of a VPD based on history and clinical examination.Response time and national levels and generates analytical reports.Stockout SurveillanceA condition when no stock is available of a vaccine or other supply.Stureillance to proping and valuting disease prevention and control activities, including immunization.Suspect VPD timeless of reportingDiagnosis of a VPD based on history alone.Sturgetillance to any instructionDiagnosis of a VPD based on history alone.Suspect VPD timeless of reportingDiagnosis of a VPD based on history alone.Sturgetillance timeless of reportingA condition that can potentially harm the recipient, the health worker or the community.Suspect VPD timeless terportingDiagnosis of a VPD based on history alone.Timeliness terportingThe	Inadequate Stock	Stock less than the buffer stock (i.e. less than 25% for vaccines and 10% for syringes).

Preface

This handbook has been written for Medical Officers at district, block and PHC levels. Our intention is to provide information that is practical as well as technically and operationally sound. For readers who would like to explore topics in greater depth, we have provided additional references.

India's Immunization Program has undergone a number of significant changes in recent years. These include a new policy environment (the National Rural Health Mission), new vaccines (e.g. hepatitis B and Japanese Encephalitis), new procedures to solve old problems (e.g. injection safety) and new technologies for vaccine delivery and cold chain. Such changes underscore the need for

Medical Officers and Health Workers need to be familiar with the new developments in the Immunization Program. constant attention, sharing of experience, creativity, and flexibility in responding to problems.

In developing this handbook, we have tried to incorporate material from existing national and international guidelines and feedback from a variety of stakeholders from the central and state governments, training institutions, and international agencies working in the field of Routine Immunization (RI).

A central theme of this handbook is that there is not just one way of doing things. We provide Medical Officers with scientifically-based principles and standards, technical specifications for vaccines and equipment, and operational considerations that they must weigh to devise the best solutions for their circumstances. We have drawn on real life experiences to illustrate how technical and operational issues can be addressed in the field in order to protect every Indian child.

We view Routine Immunization, the provision of a primary series of vaccines in the first year of life, as the cornerstone of other primary health care efforts. The fact that immunization gives each child a minimum of four contacts with the health system before the age of one year is a tremendous opportunity that is often underutilized. While the impact of immunization on childhood morbidity and mortality has been great, its full potential has yet to be reached. Thousands of children in India still die from vaccine-preventable diseases each year. It is our fervent hope that this handbook will assist those responsible for

The fact that Immunization gives each child a minimum of four contacts with the health system before the age of one year is a tremendous opportunity that is often underutilized. immunization programs to meet this challenge. The protection of children, a task every health care provider takes on, is a high calling. If this handbook can make that task a little easier, then the effort to prepare it has been worthwhile.

While Routine Immunization has played a significant role in preventing childhood deaths and disability, thousands of children in India continue to die from vaccinepreventable diseases each year. |____

UNIT

Introduction and Overview of UIP

LEARNING OBJECTIVES

- 1. To explain the importance of immunization
- To describe the milestones of the Immunization Program in India
- To list the responsibilities of Medical Officers in Routine Immunization

accines provide active immunity to the body by stimulating the immune system which produces antibodies against disease-producing organisms. Vaccines can be divided into two types, live attenuated and killed formulations.

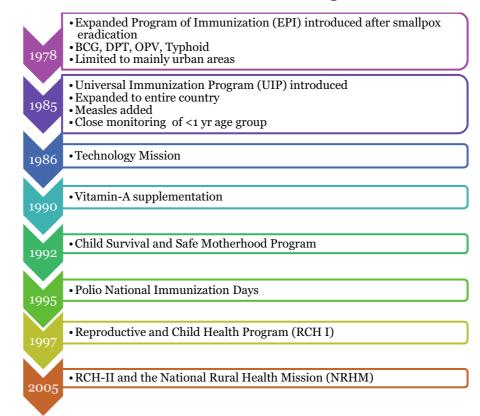

Vaccines stimulate the body's immune system, which produces antibodies against disease producing organisms. Vaccines can either be live attenuated or killed.

The live attenuated vaccines are derived from disease-causing viruses or bacteria that have been weakened under laboratory conditions. They replicate in a vaccinated individual, but because they are weak, they cause either no disease or only a mild form of the disease. Examples are BCG, Measles and the Oral Polio Vaccine. Inactivated or killed vaccines, on the other hand, are produced by viruses or bacteria and then inactivated with heat or chemicals. They cannot grow in a vaccinated individual and so cannot cause the disease. They are less effective than live vaccines, requiring multiple doses for full protection as well as booster doses to maintain immunity. Examples are whole-cell (pertussis); fractional protein based (diphtheria toxoid and tetanus toxoid) and recombinant (hepatitis B) vaccines.

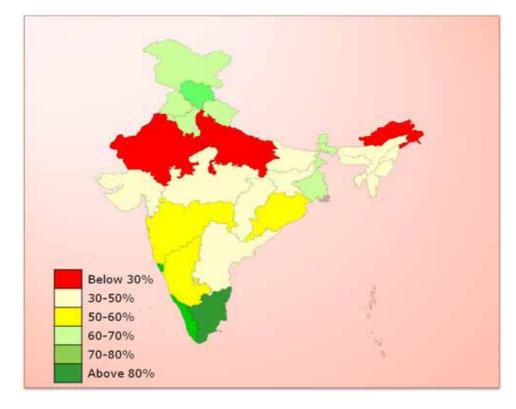

These vaccines vary in efficacy, according to the age at which the vaccine is administered and the number of doses given. For example, the measles vaccine is 85% effective at the age of 9 months and three doses of DPT provide over 95% protection against diphtheria, 80% against pertussis and 100% against tetanus.

Milestones in the Immunization Program in India

Routine Immunization is one of the most cost effective public health interventions and was first introduced in India in 1978. Routine Immunization is one of the most cost effective public health interventions and was first introduced in India in 1978. Yet, despite the concerted efforts of the government and other health agencies, a large proportion of vulnerable infants and children in India remain unimmunized. India has the highest number (approximately 10 million) of such children in the world.

The **National Family Health Survey** (2005-06) reports that only 43.5% of children in India received all of their primary vaccines by 12 months of age. There is a wide variation among states, and states with poorer immunization coverage have higher child mortality rates.

The National Family Health Survey (2005-06) reports that only 43.5% of children in India received all of their primary vaccines by 12 months of age.

Strengthening Immunization under NRHM

- Introduction of Auto Disable (AD) syringes and hub cutters.
- Support for alternate vaccine delivery to session sites from the last storage point
- Mobility support to State and District Immunization Officers and other supervisory staff
- Alternate vaccinators for sessions in urban slums and under-served areas, including vacant SCs.
- Mobilization of children and pregnant women by ASHA/link-workers to increase coverage, decrease dropouts and for convergence of Nutrition with Immunization

- Biannual RI review meetings at national and state levels
- Computer Assistants for every district and at state
- Routine Immunization Monitoring System (RIMS)
- Decentralized printing of recording, reporting and monitoring tools (e.g. Immunization cards, monitoring charts, tracking bags, temperature charts)
- Miscellaneous (e.g. polythene bags, POL for generators etc.)
- Strengthen cold chain maintenance and expansion
- Strengthen vaccine management

ASHAs/Link Workers provide critical support in mobilizing and tracking beneficiaries for immunization.

Responsibilities of Medical Officers in Routine Immunization

Planning

- Guide Health Workers to analyze their data, identify bottlenecks/constraints and prepare micro-plans
- Prepare Block micro plan based upon Sub-Center microplan
- Prioritize health facilities or areas (e.g. hard to reach) for additional support.
- Regular review and update of microplans
- Ensure that all health facilities display a map of the respective areas with population covered, session plan and work-plan
- Ensure that signboards are placed for the session sites
- Plan for monitoring and supervision
- Plan for IEC

Cold chain and logistics management

- Ensure monthly visit from district HQ cold chain store for monitoring.
- Maintain and monitor cold chain and manage vaccine stock & logistics of PHC/CHC.
- Ensure that sufficient vaccines and supplies are available for all sessions
- Ensure regular distribution of vaccines and supplies to ANM/HW at outreach session sites through Alternate Vaccine Delivery system

Supervision, Monitoring, and Surveillance

- Ensure planned outreach sessions are implemented even if HW is on leave by making alternate arrangements.
- Establish a system to aggregate and review SC monthly reports and prioritize for support.
- Ensure reporting of VPD and AEFI cases in the monthly reports.
- Send complete report to the district on time. Give update on the progress of the activity during monthly meeting in district HQ
- Ensure the use of simple monitoring tools such as coverage monitoring chart, supervision checklist, tracking bags etc.
- Prepare a supervisory schedule for visits and regular meetings for follow up with each health facility.
- Provide on job training and solve issues on spot as often as possible
- Maintain supervisory log book at PHC and sub-centers
- Conduct monthly/fortnightly review meeting of HWs
- Organize inter-sectoral coordination meetings at PHC to coordinate with ICDS, local village administration and NGOs

Community Involvement and Communication

- Support SC staff in establishing regular dialogue with community (IPC)
- Establish alliances with programs (e.g. ICDS) and organizations (e.g., NGOs) with community reach.
- Meet community/Panchayat leaders, teachers and volunteers on a regular basis; inform them to tell about immunization in their meetings; give them some handouts with immunization information to be disseminated
- Get feedback from the community to ensure a high quality service.
- Activate network to publicly announce arrival of ANM
- Monitor tracking of newborns and dropouts and ensure that due list is shared with ASHA and AWW.

Financial management

- Ensure timely release of funds to the health centers.
- Maintain records of payment to porters for alternate vaccine delivery, payment to social mobilizers and of JSY wherever applicable.
- Keep record of all funds received and expenditure incurred with vouchers under various heads.
- Monitor timely dispersal of funds at grass root level.
- Send the statement of expenditure and utilization certificate to the district.

Immunization Schedule and Frequently Asked Questions

LEARNING OBJECTIVES

- To identify and list vaccines administered in the National Immunization Program, the ages at which they are given, the number of doses along with the site and route of administration
- To explain the answers to the Frequently Asked Questions on the Immunization Schedule

Vaccine	When to give	Dose	Route	Site			
For Pregnant Women							
TT-1	Early in pregnancy	0.5 ml	Intra-muscular	Upper Arm			
TT-2	4 weeks after TT-1*	0.5 ml	Intra-muscular	Upper Arm			
TT- Booster	If received 2 TT doses in a pregnancy within the last 3 yrs*	0.5 ml	Intra-muscular	Upper Arm			
For Infants							
BCG	At birth or as early as possible till one year of age	0.1ml (0.05ml until 1 month age)	Intra-dermal	Left Upper Arm			
Hepatitis B	At birth or as early as possible within 24 hours	0.5 ml	Intra-muscular	Antero-lateral side of mid-thigh			
OPV-0	At birth or as early as possible within the first 15 days	2 drops	Oral	Oral			
OPV 1,2 & 3	At 6 weeks, 10 weeks & 14 weeks	2 drops	Oral	Oral			
DPT1,2 & 3	At 6 weeks, 10 weeks & 14 weeks	0.5 ml	Intra-muscular	Antero-lateral side of mid thigh			
Hepatitis B 1, 2 & 3****	At 6 weeks, 10 weeks & 14 weeks	0.5 ml	Intra-muscular	Antero-lateral side of mid-thigh			
Measles	9 completed months-12 months. (give up to 5 years if not received at 9-12 months age)	0.5 ml	Sub-cutaneous	Right upper Arm			
Vitamin A	At 9 months with measles	1 ml	Oral	Oral			
(1stdose)		(1 lakh IU)					
For Children	•	<u>.</u>	·				
DPT booster	16-24 months	0.5 ml	Intra-muscular	Antero-lateral side of mid-thigh			
OPV Booster	16-24 months	2 drops	Oral	Oral			
Japanese Encephalitis**	16-24 months with DPT/OPV booster	0.5 ml	Sub-cutaneous	Left Upper Arm			
Vitamin A*** (2nd to 9th dose)	16 months with DPT/OPV booster Then, one dose every 6 months up to the age of 5 years.	2 ml (2 lakh IU)	Oral	Oral			
DT Booster	5-6 years	0.5 ml.	Intra-muscular	Upper Arm			
TT	10 years & 16 years	0.5 ml	Intra-muscular	Upper Arm			

National Immunization Schedule (NIS) for Infants, Children and Pregnant Women

*Give TT-2 or Booster doses before 36 weeks of pregnancy. However, give these even if more than 36 weeks have passed. Give TT to a woman in labour, if she has not previously received TT. ** SA 14-14-2 Vaccine, in select endemic districts after the campaign.

*** The 2nd to 9th doses of Vitamin A can be administered to children 1-5 years old during biannual rounds, in collaboration with ICDS.

*** In select states, districts and cities.

Proposed Changes in the National Immunization Schedule: 2009-10

- DT Booster to be replaced by DPT Booster at 5-6 years of age.
- In select well-performing states, MR to be given with DPT Booster at 16-24 months (Dose: 0.5 ml; Route: Sub-cutaneous; Site: Right Upper Arm)
- DPT and HepB vaccines at 6, 10 and 14 weeks to be replaced by DPT-HepB-Hib (Pentavalent) vaccine.

Frequently Asked Questions on the National Immunization Schedule

BCG vaccine

Why give BCG vaccine only on the left upper arm?

BCG is given on the left upper arm to maintain uniformity and for helping surveyors in verifying the receipt of the vaccine.

Why do we give 0.05ml dose of BCG to newborns (below 1 month of age)?

This is because the skin of newborns is thin and an intradermal injection of 0.1ml may break the skin or penetrate into the deeper tissue and cause local abscess and enlarged axillary lymph nodes.

Why is BCG given only up to one year of age?

Most children acquire natural clinical/ sub-clinical tuberculosis infection by the age of one year. This too protects against severe forms of childhood tuberculosis e.g. TB meningitis and miliary disease.

If no scar appears after administering BCG, should one re-vaccinate the child?

There is no need to revaccinate the child even if there is no scar.

OPV

Till what age can a child be given OPV?

OPV can be given to children till 5 years of age.

Can OPV and vitamin A be given together with DPT-Booster dose?

Yes.

Can an infant be breastfed immediately after OPV? Yes.

DPT / DT VACCINE

If a child could not receive DPT1, 2, 3 and OPV 1, 2, 3 according to the schedule, till what age can the vaccine be given?

The DPT vaccine can be given until 2 years of age and OPV can be given till 5 years of age. If a child has received previous doses but not completed the schedule, do not restart the schedule and instead administer the remaining doses needed to complete the series.

If a child comes between the ages of 2 to 5 years without having received any vaccine, what vaccines should be given?

If the child comes between 2 to 5 years without any vaccination, two doses of DT can be given with OPV with a minimum gap of 4 weeks (or one month). A single dose of measles vaccine also needs to be given with first dose of DT.

Why should there be a minimum gap of 4 weeks between two doses of DPT?

This is because decreasing the interval between two doses may interfere with the antibody response and protection.

Why give the DPT vaccine in the antero-lateral mid thigh and not the gluteal region (buttocks)?

DPT is given in the antero-lateral mid-thigh and not the gluteal region to prevent damage to the sciatic nerve. Moreover, the vaccine deposited in the fat of gluteal region does not invoke the appropriate immune response.

What should one do if the child is found allergic to DPT or develops encephalopathy after DPT?

A child who is allergic to DPT or develops encephalopathy after DPT should be given the DT vaccine instead of DPT for the remaining doses, as it is usually the P (whole cell Pertussis) component of the vaccine which causes the allergy/encephalopathy.

TT VACCINE

If a girl received all doses of DPT, DT and TT as per the NIS till 16 years of age and she gets pregnant at 18 years, should she get one dose of TT during pregnancy?

Give 2 doses of TT during the pregnancy as per the schedule.

HEPATITIS B VACCINE

Can Hepatitis B vaccine be mixed in the same syringe with DPT and given as one injection?

No, DPT and Hepatitis B vaccine (if supplied separately) cannot be mixed or administered through the same syringe.

Until what age can Hepatitis B vaccine be given?

According to the National Immunization Schedule, Hepatitis B vaccine should be given with the first, second and third doses of DPT till one year of age.

Why give the birth dose of Hepatitis B vaccine only within 24 hours of birth?

The birth dose of Hepatitis B vaccine (within the first 24 hours) is effective in preventing peri-natal transmission of Hepatitis B.

MEASLES VACCINE

Why give the Measles vaccine only on the right upper arm?

The Measles vaccine is given on the right upper arm to maintain uniformity and to help surveyors in verifying the receipt of the vaccine.

If a child has received the Measles vaccine before 9 months of age, is it necessary to repeat the vaccine later?

Yes, the Measles vaccine needs to be administered, according to the National Immunization Schedule, after the completion of 9 months until 12 months of age. If not administered in the ideal age for Measles vaccine, it can be administered until 5 years of age.

JE (SA 14-14-2) VACCINE

If a child 16-24 months of age has been immunized with JE vaccine during an SIA, can it receive the JE vaccine again, as part of RI?

No, currently this is a single dose vaccine and should not be repeated.

If a child above 2 years (24 months) of age has not received the JE vaccine through either RI or an SIA, should s/he be given the JE vaccine?

VITAMIN A

How many prophylactic doses of vitamin A should be given and till what age?

A total of 9 prophylactic doses of vitamin A should be given till 5 years of age.

What should be the minimum gap between two doses of Vitamin A?

The minimum gap between any two doses of vitamin A should be 6 months.

How should Vitamin A syrup be administered?

Vitamin A syrup should be administered using only the spoon/dispenser provided with each bottle. The half mark in the spoon indicates 100,000 IU and a level full spoon contains 200,000 IU of Vitamin A.

What is the treatment schedule for children with clinical signs of vitamin A deficiency?

Administer 200,000 IU of Vitamin A immediately after diagnosis, followed by another dose of 200,000 IU, 1-4 weeks later.

What are the storage guidelines for un-opened bottles of Vitamin A solution?

Vitamin A solution must be kept away from direct sunlight and can be used until the expiry date.

How long can a bottle of Vitamin A be used, once opened?

A Vitamin A bottle, once opened, should be used within 6-8 weeks. Write the date of opening on the bottle.

Other than Vitamin A supplementation, what are other policy guidelines to prevent vitamin A deficiency?

These are promotion of:

- early and exclusive breast feeding, including feeding of colostrum, rich in vitamin A.
- regular consumption of dark green leafy vegetables or yellow and orange fruits and vegetables like pumpkin, carrots, papaya, mango, oranges along with cereals and pulses to a weaning child
- consumption of milk, cheese, curd, ghee, eggs, liver etc.

ALL VACCINES

If a child who has never been vaccinated is brought at 9 months of age, can all the due vaccines be given to a child on the same day?

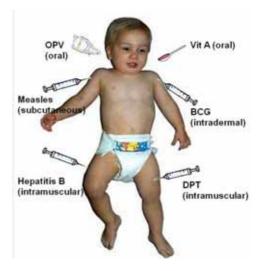

Yes, all the due vaccines can be given during the same session but at different injection sites using separate AD syringes. It is safe and effective to give BCG, DPT, Hepatitis B, OPV and Measles vaccines and Vitamin A at the same time to a 9 months old child who has never been vaccinated.

If the mother/caregiver permits administration of only one injection during an infant's first visit at 9 months of age, which vaccine should be given?

At 9 months of age, the priority is to give measles vaccine with OPV and Vitamin-A.

Which vaccines can be given to a child between 1-2 years of age, who has never been vaccinated?

The child should be given DPT1, OPV-1, Measles and 2ml of Vitamin A solution. It should then be given the second and third doses of DPT and OPV at one month intervals till 2

years of age. The Booster doses can be given at a minimum of 6 months after administering OPV3/DPT3.

What vaccines should one give to a child who is brought after 6 years of age for the first time?

Give the child only 2 doses of TT one month apart.

Why is it not advisable to clean the injection site with a spirit swab before vaccination?

This is because some of the live components of the vaccine are killed if they come in contact with spirit.

Emphasize the need for completing immunization at the correct age. Even If a child comes beyond the due date for a vaccine, the child should receive all the due vaccines. |____

Planning Immunization Services

LEARNING OBJECTIVES

1. To develop an appropriate micro-plan for the sub-center and PHC/UHC levels

lanning for routine immunization is a continuous process of analyzing data, evaluating progress and constraints and making decisions about

reaching program objectives. The building block of planning for routine immunization is the sub-center microplan, which is compiled at the PHC and further at the district level. *Table 3.1* summarizes the components of a microplan and the levels at which it is prepared.

Tab	le 3.1: Components of the Immunization Microplan					
ter	 An estimation of beneficiaries An estimation of vaccines, and logistics A work plan, including: Who will provide the services? 					
Sub-center	 Who will assist in provision of the services (AWW, ASHA, Social mobilizers, Gram Panchayat members, NGOs etc) Where will the services be provided (selection of sites)? 					
SC/PHC	 When will the services be provided (planning of sessions)? An Area Map (with villages, hamlets, hard to reach areas, etc. at the SC-level. For the block level, the map includes SC boundaries, with alternate vaccine delivery routes and vaccine storage points. 					
PHC/District	 A plan for Supervision A budget that includes the costs of transport, meetings, social mobilization and other activities. IEC and Training Plans 					

With the help of IO/ICC and other supervisors, assist Health Workers, with AWW, ASHA, Social mobilizers, Gram Panchayat members and NGOs/CBOs, in preparing the annual SC microplan. Microplanning is a dynamic process. Regularly review and update your microplans.

Steps in preparing a Microplan

To prepare the Microplan for the immunization of pregnant women and children till 5 years of age, (See Table 3.2) follow the steps outlined below.

Step	What to write	Formula/Explanation			
1	In the column <u>village</u> : All the villages and hamlets in the sub-center area.	If some hamlets have too small a population to warrant an exclusive session in their area, tag these along with larger neighbouring villages.			
2	In the column <u>total population</u> : Each village and hamlet's population based on the actual headcount.	Conduct the head count through the Community Needs Assessment Approach or the biannual/annual survey method.			
Estim	ation of Beneficiaries				
3	In the column <u>a</u> : The annual target of pregnant women by multiplying the actual headcount of pregnant women by 2.	The headcount would provide a point estimate for only 6 months (as pregnancies in the first trimester may be undetected). Hence, multiply the headcount by 2 to arrive at an estimate for 12 months.			
4	In the column <u>b</u> : The annual target of infants	Based on actual headcount			
5	In the column <u>c</u> : The monthly target of pregnant women.	=annual target of pregnant women (column a) \div 12			
6	In the column \underline{d} : The monthly target of infants	=annual target of infants (column b) ÷ 12			
7	In the columns <u>e</u> to <u>l</u> : The beneficiaries per month for each vaccine ¹ and Vitamin A.	TT=Monthly target of pregnant women (column c) x 2 dosesBCG=Monthly target of infants (column d) x 1 doseDPT=Monthly target of infants (column d) x 4 doses²OPV=Monthly target of infants (column d) x 4 doses³HepB=Monthly target of infants (column d) x 3 dosesMeasles=Monthly target of infants (column d) x 1 doseDT=Monthly target of infants (column d) x 1 doseVitA=Monthly target of infants (column d) x 9 doses			
Estima	ation of vaccines and logistics				
8	8 In the columns \underline{m} to \underline{t} : The A wastage rate of 25% or a wastage multiplica requirement of vaccine vials and factor (WMF) of 1.33^4 is allowed for all vacc				

¹ Based on the specific needs of the PHC, add the calculations of beneficiaries for the following doses:

OPV-0 = Monthly target of infants (column d) x 1 dose

HepB-Birth = *Monthly target of infants* (column d) x 1 dose.

If the combo DPT-Hep B vaccine is available, then calculate for only 3 doses of DPT-HepB combo.

