INTRODUCTION

The 2019-21 National Family Health Survey (NFHS-5), the fifth in the NFHS series, provides information on population, health, and nutrition for India and each state and union territory. Like NFHS-4, NFHS-5 also provides district-level estimates for many important indicators. All five NFHS surveys have been conducted under the stewardship of the Ministry of Health and Family Welfare (MoHFW), Government of India. MoHFW designated the International Institute for Population Sciences (IIPS), Mumbai, as the nodal agency for the surveys. Funding for NFHS-5 was provided by the Government of India. Technical assistance and additional funding for NFHS-5 was provided by the USAID-supported Demographic and Health Surveys Program, ICF, USA. Assistance for some of the Clinical, Anthropometric, and Biochemical (CAB) tests was provided by the ICMR and the National AIDS Research Institute (NARI), Pune.

Four survey questionnaires – household, woman's, man's, and biomarker – were used to collect information in 19 languages using Computer Assisted Personal Interviewing (CAPI). All women age 15-49 and men age 15-54 in the selected sample households were eligible for interviewing. In the household questionnaire, basic information was collected on all usual members of the household and visitors who stayed in the household the previous night, as well as socioeconomic characteristics of the household, water and sanitation, health insurance, and number of deaths in the household in the three years preceding the survey. Two versions of the woman's questionnaire were used in NFHS-5. The first version (district module), which collected information on women's characteristics, marriage, fertility, contraception, reproductive health, children's immunizations, treatment of childhood illnesses, and nutrition was fielded in the entire sample of NFHS-5 households. Information on these topics is available at the district, state, and national levels. In the second version of the questionnaire (state module), four additional topics, namely, sexual behaviour, HIV/AIDS, husband's background and women's work, and domestic violence, were also included. This version was fielded in a subsample of NFHS-5 households designed to provide information only at the state and national levels. The man's questionnaire covered the man's characteristics, marriage, number of children, contraception, fertility preferences, nutrition, sexual behaviour, attitudes towards gender roles, HIV/AIDS, and lifestyle. The biomarker questionnaire covered measurements of height, weight, and haemoglobin levels for children; height, weight, waist and hip circumference, haemoglobin levels, and finger-stick blood for additional CAB testing in a laboratory for women age 15-49 and men age 15-54; and blood pressure and random blood glucose for women and men age 15 years and over. Questionnaire information and biomarkers were collected only with informed consent from the respondents.

The NFHS-5 sample was designed to provide estimates of all key indicators at the national and state levels, as well as estimates for most key indicators at the district level (for all 707 districts in India, as on 31 March, 2017). The total sample size of approximately 610,000 households for India was based on the size needed to produce reliable indicator estimates for each district. The rural sample was selected through a two-stage sample design with villages as the Primary Sampling Units (PSUs) at the first stage (selected with probability proportional to size), followed by a random selection of 22 households in each PSU at the second stage. In urban areas, there was also a two-stage sample design with Census Enumeration Blocks (CEB) selected at the first

stage and a random selection of 22 households in each CEB at the second stage. At the second stage in both urban and rural areas, households were selected after conducting a complete mapping and household listing operation in the selected first-stage units.

Readers should be cautious while interpreting and comparing the trends as some States/UTs may have a smaller sample size. Moreover, at the time of survey, *Ayushman Bharat* AB-PMJAY and *Pradhan Mantri Surakshit Matritva Abhiyan* (PMSMA) were not fully rolled out and hence, their coverage may not have been factored in the results of the percentage of households with any usual member covered under a health insurance/financing scheme and the percentage of mothers who received 4 or more antenatal care visits, respectively. Hence, the results should be interpreted with caution. The decline in the percentage of households with any usual member covered under a health insurance/financing scheme and the percentage of mothers who received 4 or more antenatal care visits may be due to many factors, including compositional changes of the population in the newly formed districts.

NFHS-5 fieldwork for Tripura was conducted in all 8 districts of the state from 04 July, 2019 to 10 November, 2019 by the Indian Institute of Health Management Research (IIHMR). Information was collected from 7,209 households, 7,314 women age 15-49 (including 1,137 women interviewed in PSUs in the state module), and 990 men age 15-54.