TT-10 = expected 10 yr old population x 1 dose

TT-16 = expected 16 yr old population x 1 dose

JE = *Monthly target of infants* (column d) x 1 dose ² including 1 booster dose

³ including 1 booster dose

Step	What to write	Formula/Explanation				
	Vitamin A per month.	month for the particular v			ultiply the beneficiaries per vaccine (columns "e" to "k") I then divide the product by vial.	
			TT/BCG/DPT/Hep	B/DT	= <u>columns e/f/g/i/k</u> X 1.33 10	
			OPV		= <u>column h</u> X 1.33 20	
		Measles			= <u>column j</u> X 1.33 5	
vial of each v session. Also diluents are e of BCG and M 10% (or a WMF of the beneficiaries p by the WMF fact calculate the first months) and the Vitamin A = {				ure that a minimum of one accine is available for every ensure that the ampoules of qual to the required number leasles vials. A wastage rate of of 1.11) ⁵ is allowed for VitA. Multiply ber month for vitamin A (column "I") or of 1.11. However, remember to a 1 ml dose of Vitamin A (for 9-12 subsequent 8 doses of 2ml each. (column d x 1 ml) + (column d x 2 x 8)} x 1.11		
9	In the columns \underline{u} , \underline{v} and \underline{w} : The requirement of syringes per month.	A wastage rate of 10% (or a WMF of 1.11) is allowed for all ADS and reconstitution syringes. Multiply the beneficiaries per month for each vaccine (columns "e" to "k") by the WMF of 1.11. Individually for each logistic, the formula is thus:				
			0.1 ml ADS		neficiaries for BCG nn f) x 1.1	
			0.5 ml ADS	= Bei Measl	neficiaries for TT, DPT, HepB, es and DT	
			Reconstitution		<u>nns e + g + i + j + k</u>) x 1.1 G and Measles vials	
			Syringes	-	<u>nns n + r</u>) X 1.1	

⁴ The Wastage rate (%) is the proportion of vaccine (and other injection items) that are wasted due to a variety of reasons to that which was appropriately used (i.e. number of infants vaccinated). The Wastage multiplication factor is a mathematical derivative used to account for the correct amount needed for an immunization session, taking into account the existing wastage rate. E.g. if the vaccine wastage rate is 25 %, the WMF is 100/(100 - 25) = 1.33 ⁵ If the Wastage rate is 10%, the WMF is 100/(100 - 10) = 1.11

Step	What to write	Formula/Explanation		
ANM \	Nork Plan/ Roster			
10	In the column <u>village</u> : The list of villages and hamlets in the SC area with session sites. Remember to follow the "Fixed Day, Fixed Site" principle.	List all the villages and hamlets in the Sub-Center area in the same order as described in Step 1. Consult the AWW, ASHA, TBAs, PRI and the community to select accessible immunization session sites (government buildings ⁶ such as SCs or AWCs) and convenient days and time.		
11	In the column <u>Distance [km]</u> : The distance of the village from the closest ILR point.	The ILR point refers to the last vaccine storage point, where vaccines are distributed to session sites. Usually, these are located in the PHCs, Additional PHCs and CHCs etc.		
12	In the columns <u>AWW</u> and <u>ASHA</u> : The names of the AWW and ASHA			
13	In the column <u>Injections per month:</u> The monthly injection load per village	= $columns \ e + f + g + i + j + k$ (i.e. all vaccines, except the non- injectable OPV).		
14	In the column <u>Sessions required per</u> <u>month</u> : The number of sessions required per month.	Outreach sites (SC, AWC, etc, without vaccine storage facility) with an injection load ⁷ of: 1-24 injections = 1 session every alternate month 25-50 injections= 1 session per month 51-100 injections = 2 sessions per month, Etc For hard-to-reach areas with a population of less than 1000, hold a minimum of 4 sessions in a year. Fixed sites (PHC, CHC, district hospital or others, where vaccine is stored) with an injection load of: 1-39 injections = 1 session every alternate month 40-70 injections= 1 session per month 71-140 injections = 2 sessions per month, Etc For a busy CHC/RH, plan daily sessions.		
15	In the column <u>month</u> : The day of immunization session in the village.			

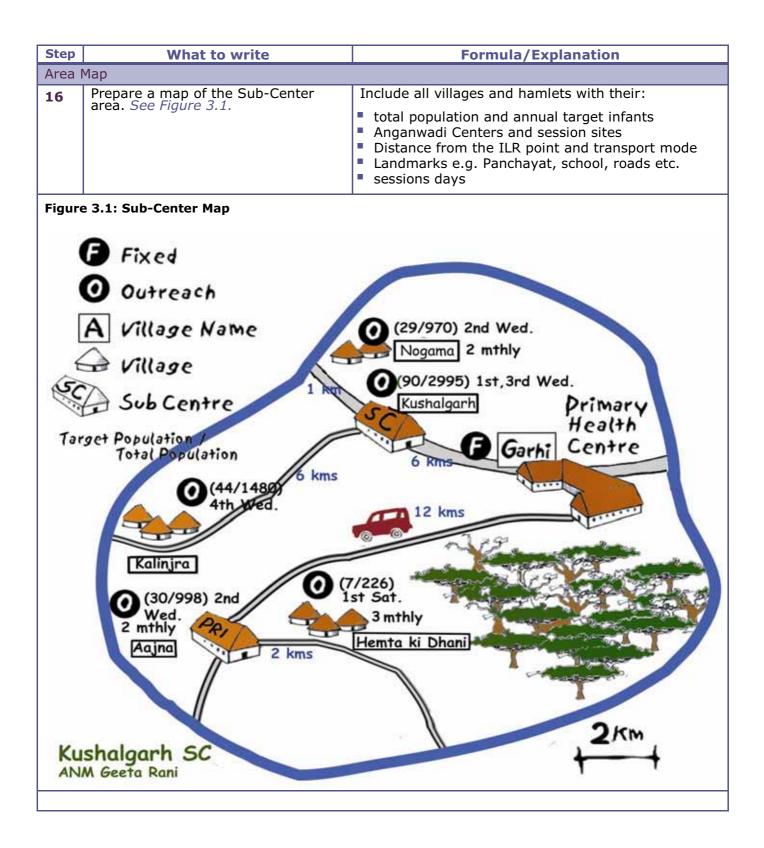

⁶ In case such buildings do not exist, use alternative sites such as Community Centers, Schools and other places, which are easily accessible to all sections of the community

- 2 infants for BCG and 2 infants for Measles (4 injections)
- 2 infants each for DPT and OPV 1,2,3 (6 injections)
- 2 infants each for Hepatitis B 1, 2, 3 (6 injections).
- 2 Children each for DPT booster and DT booster (4 injections)
- 2 pregnant women, each for TT1 and TT2 (4 injections)

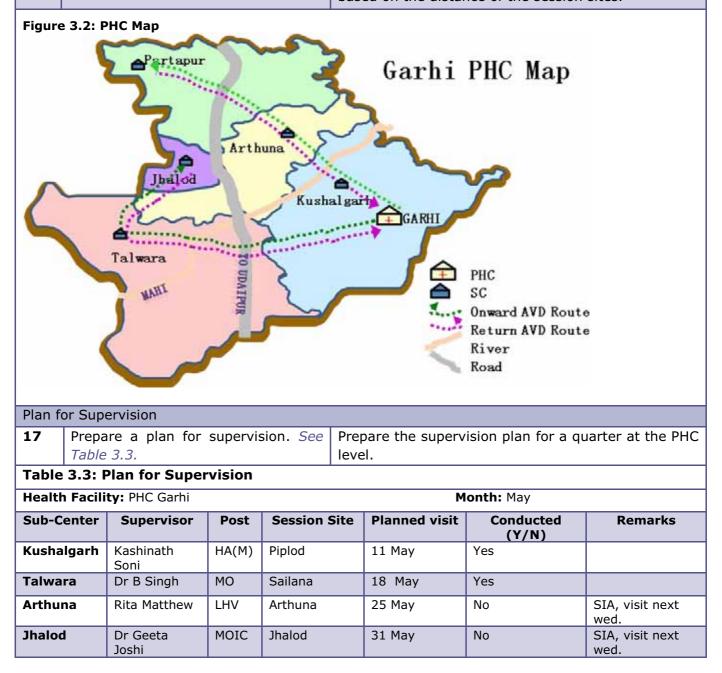

Therefore, a total of about 24 injections need to be given in a month. This means that one session has to be held every alternate month.

⁷ The **Injection load** is the average injections during a session based on the expected number of beneficiaries. For example, if there are 25 births annually in a population of 1000, there would be approximately 2 infants and 2 pregnant women for immunization every month. The monthly injection load for such a village can be calculated as follows:

Prepare a map of the PHC area. *See Figure 3.2.* Also prepare a route chart for Alternate Vaccine Delivery. *See Appendix 3.1.* Base the PHC map on the Sub-Center maps. Additionally, include the route chart for alternate vaccine (and logistics) delivery (AVD) to the session sites from cold chain storage points. AVD helps ensure that sessions are held according to plan and on time. You can exercise flexibility in planning for AVD in terms of methods of delivery and routes, based on the distance of the session sites.

Budg	et	
18	Prepare a budget	 Although there are certain funding norms, there is also flexibility, based on local requirements, in the NRHM PIP Part C funding for the following immunization-related activities: Strengthening of monitoring and supervision Alternate vaccine delivery Mobilization of children by ASHA/Link workers Alternate Vaccinators for Slums and under served areas, including vacant SCs. Computer Assistants to the States Cold chain maintenance Review meetings Printing of RI cards and monitoring tools Construction of waste pits Purchase of polythene bags Training of ANMs and other health workers Training of DIOs and MOs

In Microplanning for urban areas, consider these additional points:

Issues	Possible Solutions
Multiplicity of public health services with unclear demarcation of catchment areas	Map all administrative zones and wards, with clear demarcation of catchment areas of various public health service providers (Municipal or Health Department). Include all NGOs, Private and Charitable hospitals, AWCs etc.
Large slums, with populations un-served or under-served by public health services or ICDS Presence of multiple private sector health providers, including NGOs and CBOs	Include all slums (recognized and unrecognized) and other under-served areas. If there is a paucity of ANMs, hire alternate vaccinators, including private doctors, NGOs. Also involve local CBOs in social mobilization. If there are insufficient AWCs, plan sessions in schools, CBOs, youth clubs etc.
Overcrowding in slums	Plan sessions more frequently, if required

Cold Chain and Logistics Management

LEARNING OBJECTIVES

- To list essential elements of the cold chain system and its importance in the immunization Program.
- To list factors affecting potency of vaccines and precautionary measures to ensure the potency of vaccines.
- 3. To describe the cold chain equipment at various levels in the district
- 4. To correctly store and stock vaccines, ice packs and diluents in the refrigerator/ILR/freezers at district and block health facilities and during the transport.
- **5**. To institute preventive maintenance measures for Cold Chain Equipment and contingency plans in case of breakdown of equipment
- **6**. To follow the steps for managing logistics of vaccines and other supplies.

Ţ

The Cold Chain is a system of storing and transporting vaccines at recommended temperatures from the point of manufacture to the point of use. The key elements of the cold chain are:

- Personnel: to manage vaccine storage and distribution
- Equipment: to store and transport vaccine and to monitor temperature
- Procedures: to ensure that vaccines are stored and transported at appropriate temperatures

Keeping vaccines at the right temperature is not an easy task, but the consequences of not doing so can be disastrous. Once vaccine potency is lost, it cannot be regained. The damaged vaccines must be destroyed, leading to inadequate vaccine stocks and wastage of expensive vaccines. Moreover, children and women who receive a vaccine that is not potent are not protected. For a summary of vaccine sensitivities, *see Table 4.1*

The Cold Chain is a system of storing and transporting vaccines at recommended temperatures from the point of manufacture to the point of use.

Table 4.1:	Summary of Vaccine Sens	itiviti	es			
Vaccine	Exposure to heat/light	I	Exposure to cold	Temperature at PHC		
Heat and	light sensitive vaccines					
BCG	Relatively heat stable, but sensitive to light	Not free	damaged by zing.	+2°C to +8°C		
ΟΡV	Sensitive to heat	Not free	damaged by zing	+2°C to +8°C		
Measles	Sensitive to heat and light	Not free	damaged by zing	+2°C to +8°C		
Freeze Sensitive Vaccines						
DPT	Relatively heat stableFreezes at -3°C(Should not be frozen)			+2°C to +8°C		
Hepatiti s B	Relatively heat stable	Freezes at -0.5°C+2°C to +8°C(Should not be frozen)				
DT	Relatively heat stable	Free (Sh	+2°C to +8°C

•	before reconstitution)	east	• TT	Least		

Vaccine Damage

The physical appearance of the vaccine may remain unchanged even after it is damaged. However, the loss of potency due to either exposure to heat or cold is permanent and can not be regained.

HEAT DAMAGE

All vaccines are damaged by temperatures more than $+8^{\circ}$ C, whether they are exposed to a lot of heat in a short time (e.g., as a result of keeping vaccine in a closed vehicle in the sun) or a small amount of heat over a long period (e.g., as a result of the frequent opening of lid of ILR).

Reconstituted BCG, measles and JE vaccines are the most sensitive to heat and light. Since these live vaccines do not contain preservatives, there is risk of contamination with staphylococcus aureus leading to Toxic Shock Syndrome and, therefore, they should not be used after 4 hours of reconstitution.

Checking for heat damage: The Vaccine Vial Monitor (VVM): A VVM is a label containing a heat-sensitive material which is placed on a vaccine vial to register cumulative heat exposure over time.

The combined effects of time and temperature cause the inner square of the VVM to darken gradually and irreversibly. Before opening a vial, check the status of the VVM.

Does a VVM measure vaccine potency? No, the VVM does not directly measure vaccine potency but it gives information about the main factor that affects potency: heat exposure over a period of time. The VVM does not, however,

The physical appearance of the vaccine may remain unchanged even after it is damaged. However, the loss of potency due to either exposure to heat or cold is permanent and cannot be regained. measure exposure to freezing that contributes to the degradation of freeze-sensitive vaccines.

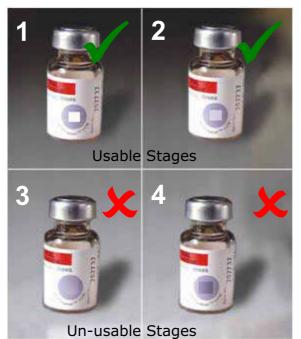

Figure 4.1: Different stages of the VVM

Reading the Stages of the VVM

- 1. The inner square is lighter than the outer circle. *If the expiry date has not been passed* : **USE** *the vaccine*
- 2. The inner square is still lighter than the outer circle. *If the expiry date has not been passed:* **USE** the vaccine

Discard Point:

3. The colour of the inner square matches that of the outer circle: **<u>DO NOT</u>** use the vaccine

Beyond the Discard Point:

4. The colour of the inner square is darker than the outer circle: **DO NOT** use the vaccine

Correct Storage and Use of Diluents

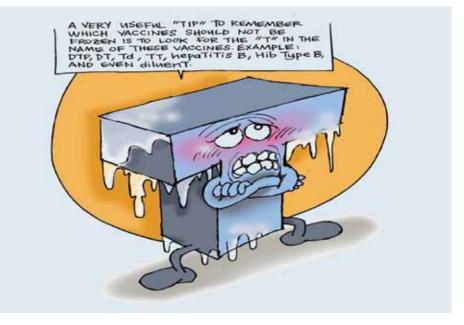

Only use the diluents supplied and packaged by the manufacturer with the vaccine, since the diluent is specifically designed for the needs of that vaccine, with respect to volume, PH level and chemical properties.

Store the diluents, between $+2^{\circ}$ to $+8^{\circ}$ C in the ILR. If there are constraints of space, then store diluents outside the cold chain. However, remember to cool diluents for at least 24 hours before use to ensure that vaccines and diluents are at $+2^{\circ}$ to $+8^{\circ}$ C when being reconstituted. Otherwise, it can lead to thermal shock i.e. the death of some or all the essential live organisms in the vaccine. Store the diluents and droppers with the vaccines in the vaccine carrier during transportation. Diluents should not come in direct contact with the ice pack.

FREEZE DAMAGE

Hepatitis B, DPT, DT, and TT vaccines lose their potency if frozen. Freezing dissociates the antigen from the adjuvant alum thus interfering with the immunogenicity of the vaccine. Moreover, the risk of adverse events following immunization, such as sterile abscesses, may increase.

Therefore, always store 'T-series' vaccines (DPT, DT, TT) and Hep.B vaccine between $+2^{\circ}$ and $+8^{\circ}$ C.

If the vials are found to be frozen or contain floccules, discard the vials. Conduct the shake test (*See Appendix* 4.1.) if you suspect that vials could have been frozen.

Diluents must be cooled for at least 24 hours before use to ensure that vaccines and diluents are at +2°C and +8°C when being reconstituted.

LIGHT DAMAGE

BCG and Measles vaccines are also light-sensitive, which is why they are supplied in amber-colored vials. Therefore, they need to be kept away from light.

Protect all vaccines from direct sunlight.

Do not keep in the cold chain, any vials that are expired, frozen or with VVMs beyond the discard point, as they may be confused with those containing potent vaccines. Keep them in the red bag for disinfection and disposal.

Cold Chain Equipment

Cold chain equipment, both electrical and non-electrical, is used for storing vaccines and/or transporting them at appropriate temperatures. *Table 4.2* summarizes the cold chain equipment supplied under the UIP.

Table 4.2: Su	mmary of Cold	Chain Equipment		
Equipment	Temperature	Storage Capacity	Holdover time ⁸	
Electrical				
Deep Freezer (Large)	-15ºC25 ºC	200 ice packs or OPV stock for 3 months (120,000 – 180,000 doses)	43° C for 18 Hrs 32° C for 22 Hrs	
ILR (Large)	+2°C - +8°C	BCG, DPT, DT, TT, Measles, Hep- B Vaccine stock for 3 months (60,000 doses)	At 43°C for 62 Hrs At 32°C for 78 Hrs	
Deep Freezer (Small)	-15ºC25ºC	100 ice packs	At 43 [°] C for 18 Hrs At 32 [°] C for 22 Hrs	
ILR (Small)	+2°C - +8°C	BCG, OPV, DT, DPT, TT, Measles, Hep-B vaccine stocks for one month (25,000 doses)	At 43 ⁰ C for 62 Hrs At 32 ⁰ C for 78 Hrs	
Non-electrical				
Cold Box (Large)		All vaccines stored for transport or in case of power failure (6000 doses of mixed antigen with 50 ice-packs/ 72-96 icepacks)	At 43 ⁰ C for 6.5 days At 32 ⁰ C for 10 days	
Cold Box (Small)		All vaccines stored for transport or in case of power failure. (1500 doses of mixed antigen with 24 ice-packs/36 icepacks)	At 43 ⁰ C for 6.5 days At 32 ⁰ C for 10 days	
Vaccine carrier (1.7 litres)	$+2^{0}C - +8^{0}C$	All vaccines carried for 12 hours(4 Ice packs & 16-20 vials)	At 43 [°] C for 34 Hrs At 32 [°] C for 51 Hrs	

Keep all Electrical Cold Chain equipment

- at least 10 cm away from walls
- protected from rain or flooding and away from direct sunlight
- level and on wooden blocks
- permanently fixed to power socket, labeled "DO NOT UNPLUG"
- properly connected to one Voltage stabilizer per equipment
- Iocked and keys accessible to designated personnel

⁸ **Holdover time** is the time taken for increasing the temperature of vaccines at the time of power failure from its minimum range to its maximum range, subject to the condition that the equipment is functioning well. For example, if the inside temperature of an ILR is 2°C at the time of power failure, the time taken up to reach 8°C will be the holdover time of that ILR. Holdover time depends on the frequency of opening the lid, the quantity of vaccines kept inside with adequate space between the boxes, exposure to direct sunlight and, only in the case of non-electrical cold chain equipment, the condition of icepacks placed inside. Holdover Time varies from one manufacturer to the other.

DEEP FREEZERS (*DFs*): maintain a cabinet temperature between -15°C to -25°C; and store OPV and prepare ice packs at the district level. *At the PHC level, Deep freezers are used only for preparation of ice packs and are not to be used for storing UIP vaccines.* About 20-25 icepacks can be prepared by a 140 Liter DF in 24 hours with at least 8 hours of continuous electricity supply. *See Figure 4.2* for correct placement of ice-packs in the DF.

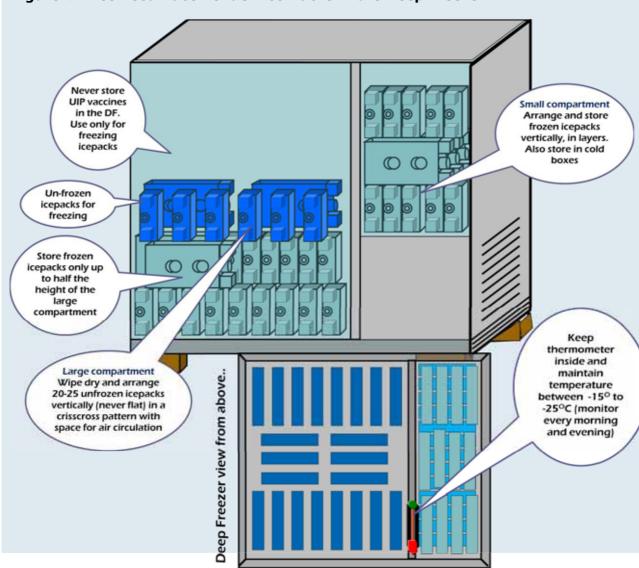

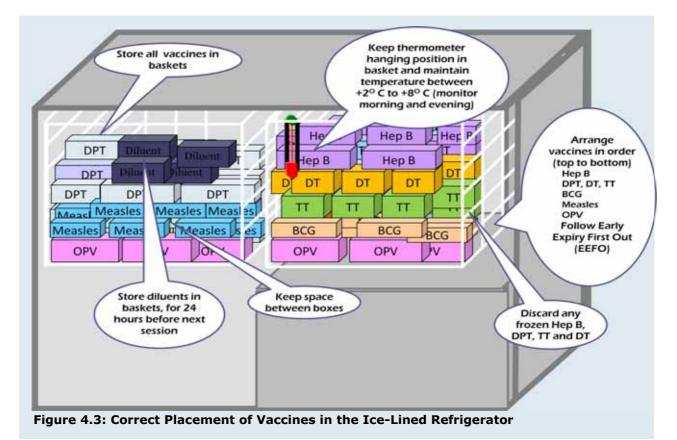

Figure 4.2: Correct Placement of Ice-Packs in the Deep Freezer

ICE LINED REFRIGERATORS *(ILRs):* maintain a cabinet temperature between +2°C to +8°C; and are used to store all UIP vaccines at the PHC level. ILRs are lined with tubes or ice packs filled with water which freezes and keeps the internal temperature at a safe level despite electricity failure. ILRs can keep vaccine safe with as little as 8 hours continuous electricity supply in a 24-hour period. Since ILRs are top-opening, they can hold the cold air inside better than a front-opening refrigerator. *Figure 4.3* indicates correct placement of vaccines in the baskets of an ILR. If baskets are not available, store vaccines (other than OPV and Measles) over two rows of empty ice-packs kept on the platform of the ILR. Measles and OPV can be kept over two rows of empty ice-packs on the floor of the ILR.

DOMESTIC REFRIGERATORS: also maintain a cabinet temperature between +2° to +8°C with a holdover time of only 4 hours. Therefore, they are *not recommended for common use in the UIP.* However, they are used in urban dispensaries and by private practitioners in urban areas due to more assured power supply and non-availability of ILRs and DFs. Arrange vaccines and ice-packs in the domestic refrigerator as shown in *Figure 4.4.*

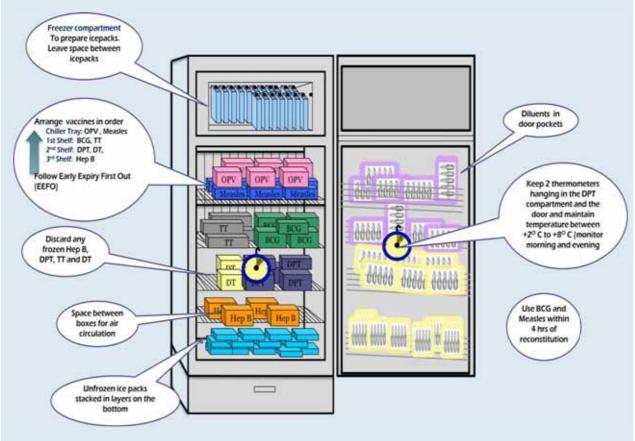

Figure 4.4: Correct Placement of Vaccines and Ice-packs in the Domestic Refrigerator

VACCINE VANS: are insulated vans used for transporting the vaccines in bulk. The vaccines should be transported to the last cold storage point only through vaccine vans. Approximately 6 lakh to 10 lakh mixed antigen can be transported at a time. Vaccines should be transported only in Cold boxes with the desired number of conditioned ice packs.

COLD BOXES: are insulated boxes, used for transportation and emergency storage of vaccines and icepacks.

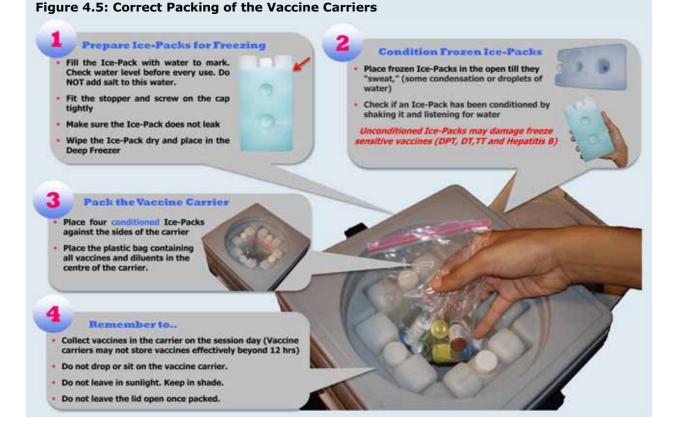

- Place conditioned ice packs at the bottom and sides of the cold box before loading the vaccines in cartons or polythene bags.
- Always keep a thermometer inside the cold box.
- Do not place DPT, DT, Hep B and TT vials in direct contact with conditioned ice packs.
- Do not place weights or other cold boxes on the lid since it will damage the rubber seal

VACCINE CARRIERS: (with 4 conditioned ice packs) maintain the inside temperature between +2°C to +8°C for 12 hours, if not opened frequently. They are used for carrying vaccines (16-20 vials) and diluents from PHCs to session sites. *Ensure the return of unused vaccine vials from session sites to the PHC on the same day in the cold chain through alternate vaccine delivery. Keep a box labeled "RETURNED UNUSED" in the ILR for all unused vaccines that can be used in subsequent sessions. Discard vaccines that have been returned unopened more than thrice. Do not keep any used vials in the cold chain.*

Never keep any used vials in the cold chain.

- Never use day carriers which contain 2 ice packs or thermos flasks for routine immunization.
- Never use any screw driver or any other sharp shaft to open the lid of vaccine carrier.

ICE-PACKS: are plastic containers filled with water. These are frozen in the deep freezer and when placed in non-electrical cold chain equipment such as vaccine carriers and cold boxes, help increase the holdover time.

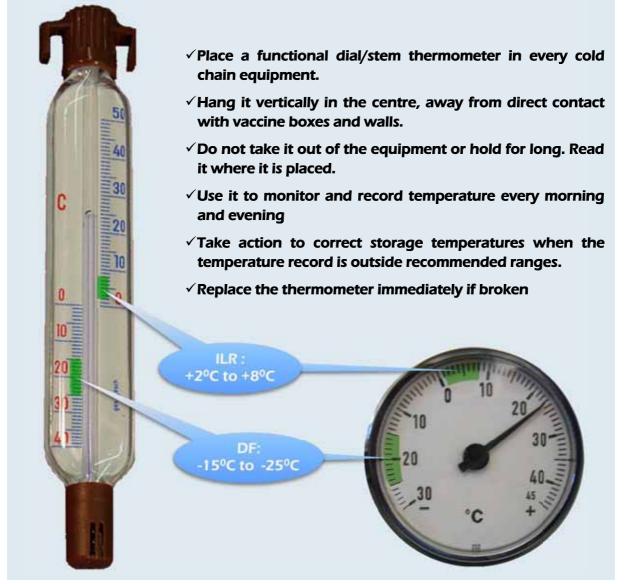

Condition Icepacks

The most common cause of exposure to freezing temperatures is the failure to correctly condition ice packs prior to transport. Conditioning prevents freezing of freeze- sensitive vaccines. When icepacks are removed from a freezer, at say - 25°C, they need to be kept at room temperature for long enough to allow the temperature of the ice at the core of the icepack to rise to 0°C. This process is called "conditioning". An icepack is adequately "conditioned" as soon as beads of water cover its surface and the sound of water is heard on shaking it.

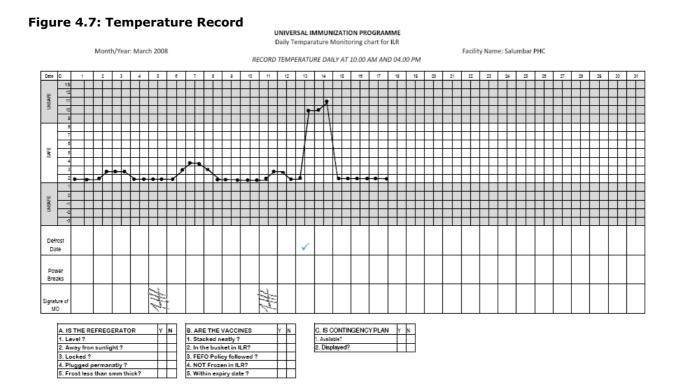

An icepack is adequately "conditioned" as soon as beads of water cover its surface and the sound of water is heard on shaking it. **THERMOMETERS:** whether, dial or stem (alcohol) are used to measure the temperature during storage of vaccines. Alcohol thermometers are more sensitive and accurate as they can record temperatures from -50° C to $+50^{\circ}$ C and can be used for ILRs and deep freezers.

Figure 4.6: Correct use of Thermometers

Keep the booklet of 12 monthly temperature recording forms on the top of each unit and check daily to see that the temperature record is maintained as given in *Figure 4.7.*

Record the details about the equipment (Make, Machine Number, Functional Status, date of breakdown, Date of Intimation and Date of Restoration) in Monthly PHC UIP Report. This will provide the information that is needed to schedule maintenance and repair and evaluate the adequacy of equipment.

Preventive Maintenance

Maintenance is performed to reduce the likelihood of equipment failure. Planning for maintenance includes identifying what needs to be done on a regular basis to clean the equipment and keep it running, ensuring that appropriate tools and spare parts are available, and scheduling these activities. Some types of equipment, (e.g. vaccine refrigerators) need daily, weekly, and monthly attention. Others (e.g. cold boxes and vaccine carriers) need maintenance after every use. (See Table 4.3). The cold technician should regular chain record preventive maintenance and minor repairs.

Remember to defrost ILRs and DFs if there is more than 0.5 cm of frost.

Table 4.3: Preventive Maintenance of Col	d Chain Equipment
ILRs/DFs	Cold Boxes and Vaccine Carriers
 Check Daily if Exterior is clean Temperature is within prescribed limits (twice daily) Seal is tight and door shuts Check Weekly if Frost is less than 0.5 cm thick (if more than 0.5 cm, then defrost)⁹ Check Monthly If Equipment is defrosted and cleaned (adjust thermostat if necessary). 	 After every use Keep latches open and free from load and tension. Clean with detergent and dry Examine inside and outside surface for cracks Check that the rubber seal around the lid is not broken (if so, replace immediately) Hinges and locks are lubricated with machine oil.

⁹ If you need to defrost your refrigerator more than once a month:

you may be opening it too often (more than three times daily); or

the door may not be closing properly; or

the door seal may need to be replaced.

REPAIR

Repair is performed to fix equipment when it fails. Minor repair of cold chain equipment and accessories (such as fuse, faulty thermostat, starting relay, overload relay, three core wire, three-pin plug or door gasket etc.) can be usually handled at the Health Facility level with local resources. However, major repair of Cold Chain equipment (such as gas leakage in ILR/DF or faulty compressor) requires additional support from the district cold chain technician.

*Cold Chain Sickness Rate*¹⁰ or the proportion of cold chain equipment out of order at any point of time, should be kept to the minimum acceptable level of less than 2%. An efficient Sickness reporting system contributes greatly to reduce the cold chain sickness rate by reducing the **Down**

The Down Time of equipment should be less than two weeks for plains and three weeks for hilly terrain, whereas the Response Time should be 48 hours for plains and 72 hours for hilly terrains.

¹⁰ E.g. if there are 100 ILRs/Freezers in a district and 7 are out of order, the cold chain sickness rate on that day is 7%).

*Time*¹¹ of the equipment. The down time should be less than two weeks for plains and three weeks for hilly terrain. The reporting should be direct from "who wants the service" to "who will provide the service", with information to other officers concerned. The aim is to maintain a *Response Time*¹² of 48 hours for plains and 72 hours for hilly terrain.

Condemnation of Cold Chain Equipment: Cold chain equipment which is obsolete or unserviceable should be condemned according to State Government rules by state/district level committees. In the absence of statespecific rules for condemnation, follow the Rule 124 of General Financial Rules (GFR) and Government of India decisions read with Schedule VII of Delegation of Financial Power Rules.

PLANNING FOR EMERGENCIES

Equipment breakdown or electricity failure can interrupt immunization services. This can be minimized through plans for emergencies that have to be established in advance, at the PHC level, so that no time is lost during an emergency. Follow the steps outlined below to prepare a plan for emergencies:

Plan for emergencies in advance, so that no time is lost during an emergency.

Make sure that the emergency plan is discussed and prepared by consulting staff and stakeholders.

¹¹ Down time refers to the time between breakdown of equipment and its repair or the period for which an equipment remains out of service (e.g. if an ILR is out of order on 10th April, and is functional again on 20th April, the down time is 10 days).

¹² The Response Time is the period between sending information regarding breakdown to actually attending (e.g. if information about the breakdown of an ILR is sent on 10th April and the ILR is attended to on 12th April by a mechanic , the response time is 2 days).

- Jointly identify a range of alternative storage arrangements for vaccines in the event of equipment breakdown or electricity failure of more than 24 hours. *Table 4.4* provides possible alternatives.
- Check identified alternative stores to ensure that they are functional, have adequate space and are capable of maintaining vaccines at the correct temperature. There is no point moving stock to another storage point only to find that all your freeze-sensitive vaccine is frozen and destroyed.

Table 4.4: Alter	Table 4.4: Alternative Storage Arrangements for Emergencies					
Equipment	Options					
ILR	Store vaccines in cold boxes with conditioned icepacks. Place thermometer inside the cold box. OR Transfer to nearby PHC or other vaccine storage facility					
	Freeze icepacks in domestic refrigerator/s or in commercial ice factory. OR Collect required quantity of frozen icepacks from nearby PHC in cold boxes on session days. (Hold over time may not be same)					
Deep Freezer	At the district level, Transfer OPV to available ILR or refrigerator OR Store OPV in cold box lined with frozen icepacks or commercial ice in polythene bags.					
Voltage Stabilizer	Disconnect the stabilizer and obtain replacement immediately from float assemblies ¹³ from District/Regional HQ and reconnect.					

¹³ A float assembly is a stock of spare units of cold chain equipment (at district/state headquarters) for immediate replacement of defective units (brought from the Primary Health Centers). The defective units once repaired go into the float assembly.

Table 4.5: Sample Emergency Plan for Vaccine Storage

PHC: Garhi, (Prepared: March 2008) *When to act:*

- ILR / Deep Freezer breaks down OR
- Electricity failure of more than 24 hours

Who will act:

Kashinath Soni (Health Assistant Male and Cold Chain Handler)
 What to do:

ILR Transfer vaccine to the cold box with conditioned icepacks. Place a thermometer inside the cold box.

DeepFreeze icepacks in Kejriwal ice factory at Navapura. Contact personFreezerAshutosh Kejriwal (Ph: XXXX)

In case of ILR/DF breakdown, immediately inform:

Designation	Name	Phone (O)	Phone (R)/Mobile
MOPHC	Dr Bhawar Singh	XXXXX	XXXXX
DIO	Dr Rathore	XXXXX	XXXXX
District Cold Chain Technician	Sunil Kumar	XXXXX	XXXXX
Record details of brea Performance Report	akdown in inventory	register and U	IP Monthly PHC

- List out the resources and actions involved and the persons identified to carry them out.
- Include an updated list of emergency contact names, addresses and telephone numbers. Make sure that emergency contacts can be made both inside and outside normal working hours.
- Obtain appropriate approval from superiors
- Confirm the plan in writing and paste clear instructions in local languages on the cold chain equipment
- Make all who are concerned aware of the requirements and the activities that may be necessary during emergency and educate/train them accordingly.
- Do not wait until an emergency occurs. Rehearse the plans before they are needed.
- Periodically check availability of the identified requirement and ensure awareness of the persons concerned.

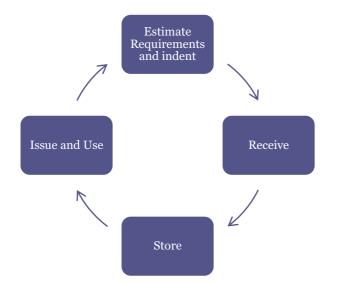

Managing Logistics of Vaccines and Other Supplies

Logistics management ensures regular and smooth flow of vaccines and other supplies to all health facilities. To ascertain that an appropriate amount of vaccine is always available, ensure that supplies are checked continuously, and records of all stock movements in and out of storage areas, are maintained.

Three commonly encountered problems in vaccine and logistics management are;

- Stockout: A condition when no stock is available of a vaccine or other supply.
- Inadequate Stock: less than the buffer stock (i.e. less than 25% for vaccines and 10% for syringes)
- Excess Stock: more than the requirement for one month, including the buffer stock (i.e. more than 125% for vaccines and 110% for syringes).

Logistics management is a cyclical process and involves several steps, namely demand estimation, indenting, receipt, storage and distribution of vaccines and other supplies to health facilities in a timely fashion and at an optimum cost.

Logistics management is a cyclical process of demand estimation, indenting, receipt, storage and distribution of vaccines and other supplies.

Step 1: Estimate requirements and indent

Compile the microplans of all the sub-centers at the PHC level and estimate the requirement of vaccines and other supplies. UIP requires that at the:

- PHC: 1 month of vaccines and supplies are stored
- District: 3 months of vaccines and supplies are stored

Furthermore, ensure that the overall estimate includes a buffer or safety stock (25% for vaccines and 10% for syringes). The *buffer* stock serves as a cushion or buffer against emergencies, major fluctuations in vaccine demands or unexpected transport delays.

The problems of stockout, inadequate or excess stock can be avoided if a *minimum/maximum inventory control system* is implemented. This system ensures that the quantity in hand is always between established maximum and minimum stock levels. The minimum/ maximum inventory control system ensures that the quantity in hand is always between established maximum and minimum stock levels. The *Minimum stock level* (also known as the re-order level) implies the least amount that you should have in stock or the level which, when reached, initiates a re-order; usually expressed as the number of weeks/months of supply. It is the amount of stock you will use in the time between placing and receiving an order plus the buffer stock. The minimum stock level is the level below which stocks should never drop without having placed an order.

The *Maximum stock level* implies the largest amount of stock that you should have, usually expressed as the number of weeks/months of supply. It is the minimum stock plus the amount of stock used between orders. The maximum stock level is set to guard against excess stock which results in losing vaccines to expiration before use.

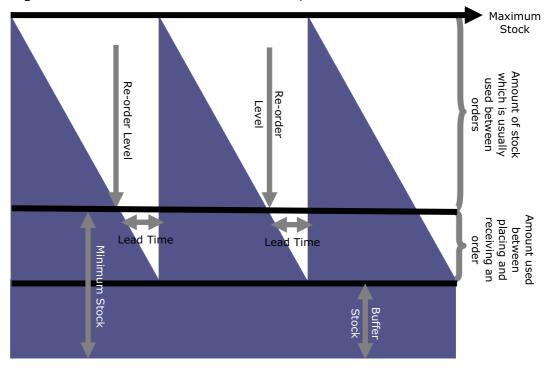

Figure 4.8: The relation between minimum, maximum and buffer stocks

The *Lead time* refers to the time between ordering of new stock and its receipt. The lead time varies, depending on the speed of deliveries, availability and reliability of transport, and sometimes the weather. For instance, if a PHC's monthly requirement of DPT is 280 doses, the Buffer Stock will be 70 doses (or 25% or one week's supply). Additionally, if the Lead Time is one week, then the Minimum Stock (or Re-order) Level is the stock for one week and the Buffer Stock (70 doses + 70 doses = 140 doses). The Maximum Stock Level, therefore, will be the Minimum Stock and the stock used between orders (140 doses + 3 weeks stock of 210 doses = 350 doses).

If the stock level falls to the re-order level, inform the district vaccine stores for replenishment and place an indent (*See Appendix 4.2*) to avoid any shortage or stock-out.

Step 2: Receive

During receipt, check and record the details of vaccines, diluents and other supplies and sign in the vaccine and logistics supply voucher. (*See Appendix 4.3*)

When the supplies reach the PHC, also enter the details in the vaccine and logistic stock register each time they arrive at the storage point, including Batch numbers, Expiry dates, VVM status, etc. (*See Appendix 4.4*)

Step 3: Store

Systematically arrange vaccines and supplies to facilitate issue of stocks whose expiry date is the closest i.e. distribute vaccine with the shortest shelf-life first, even if it arrived last. This system, commonly known as EEFO (Earliest- Expiry-First-Out) is preferable to FIFO (First-In-First-Out) handling.

While in storage, periodically conduct a physical inventory of all vaccines once every month and other supplies at least once every three months. Check and record the details at the bottom of the stock register.

Include only vaccine stocks that are suitable for use and kept in the cold chain. Any expired vials, freeze-damaged vials or vials with VVMs beyond the discard point should not appear in the available stock balance and also should not be kept in the cold chain. If such vaccines have to be retained for some time, e.g. until accounting or auditing procedures have been completed, clearly mark/label them for discard.

Systematically arrange vaccines and other supplies in a fashion that facilitates issue of stocks whose expiry date is the closest.

Do not keep in the cold chain or include in the available stock balance, any expired vials, freezedamaged vials or vials with VVMs beyond the discard point. Also record their details in the "remarks" column in the Stock Register until final disposal takes place.

Ensure that the following good storage practices are in place:

- Stock security: keep all vaccines and consumables under secure (lock and key) conditions.
- *Data security:* keep all records secure.
- Orderliness: store all vaccines, diluents and droppers and other consumables in an orderly fashion.
- Cleanliness: keep the vaccine store clean, dry and free of pests.
- *Supervision:* ensure that all staff is effectively supervised.
- Accountability: depute a person to manage stores.

Step 4: Issue and Use

Follow the earliest expiry, first out (EEFO) procedure during distribution. Follow the FIFO principle if all the vaccines and supplies are of the same shelf-life.

Check that the types and amount of vaccine, diluent and dropper are the same, as per microplan for that session site.

Check the status of randomly selected vials for intact labels, expiry date, VVM and freezing.

Check and record details, in the stock register, of vaccines and supplies every time they leave the storage point for distribution to session sites and, eventually, the user. Calculate and record the end balance of the stock. Ensure that the health worker is present to receive the stocks at the expected time of delivery. Record the issue of vaccines and supplies to each session site in the Vaccine and Logistics Issue Register (*See Appendix 4.5*) with the date, signature of delivery person, and signature of PHC official.

At the PHC level, ensure that doses used, discarded and returned to the PHC at the end of the session are recorded in the stock register.

Since provision of immunization services depends on the simultaneous availability of a number of related supplies, shortage or stock-out of any of these negatively impacts the program. "**Bundling**" ensures that vaccines are always supplied with diluents, droppers, AD syringes and reconstitution syringes, in corresponding quantities, at each level of the supply chain. Also supply other related items (e.g. Tablet IFA, ORS) required for the conduct of Village Health and Nutrition Day.

And then re-start with Step 1: Estimate Requirements... Before you indent the next batch of vaccine, conduct a physical inventory to make sure that the ledger is accurate, i.e. all supplies issued to sessions are accounted for. Before indenting additional supplies for the next month, subtract your End Balance from next month's stock requirements and include a 25% buffer stock.

"Bundling" or the simultaneous availability of a number of related supplies, ensures that vaccines are always supplied with diluents, droppers, AD syringes and reconstitution syringes, in corresponding quantities, at each level of the supply chain.

Improving vaccine use and reducing wastage

Although a certain amount of wastage of vaccines and other supplies is expected at all levels of the program, indeed inevitable, good management can reduce avoidable wastage. *Table 4.8* lists the types of wastage commonly encountered, both avoidable and unavoidable in opened andnopened vials.

Table 4.8: Common T	ypes of Vaccine Wastage	
	Unopened Vials	Opened Vials
Unavoidable wastage		Discarding remaining doses at end of session Reconstituted vaccines that have to be discarded after four hours.
Avoidable wastage	Unused vials thrice returned from outreach sessions. (Poor micro-planning regarding expected beneficiaries). Expiry (Poor stock management) VVM in discard stage, Frozen T series vaccines (Cold chain failure) Breakage, Loss, Theft (Poor Store Management)	Drawing more doses from a vial (Incorrect dosage) Suspected contamination (Poor reconstitution practices)

Regular calculation of vaccine usage/wastage rates (subcenter wise) helps in pointing out the source of wastage and in taking appropriate corrective action. Calculate wastage of vaccines and other supplies with the help of the following formula: Vaccine wastage rate =100 -Vaccine Usage Rate

OR

Vaccine wastage rate =100 - Doses administered x 100 Doses Issued¹⁴

Five "RIGHTS" Ensure Quality Vaccines and Supplies

- The **RIGHT** goods
- In the **RIGHT** quantities
- In the **RIGHT** condition

delivered . . .

- To the **RIGHT** place
- At the **RIGHT** time

The goal is to immunize the maximum number of infants and pregnant women. Encourage HWs to not hesitate in opening a new vial of vaccine for even one beneficiary. They may not have another opportunity to provide a dose to that infant or pregnant woman.

¹⁴ This includes doses used for immunization and all doses discarded or lost for any reason (expiry, unusable VVM, frozen T-series, loss, theft or routine discard of opened vials at the end of sessions.

APPENDIX 4.1: CHECKING FOR COLD DAMAGE -THE SHAKE TEST

The shake test is designed to determine whether adsorbed vaccines (DPT, DT, TT or Hepatitis B) have been frozen at some point of time in the cold chain. Once the vaccine is frozen it tends to form flakes which gradually settle to the bottom after the vial is shaken. Sedimentation occurs faster in a vaccine vial which has been frozen as compared to a vaccine vial which has not been frozen.

Conduct the shake test if you suspect that vials could have been frozen if:

- the temperature goes below recommended ranges
- Freeze-sensitive vaccines are stored below the basket of ILR.

Step 1: Take a vial of vaccine of the same batch number and from the same manufacturer as the vaccine you want to test, and freeze the vial until the contents are solid (at least 8 hours at -18°C). Let the vial thaw by keeping it at room temperature until it becomes liquid. Label the vial as "control" clearly so that it is easily identifiable and will not be used. Similarly label the test (suspect vial)

Step 2: Hold the "control" and "test" samples together in the same hand and shake vigorously for 10 to 15 seconds.

Step 3: Place both the vials on a table and do not move them further.

Step 4: View both vials against the light to compare their sedimentation rates.

- If the test sample shows a much slower sedimentation rate than the control sample, the test sample has most probably not been frozen and can be used.
- If the sedimentation rate is similar or more, the vial has probably been damaged by freezing and should not be used. Record the details in the stock register.

Note: Some vials have large labels which conceal the vial contents. This makes it difficult to see the sedimentation process. In such cases, turn the control and test vials upside down and observe sedimentation taking place in the neck of the vial.

APPENDIX 4.5: VACCINE & LOGISTICS ISSUE REGISTER

Safe Injections and Waste Disposal

LEARNING OBJECTIVES

- **1**. To describe the importance and advantages of safe injections and safe disposal of immunization waste.
- To list steps to achieve safe injections and safe disposal of immunization waste according to existing GoI guidelines.

he cardinal rule of health care is "*first, do no harm."* Yet, unsafe injection practices pose serious health risks to recipients, health workers, and the general public. 95%

injections are administered for therapeutic purposes, rather than for immunization and many of these "curative" injections may be unnecessary, ineffective, or inappropriate. The provision of auto disable syringes by the Government of India and the implementation of Central Pollution Control Board (CPCB) outlined waste management procedures are attempts to improve injection safety in the immunization program.

Unsafe injection practices pose serious health risks to recipients, health workers, and the general public.

Safe Injections

An *unsafe injection* is an injection that can potentially harm the recipient, the health worker or the community.

They are at risk of contracting deadly diseases, such as hepatitis B, Hepatitis C and HIV as well as parasitic, fungal, bacterial and other types of infections. *Table 5.1* describes the common reasons for and solutions to unsafe injection practices.

Table 5.1: Common Reasons a	nd Solutions for Unsafe Injection Practices
Reasons	Solutions
Supplies are low or erratic	Ensure injection safety through a continuous supply of injection safety equipment (e.g. AD syringes, reconstitution syringes, hub-cutters and waste disposal bags).
Health workers have not been trained in correct use of this equipment or in disinfection and safe disposal of immunization waste. They recap or bend used needles, causing needle-stick injuries	to all health workers, whether or not, they

Figure 5.1: Correct use of AD syringes

Select the correct syringe for the vaccine to be administered (BCG 0.1ml and all others 0.5ml).

Check the packaging. Don't use if the package is damaged, opened, or expired.

Peel open or tear the package from the plunger side and remove the syringe by holding the barrel. Discard the packaging into a <u>black</u> plastic bag.

Remove the needle cover/ cap and discard it into the <u>black</u> plastic bag. Do not move the plunger until you are ready to fill the syringe with the vaccine and do not inject air into the vial as this will lock the syringe.

Invert the vial, and insert the needle into the vial through the rubber cap, such that the tip is within the level of the vaccine. If inserted beyond you may draw an air bubble which is very difficult to expel.

Do not touch the needle or the rubber cap (septum) of the vial.

Pull the plunger back slowly to fill the syringe. The plunger will automatically stop when the necessary dose of the vaccine has been drawn (0.1 or 0.5 ml).

Do not draw air into the syringe.

In case air accidentally enters the syringe, remove the needle from the vial. Holding the syringe upright, tap the barrel to bring the bubbles towards the tip of syringe.

Then carefully push the plunger to the dose mark (0.5 or 0.1 ml) thus expelling the air bubble.

If the injection site is dirty then clean it with a clean water swab and administer the vaccine. (BCG: Left upper arm; DPT, DT and Hep B: Antero-lateral aspect (outer side) of mid thigh Measles: Right upper arm; TT: Upper arm)

Push the plunger completely to deliver the dose. Do not rub the injection site after vaccine is given.

Figure 5.2: Correct use of Hub-cutters

Figure 5.3: Simple ways to improve injection safety

Keep hands clean before giving injections

Cover any small cuts on the service provider's skin. Wash or disinfect hands prior to preparing injection material.

Prevent the contamination of vaccine and injection equipment Avoid giving injections if the skin of the recipient is infected or compromised by local infection (such as

a skin lesion, cut, or weeping dermatitis).

Prepare each injection in a clean area where contamination from blood or body fluid is unlikely. If the injection site is dirty, wash with clean water Follow product-specific recommendations for use, storage, and handling of a vaccine.

Use sterile injection equipment

Always use an ADS for each injection and a new disposable syringe to reconstitute each vial of BCG and measles

Discard any needle that has touched any non-sterile surface.

Discard a syringe that has been punctured, torn or damaged by exposure to moisture

Consider all used equipment as contaminated

Cut the used syringe at the hub immediately after use.

Prevent needle-stick injuries Do not recap or bend needles.

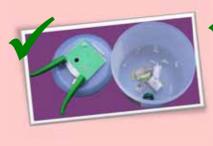

Practice safe disposal of all

sharps Deposit used sharps (needles) in a hub cutter and send to the PHC for disinfection and safe disposal.

Collect sharps in the Hub cutter.

Anticipate sudden movement of child.

Safe disposal of immunization waste

Unsafe disposal of immunization waste poses:

Dangers to health: Throwing used needles in open pits can put the community at risk of acquiring infection. Usually children, rag pickers and animals are the unfortunate victims of needle-stick injury from unsafe disposal of needles and other sharps.

Dangers to the environment: Due to the significant environmental risks posed by the unsafe disposal of immunization waste, CPCB disallows:

- throwing used needles and syringes in the open
- burying used needles and sharps
- burning immunization waste.

Never throw in the open used syringes, used unbroken vials, broken vials and ampoules, caps and wrappers. Never burn immunization waste. Never bury used syringes and used needles. Never store returned waste at Health facility for long. Dispose periodically

Steps to ensure safe disposal of immunization waste

The CPCB outlines the following Guidelines for disposal of biomedical waste generated during immunization under UIP.

The concerned CMO or the officer responsible for implementation of UIP in the respective area, as decided by the MoHFW, will obtain authorization from the "Prescribed Authority", notified under the Bio-medical Waste (Management & Handling) Rules¹⁵ for generating, collecting, receiving, storing, transporting, treating, disposing and/or handling bio-medical waste in any other manner.

Disposal of bio-medical waste generated at Outreach Points/PHCs/ CHCs/ District Hospitals etc.

Step 1: At the session site, cut the needle of the AD syringe immediately after administering the injection, using the Hub cutter that cuts the plastic hub of the syringe and not the metal part of needle. The cut needles will get collected in the puncture-proof translucent container of the hub-cutter.

Step 2: Store the broken vials in a separate white translucent sturdy and puncture proof container or in the same hub-cutter, in case its capacity is also able to accommodate broken vials.

Step 3: Segregate and store the plastic portion of the cut syringes and unbroken (but discarded) vials in the red bag or container. Both the containers should bear the biohazard symbol as stipulated in the Schedule III of the BMW Rules.

¹⁵ i.e. State Pollution Control Board/ Committee

Step 4: Send the collected materials to the Common Biomedical Waste Treatment Facilities (CBWTF). If the CBWTF doesn't exist then, go to step 5.

Step 5: Treat the collected material in an autoclave. If it is unable to impart autoclaving, boil the waste in water for at least 10 minutes or provide chemical treatment (using at least 1% solution of sodium hypochlorite for 30 minutes). Ensure that these treatments result in disinfection. However, the District Hospital/CHC/PHC etc. will ultimately make the necessary arrangements to autoclave on a regular basis.

Step 6: Dispose the autoclaved (or boiled/chemically disinfected) waste as follows:

- Dispose the needles and broken vials in a safety pit/tank
- Send the syringes and unbroken vials for recycling or landfill.

Step 7: Wash properly the containers properly for reuse.

Step 8: Maintain a proper record of generation, treatment and disposal of waste at the District Hospitals/CHC/PHC/etc. in order to assess that waste (needles/syringes/vials) reported back to District Hospital/CHC/PHC matches with the stock issued to Health Workers at the beginning of the session day. Match by weighing rather than counting in order to avoid occupational and safety hazards. This would enable preparation of annual reports, submitted to the "Prescribed Authority" by 31st January of every year. These steps can be easily summarized in the *Figure 5.4.*

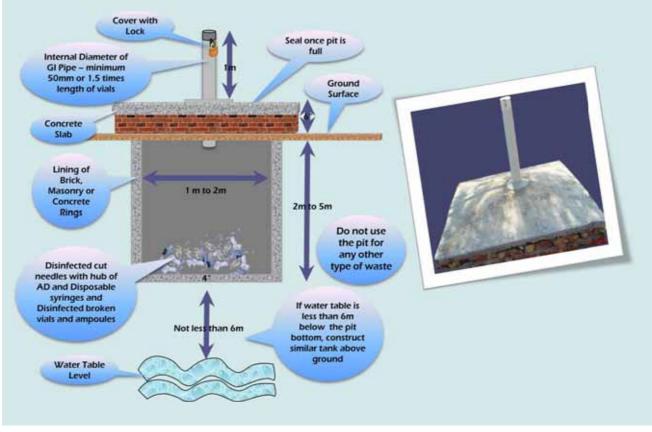

To prepare **1% Hypochlorite solution**, dissolve 10-15g or 1 tablespoonful of bleaching powder in 1 liter of water, in a well ventilated area. Chlorine solutions gradually lose strength, therefore prepare freshly diluted solutions daily. Use clear water, because organic matter destroys chlorine. Since this bleach solution is also caustic, avoid direct contact with skin and eyes. Use plastic containers as metal containers are corroded rapidly and also affect the bleach.

30 Lt. (24" x 28") **Red/ Black Plastic Bags** (Biodegradable). HDPE/LLDPE/PP made with virgin, non-chlorinated polymer material with minimum thickness of 55 micron, with easy to hold collar tie/knot arrangement and preprinted as per requirements of Bio Medical Waste Management Rules.

APPENDIX: 5.1 DESIGN OF THE PIT/TANK FOR DISPOSAL OF TREATED NEEDLES AND BROKEN VIALS (SHARPS)

The treated needles/broken vials should be disposed in a circular or rectangular pit as shown below. Such a rectangular or circular pit can be dug and lined with brick, masonry or concrete rings. The pit should be covered with a heavy concrete slab, which is penetrated by a galvanized steel pipe projecting for about 1 meter above the slab, with an internal diameter of up to 50 millimeters or 1.5 times the length of vials, whichever is more. The top opening of the steel pipe shall have a provision of locking after the treated waste sharps has been disposed in. When the pit is full it can be sealed completely, after another has been prepared. For high water table regions where water table is less than 6 meters beneath bottom of the pit, a tank with above mentioned arrangements shall be made above the ground.

Adverse Events Following

Immunization

LEARNING OBJECTIVES

- To define Adverse Events Following Immunization (AEFIs) and describe types of AEFIs
- 2. To report, investigate and respond to AEFIs.
- To list the roles and responsibilities of health functionaries at all levels in managing AEFIs

n adverse Event Following Immunization (AEFI) is defined as a medical incident that takes place after an immunization, causes concern, and is believed to be caused by immunization. AEFIs, particularly when they are not properly managed,

represent a genuine threat to the immunization program and, in some cases, to the health of the beneficiaries. It is important that AEFIs are detected, investigated, monitored and promptly responded to for corrective interventions.

Types of AEFI

Encourage Field workers to report AEFIs without fear of penalty. The aim is to improve systems to prevent/minimize further AEFI and not to blame individuals.

AEFIs may be reported as individual cases or clusters. A cluster is defined as two or more cases of the same or similar events, which are related in time, and have occurred within specific geographical area, or associated with the same vaccine, the same batch number or the same vaccinator. For example, two or more cases of abscess occur in a village following an immunization session (with one or more vaccinators) or multiple abscess cases following

immunization by the same vaccinator or the same batch of the vaccine, but in different villages.

AEFIs can be classified into five types as described in *Table* 6.1.

Table 6.1: Ty	pes of AEFIs	
Туре	Definition	Example
	1. Vaccine reaction An event caused or precipitated by the active component or one of the other components of the vaccine (e.g. adjuvant, preservative or stabilizer). This is due to the inherent properties of the vaccine.	High grade fever following DPT vaccination
	2. Program Error An event caused by an error in vaccine preparation, handling or administration.	Bacterial abscess due to un-sterile injection
	3. Coincidental An event that occurs after immunization but is not caused by the vaccine. This is due to a chance temporal association	Pneumonia after oral polio vaccine administration
	4. Injection Reaction Event caused by anxiety about, or pain from the injection itself rather than the vaccine	Fainting spell in a teenager after immunization
r	5. Unknown The cause of the event cannot be determined	

Vaccine reactions

These may be classified into common, minor reactions or rare, more serious reactions.

Common, minor vaccine reactions such as local reaction (pain, swelling and/or redness), fever and systemic

symptoms (e.g. vomiting, diarrhoea, malaise) can result as a part of the immune response. In addition, some of the non-antigenic vaccine components (e.g. adjuvants, stabilizers or preservatives) can lead to reactions. An ideal vaccine reduces these reactions to a minimum while producing the best possible immunity.

Local reactions and fever should be anticipated in only 10% of the vaccine recipients, except in the case of whole cell DPT which produces fever in nearly half of those vaccinated. Fever and minor local and systemic reactions usually occur within a day or two of immunization (except for those produced by measles/MMR vaccine which occurs 6 to 12 days after immunization) and only last for few days. Fever and minor local reactions can usually be treated symptomatically with paracetamol.

Rare serious vaccine reactions such as high $(39 - 40.4^{\circ}C/102-104.7^{\circ}F)$ to extreme fevers (>40.5°C /105 °F) may indicate the possibility of:

 Sepsis or Toxic Shock Syndrome (TSS) resulting from a program error; or A coexisting illness and other accompanying signs.

Table 6.2 summarizes the rare serious vaccine reactions. Case definitions for these reactions are in Appendix 6.3. Anaphylaxis, the most serious of these reactions and potentially fatal, is treatable without leaving any long-term effects (*Appendix 6.4*). Although encephalopathy is included as a rare reaction to measles or DPT vaccine, a causal link with these vaccines has not been fully proven.

Table 6.2 : S	ummary of Rare Serious AE, onset interval	and rate	
Vaccine	Reaction	Interval between vaccination and onset	Number of events per million doses
BCG	Suppurative adenitis	2-6 months	100-1000
	BCG Osteitis	Up to several years	-
	Disseminated BCG infection	1-12 months	-
Hib	None known	-	-
Нер В	Anaphylaxis	0-1 hour	1-2
Measles/MM	Febrile seizures	5-12 days	330
R ^a	Thrombocytopenia (low platelets)	60 days	30
	Anaphylaxis	0-1 hour	1
OPV	Vaccine-Associated Paralytic Poliomyelitis	4-30 days	Up to o.4 ^b
Tetanus	Brachial Neuritis	2-28 days	5-10
	Anaphylaxis	0-1 hour	1-6
	Sterile abscess	1-6 weeks	6-10
DPT	Persistent (>3hours) inconsolable screaming	0-48 hours	1,000-60,000
	Seizures	0-3 days	600 ^c
	Hypotonic Hypo Responsive Episode (HHE)	0-24 hours	30 - 990
	Anaphylaxis/Shock	0-1 hour	1 -6
Japanese	Serious allergic reaction	0 – 2 weeks	10 - 1000
Encephalitis	Neurological event	0 – 2 weeks	1 - 2.3

^a Reactions (except anaphylaxis) do not occur if already immune (~ 90% of those receiving a second dose): children over six years are unlikely to have febrile seizures ^b VAPP risk is higher for first dose (12 per 1.4 to 3.4 million doses) compared to 1 per 5.9 million for subsequent doses and 1 per 6.7

^c Seizures are mostly febrile in origin, and the rate depends on past history, family history and age, with a much lower risk in infants under the age of 4 months.

^o VAPP risk is higher for first dose (12 per 1.4 to 3.4 million doses) compared to 1 per 5.9 million for subsequent doses and 1 per 6.7 million doses for subsequent contacts.

Program Errors

Adverse events can occur as a result of inappropriate storage, handling, preparation and administration of vaccines. The most common program error is infection as a result of nonsterile injection or poor injection

technique. The infection can manifest as a *local reaction* (e.g., suppuration, abscess), *systemic effect* (e.g., sepsis or toxic shock syndrome), or *blood-borne virus infection* (e.g., HIV, Hepatitis B or Hepatitis C).

A program error may lead to a cluster (2 or more cases) of adverse events associated with a particular vaccine provider, or health facility, or even a single vial of vaccine that has been inappropriately prepared or has been contaminated. Program errors can also affect many vials (e.g. freezing of freeze-sensitive vaccines leading to an increase in local reactions).

Common Program Errors (*See Table 6.3*) can usually be prevented through training of health workers, regular supervision and an adequate supply of equipment for safe immunization injections.

87

Table 6.3:	Common Program errors leading to AE	FIs
	Program Errors	Possible AEFI
Non-sterile	e injection	
The	 Contact of needle with unsterile surface e.g. finger, swab, table etc. Contaminated vaccine or diluent Administering injection over clothes 	Infection e.g local abscess at site of injection, sepsis
	 Use of reconstituted vaccines beyond the stipulated 4 hours Reuse of reconstituted vaccine at subsequent sessions 	Toxic shock syndrome or death.
	 Reuse of disposable syringe & needle 	Blood-borne infections e.g Hep B, HIV, Hep C etc., abscess
Reconstitu	tion error/ Wrong vaccine preparation	
	Reconstitution with incorrect diluent	Less vaccine effectiveness
generation of	 Drug substituted for diluent 	Drug reaction; Death
	 Inadequate shaking of T-series vaccines 	Local abscess
Injection a	t incorrect site/route	
	 Injection into gluteal region (buttocks) 	Sciatic nerve damage, paralysis
	 BCG/T series vaccine given subcutaneously 	Local reaction or abscess
Vaccine tra	nsportation/storage incorrect	
	freeze-sensitive vaccine	Local reaction such as sterile abscess
Contraindi	cations ignored	
	 DPT2 given after H/O convulsions with DPT1 	Convulsions

Coincidental Events

Coincidental events have only a temporal association with vaccination and are not causally related. They are likely if:

 The same or a similar event also affected others in the same age group around the same time, but they did not

receive the suspect vaccine(s).

 There is clinical/ laboratory evidence that the event is not related to immunization.

Once an event is established as coincidental (e.g. pneumonia) no further investigation is required, other than what would be needed for the clinical management of the case. However, certain serious events may be blamed on the vaccine by the community because of the close temporal association with immunization, especially if the vaccinated individual was previously healthy. Ensure appropriate follow-up communication with the affected group or community to avoid misunderstanding or negative rumors.

Injection Reactions

Vaccinated children or adults can react in anticipation to and as a result of an injection of any kind. This reaction is unrelated to the content of the vaccine. Examples of injection reactions include fainting, lightheadedness, dizziness, tingling around the mouth and in the hands, and breath-holding in younger children, which in some cases can lead to unconsciousness.

Minimize overcrowding by proper planning of the immunization sessions and informing parents in advance about the time they should arrive for vaccination. This is likely to reduce the likelihood of such an event occurring by creating a calmer environment.

Unknown

Unknown AEFIs imply that the cause of the event cannot be determined. Rule out all the above mentioned causes before reaching this conclusion.

Reporting AEFIs

Figure 6.1 and Table 6.4 summarize the AEFIs that should be reported, methods, responsibilities and periodicity of reporting.

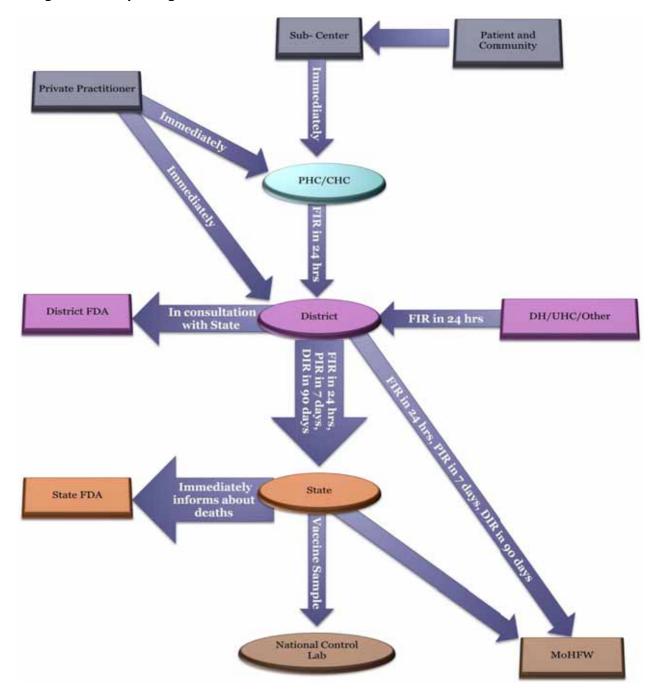

Figure 6.1: Reporting for Serious AEFIs

Table 6.4: Reporting of AEFIs			
What to report	How to report	Who reports to Whom	When to report
 For Immediate Reporting and Investigation Death, hospitalization, disability or other serious and unusual events that are thought by HWs or the public to be related to immunization 	Telephone or any other quick means of communication	↓ HWS ↓ MO ↓ DIO/CMO ↓ SIO	Immediately
 Anaphylaxis Toxic shock syndrome (TSS) Anaphylactoid (acute hypersensitivity) reaction 	First Information Report (FIR). <i>See</i> Appendix 6.1.	MO to DIO	Within 24 hrs to District and 48 hrs to GOI
 Acute Flaccid Paralysis¹⁶ (AFP) Encephalopathy Sepsis 	Preliminary Investigation Report (PIR). <i>See</i> <i>Appendix 6.2.</i>	MO / DIO to GoI	Within 7 days
 Any event where vaccine quality is suspected Events occurring in a cluster 	Detailed Investigation Report (DIR)	AEFI investigation team to GoI	Within 90 days
 For Routine Monthly Reporting Deaths Injection site abscesses 		HWs to MO	
 Other complications: Persistent (> 3 hrs) inconsolable screaming Hypotonic hypo-responsive episode (HHE) Severe local reaction Seizures including fehrile seizures 	IIIP Report	MO to DIO/CMO	Month Vidta
 Brachial neuritis Thrombocytopenia Lymphadenitis Disseminated BCG infection Osteitis / Osteomyelitis Events occurring in cluster or causing significant parental or community concern 		DIO/CMO to SIO	
-)			

 16 Any case of AFP will be reported through the current system for AFP surveillance and reporting

Investigating AEFIs

On receiving reports of AEFIs from public or private sources, regarding both NIS and non-NIS vaccines, you should conduct an investigation to:

- confirm the reported diagnosis of AEFI and clarify the details and outcome;
- determine whether unimmunized persons are experiencing the same medical event(s);
- investigate the link between the vaccine given and the AEFI;
- determine the contribution of operational aspects of the program to the reported AEFI;
- determine whether a reported event was isolated or part of a cluster;
- determine the cause of the AEFI to provide the best intervention/ medical care and take further actions deemed necessary.

When an investigation is deemed necessary, initiate it urgently to determine the cause (where possible) and, in some cases, prevent additional cases. **Identify system problems rather than finding individuals to blame.** Establish a working hypothesis as soon as there is sufficient information. You may change the working hypothesis during the course of your investigation. The focus of your investigation should then be to confirm the working hypothesis. Do not take action based on the hypothesis, until it is confirmed with reasonable certainty.

Request laboratory testing only on a clear suspicion and not as routine, and never before the working hypothesis has been formulated

Laboratory testing may sometimes confirm or rule out the suspected cause. The vaccine and diluent may be tested for sterility and chemical composition; and the needles and syringe for sterility. Request testing only on a clear suspicion and not as routine, and never before the working hypothesis has been formulated. Send *unopened* vaccine vials and matching diluent of the same batch for testing of a total of 50 ml (i.e. 10 vials for vaccines in 5ml vials and 5

vials for vaccines in 10 ml vials). Send vaccine samples for testing to the National Control Laboratory, Central Research Institute, Kasauli accompanied with a completed Lab Requisition Form (LRF) along with a copy of the available FIR/PIR. Send the samples in cold chain ($+2^{\circ}$ C to $+8^{\circ}$ C) and by fastest means, by a messenger or a courier agency with experience in transporting vaccines.

Roles and Responsibilities

ANMs should:

- Ask the beneficiaries to wait for half an hour after vaccination to observe for any AEFI.
- Leave the list of children vaccinated in a session with the AWW/ASHA and request them to be alert and report AEFIs. Share contact details of self and PHC.

- Treat mild symptoms like fever, pain
- Report deaths, injection site abscesses and other complications in the monthly UIP report. Mention in the

Report deaths, injection site abscesses and other complications in the monthly UIP report. Mention in the report any non-occurrence of AEFI. A nil report is also important. report any non-occurrence of AEFI. A nil report is also important.

- Refer serious cases to MO (PHC) or to appropriate health facility for prompt treatment.
- Report serious events/ cluster of events immediately to the supervisor/ MO (PHC)/ DIO
- Record the time of opening/ reconstitution of vial on the vial label.
- Communicate with parents and other members of the community
- Assist in investigation of AEFIs

Health Supervisors should:

- Collect and review reports of AEFIs during their supervisory visits to immunization session sites/ SC.
- Provide on-the-job training to the field staff on safe injection practices and reporting.
- Assist the MO in collecting and compiling reports and in conducting the investigation.

MO PHC/ CHC should:

- Improve/arrange logistics to prevent AEFI due to program errors.
- Train staff in detecting, managing and reporting of AEFIs and differentiating between minor, non-significant AE and more serious events.
- Manage AEFIs and refer to the higher level, if required.
- Initiate investigation, when required
- Complete case report forms (FIR, PIR and DIR) and inform the DIO immediately for serious cases and deaths
- Report deaths, injection site abscesses and other complications in the monthly UIP report. Mention in the report any non-occurrence of AEFI. A nil report is also important.

Complete case report forms (FIR, PIR and DIR) and inform the DIO immediately for serious cases and deaths.

- Supervise all reported AEFI through site visits and give immediate feedback to health workers.
- Communicate with and share the conclusions and results of investigation with health workers and the community.

CMO/CS, DIO, RIT, MO at the district hospital should:

- Establish a functional district AEFI committee/regional investigation team.
- Train field staff in managing, investigating and reporting AEFIs.
- Identify a focal person for investigations.
- Identify a designated spokesperson to address the media if required
- Coordinate AEFI case management

- Report deaths, injection site abscesses and other complications in the monthly UIP report. Mention in the report any non-occurrence of AEFI. A nil report is also important.
- Investigate serious AEFIs and deaths (District AEFI committee/RIT in collaboration with State-level Investigation Teams)
- Immediately inform about serious AEFIs to the local FDA in consultation with the SIO
- Follow up reporting of serious AEFIs (FIR, PIR and DIR) and other cases (routine reports)
- Analyze the AEFI data through RIMS (maps and graphs) and disseminate this information to field personnel and state government.

AEFI	Case definition	Treatment	Vaccine	
Vaccine associated paralytic poliomyelitis (presenting as AFP)	Acute onset of flaccid paralysis and neurological deficits, compatible with diagnosis of poliomyelitis, with isolation of vaccine virus and absence of wild virus in stool.	No specific treatment available; supportive care.	OPV	
Anaphylactoid reaction (acute hypersensitivity reaction)	 Exaggerated acute allergic reaction, occurring within 2 hours after immunization, characterized by one or more of the following: wheezing and shortness of breath due to bronchospasm laryngospasm/laryngeal oedema One or more skin manifestations, e.g. hives, facial oedema, or generalized oedema. Do not report less severe allergic reactions 	Self-limiting Anti-histamines may be Useful	All	
Anaphylaxis	Severe immediate (within 1 hour) allergic reaction leading to circulatory failure with or without bronchospasm and/or laryngospasm/laryngeal oedema.	Adrenaline injection (See Appendix 6.4)	All	
Disseminated BCG infections	Widespread infection occurring within 1 to 12 months after BCG vaccination and confirmed by isolation of Mycobacterium bovis BCG strain. Usually in immuno- compromised individuals.	of tuberculous regimens		
Encephalopathy	 Acute onset of major illness characterized by any two of the following three conditions: seizures severe alteration in level of consciousness lasting for one day or more Distinct change in behavior lasting one day or more. Needs to occur within 48 hours of DPT vaccine or from 7 to 12 days after measles vaccine, to be related to immunization. 	No specific treatment available; supportive care.	Measles, Pertussis	
Fever	The fever can be classified (based on rectal temperature) such as Mild fever: 100.4 °F to 102 °F (38 to 38.9 °C), High fever: 102 °F to 104.7 °F (39 to 40.4 °C) and Extreme fever: 104.7 °F or higher (>40.5 °C).	Symptomatic; paracetamol. Give extra oral fluids. Tepid sponge or bath. In cases of high and extreme fever, other signs and symptoms should be sought and reported/managed as appropriate.	All	
Hypotonic, hypo responsive episode (HHE or shock-collapse)	Event of sudden onset occurring within 48 [usually less than 12] hours of vaccination and lasting from one minute to several hours, in children younger than 10 years of age. All of the following must be present: • limpness (hypotonic) •reduced responsiveness (hypo responsive) • pallor or cyanosis – or failure to observe/ recall	The episode is transient and self-limiting, and does not require specific treatment. It is not a contraindication to further doses of the vaccine.	Mainly DPT, rarely others	

APPENDIX 6.3: CASE DEFINITIONS AND TREATMENTS FOR AEFI

AEFI	Case definition	Treatment	Vaccine
Injection site abscess	Fluctuant or draining fluid-filled lesion at the site of injection. Bacterial if evidence of infection (e.g. purulent, inflammatory signs, fever, culture), Sterile abscess if no evidence of bacterial infection on culture. Sterile abscesses are usually due to the inherent properties of the vaccine.	Incise and drain; Antibiotics if bacterial.	All injectable vaccines
Lymphadenitis (includes Suppurative lymphadenitis)	Either at least one lymph nodes enlarged to >1.5 cm in size (one adult finger width) or a draining sinus over a lymph node. Almost exclusively caused by BCG and then occurring within 2 to 6 months after receipt of BCG vaccine, on the same side as inoculation (mostly axillary).	Heals spontaneously over months and best not to treat. If lesion is sticking to skin or already draining, surgical drainage and local instillation of anti-tuberculosis drug. Systemic treatment with anti- tuberculosis drugs is ineffective	BCG
Osteitis/ Osteomyelitis	Inflammation of the bone with isolation of Mycobacterium bovis BCG strain.	Should be treated with anti- tuberculosis regimens including isoniazid and rifampicin.	BCG
Persistent inconsolable screaming	Inconsolable continuous crying lasting 3 hours or longer accompanied by high-pitched screaming.	Settles within a day or so; analgesics may help.	DPT, Pertussis
Seizures	Occurrence of generalized convulsions that are not accompanied by focal neurological signs or symptoms. Febrile seizures: if temperature elevated >100.4 °F or 38 °C (rectal) Afebrile seizures: if temperature is normal	Self-limiting; supportive care; paracetamol and cooling if febrile; rarely anticonvulsants.	All, especially Pertussis, Measles
Sepsis	Acute onset of severe generalized illness due to bacterial infection and confirmed (if possible) by positive blood culture. Needs to be reported as possible indicator of Program error.	Critical to recognize and treat early. Urgent hospitalization for intravenous antibiotics and fluids.	All injectable vaccines
Severe local reaction	 Redness and/or swelling centered at the site of injection and one or more of the following: Swelling beyond the nearest joint Pain, redness, and swelling of more than 3 days Requires hospitalization. Local reactions of lesser intensity occur commonly and are trivial and do not need to be reported. 	Settles spontaneously within a few days to a week. Symptomatic treatment with analgesics. Antibiotics are inappropriate.	All injectable vaccines
Toxic shock syndrome (TSS)	Abrupt onset of fever, vomiting and watery diarrhoea within a few hours of immunization. Often leading to death within 24 to 48 hours. Report as a possible indicator of program error.	Critical to recognize and treat early. Urgent hospitalization for intravenous antibiotics and fluids.	All injectable vaccines

APPENDIX 6.4: RECOGNITION AND TREATMENT OF ANAPHYLAXIS

Anaphylaxis is a very rare (estimated as once every million doses of vaccine given) but severe and potentially fatal allergic reaction. When anaphylaxis does occur, the patient must be diagnosed properly, treated and managed urgently by trained staff and transferred to a hospital setting.

Recognition of anaphylaxis

Anaphylaxis is a severe reaction of rapid onset (usually 5-30 minutes after the injection) characterized by circulatory collapse. The early signs of anaphylaxis are generalized erythema and urticaria with upper and/or lower respiratory tract obstruction. In more severe cases, limpness, pallor, loss of consciousness and hypotension become evident in addition. Vaccinators should be able to recognize the signs and symptoms of anaphylaxis in the box below. In general, the more severe the reaction, the more rapid the onset. Most life-threatening reactions begin within 10 minutes of immunization. *Keep the vaccinee under observation for at least 20 minutes after the injection.*

Unconsciousness is rarely the sole manifestation of anaphylaxis - it only occurs as a late event in severe cases. A strong central pulse (e.g. carotid) is maintained during a faint, but not in anaphylaxis. Anaphylaxis usually involves multiple body systems. However, symptoms limited to only one body system (e.g., skin itching) can occur, leading to delay in diagnosis. Occasional reports have described reactions where symptoms recur 8 to 12 hours after onset of the original attack and prolonged attacks lasting up to 48 hours.

Clinical Progression	Signs and symptoms of anaphylaxis				
Mild, Early Warning Signs	Itching of the skin, rash and swelling around injection site. Dizziness, general feeling of				
	warmth				
	Painless swellings in part of the body e.g., face or mouth. Flushed, itching skin, nasal				
	congestion, sneezing, tears.				
	Hoarseness, nausea, vomiting				
▼	Swelling in the throat, difficulty breathing, abdominal pain				
Late, Life-threatening Symptoms	Wheezing, noisy, difficult breathing, collapse, low blood pressure, irregular weak pulse				

Treatment of anaphylaxis

Once the diagnosis is made, **consider the patient as being in a potentially fatal condition, regardless of the severity of the current symptoms.** Begin treatment immediately and, at the same time, make plans to transfer the patient swiftly to hospital (if not already in a hospital setting). Adrenaline (epinephrine) stimulates the heart and reverses the spasm in the lung passages, and reduces edema and urticaria, thus countering the anaphylaxis. But this very potent agent can cause irregular heartbeat, heart failure, severe hypertension, and tissue necrosis if used in inappropriate doses.

Each vaccinator who is trained in the treatment of anaphylaxis should have rapid access to an emergency kit with adrenaline, and be familiar with its dosage and administration. The expiry date of the adrenaline should be written on the outside of the emergency kit and the whole kit should be checked three or four times a year. Adrenaline that has a brown tinge must be discarded.

Steps in initial management

If already unconscious, place the patient in the recovery position and ensure the airway is clear.

Assess heart rate and respiratory rate (if the patient has a strong carotid pulse, he/she is probably not suffering from anaphylaxis).

If appropriate, begin cardiopulmonary resuscitation.

Give 1:1000 adrenaline (see below for correct dose for age or weight) *by deep intramuscular injection* into the opposite limb to that in which the vaccine was given. (Subcutaneous administration is acceptable in mild cases).

And give an additional half dose around the injection site (to delay antigen absorption).

If the patient is conscious after the adrenaline is given, place his/her head lower than the feet and keep the patient warm. Give oxygen by face mask, if available.

Call for professional assistance but never leave the patient alone. Call an ambulance (or arrange other means of transport, *after* the first injection of adrenaline, or sooner if there are sufficient people available to help you.

If there is no improvement in the patient's condition within 10-20 minutes, of the first injection, *repeat* the dose of adrenaline up to a maximum of three doses in total. Recovery from anaphylactic shock is usually rapid after adrenaline.

Record, or get someone to record, vital signs (pulse rate, respiratory rate and blood pressure), as well as time and exact dose of any medication given. Make sure the details accompany the patient when he is transferred. Mark the immunization card clearly so the individual **never** gets a repeat dose of the offending vaccine. At a suitable moment, explain to parents or relatives the importance of avoiding the vaccine in the future.

Report the occurrence of anaphylaxis to the appropriate officer in the ministry of health by fax or phone when the clinical situation is dealt with.

Adrenaline dosage: 1:1000 adrenaline (epinephrine) at a dose of 0.01ml/kg up to a maximum of 0.5 ml injected intramuscularly (or subcutaneously in very mild cases)

If the weight of the patient is unknown, an approximate guide is:

Less than 2 years	0.0625 ml (1/16 th of a ml)
2-5 years	0.125 ml (1/8 th of a ml)
6-11 years	0.25 ml (1/4 of a ml)
11+ years	0.5 ml (1/2 of a ml)

Community Involvement and Communication

UNIT

LEARNING OBJECTIVES

- **1**. To describe the importance of community participation
- To identify possible roles that the community can play in supporting immunization services.
- **3**. To list the steps in involving the community including
 - Identifying the key stakeholders in the community and where they are located
 - Conducting a situation analysis by exploring reasons for left-outs and dropouts and possible solutions
 - Establishing mechanisms for coordination
 - Developing a communication plan
- To identify different communication channels and tools for communicating information on immunization.

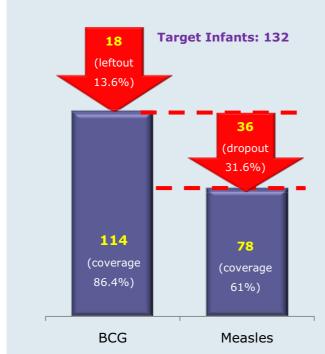

ommunity participation or "increasing demand"

gives the false impression that lack of motivation for immunization is the reason why children are not getting vaccinated. In reality, mothers are often very willing to have their children vaccinated, if convenient and good quality services are available. Community participation in the immunization program results in higher coverage, reduced left-outs and dropouts and ultimately reduction in the number of cases of VPDs because:

- an informed community has confidence in the immunization program and therefore supports and demands immunization services
- provision of immunization services is tailored to the community's context (time, place and convenience).

You serve many different communities, but are they your partners in the service? Do they have a voice in helping to make sure that immunization services meet their needs?

Who are the Left-outs and Dropouts?

Left-outs are children and women who do not utilize the immunization services for reasons including lack of knowledge, trust in immunization services or geographic and other reasons.

Dropouts are children who receive one or more vaccinations but do not return for subsequent dose.

Since there are varied reasons for leftouts and dropouts, they also require differing interventions (*See Tables 7.1 and 7.2*).

People who "drop out" of the immunization system are the easiest to reach and convince to return for full immunization.

Types of Communities

Communities can be classified as:

- Geographic (an urban mass; scattered rural dwellings; temporary homes built alongside railroad tracks.)
- Religious/ethnic/political
- Socio-economic (caste/class)

Communities are rarely, if ever, homogenous and are usually characterized by wide inequities (e.g. sections of a village or town where the poorest families live). It is important to recognize community differences and dynamics, and to interact with the various sections within the community.

The community's role in supporting immunization

Attempt to involve the community, as much as possible, in each phase of the immunization program- planning, implementation and evaluation.

Planning: HWs should consult communities about service locations and timing to ensure a convenient service (e.g. shifting vaccination hours from mornings to afternoons in areas where mothers are busy in the fields in the morning).

You may not have much time to directly interact with the various community groups and leaders. However, encourage and support HWs and supervisors in establishing strong links with the community. **Implementation**: Communities can assist with:

- arranging a clean outreach site (school, club, Panchayat Bhavan, etc.)
- publicizing immunization sessions (e.g. through announcements, messages from community volunteers, flags or banners at health centers or village sites that announce when immunization days are taking place)
- informing community members when the HW arrives at the session site
- registering patients, crowd-control, and making waiting areas more comfortable (by providing shade and organizing space and seating)
- health education disseminating appropriate messages
- identifying and referring newborns and/or infants who have recently arrived in the community and sharing the list with HW to include in the Immunization register
- motivating fellow community members to use immunization services to bridge cultural or educational gaps between HWs and caregivers. This is particularly important where knowledge of and participation in preventive services is low
- transporting vaccines and HWs
- identifying dropouts and left-outs, making home visits when children are behind schedule, to explain immunization and to motivate caregivers
- communicating with local people and informing HWs about suspected Vaccine-Preventable Diseases (VPDs) and Adverse Events Following Immunization (AEFIs)
- monitoring the immunization program by reviewing the coverage data with the health team

Evaluation: Community leaders can contribute by responding to questions about the quality of services.

Steps for involving the community

Step 1: Identify the key stakeholders in the community and where they are located. These could be:

- Governmental departments and Staff (Health, ICDS, Education, District/ Block Administration, PRI)
- NGOs and local organizations (Nehru Yuva Kendra, National Service Scheme)
- Professional Associations (Indian Medical Association, Indian Association of Pediatrics)
- Community (Parents, Village Health and Sanitation Committee, caste and religious groups, SHGs)
- Private and traditional health practitioners
- Media

Step 2: Conduct a situation analysis

- Identify well performing and poor performing areas in terms of data on vaccination session attendance and local coverage levels
- Assess through meetings, small group discussions or discussions with opinion leaders (See Appendix 7.1)
 - community awareness and perceptions about immunization services
 - perceived barriers to immunization (related to quality of immunization services and the community's knowledge, attitudes and practices)
 - issues affecting physical access to services (location, frequency, schedule)
 - access by special groups (minorities, migrants etc.)
- Explore the problems and possible reasons for left-outs and dropouts. Jointly seek possible solutions.
- Assess the current extent of community's involvement with immunization services and discuss possible community support.

Table 7.1: Reasons for Left-outs and Possible Interventions						
Possible Reasons	Possible Interventions					
All newborns and infants not identified and listed	Involve AWW/ASHA/TBA to identify and share lists of newborns and children with the HWs.					
Parents not motivated to immunize children because of their poor understanding of its purpose and importance	Orient community leaders and encourage them to talk to parents about immunization. Train HWs to provide talks and counseling on the importance of immunization. Teach about immunization in health fairs and other events. Use other Communication channels such as local cable television, Wall paintings and posters, Mosque and temple announcements.					
Session site too far away (e.g. border populations)	Include all the areas in the microplan. Reorganize the catchment area so that remote sites are visited at least once every two or three months (plan at least 4 immunization sessions a year). Work with neighboring health facilities to coordinate services for border areas. Improve outreach to communities through appropriate transport, additional staff and publicize outreach services.					
Refugees/ Families that fear contact with government (e.g. lack proper documents)/ scheduled castes or tribes/ unempowered poor Migrants/Nomadic groups/Homeless families/Urban slums/street children	Determine where these populations reside. Visit the communities and work with local mobilizers/educators and community groups/leaders to discuss reasons why they have never accessed immunization services. Use the opportunity to provide information on the importance of vaccination, the date, time and place of the nearest session. Develop a list of children who have never accessed immunization services in the area.					
Sessions too infrequent or timings and days not convenient/ not understood	Plan sessions after consulting the community (e.g. early in the morning/late evening).					
Cultural or Religious reasons for refusal of vaccination (myths, rumors and misconceptions)	Find out the reasons for reluctance by talking directly to communities/leaders. Try to address their misconceptions, doubts, and fears by listening to them and offering support. Involve community leaders, particularly the ones favorable to immunization, and other staff working within that particular community in order to encourage their fellow members to have their children immunized. Arrange for an interaction between resistant groups and satisfied beneficiaries in the area to promote immunization.					
Financial or gender barriers to immunization (e.g husbands disallow wives to attend sessions because of time/lost labor, expense and/or fear of side effects)	Counsel opinion leaders and influential persons about the danger of VPDs and the benefits of immunization. Encourage peer counseling by fathers of children who accept immunization. Publicize the fact that immunization services are entirely free.					

Table 7.2: Reasons for Dropou	Table 7.2: Reasons for Dropouts and Possible Interventions						
Possible Reasons	Possible Interventions						
HWs have not clearly explained to parents what vaccines are due, when they are due and why they are needed	Improve talks and counselling by reminding HW /AWW/ASHA to always tell 4 key messages (<i>See Appendix 7.2</i>) to mothers using simple language understood by parents. Teach HWs to provide filled in immunization cards to all beneficiaries and to write the next due date on the card. Ask caregivers to repeat the information given to them in order to increase the chance that they will remember when to return. Praise correct answers. Thank the parent for bringing the child. Publicize the immunization schedule.						
HWs do not know which children are due and what vaccines are due	Organize tracking of children using immunization registers, counterfoils and tracking bags. Involve community teams (AWW, ASHA, NGOs etc) and share with them the list of dropouts to remind parents about the importance of full immunization and inform them about the date and time of the next session.						
HWs have not shown parents respect or conveyed an interest in the child's health (e.g. long waits, HWs shouting at mothers for forgetting the card or bringing the baby in late)	Guide HWs to visit dropouts before the next session to find out the reasons why they missed the session. Sensitize and train HWs, ASHAs and AWWs to communicate with and treat parents with respect, warmth and friendliness. Show concern for the parents' particular situation. Praise and encourage the parents for bringing their children for immunization. Encourage parents to ask questions.						
Parents do not return because sessions are not held as planned or vaccines are unavailable	Ensure that each planned immunization session is held despite holidays and in case of HW's leave, by alternate vaccinators. Ensure alternate delivery of vaccines to session sites Encourage community groups to report problems regarding HW's attendance on session days to the PHC. Conduct session monitoring and make real improvements; then publicize the improvements to communities. Ensure adequate supplies of vaccines and logistics.						
AEFI in the community discourages parents to immunize their children	Remind HWs to always tell mother/care-givers about common side effects that may occur and what to do should they occur. Investigate the AEFI and apprise community of the details of the case, possible causes and actions taken.						
Children and mothers are not immunized when coming to the HWs for curative care (missed opportunities)	When providing other services, always keep an eye out for eligible children visiting the session with a parent or sibling. Ask about their immunization status or refer to the list of due beneficiaries and provide services, as appropriate. Put a reminder about immunization in the facility's waiting area.						
HWs do not understand/explain to caregivers that immunization may be given to mildly ill children (false contraindication)	Orient HWs that immunization can be safely provided to mildly ill children and that they should convince parents about this fact.						

Step 3: Establish mechanisms for coordination

Establish a consultative mechanism at the block/PHC level or use existing forums such as the Rogi Kalyan Samitis to ensure regular coordination between departments and to enlist community support for immunization services.

- Involve representatives of the key stakeholder groups (Listed in Step 1)
- Inform the members well in advance and prepare a clear agenda for the meeting including:
 - State and district immunization goals
 - Current status of immunization in the district and block
 - Key challenges and areas requiring support
 - Possible roles of stakeholders
 - Preparing and implementing a communication plan

If required, re-align Health and ICDS sector boundaries for joint planning, implementation and monitoring of immunization activities.

Step 4: Develop a communication plan

The plan should broadly address the following issues.

- The communication activities in response to specific problems in the immunization program
- The personnel and resources required
- Timeline for implementation
- Monitoring mechanisms.

Based on the prioritization of areas described in *Table 9.4*, prepare a communication plan as outlined in *Table 7.3*.

Sub-	Problem	Reasons	Community	Participants	Responsible	Resources	Time-	Monitoring
center		involvement Person		Person	needed frame		tools	
			activity					
Arthuna	55% left-	Session time	Meeting with	Community	PHC Health	Refreshments	Next	Minutes of

			of vaccines		МО			

Channels and tools for communicating information on immunization

The Immunization Program uses many different communication methods to reach parents and other target audiences e.g. radio, television, folk media, community meetings, and interpersonal communication during sessions. At the PHC level, you can effectively use the channels and tools for involving and informing the community about immunization services. (*See Table 7.4*)

Table 7.4: Channels and tools for communicating information on immunization								
Communication Channel or Tool	Settings	Objectives						
Discussions between HWs and small groups of parents	Immunization sessions	Inform parents (using storyboards or flip charts) about importance of immunization, the immunization schedule and clarify individual concerns						
community mobilizers (ASHAs and AWWs)	Immunization sessions, home visits	Identify target beneficiaries and share lists with HWs. Make home visits to mobilize beneficiaries, inform about session dates and times and follow up dropouts.						
local leaders such as PRI members, political/religious leaders, teachers, private medical practitioners	Work places or community events	Advocate for increasing immunization coverage and seek their support in mobilizing the community						
Community Groups, NGOs, CBOs, SHGs	Work places or community events	Advocate for increasing immunization coverage and seek their support in mobilizing the community						
Public/ Street announcements	Town criers, community events	Provide basic information in support of immunization and publicize date and time of session						
Drama and Songs	As a precursor to discussion in community meetings	Counter rumors, misconceptions, and other barriers to understanding Provide basic information (e.g. on RI schedule)						
Posters, Banners, Tinplates and Wall writing	Well-frequented places such as AWC, markets, bus stops, ration shops, school, Panchayat Bhawan	Display information related to the session site, date, and immunization schedule						
Community Self- Monitoring Tools –"My Village is my Home". (<i>See Appendix 7.3</i>)	AWC, Panchayat Bhawan, school	Motivate and remind families to get their children immunized.						

Table 7.4: Channels and tools for communicating information on immunization

In most situations, one-to-one, interpersonal communication is best when providing specific information

APPENDIX 7.1: HOLDING AN EFFECTIVE COMMUNITY MEETING

- Hold at a convenient time and place (e.g. on market days or close to places of worship)
- Be prepared with analyzed data on the coverage and dropout rates, a map of the health areas with low coverage
- Identify local community representatives who would participate in the meeting
- Provide a comfortable and welcoming environment for the discussion.
- Listen to the community, find out what the community already knows about vaccine-preventable diseases and immunization
- Provide information, using basic language and non-scientific terminology, on the importance of immunization, the status of the immunization program and where and when services are available. Dispel misinformation and doubts that sometimes surround immunization
- Encourage them to ask questions so that everyone can be better informed.
- Use stories, short plays, songs and visual aids to hold the group's attention and make meetings interesting
- Involve as many group members as possible in the discussion and ask them to suggest solutions to problems
- Help mobilize resources for immunization

APPENDIX 7.2: FOUR KEY MESSAGES FOR CARE GIVERS

...remind parents of 4 key messages

• What vaccine was given and what disease it prevents

• When to come for the next visit

• What are the minor sideeffects and how to deal with them

• To keep the immunization card safe and to bring it along for the next visit

remember: fully immunize each child before its first birthday

Supportive Supervision

LEARNING OBJECTIVES

- **1**. To follow the key steps for effective supportive supervision
- 2. To conduct effective review meetings

upportive supervision is a process of helping staff to continuously improve their own work performance. It is carried out in a respectful and non-authoritarian way with a focus on using

supervisory visits as an opportunity to improve the knowledge and skills of health staff.

This type of supervision encourages open, two-way communication and builds team approaches that facilitate problem-solving. It focuses on monitoring performance towards goals and using data for decision-making. It depends upon regular follow-up with staff to ensure that assigned tasks are being implemented correctly.

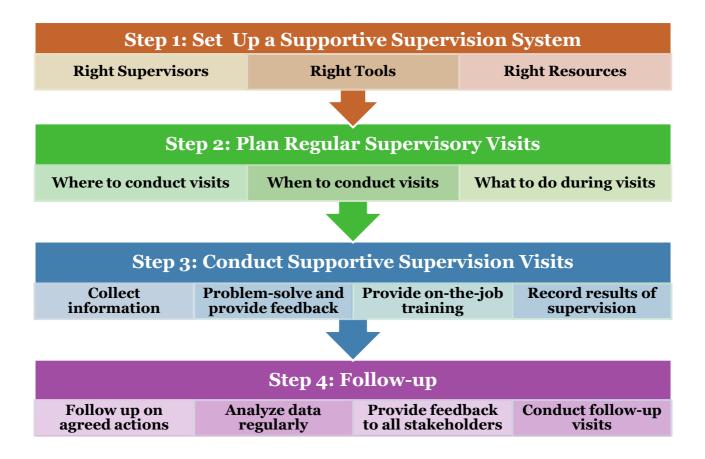

Supportive supervision is helping to make things work, rather than checking to see what is wrong.

Controlling Supervision versus Supportive Supervision

Traditionally, many supervisors used an authoritarian inspection or control approach to supervision. This approach is based on the thinking that health workers are unmotivated and need strong outside control to perform correctly. However, it has been shown that a supportive approach, where supervisors and health workers work together to problem-solve and improve performance, delivers improved results for the immunization program. *Table 8.1* compares the characteristics of the control approach and the supportive approach.

Та	Table 8.1: Controlling Supervision versus Supportive Supervision							
Co	ontrol approach	Supportive approach						
•	Focus on finding faults individuals.	with	 Focus on improving performance and building relationships. 					
-	Supervisor is like a policeman.		 More like a teacher, coach, mentor. 					
•	Episodic problem-solving. Little or no follow-up.		 Use local data to monitor performance and solve problems. 					
•	Punitive actions intended.		Follow up regularly.Support provided.					
			05					

Steps for Conducting Supportive Supervision

Step 1: Set Up a Supportive Supervision System

The three main "Rs" for an effective supportive supervision system are as follows.

Right Supervisors: a core set of supervisors, well-trained on supportive supervision techniques and with updated information and skills on immunization issues. As the supervisors will be providing on-the-job training to health workers, it is important that the supervisors are themselves well informed and trained. As an initial step, provide refresher training for the core supervisors. The training could be on new policies or reporting procedures, changes to the immunization schedule etc or on supportive supervision techniques and participatory approaches.

Right Tools: availability of Supervisory checklists and forms (for recording observations, recommendations and follow up) and training materials and job aids (to update skills of health workers during supervision visits).

Right Resources: sufficient mobility, time allocated for supervision and follow-up.

Step 2: Plan Regular Supportive Supervision Visits

Regular supportive supervision visits are an integral part of the micro-plan and include

Where to conduct visits: Common criteria that can be used for selecting priority areas include:

- high number of unimmunized (in absolute numbers)
- high dropout rates
- Iow coverage rates
- poor reports from previous supervision visits
- areas with recent outbreaks of measles/AEFI cases; high risk areas for diphtheria, tetanus or measles
- new staff who may need training on immunization practices
- areas with little or no visits in the past
- problems identified by health staff or the community

When to conduct visits: Once you have prioritized areas to be visited over the next quarter/year, prepare a Plan for supervision (*See Table 3.3 in Unit 3*) with at least 4-8 visits planned per month. Consider the following issues:

- Plan visits on immunization session days.
- Supervise both fixed as well as outreach sessions.
- Inform the health worker about the scheduled supervision visit and never go without informing.
- Prepare the supervision plan taking into account the distance, transportation difficulties, or constraints due to weather and travel conditions.
- Schedule enough time to visit the site fully, and if possible provide on-site training; for example it may take two hours or more to meet the needs of a single supportive supervision visit.
- Carry checklists and practical tools/Job aids to provide on site training.

Conduct the visit according to the plan, otherwise inform the health worker in advance. Analyze your planned visits versus held visits and record the reasons for not holding any visit as planned (e.g. lack of transport, competing priorities). The frequency of supervisory visits will vary and poorly-motivated staff, new health centers, new staff or new responsibilities will require more frequent supervision.

What to do during visits: Although certain topics can be planned in advance, interventions may become evident during the visit or during discussions with health workers. Review data of the site, previous supervision reports, filled checklists and data for that PHC/ session site to identify the topics to cover during the visit.

Step 3: Conduct Supportive Supervision Visits

During a supervisory visit to a health facility or a session site, conduct the following main steps.

Collect information: Explain the purpose of your visit and use the supervision checklists (*See Appendices 8.1 and 8.2*) to:

- observe the health-facility environment and the health worker giving vaccination;
- review the adequacy of vaccines & logistics
- review the records
- talk with parents and community members;
- review recommendations from past visits;
- conduct a rapid community survey using the Rapid Immunization Coverage Assessment Tool (See Appendix 8.3)

Do not intervene or correct the health worker while she/he is working (unless you feel that the beneficiary will be harmed without your intervention).

Problem-solve and provide feedback:

Describe the problem and its impact

- Focus on the problem and not individuals.
- Tackle one problem at a time.
- Explain the long-term and short-term impact of the problem.
- Be specific in explaining the problem. If possible, back it up with facts, rather than judgment alone.

Discuss the causes of the problem with health staff

- Identify the cause of the problem by asking "why" repeatedly and having open dialogue with the staff. Is it due to lack of skills or to an external factor?
- Do not blame others or blame the system.
- It may sometimes be necessary to seek explanation from other sources (e.g. community members, data, etc.).

Implement solutions and monitor regularly

- Develop, through common consensus, an implementation plan that details what, how, who and when.
- Implement those solutions that can be implemented immediately e.g. training on how to use hub cutter.
- Follow up on progress.

Provide feedback to the health staff concerned

- If you have some bad behavior to comment on, begin with the positive, and be specific about weaknesses, rather than simply saying, "That was not done well".
- Give health workers reasons for their success or failure. Don't just say "Well done". Give a reason saying, "Well done. You correctly read the VVM and took the appropriate action." Don't say "you are wrong" but rather "there may be a problem. The data from your tally sheet do not match the data in the UIP reporting format. How can this be corrected?"

Provide on-the-job training: by following the main steps

when teaching a skill:

- 1. Explain the skill or activity to be learned.
- 2. Demonstrate the skill or activity using an equipment, model, or role-play.
- 3. Allow health workers to practice the demonstrated skill or activity.
- 4. Evaluate the health workers' ability to perform the skill according to the correct procedure and give constructive feedback.

Record results of supervision

After each supervisory visit, prepare a supervisory report with a file copy. This report is vital for planning corrective measures as well as for use in future supervisory visits. The sample Supervisory Visit Report (*Table 8.2*) summarizes the key points from a supervisory visit and meeting.

Table 8.2: Sample Report of Supervisory Visit									
Site: Aajna PHC	Garhi	Date of visit: 8	3.03.08	District: Banswara					
Summary: 1. Used supportive supervision checklist (attached) for observing an outreach immunization									
session and for conducting 2 exit interviews with mothers 2. Used Rapid Immunization Coverage Assessment Tool (attached) to interview 10 ST families living on the outskirts to find out immunization status of their children. 3. Discussed and reviewed with health worker and provided on the job training.									
Problems identified	Sol	ution(s)	By whom	By date	Completed-Y/N				
Wrong injection technique		nonstrate rect technique	МО	8 Mar.	Y				
HW does not know how to the Coverage Monitoring ch		site training on of chart	МО	8 Mar.	Y				
Vaccine carrier had a crack	Rep	lace VC	МО	14 Mar.	N				
<i>ST children under-vaccina due to poor tracking</i>	AW and	olve ASHA, W to identify ' mobilize ALL eficiaries	MO and CDPO	31 Mar	N				
Signature of Supervisor: Dr Geeta Joshi, MOIC			Dat	e: 8 Marc	h 2008				

Step 4: Follow-up

Supportive supervision does not end with the conducted visit and you should plan for follow-up, which may include the following:

Follow up on agreed actions by supervisors and supervised staff

Analyze data regularly and establish regular communication with supervised staff to see if recommendations are being implemented.

Review monthly reports and establish regular communication with supervised staff to see if recommendations are being implemented.

Provide feedback to all stakeholders discussing equipment supply and delivery problems with higher levels **Conduct follow-up visits**

- Review reports from previous supervision visits and continue to work on the issues raised. Tell health workers what you have learned from the previous visit, in order to avoid repeating the same information
- Observe health workers to see if bad behaviours or attitudes have been corrected and, if it is the case, congratulate them. Check if any perceived lack of improvement is due to hidden problems that need to be addressed.
- Fulfill promises made at the previous visit (i.e. if supplies or other support had been promised).

Conducting Effective Review Meetings

In order to conduct effective review meetings with health workers and staff from other line departments, NGOs and community members, you should:

Involve Health and ICDS supervisors, AWWs, local NGOs. The meeting could be chaired by Medical officer or any other Block level officer

- Set clear objectives for the meeting.
- Prepare and circulate an agenda with the list of the topics to be covered; resources required and the time duration.

Do not deviate from the agenda and ensure that set objectives are met. (*See Table 8.3*)

- Assign, to concerned supervisors and colleagues, talks on specific technical topics.
- Assign responsibilities of logistics support to a designated staff member.
- Identify the meeting participants and the chairperson.
- Inform the participants in advance of the venue and date. To avoid cancellation of the meeting due to competing priorities, share in advance the dates of meeting at Block / District level and with other nodal officers. Otherwise, delegate the responsibility of chairing the meeting to another colleague.
- Ensure that the meeting is focused and participatory and not just collection of monthly reports. Keep listening and summarizing the key points raised after intervals.
- Ensure that minutes are taken with actionable points and time-lines.
- Forward unresolved issues to block/district level for necessary actions.

Table: 8.3: Sample	Table: 8.3: Sample Agenda for PHC Review Meeting of HWs & ICDS Supervisors											
Time	Activities	Facilitators										
10:00 - 10:15	Welcome & objectives of the meeting	MOIC										
10:15 - 11:15	ANM wise presentation on immunization coverage, dropouts & left-outs using coverage monitoring charts	LHV										
11:15 - 11:45	Feedback on supervisory visits & monitoring data	ICC/Health Supervisors/Partners										
11:45 - 12:30	Review of immunization register, Sub center reports. Sharing and updating of Health and ICDS Registers	CDPO, MOIC, ICC										
12:30 - 13:00	Feedback on ASHA/AWWs/other community mobilizers' involvement for mobilization of beneficiaries	MOIC/CDPO/BDO										
13:00 - 13:15	Summary and conclusion	MOIC										

Share the tentative dates of the next meeting.

Records, Reports and Using Data for Action

LEARNING OBJECTIVES

- To list immunization-related recording and reporting formats and describe their use.
- 2. To identify and solve common issues related to RI records and reports.
- **3**. To explain the use of Routine Immunization Monitoring System (RIMS) and monitoring charts.
- To analyze routine coverage data to identify problems of access and utilization.
- To develop an appropriate action plan for the sub-Center and PHC/UHC levels.

ecords focus on collecting details of beneficiaries, vaccination status, visit dates and the number of cases of VPDs and AEFIs. These remain with the individual collecting the information and are

usually meant for action at that level.

Reports, on the other hand, are based on records and are submitted to higher levels of program management. Both types of documents provide immunization program managers and health workers with a continuous flow of information that tells them:

- whether RI services are reaching the target population,
- what proportion of the target population is being vaccinated
- who is not being vaccinated
- what is the quality of the services
- are resources being used efficiently and
- is there any reduction in VPDs and AEFIs.

Figure 9.1 shows the records maintained and reports generated at each level of the immunization program.

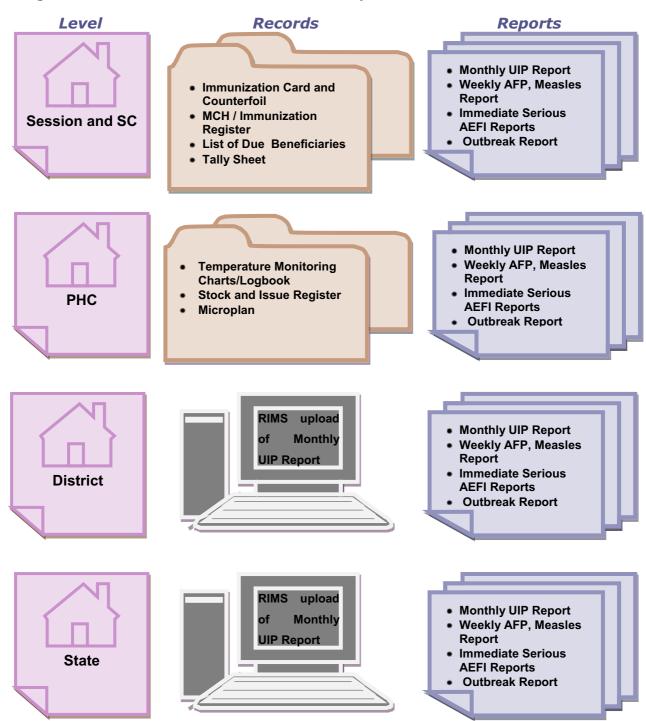

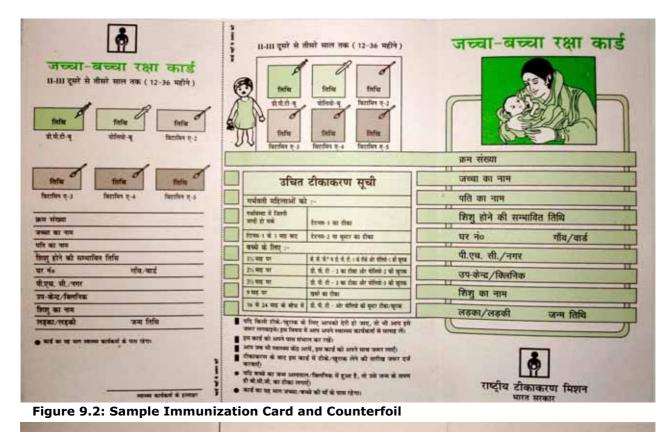

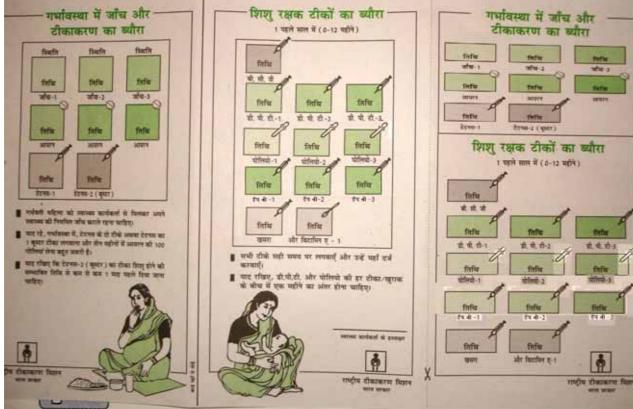

Figure 9.1: Immunization-related Records and Reports

Records

Immunization Card and Counterfoil (Figure 9.2)

Data Collected	Uses
 unique identification number name of mother, father/ husband date of ANC expected date of delivery residential address, name of PHC/UHC and SC/Clinic name of Infant infant's sex date of birth date of each vaccination and vitamin A supplementation by dose TT vaccination provided to the motherz 	 Enables the health worker to monitor an individual pregnant woman and child's progress towards full immunization. Reminds the caregiver which vaccines have been given and which vaccines are due Provides information about vaccination status if the beneficiary is from another area.
Common Problems	Solutions
Cells in the immunization card are left incomplete	During supervision visits, check cards to see if all cells are filled correctly and completely
The child's age is entered in the card instead of the date of birth	Train HWs to calculate and note at least the approximate date of birth
The card's serial number does not tally with that of the MCH/ immunization register	Ensure that HWs assign a unique running number such as ECR survey number or ANC number
Often counterfoils are not filled at all or not stored and filed correctly	Train HWs in the correct use of tracking bags for filing counterfoils and tracking dropouts

Tracking Bag

A cloth tracking bag, comprising of fourteen pockets, is a simple, easy- to- use tool for follow up of beneficiaries by filing counterfoils of Immunization cards. It provides the basis for preparing a session-wise name-based list of due beneficiaries for sharing with the AWW /ASHA/Mobilizer and helps estimate the logistics required. Provide one tracking bag for every SC / village / urban area.

The first twelve pockets indicate each of the twelve months of the year.Figure 9.3: Sample Tracking BagCounterfoils are filed in the pocket

indicating the month when the next vaccine is due. For example, if a child receives DPT1 in January, DPT2 is due in February. Therefore, the counterfoil is updated and placed in the pocket for February. When the DPT2 dose is given in February, the counterfoil is updated and moved to the pocket for March, when DPT3 is due. The thirteenth pocket is meant for placing counterfoils of beneficiaries who have left the HW's catchment area or have died. The fourteenth pocket is for filing counterfoils fully of immunized children.

At the end of each month, cards

remaining in the pocket for that month represent dropouts who need to be followed up or moved in the next month's pocket. In the absence of a tracking bag, counterfoils for each month can be tied with rubber bands and labelled.

MCH/Immunization Register (Table 9.1)

Data Collected	Uses
 Name and other details of beneficiary EDD/ Date of Birth Vaccines administered and dates of visit 	 Records doses given to each beneficiary Helps track beneficiaries who are due for vaccination
Common Problems	Solutions
Standard printed registers are often not available and handmade registers of uneven quality are used.	Ensure that printed registers are available in adequate quantities
Data entered is often incomplete	Ensure that registers are filled on the basis of counterfoils after every session and check registers periodically to see if all columns are filled correctly and completely
Even when a beneficiary returns for a subsequent dose, a fresh entry is made, leading to repetition, additional work and confusion.	Guide HWs to allocate different pages of the register to different session sites. This would help the HW to easily locate the data of beneficiaries returning for subsequent vaccinations.
	Also, train HWs to NOT create a new entry in the register each time the mother returns with the infant for immunization. HWs should ask the mother for the immunization card and look for a corresponding entry in the register. If the immunization card is not available, they should ask the mother the age of her infant and details of the first immunization to locate and update the infant's entry in the register.
The register is not updated to reflect new pregnancies and births found in the AWW's Pregnancy and Birth Register or newborns identified during Polio SIAs.	Advise HWs to periodically update registers before every session to include new pregnancies and births, including those identified during SIAs. Use joint sector-level review meetings of AWWs and HWs to share information about new pregnancies and births in the AWW's area.
The entries do not tally with the AWW's beneficiary register	Ensure that HWs facilitate updating of AWWs' registers after every session

Data Collected	Uses			
 Names of beneficiaries due for each vaccine for that session Antigen-wise coverage by gender, age for every session Vaccines and syringes issued and consumed 	 Enables the mobilizer to track individual children who are due for vaccination on a particular session day Copy of the same enables the health worker to document an immunization session by recording every dose of vaccine given Serves as a basis for monitoring the performance of the health worker and the mobilizer for allowing comparison between the number of beneficiaries actually vaccinated against the expected number of beneficiaries 			
Common Problems	Solutions			
The list of due beneficiaries is rarely prepared and shared with mobilizers. Instead, mobilizers rely on chance visits or their memory to mobilize beneficiaries.	Encourage HWs to use counterfoils in tracking bags and MCH register to prepare the list of due beneficiaries, for sharing with the AWW/ ASHA /Mobilizer for mobilizing beneficiaries to the session site.			
Beneficiaries who did not attend the session are not identified for follow-up.	Encourage HWs to cross check the list of due beneficiaries with the remaining counterfoils at the end of the session. This helps to evaluate the effectiveness of the mobilization and follow-up of dropouts.			
The sheet is not used at all or the same sheet is used for more than one session	Ensure the use of a new tally sheet for each session, whether fixed or outreach			
Entries are made before the vaccine is administered, leading to incorrect reporting	Instruct HWs to administer the dose first and then enter data in the tally sheet			
Tallies are made based on the number of doses remaining in the used vials at the end of a session rather than on actual number of beneficiaries vaccinated.	Explain to HWs that this method leads to inaccuracies such as inclusion of wasted doses and an over-reporting of actual coverage.			
Doses administered to those over 1 year are entered in the less than 1 year age group, leading to inaccurate figures.	Periodically cross-check tally sheets with immunization registers to identify inaccuracies in recording of data.

Temperature M	onitoring Charts	(See Figure 4.7)
----------------------	------------------	------------------

Data Collected	Uses
 A daily record of ILR/DF temperature and Powers breaks, if any. 	 Helps monitor the cold chain
Common Problems	Solutions
 The charts are not filled regularly and correctly due to: Absence of individual charts for each ILR/DF Lack of functional thermometers Inability to correctly read and record temperatures Non-recording during weekends and holidays Hiding instances of out of range temperatures 	 Ensure that each ILR/DF has a functional thermometer and a separate temperature monitoring chart attached to it. Train cold chain handlers in the importance of these charts and in correct data entry. Also emphasize the necessity of recording data regularly, even during weekends and holidays. Regularly cross check temperatures recorded in the chart with actual temperatures in the ILR/DF.
 Temperature ranges in the chart are not analyzed 	 Regularly check the chart to identify problems and to take corrective action.

Stock Register (See Appendix 4.4)

Data Collected	Uses
 Opening balance, vaccines received, vaccines issued and used Dates of receipt and issue VVM/Freeze Status, expiry dates, batch numbers 	 Ensures that vaccines are used before their expiry date and that there are no stock-outs, or over-stocking. In case of a serious AEFI, allows tracking of the vaccine (manufacturer, batch number etc)
Common Problems	Solutions
 Since the register is not updated regularly it leads to overstocking, shortage of storage space or stock- outs 	 Ensure that the register is updated for every transaction. Conduct a monthly inventory and accordingly adjust the entries
 Entries regarding expiry date, VVM and batch number are often incomplete 	 Routinely check the stock register for completeness of entries.

REPORTS

Monthly UIP Report (See Figure 9.4)

Data Collected	Uses					
 Target beneficiaries Sessions planned vs held Sessions with Alternative Vaccine Delivery Mobilizers engaged to mobilize children Sessions with Alternate/private vaccinators Coverage by sex, age VPDs and AEFIs Additional data collected at the PHC includes: Vaccines, logistics and cold chain status 	 Contains critical data for every level (Sub-center; PHC/CHC/Reporting unit; district and State) on each component of the immunization system. 					
Common Problems	Solutions					
Annual targets, either not mentioned or inaccurate	Ensure HWs conduct CNA to arrive at correct estimate of beneficiaries					
Columns are left incomplete or are incorrectly filled	Routinely check reports for completeness and accuracy					
Since the report is based on data from either the tally sheet or MCH register, it merely aggregates inaccuracies recorded in them. Often the aggregation of data from various tally sheets itself is incorrect.	Routinely validate that data reflected in this report is based on correctly filled tally sheets (ideally) or MCH register. Also ascertain that the aggregation of data from various tally sheets is correct.					
VPDs and AEFIs are not reported	Explain to HWs the importance of promptly reporting VPDs and AEFIs and reassure them that no punitive action will result.

Management of Data

Data collected from monthly reports and other sources needs to be consolidated, stored and managed at each level. You need to check both:

Q	uality of Individual Reports	Quality of the Reporting System
•	Accuracy: miscalculation or	1) Completeness of reporting
	misplacement of figures	reports received x 100
•	Consistency of data: with what is	
	expected (based on previous	2) Timeliness of reporting
	experience)	reports received on time x 100
•	Completeness of all entries	reports expected

Maintain a chart that records timeliness and completeness of monthly reports from PHCs/SCs for tracking purposes (*See Table 9.3*). Late reports should not be rejected or ignored. Instead they can be submitted as an addendum to the monthly report or included in the next monthly report, with an explanatory note specifying the month of the data.

Tools for monitoring data

It is not very important as to 'what data you have.' It is more important as to 'what you do with the data you have' for planning, identifying the deviations from plans and taking corrective actions (monitoring and evaluation). The tools described below help in using the data efficiently and effectively.

Coverage Monitoring chart

This chart has been developed to track the coverage of infants on a month-by-month basis against the target population (left-outs). It also helps to determine whether the beneficiaries are completing the series of vaccines (dropouts). Ensure that the chart is prepared for each level (sub-center upwards), using the data for that particular level. Moreover, each chart should be displayed and updated regularly.

How to prepare a coverage/dropout monitoring chart

The following steps will help you prepare a chart for monitoring the number of doses administered and dropouts in infants less than one year of age.

Step 1: Write down the annual target population to receive immunization services of infants less than one year of age.

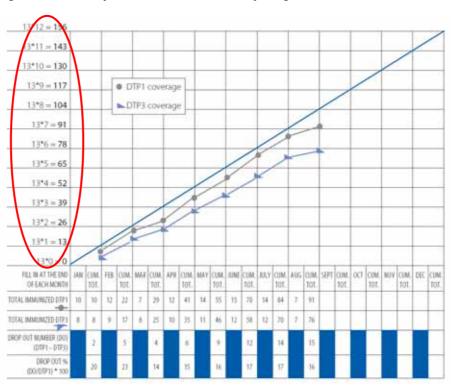

The annual target population is based on the annual/biannual headcount of the total number of infants in the catchment area (SC/PHC/CHC etc).

Step 2: Calculate the monthly target population of infants. To calculate the number of children who should be vaccinated each month (i.e. the monthly target population), divide the annual target population by 12.

For example: If the annual target under one year is 156, the monthly target is 156/12 = 13. That

means each month 13 infants should be vaccinated: 13 in April, another 13 in May, another 13 in June, etc. Step 3: Label the chart. Always ensure that the chart has a title, usually written across the very top so that it does not obscure the chart. For example: DPT1 and

DPT3 doses administered and dropouts in infants

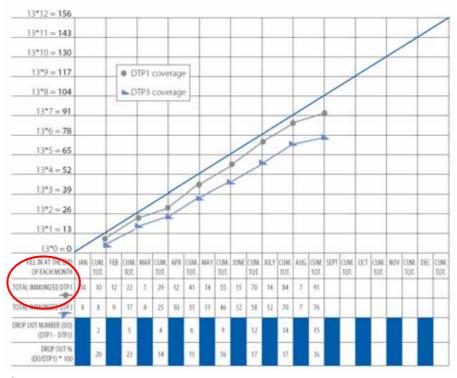

less than one year of age – Kushalgarh SC – 2008

Label the left side (Y axis) of the chart with the 'cumulative' monthly target, i.e. the increasing number of children that are targeted each month.

For example: If the monthly target is 13, the cumulative target for April will be 13; for May it will be 26 (13 + 13); for June it will be 39 (13 + 13 + 13); for July it will be 52 (13 + 13 + 13 + 13), etc.

Step 4: Label the boxes at the bottom with the name of the vaccine and dose that you are monitoring, e.g. DPT1 and DPT3, or BCG and Measles.

Step 5: Draw a diagonal line from zero to the top righthand corner to show the ideal coverage rate if every targeted

infant is immunized on time.

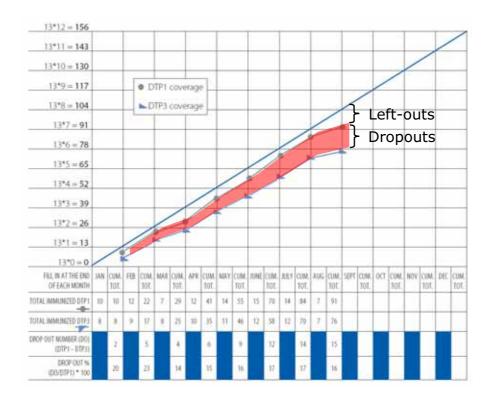

Step 6: Plot the immunization data on the chart. Locate the row of boxes underneath the graph. Locate the spaces for the month you are recording. Enter the monthly total of DPT1 doses given.

- a) Add the current month's total doses to the previous cumulative total to calculate the current cumulative total, and enter it on the right side of the month column you are recording.
- b) Make a dot on the graph for the cumulative total recorded on the right side of the month column you are recording.
- c) Connect the new dot to the previous month's dot with a straight line.
- d) Repeat Steps a to c every month until the end of the year.
- e) Plot DPT3 immunizations given in the same way as DPT1 (follow steps a to d).

Step 7: Calculate the total number of dropouts between DPT1 and DPT3 by subtracting the cumulative total for DPT3 from the cumulative total for DPT1.

Step 8: Calculate the cumulative dropout rate as follows:
Dropout Rate = DPT1 cumulative total minus DPT3 cumulative total x 100
DPT1 cumulative total

The left-outs for DPT1 can be visually monitored: it is the gap between the diagonal target line and the DPT1 line. Similarly, the dropouts can be seen: it is the gap (shaded pink) between the line of DPT1 and of DPT3.

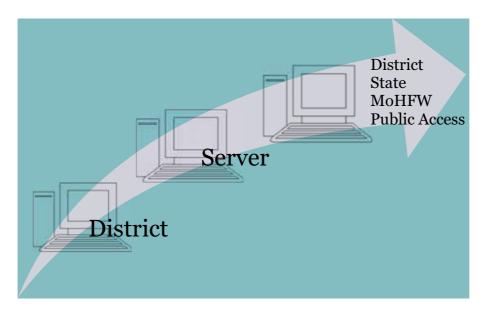

Routine Immunization Monitoring System (RIMS)

Late, incomplete and intermittent information about RI program inputs and performance hampers comparison across time and place and leads to poorly informed decision-making and implementation. Moreover, for a vast country like India, with reports received from a range of units, paper-based reports render the tasks of submission and analysis very difficult.

RIMS is a computerbased monitoring system that facilitates the regular and timely entry of immunization data from the PHC/block level to districts, states and at the national level and for generating analytical reports.

Therefore, GoI implemented the Routine Immunization Monitoring System (RIMS) a computer-based monitoring system that facilitates the regular and timely entry of immunization data from the PHC/block level to districts, states and at the national level and for generating analytical reports. The software has both offline and online components. RI data from monthly UIP reports from the district's reporting units is entered into the software at the district level by a designated computer assistant in the DIO's office. Additional information relevant at the district level (finance, etc) is also entered. Furthermore, data is entered at the state level by the computer assistant handling RI data. If entered offline, data is uploaded later to the national server at *www.rimsindia.org*. As this is an intranet system, unique user ids and passwords are required for all users. This data can be reviewed by immunization managers at district, state and national levels and various useful reports (graphs and maps) can be generated for taking corrective action. Data Flow in RIMS is as follows:

This data can be reviewed by immunization managers at district, state and national levels and various useful reports (graphs and maps) can be generated for taking corrective action.

Steps in Using Routine Data for Action

Step 1: Compile population and coverage data of the

last full financial year (See Table 9.4).

- List each SC, village or urban area covered (column a).
- List the headcount-based infant population (column b).
- Enter the number of doses of vaccine administered to the target age group during the last full financial year for DPT1 and DPT3 (columns c and d)¹⁷.

¹⁷ Coverage rates for estimating left-outs and dropouts can be calculated using various antigens. In this example, we have used DPT1 and DTP3. BCG and Measles can also be used similarly.

Table 9.4: I	Using	Routin	e Dat	a for Ac	tion					
Step:1 Cor and immun data of las	izatio	n cove	rage	Calc	p 2: ulate rage	Ster Anal prob	yze	4:Ide	ep entify plem	Step 5: Prioritize area
а	b	с	d	е	f	g	h	i	j	k
SC Name	Infant population	DPT1 Doses administered	DPT3 Doses administered	DPT1 Coverage (%)	DPT3 Coverage (%)	Unimmunized with DPT3 (No.)	DPT1 - DPT3 Drop- out rates (%)	Access	Utilization	Priority (1,2,3)
Kushalgarh	200	212	122	106%	61%	78	42%	Good	Poor	2
Talwara	133	125	89	94%	67%	44	29%	Good	Poor	4
Arthuna	125	56	26	45%	21%	99	53%	Poor	Poor	1
Jhalod	138	154	88	112%	64%	50	43%	Good	Poor	3
Partapur	46	36	26	78%	56%	20	28%	Poor	Poor	5

Step 2: Calculate Immunization coverage of DPT1 and

DPT3 (in columns e and f) using the following formula:

DPT1/ DPT3 coverage =

Doses of DPT1/DPT3 administered (column c/d) x 100 Target population < 1 year (column b)

Note: Kushalgarh SC and Jhalod SC have a higher number of children immunized with DPT1 than the infant population, possibly because of:

- incorrect estimation of the infant population
- including children older than 1 year of age in the infants vaccinated
- including children from other areas

The same reasons could also apply for negative DPT1-DPT3 dropout rates.

Step 3: Analyze the Problem. Calculate the number of infants unimmunized with DPT3 vaccine (in column g), using the following formula:

Unimmunized with DPT3 vaccine =

target population < 1 year (column b)*minus* DPT3 doses administered (column d)

Calculate (in column h) the annual dropout rate for DPT1-

DPT3 using the following formula:

Annual dropout rate for DPT1–DPT3=

Doses of DPT1 administered (column c) *minus* doses of DPT3 administered (column d) x 100 Doses of DPT1 administered (column c)

Step 4: Identify the problem (access or utilization?)

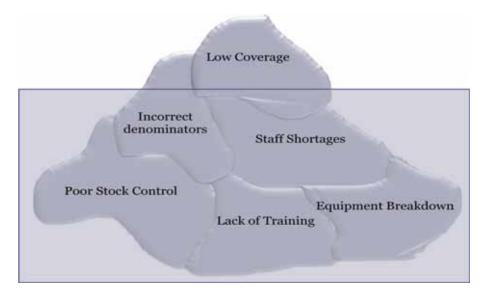

for each SC area using Table 9.5.

Table 9.5: Access or Utilizati	on Problem	
Coverage (DPT1)	Dropout Rates (DPT1-DPT3)
	Low (≤10%)	High (>10%)
High (≥80%)	Good access	Good access
	Good utilization	Poor utilization
Low (<80%)	Poor access	Poor access
	Good utilization	Poor utilization

Specify (in column i) the quality of access (good or poor) depending on the DPT1 coverage of 80% or more (good) or <80% (poor)

Specify (in column j) the quality of "utilization" (good or poor) depending on the DPT1-DPT3 dropout rates of 10% or less (good) or more than 10% (poor).

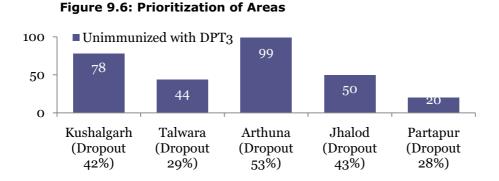

Any single problem identified through data review may just be a symptom of many underlying problems in the immunization system.

Step 5: Prioritize areas

Assign each SC with a distinct priority i.e. there should be no SC with the same priority. Give higher priority to areas with the larger absolute number of unimmunized infants, and not necessarily the higher dropout rates. As we can see in *Figure 9.6*, Arthuna SC which has the highest dropout rates (53%) and also the highest number of unimmunized infants with DPT3, naturally receives the highest priority i.e. priority 1. However, although Kushalgarh SC and Jhalod SC both have almost equally high dropout rates, Kushalgarh SC gets higher priority because it has a much larger number of infants unimmunized with DPT3 (78) as against Jhalod SC (50).

Other factors that can be considered are areas which have experienced VPD outbreaks and other high risk areas, etc.

Step 6: Decide on the actions needed and when to **respond** to a problem. The speed at which you respond to a problem depends on the potential impact that problem will have on the immunization program. In general these can be categorized into three levels of priority.

- Immediate problems that may cause interruption to the immunization service or risk health and/or lives (urgent).
- Trends that threaten the failure of the immunization program (medium-term).
- General improvements required in the performance and quality of the immunization program (long-term).

Table 9.6: I	Priority Problem and Speed o	f Response	
	Urgent	Medium term	Long term
Purpose	Solve <u>immediate problems</u> that may cause interruption of RI services or risk health	Reverse <u>trends</u> that threaten the failure of the RI program.	Improve the <u>performance and</u> <u>quality</u> of RI services
Solved within	Next few days/weeks.	Next few months.	Next planning cycle: (quarterly or annually)
Examples	Stock out or confirmed report of polio case.	Reduced coverage or increased dropout.	Improving the number of reports of AEFIs

Table 9.6 shows how each priority level will affect the speed at which the problems should be resolved

Sometimes an urgent problem may also need some medium and long-term action. For example: If a cold chain failure due to breakdown of the ILR has been identified, the urgent response will be to ensure that vaccines are transferred to a cold box or to an alternative cold storage point to avoid an interruption to the immunization program. A medium-term action might be to arrange for repairs of the ILR. A longterm action might be to indent for a new ILR if the ILR is beyond repair.

Step 7: Formulate action plan as a simple way to track the decisions you have made and the people responsible for implementing the solutions. Once complete, an action plan, becomes part of the monitoring process, and must be reviewed regularly to ensure that progress is being made. Identify and list the main causes of problems associated with high dropouts and poor access in each SC under the categories of supply, staffing and service delivery and demand.

For each category, list the causes associated with quality and quantity separately. The action plan also assigns responsibilities and completion dates. See *Table 9.7* for a sample action plan to increase immunization coverage in Arthuna SC (priority 1) which has problems of both access and utilization.

156

Table 9.7: A	Table 9.7: Action Plan for Increasing	Immunization Coverage in Arthuna SC	age in Arthuna St	U		
Component	Causes of access and utilization problems	Solutions With existing resources	Solutions With extra resources	Person(s) responsible	Date for completion	Completed (Yes/No)
Supply Quality	Hub cutter not functioning		Inform DIO for replacement of hub-cutters	Stock in- charge, MO	Immediately	Yes
Supply Quantity	No buffer stock of AD syringes	Better local forecasting and timely indenting		Stock in- charge, MO	By the end of the month	Yes
Staffing Quality	ANM has poor injection practice resulting in 2 abscesses.	Use monthly meetings to provide hands on training to improve injection techniques of ANMs		сни, мо	During next meeting Next week	Yes Yes
	Received no supervisory visit last year from LHV/MO/HA(M)	Plan and conduct regular visits by LHV and MO				
Staffing Quantity						
Service Quality and Demand	Rumors or myths against vaccination	Conduct advocacy visits with local leaders and meetings to promote RI		MO, Block Extension Educator/He alth Educator	Within two weeks	Yes
	ASHAs/ mobilizers not being used effectively	Share list of due beneficiaries with ASHA/mobilizer		ANM	Immediately	Yes
Service Quantity and Demand	Outreach sessions not held during the monsoon floods	List flood affected villages as hard to reach areas in the microplan	Request additional mobility support for conducting sessions in flood affected villages	сни, мо	By the end of the month	Yes

|____

Feedback refers to the process of routinely sending analysis and reports to the peripheral levels of the reporting system (SC). Monthly feedback of results, regardless of what the analysis shows, creates a collaborative environment by acknowledging the hard work of data providers (health workers) and making them aware that their data is used. Feedback can improve the accuracy and promptness of the reports and raise the morale of the staff. Feedback can be provided through:

- Supervisory visits to health centers
- Periodic meetings
- Telephone calls
- Letters or memoranda
- Any other time you meet staff from peripheral levels
 Content of feedback includes:
- Comments on the timeliness of reports
- Information on the total number of cases of each disease
- Comparisons of data from different sub-centers/ PHCs
- Information on actions taken
- Congratulations on doing a good job or encouragement to do a better job

Feed-forward is the reverse of feedback. It is the process of forwarding surveillance and other monitoring data to higher levels. The content of feed forward includes:

- the number of VPD cases and other data from different components of the RI program
- the analysis of why a trend occurred
- a summary of the actions that have been taken or that are recommended (such as an outbreak investigation or an increase in the supply of AD syringes)

a copy of all completed case investigation forms (e.g. for measles, neonatal tetanus or AEFI).

U N I T 10

Vaccine Preventable

Diseases and VPD Surveillance

LEARNING OBJECTIVES

- To list the various Vaccine Preventable Diseases (VPDs), their standard case definitions (suspect, probable and confirmed), treatment and preventive measures
- 2. To define surveillance and list its uses
- 3. To explain steps in conducting surveillance
- 4. To effectively investigate a VPD outbreak

Vaccine Preventable Diseases

DIPHTHERIA

1. Standard Case Definition

Suspect (history)

- Sore throat, mild fever, grayish white membrane in throat
- Exposure to a suspect case of diphtheria in the previous one week or a

diphtheria epidemic in the area

Probable (history and clinical examination)

 An illness characterized by laryngitis or pharyngitis or tonsillitis and an adherent membrane of the tonsils, pharynx and/or nose.

Confirmed (laboratory tests)

Probable case that is lab-confirmed or linked epidemiologically to a labconfirmed case i.e. Isolation of the corynebacterium diphtheria from throat swab or four fold or greater rise in serum antibody titre (only if both serum samples are obtained before administration of diphtheria toxoid or antitoxin).

2. Treatment

- Diphtheria antitoxin and antibiotics (erythromycin or penicillin) for suspects and cases.
- Cases are isolated and contacts are vaccinated with diphtheria toxoid to prevent additional cases.

3. Prevention

Immunization of children with DPT vaccine as per the NIS.

PERTUSSIS (WHOOPING COUGH)

1. Standard Case Definition

Suspect (history)

- Cough persisting for 2 weeks or more
- Fits of coughing which may be followed by vomiting.
- Typical whoop in older infants and children

• Exposure to a suspect case in the previous 2 weeks or an epidemic of whooping cough in the area

Probable (history and clinical examination)

- A case diagnosed as Pertussis by a physician or a person with cough lasting at least 2 weeks with at least one of the following symptoms:
 - Paroxysms (i.e. fits) of coughing
 - Inspiratory whooping
 - Post-tussive vomiting (i.e. vomiting immediately after coughing) without other apparent cause

Confirmed (laboratory tests)

 Isolation of Bordetella pertussis or detection of genomic sequences by means of the polymerase chain reaction (PCR) or Positive paired serology

2. Treatment

- Antibiotics, usually erythromycin to shorten the period of communicability.
- Children infected with Pertussis should receive plenty of fluids to prevent dehydration.

3. Prevention

Immunization of children with DPT vaccine as per the NIS.

NEONATAL T**ETANUS**

1. Standard Case Definition

Suspect (history)

Any neonatal death between

3 and 28 days of age in which the cause of death is unknown, or any neonate reported as having suffered from Neonatal Tetanus (NT) between 3 and 28 days of age and not investigated

Probable (history and clinical examination)

 Any neonate with normal ability to suck and cry during the first 2 days of life and who, between 3 and 28 days of age, cannot suck normally and becomes stiff or has spasms

Confirmed (laboratory tests)

 The basis for case classification is entirely clinical and does not depend upon laboratory confirmation. NT cases reported by physicians are considered to be confirmed

2. Treatment

- Excellent 24-hour-a-day nursing care in a referral hospital, with careful use of drugs can reduce the case fatality rate in neonatal tetanus from 80% to 50% or lower.
- Individuals who recover from tetanus do not have natural immunity and can be infected again and therefore need to be immunized.

3. Prevention

- Immunization of infants and children with DPT/DT/ TT vaccine according to the NIS.
- Immunization of women of childbearing age with TT, either during or outside of pregnancy.
- Clean practices during and after child birth, even if the pregnant woman has been immunized.

POLIOMYELITIS

1. Standard Case Definition

Suspect (history)

 Sudden onset of weakness and floppiness in any part of the body in a child less than 15 yrs of age or paralysis in a person of any age in whom polio is suspected.

Probable (history and clinical examination)

Epidemiologically linked case.

Confirmed (laboratory tests)

Isolation of wild polio virus from stool.

2. Treatment

- In acute stage, complete bed rest with proper positioning of the affected limb. Avoidance of massage and injection.
- Physiotherapy after the acute phase subsides.
- Orthopedic surgery for deformities/contractures.

3. Prevention

 Immunization with OPV as per NIS. OPV is recommended for both routine immunization and Supplementary Immunization Activities (SIAs) for children up to 5 years of age.

MEASLES

1. Standard Case Definition

Suspect (history)

Any case with fever and rash

Probable (history and clinical examination)

Fever AND maculopapular rash

(i.e. non-vesicular or without fluid) lasting for more than 3 days AND {Cough OR coryza (running nose) OR conjunctivitis (red eyes)}

Confirmed (laboratory tests)

 At least a fourfold increase in antibody titer, or isolation of measles virus, or presence of measles-specific IgM antibodies in blood OR case is linked epidemiologically to a laboratory confirmed case

2. Treatment

- Supportive care with frequent food and fluid intake. Antibiotics for complications as pneumonia/diarrhoea
- 2 doses of vitamin-A given 24 hours apart @ of 50000 IU for <6 months; 1 lakh IU for 6-11 months and 2 lakh IU for 12 months and above age group.

3. Prevention

Measles vaccination as per the NIS.

TUBERCULOSIS (CHILDHOOD)

1. Standard Case Definition

Suspect (history)

• A child with fever and / or cough for more than 3 weeks, with or without weight loss or no weight gain; and history of contact with a suspected or diagnosed case of active TB disease within the last 2 years

Probable (history and clinical examination)

- Ċ
- A combination of clinical presentation, sputum examination wherever possible, chest X ray, Mantoux test and history of contact

Confirmed (laboratory tests)

• A patient with culture positive for the Mycobacterium Tuberculosis or a patient with two sputum smears positive for acid-fast bacilli.

2. Treatment

 Directly Observed Treatment Short course (DOTS) under RNTCP (Revised National Tuberculosis Control Program)

3. Prevention

 Immunization of infants with BCG as per the NIS can protect against childhood forms of TB such as tubercular meningitis and miliary TB.

HEPATITIS B

1. Standard Case Definition

Suspect (history)

• An acute illness typically including acute jaundice, dark urine,

anorexia, malaise, extreme fatigue and right upper quadrant tenderness. Biological signs include increased urine urobilinogen and >2.5 times the upper limit of serum alanine aminotransferase.

Probable (history and clinical examination)

Not applicable

Confirmed (laboratory tests)

 Serum positive for IgM anti-HBc or less desirably, hepatitis B surface antigen (HBsAg)

2. Treatment

- Supportive treatment is indicated for acute condition.
- In chronic infection, medicines can limit the disease

3. Prevention

 3 doses of Hepatitis B vaccine are recommended during the first year of life. They are given at the same time as the three doses of NIS

JAPANESE ENCEPHALITIS

1. Standard Case Definition

Suspect (history)

• A person of any age, at any time of the year with acute onset of fever and a change in mental status (including symptoms such as confusion, disorientation, coma or inability to talk) AND/OR new onset of seizures (excluding simple febrile seizures). Other early clinical findings may include an increase in irritability, somnolence or abnormal behavior greater than seen with usual febrile illness.

Probable (history and clinical examination)

 A suspect case that occurs in close geographical and temporal relationship to a laboratory confirmed case of JE, in the context of an outbreak

Confirmed (laboratory tests)

 Presence of JE virus specific IgM antibodies in a sample of serum and/or cerebrospinal fluid (CSF) as detected by an IgM-capture ELISA.

2. Treatment

 There is no specific treatment for Japanese encephalitis. Antibiotics are not effective against the JE virus. Supportive treatment is indicated.

3. Prevention

Following the campaigns targeting all children in the age group of 1-15 years in the high risk districts, the vaccine is integrated into the UIP of the district. Children between 1-2 years are targeted for one dose of JE.

Surveillance of Vaccine Preventable Diseases

Each individual case of VPD needs to be recorded and reported upwards within a comprehensive VPD surveillance system. The following section provides an overview of the components of VPD surveillance.

Definition of Surveillance

Surveillance is data collection for action. It is defined as the ongoing and systematic collection, analysis, interpretation, and dissemination of data about cases of a disease and factors influencing disease behavior, which is used as a basis for planning, implementing and evaluating disease prevention and control activities, including immunization.

Key elements of a Surveillance system

- detection and notification of VPDs
- investigation and confirmation (epidemiological, clinical, laboratory) of VPDs
- collection, analysis and interpretation of data
- feedback and dissemination of results
- prevention and control responses

Key elements of a surveillance system include detection and notification of VPDs; Investigation and confirmation of VPDs; Collection, analysis and interpretation of data; Feedback and dissemination of results and Prevention and control responses

Uses of Surveillance

Disease surveillance enables the following:

- predicting or detecting disease outbreaks for containment (*What* disease is occurring)
- identifying high-risk populations (Who gets the disease)
- identifying areas requiring special attention and where system performance is poor (*Where* the disease is occurring)
- determining the frequency of occurrence of a disease in the community and magnitude of the problem (*When* the disease is occurring and *how many* get the disease)
- identifying underlying causes (or risk factors) of the disease (*Why* the disease is occurring)
- guiding response activities, including immunization (*How* the disease can be prevented, controlled or eliminated).

Prerequisites for effective Surveillance

- Standard case definitions (to ensure uniformity in reporting)
- Recording and reporting system (to ensure regularity in reporting)
- List of all the reporting units (to ensure completeness in reporting)

The quality of surveillance data depends upon correct diagnostic criteria, timeliness and completeness of reports.

Steps in Conducting Surveillance

The five steps in surveillance, carried out at various levels (sub-center upwards), include:

Step1: Collect data

Collect data on the *cases and deaths* due to all VPDs in your area. The three different data collection methods are:

Passive/Routine Surveillance: Data is collected and reported **monthly** by all the reporting units (from the SC upwards) in the UIP format. However, **Weekly** reporting is required for AFP surveillance. Detailed information regarding individual cases is essential for diseases under eradication or elimination such as poliomyelitis and Neonatal tetanus.

Reliable sources of data for routine surveillance include

outpatient and inpatient registers, and individual patient records, including:

- Cases that have visited a government health facility for treatment
- Cases seen by health workers during outreach immunization sessions
- Cases treated at non-government health facilities e.g. private practitioners, NGO-run hospitals etc.
- Cases that were reported by ASHA/AWW/community or the media and verified by the visit of a health worker

Active Surveillance: implies the collection of data on specific VPDs, through the review of records during regular visits to selected health facilities, reporting sites or the community. This method is used

 During outbreaks to determine the extent of the outbreak and keep mortality rates low by initiating early treatment. When a disease is targeted for eradication or elimination (e.g. polio eradication) every possible case must be found and investigated.

Active Surveillance does not replace passive surveillance, but if conducted regularly and frequently it has the following advantages over passive surveillance, as it:

- helps to improve the timeliness and accuracy of case detection and notification
- enables rapid case investigation, including collection of laboratory specimens
- helps to link cases epidemiologically.
- enables timely action to be taken in response to the detected case
- identifies areas where passive surveillance needs to be strengthened.

Sentinel Surveillance: Data is collected through reports from selected 'sentinel' sites, to understand the disease burden, monitor trends and detect outbreaks. This system is used when high-quality data are needed about a particular disease that cannot be obtained through a passive system e.g. in AFP surveillance. The sentinel site is usually a

hospital, health center, laboratory, rehabilitation center or other facility which attends to a relatively large number of cases of the disease.

An efficient immunization surveillance system includes a combination of passive, active and sentinel surveillance.

Reporting units for VPD Surveillance

A reporting unit is a health facility/individual in private or public sector, located in rural or urban area. Designated health workers/paramedical staff and medical officer/practitioner working in various health facilities collect information on VPDs in the specified formats and report these in a timely manner to the next higher level.

	Public Sector	Private Sector
Rural	SC, Rural dispensary, Additional PHC, PHC, CHC, DH	Sentinel private Practitioner and sentinel hospital
Urban	Urban hospital, ESIH, Railway Hospital, Medical college hospital and others	Sentinel private nursing home, sentinel hospital, Medical college, Private and NGO laboratory.

Follow these rules when reporting the total number of cases and deaths seen during a reporting period (month or week):

- Zero reporting: Submit nil reports even if there are no VPD cases seen.
- Avoid double counting: if a child makes two visits to the health center for the same disease episode count it as one case only.
- Count only those cases which have been *diagnosed by* the health personnel.
- Count current cases only: Include only those cases that occurred within the time frame specified for the VPD.

Report the occurrence of any unusual clustering of VPD cases or any death immediately by telephone, fax, email, special messenger etc. This verbal report must be followed by a written case based report.

Step 2: Compile data

In terms of passive surveillance, you need to know how many VPD cases are occurring and where they are occurring. The essential data you should receive from each reporting unit in the UIP report of all sub-centers/ PHCs is the number of cases and deaths of each of the targeted diseases counted during the reporting period. In terms of active surveillance, additional information should include the:

- Vaccination status of each case;
- Name, age and sex of each case;
- Date and place of onset of symptoms

Compile the data to describe the VPDs in terms of time, place and person. This can be done by tabulation or drawing of graphs, bar charts or maps. *Table 10.1* describes the immunization status of measles cases (among infants older than 9 months of age) regarding a Measles outbreak in five SCs in a PHC.

Table 10.1:	Example of a Meas	sles Outbreak	۲
Sub-center	Cases	Cases immunized	% immunized
Kushalgarh	21	2	10%
Talwara	17	1	6%
Arthuna	18	1	6%
Jhalod	15	2	13%
Partapur	19	1	5%
Total	90	7	8%

1. collect data

2. compile data

3. analyse and interpret data

4. take action

5. provide feedback

Step 3: Analyze and interpret the data

Regularly review the data from routine reports and check if it crosses the **threshold level**¹⁸. If the cases are approaching the threshold level or have crossed it, then suspect an outbreak. Analyze the reports for surveillance quality as follows:

1) Completeness of reporting

The number of reports received divided by the number of reports expected, expressed as a percentage. If the completeness of reports was only 50%, then the disease incidence would be under-reported by 50%.

2) Timeliness of reporting

The number of reports received on time divided by the number of reports expected expressed as a percentage. The definition of 'on time' must be clear to reporting units.

¹⁸ Threshold levels are determined based on three criteria:

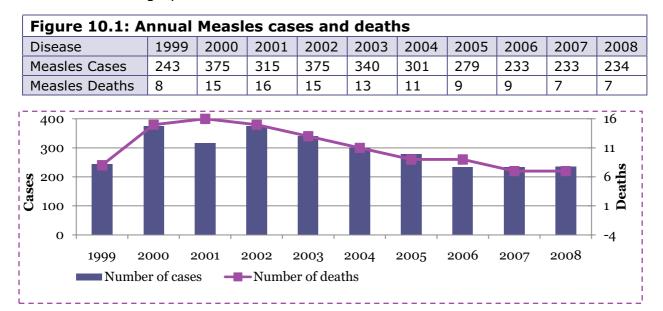

^{1.} Pre-existing National/Internationally developed thresholds: e.g. a single case of measles in a tribal area is considered an outbreak

^{2.} Based on Historical Data: e.g. if data for a particular disease is available, then the monthly mean should be calculated for the previous three years (excluding months in which there was an outbreak).

^{3.} Increasing trends of the disease over a short duration of time (e.g. in weeks). If the number of cases is found to be much below the threshold, you could interpret it as no cause for worry. Alternatively, you could check for under-reporting or review the threshold value.

3) Description by time, place and person (when, where and who gets the disease?) When the disease is occurring?

Compare the number of cases and deaths with previous weeks/ months/ years to see if there are any seasonal or cyclic trends. Table, bar or line diagrams are tools that enable analysis across time (temporal). These tools will help you to understand any increase or decrease in the incidence of a disease or the number of deaths for a particular reporting unit (as compared to other reporting units). *Figure 10.1* shows yearly trend of measles cases and deaths in a tabular and graphic form.

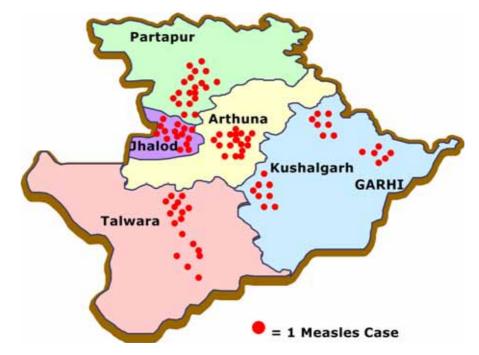

The above data could be interpreted in the following manner. The *increasing* number of cases from 1999 onwards indicates a potential outbreak, improved reporting or a change in the detection and reporting protocols. The *decreasing* number of cases from 2002 onwards indicates improved control measures, under-reporting due to incomplete reports or change in the detection and reporting protocols. The plateau in the graph from 2006 onwards

indicates either a stable situation or under reporting because of incomplete reports.

Where the disease is occurring?

Diseases tend to *cluster* in a particular area. Clustering indicates that a large number of similar cases have occurred in a limited geographical area or have occurred around the index case. This provides an idea of the causative and predisposing factors that may have played a role in the occurrence of the VPD. *See Figure 10.2.*

Figure 10.2: Measles Spot Map

A **Spot map** is a tool that enables analysis across space (spatial). It shows the occurrence of the cases, high-risk areas, areas of poor immunization coverage or areas with vacancies of HWs.

A Spot map helps to identify:

Pockets from where cases are consistently reported

- Pockets from where cases are expected but not reported
- Disease trends in comparison to similar maps for the previous corresponding period.

Who gets the disease?

VPDs also tend to occur more in specific ages and sexes. Tables, bars or pie charts are tools that enable analysis across specific age and sex groups. A high proportion of unimmunized VPD cases are a reflection of low immunization coverage in the community. You could also compare incidence and case fatality rate between different reporting units and between public and private sources. *See Figure 10.3.*

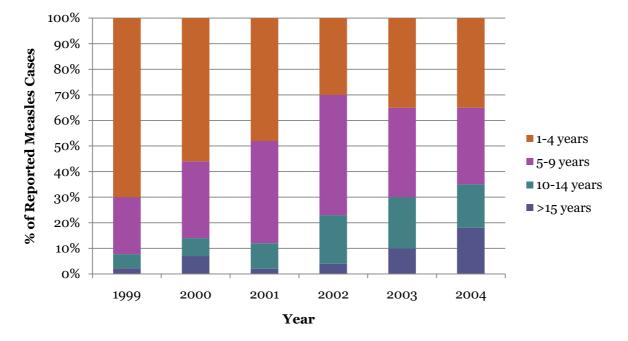

Figure 10.3: Age Distribution of Reported Measles Cases

2. compile data

Step 4: Take action

After analysis and interpretation of data, take action to correct any problems identified to prevent avoidable morbidity and mortality. If you find that there are:

- More cases than you expect: Conduct an outbreak investigation and response.
- Cases occurring in vaccinated children: This could be due to over-reporting, vaccination given at the wrong age; incorrect technique of administration or dosage and breaks in the cold chain. Possible interventions to deal with these could be improved supervision, capacity building and strengthening the cold chain.
- Fewer cases than you expect: This could be due to under-reporting of cases or actual improvement of services. If the latter is true, there is no need for action.

5. provide feedback

Step 5: Provide Feedback

Feedback to the reporting sites refers to:

- Commenting on the completeness, timeliness and accuracy of the surveillance reports;
- Informing about the effectiveness of the vaccination activities in meeting the objectives of disease reduction;
- Offering information to help them in solving problems;
- Congratulating the good performers and encouraging them to do a better job.

Feedback is essential to keep the staff motivated to achieve high levels of immunization coverage and to collect accurate and complete data on the occurrence of target diseases. It may be *urgent* for an outbreak or individual cases or *specific* e.g. the laboratory results of each AFP case. Feedback to the community helps increase community trust and involvement. It must be shared during monthly meetings as well as during visits to the reporting units.

Outbreak Investigation, Response and Control

An *outbreak* is defined as the occurrence of an illness in a community, clearly in excess of the expected numbers. Usually an outbreak is limited to a small focal area. When an outbreak covers a larger geographic area and has more than

one focal point, it is termed as an epidemic. *Outbreaks are defined differently for different VPDs. For diphtheria, polio, neonatal tetanus or JE, even a single case is an outbreak, whereas for measles and pertussis, a sudden increase in the number of cases is an outbreak. Refer to GoI guidelines for surveillance and outbreak response for AFP and Measles*¹⁹.

Warning signs of an impending outbreak are:

- Clustering of cases or deaths in time and/or space
- Occurrence of two or more epidemiologically linked cases of meningitis or measles
- Shifting in the age distribution of cases

Investigation of an outbreak helps to:

- control and limit its spread to other areas
- ascertain its etiology and understand why it occurred
- identify high risk areas and groups
- assess how prevention strategies can be strengthened to reduce or eliminate the risk of future outbreaks

Steps in Outbreak investigation

Prompt and timely action during an outbreak is critical to minimizing the damage and maintaining public trust in health and immunization services. The emphasis should be on saving lives. Without awaiting confirmation of a suspected outbreak, provide immediate logistic support to

¹⁹ *Field Guide: Measles Surveillance and Outbreak Investigation*, New Delhi, Government of India, 2006, (http://www.npsuindia.org/download/Measles%20Guide.pdf)

Field Guide: Surveillance of Acute Flaccid Paralysis, New Delhi, Government of India, 2005, (http://www.npspindia.org/download/Redbook.pdf)

the field teams. Once the cause of outbreak is confirmed, do not waste laboratory support for diagnosing every case since, standard case management for epidemiologically linked cases DOES NOT require laboratory confirmation.

Actions BEFORE an outbreak:

Form an Epidemic Response Team (ERT) which may include representatives from:

- Local health officials (DIO/ any district level epidemiologist/ district officer in charge of surveillance and the concerned BMO)
- Hospital Clinician/ Public Health Nurse
- Laboratory representative
- NGO representative/ Community leader
- Others as appropriate

The team that has been formed at district level should hold a meeting as soon as a suspected outbreak is identified. It should decide on the area to be surveyed, plan and guide the outbreak investigation, monitor progress in data collection, compile and analyze data and write a final report.

Actions DURING an outbreak

Step 1: Confirm the outbreak

Confirmation of an outbreak is done through two related steps. Firstly, you have to visit the area concerned and confirm the diagnosis of as many reported cases as possible. Next, you should ascertain its geographical spread through a preliminary search.

Confirm the diagnosis by:

Clinical criteria: according to the standard case definition using information obtained by history and examination

Epidemiological association: If an outbreak has been confirmed and similar cases in the same area in the same period of time are reported by health workers, but not investigated individually, they may be confirmed by epidemiologically linked association with confirmed cases.

Laboratory tests: For VPDs subject to eradication or elimination, collect laboratory specimens from every suspect case (e.g. stool sample from each AFP case). For VPDs subject to control, collect specimens from a sufficient number of cases (e.g. five blood samples in case of a measles outbreak) to confirm the outbreak. However, no laboratory specimens are required for neonatal tetanus.

Ascertain the geographical extent of the outbreak to the surrounding villages/ blocks. The search for additional cases must include visits to:

The health facilities: Talk to the doctors and nurses to see if they are seeing suspected cases of the VPD. Visit hospital wards and outpatient departments and search all patient registers for cases that fit the standard case definition.

The community: Visit the area from where cases have been seen in the health facilities. Talk to volunteers and other influential persons in the community. If feasible, organize a rapid house-to-house search of the affected area(s) to

search for similar cases. Identify key informants in each village / ward for prompt information about any cases.

Step 2: Conduct house-to-house searches to find additional cases and provide case management

Train and assign health workers to conduct house-to-house searches to find the cases in the designated area. The logic is to list all the cases of VPD that have occurred in the recent past. Investigate cases using one disease-specific 'Standard Case Investigation Form' (CIF) for each case. Record the full details, including identification data, address, vaccination status and the travel history. (*See Appendix 10.2*)

Provide *standard case management/treatment* to the cases. *Trace contacts*²⁰ to establish chains of transmission for containment measures such as *Outbreak Response Immunization* (ORI) in Measles, Polio, etc. If a new case or outbreak has been detected, search for additional cases of the VPD. For example, for a suspect measles or diphtheria case, enquire whether there are any other contacts (in the specific age group) in the household or neighborhood. Provide need-based prophylaxis and/or immunization to the contacts (e.g. vitamin A for measles, vaccination for diphtheria). Health workers should notify the cases with complications to the supervisor for further referral.

During the course of investigation, it may be possible that some other areas (not included in initial planning) may report fresh cases of the VPD. Arrange to undertake case searches in these new areas as well.

²⁰ A contact is a person who has been in close association with a known or suspected case of a communicable disease during the incubation period.

Step 3: Line list and notify the cases

From the Case Investigation Forms, create **a** *line list* of all cases including the name, address, age, sex and immunization status. Include laboratory results as soon as these become available. Record these in the suggested line list as shown in *Table 10.2*.

Table 10.2: Line	Lis	t of Me	asles Cases				
Patient's name, Father's Name and Address	Sex (M/F)	Age (in years and months)	Immunization status (Doses of concerned vaccine)	Date of onset of symptoms (dd/mm/yy)	Date of lab specimen collection (dd/mm/yyyy)	Outcome of illness (still ill/ died/ recovered)	Remarks
1. Harsha d/o Ram	F	2 yrs	Un-immunized	28/12/ 07	27/1/08	Recovered	
Swaroop, Regarpura							
2. Munna, s/o Md	Μ	11 mths	Un-immunized	6/1/08	27/1/08	Still Ill	
Nazim, Char Darwaza							

Report the cases immediately to the ERT in both the CIF and the line list consolidating data acquired from all the CIFs.

Step 4: Describe the outbreak

Describe the outbreak in terms of time, place and person. *Time:* What are the dates of onset of cases?

Plot these to prepare an *Epidemic curve* i.e. a graph showing cases by date of onset or by date of report (*See Figure 10.4*). It helps to demonstrate where and how an

outbreak began, how quickly the disease is spreading, the stage of the outbreak (start, middle or ending phase), and whether control efforts are having an impact.

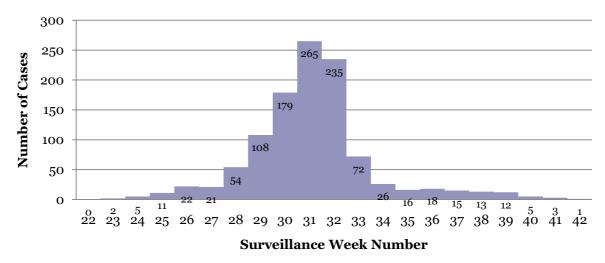

Figure 10.4: Reported measles cases by week of rash onset

Place: Where do cases reside?

Prepare a **Spot map** (See Figure 10.2) of the area showing the location of all confirmed cases. It helps to identify areas with clusters of disease. Further investigation of these areas may reveal weaknesses in the local immunization program.

Person: Who are affected?

The Graph or table of age distribution and immunization status of cases (See Figure 10.3) are prepared from the line list of cases. This information helps to identify the most affected age-groups and those cases which were not preventable (e.g. those developing measles before the scheduled age of immunization).

Step 5: Analyze the data to:

- Confirm the outbreak:
 - Is the number of cases reported greater than the number expected for this period? (e.g. threshold)
 - What proportion of cases fulfill the case definition?
- Define the extent of the outbreak (time, place and person)
- Measure the severity of the outbreak. What proportion of confirmed cases were
 - hospitalized,
 - suffered complications or
 - died (Case Fatality Rate)²¹
- Measure the effectiveness of vaccination
 - How many confirmed cases occurred in vaccinated individuals and in unvaccinated individuals?
 - How effective was the vaccine at preventing infection (Vaccine Efficacy)²²?

²¹ **Case-Fatality Rate (CFR)** is based on the case investigations and the total number of confirmed cases. If possible, estimate it by age-group.

CFR = No. of patients who died of a specific VPD/Total No. of cases of the same VPD X 100 ²² **Vaccine efficacy (VE)** is the ability of the vaccine to prevent disease effectively and is affected by the age at immunization, potency of the vaccine (quality of cold chain) and overall immunization coverage.

VE =

⁽Attack Rate among unvaccinated (ARU) - Attack Rate among Vaccinated (ARV) (Attack Rate among unvaccinated (ARU)

Attack Rate is an incidence rate (usually expressed as a percent), used only when the population is exposed to a VPD for a limited period of time, such as during an outbreak. It is calculated as follows: AR=

<u>Number of new cases of a VPD during a specified time interval</u> X 100 Total population at risk during the same interval

Step 6: Use the data for action

Use data on the various components of the immunization system such as coverage, status of the cold chain, training and availability of personnel to determine the causes of the outbreak. The reasons why susceptibles accumulate in a group could be the following.

Failure to give vaccine: A high proportion of unvaccinated among the cases in an outbreak would suggest that failure to vaccinate children was a significant factor. Spot maps will help to locate cases, high-risk areas and clusters of cases indicating a failure of the program to reach a specific geographic area or population subgroup.

Vaccine failure: The vaccines currently in use are relatively safe and effective. However, these vaccines are not 100% effective. For example, the efficacy of measles vaccine is estimated to be approximately 85% when given at 9 months.

Cold chain failure: If the efficacy of the vaccine appears to have been low across all age groups, especially during a specific period of time, review the cold chain to ensure that it has been functioning correctly. Identify and rectify the factors contributing to a cold chain failure.

Step 7: Write the report

After conducting the outbreak investigation, prepare a short comprehensive report with the following sections:

 Introduction and background information about the area affected (population structure, health facilities, regularity of RI sessions, health seeking behavior)

- Review of status of VPDs and routine immunization (coverage data)
- Short review of the VPD outbreaks in the past
- VPD reporting and surveillance system
- Confirmation of outbreak by serology (lab reports)
- Data collection methodology (sample size, number of investigating teams, approach etc.)
- Data analysis
 - Time, place and person analysis of cases (charts, graphs, spot maps etc.)
 - Age distribution and vaccination status analysis
 - Analysis of Case Fatality Rate
 - Probable reasons of outbreak
- Population at risk
- Case management
- Response to outbreak
- Conclusions and recommendations

Send the outbreak investigation report to concerned district and state government officers (*See Appendix 10.3*).

Step 8: Give feedback

Provide feedback to all levels (Community/ SC/PHC/CHC/District) on the outcomes of the VPD outbreak investigation, in order to ensure that all stakeholders are aware of the reasons for the outbreak, the actions initiated and the plan to prevent future outbreaks.

Step 9: Initiate action

In all VPD outbreaks, effective case management and follow-up of cases²³ is a priority. Thereafter, conduct activities for strengthening and raising awareness of routine immunization.

 $^{^{\}rm 23}$ Follow-up should be according to specific guidelines e.g. re-visit AFP cases after 60 days of reporting

Eradication, Elimination and Control of VPDs: the role of Surveillance Surveillance plays a critical role in Poliomyelitis Eradication, Neonatal Tetanus Elimination and Measles Control.

Polio Eradication means that there are no clinical cases of poliomyelitis for three consecutive years and the circulating wild polio virus is eliminated from the

environment. The target for global certification of polio eradication is 2010. Surveillance of Acute Flaccid Paralysis cases is one of the four pillars of eradication.

Neonatal Tetanus Elimination is defined as a rate of less than 1 case per 1000 live births in every district. However, since TT immunization is very effective and clean delivery practices substantially reduce risks of Neonatal Tetanus, all PHCs and districts are expected to have zero cases of Neonatal Tetanus. Globally year 2010 has been set as target year for NNT elimination. In order to achieve this, there is a need to strengthen the surveillance system and to undertake follow-up action in areas from where cases are reported. Even a single case of Neonatal Tetanus should trigger follow up action to prevent cases in the future. All the neonatal deaths should be investigated to exclude Neonatal Tetanus.

Measles Control requires reduction in measles mortality by two-thirds by 2010 (compared to 2000 estimates), at least 90% coverage with Measles vaccine in 80% of the districts of the country (by 2009) and collection of good quality epidemiological data through active surveillance (cases and deaths by month, age and vaccination status) and outbreak investigation.

Disease	Vaccine	Age	Dose	Schedule	Route	Site	Booster	Main Contraindications (refer to Manufacturer)
Measles, Mumps Rubella	MMR	12-15 mths	0.5 ml	1 dose	SC	Upper Arm	No	Advanced Immuno deficiency or immuno suppression, Pregnancy, Severe allergic reaction to vaccine component or
Measles, Rubella	MR	16-24 mths	0.5 ml	1 dose	sc	Upper Arm	No	following a prior dose