This report presents the key findings of the NFHS-5 survey in Tripura, followed by detailed tables and an appendix on sampling errors. At the time of finalization of this report, wealth quintiles for the country as a whole were not ready. Therefore, on finalization of the national report, the breakup of key indicators by wealth quintiles for all states will be provided as an additional document and uploaded on the official website of MoHFW and IIPS.

HOUSEHOLD CHARACTERISTICS

Important household characteristics include household composition, housing characteristics, household possessions, access to a toilet facility, and education. The household characteristics reflect the environmental risk factors and behavioural outcomes of the household population, including their likely impact on health status.

Household composition

In Tripura, less than one-third (30%) of the households are in urban areas. On average, households are comprised of 3.7 members. Seventeen percent of households are headed by women, with 13 percent of the population living in female-headed households.

Eighty-six percent of households in Tripura have household heads who are Hindu. Seven percent of households have household heads who are Muslim and 5 percent of households have household heads who are Christian.

Twenty-eight percent of households in Tripura have household heads who belong to a scheduled tribe, 24 percent belong to a scheduled caste, and 18 percent belong to an other backward class. Thirty percent of household heads do not belong to a scheduled caste, a scheduled tribe, or an other backward class. The majority of households (68%) are nuclear, and 43 percent of the population reside in non-nuclear households.

Less than one-quarter (24%) of Tripura's population is under age 15; whereas 7 percent is age 65 and over. The overall sex ratio of the population is 1011 females per 1,000 males, and the sex ratio of the population under 7 years of age is lower at (972 females per 1,000 males). Ninety-three percent of persons have an *Aadhaar* card.

Among children below 18 years of age, 5 percent have experienced the death of one or both parents. In all, 85 percent of children below 18 years of age live with both parents, 12 percent live with one parent (mostly with their mother), and the remaining 3 percent live with neither parent. Births of almost all children under 5 years of age (94%) were registered with the civil authorities, and 90 percent of children have a birth certificate.

Death registration

Eighty percent of usual residents of households were registered with the civil authorities (62 percent of deaths at age 0-4, 84 percent of deaths at age 35 and above).

The distribution of death registrations by religion shows that 79 percent of deaths were registered among Hindus, 82 percent among Muslims. Eighty-nine percent of deaths were registered among who do not belong to a scheduled caste, a scheduled tribe, or an other backward class, 81 percent among scheduled castes, 72 percent among other backward classes and 68 percent among scheduled tribes. Overall in Tripura, death registration is 9 percent higher in urban (86%) vs rural areas (77%) and among males (85%) than females (73%).

Disability

The respondent to the Household Questionnaire provided information for all usual household members on whether or not they have any disability in specified domains. The domains of disability are hearing, speech, visual, mental, locomotor, and other. Just 1 percent of the *de jure* household population has any disability. The most prominent type of disability is locomotor and speech disability, (0.3%, each). Men are slightly more likely than women to have any disability (1.2% vs 0.8%). The proportion of household members who have any disability rises with increasing age. For instance, 2.3 percent of the household members age 70 and over are reported to have any disability.

Housing characteristics

About one-quarter (21%) of households in Trimura have water nined

About one-quarter (24%) of households in Tripura have water piped into their dwelling, yard, or plot.

Eighty-seven percent of households in Tripura have basic drinking water service, and 89 percent of households use an improved source of drinking water, but only 24 percent have water piped into their dwelling, yard, or plot. Urban households (32%) are more likely than rural households (21%) to have water piped into their dwelling, yard, or plot. Over three-quarters (77%) of households use an appropriate treatment method to make drinking water potable (mostly by using ceramic, stand, or other water filter). More than two fifth(45%) households in Tripura use a clean fuel for cooking.

Access to toilet facility

Safe sanitation is one of the foundations of a healthy, comfortable, and dignified life. Households without proper sanitation facilities have a greater risk of diseases like diarrhoea, dysentery, and typhoid than households with improved sanitation facilities that are not shared with other households.

Negligible (1%) of all households (1.4% in rural areas and 0.2% in urban area) do not use any sanitation facility; they use open spaces or fields. In Tripura, almost all 99 percent of households have access to toilet facility, and in urban and rural areas, both achieved universal accessibility. Access to a toilet facility for households ranges from 98 percent among scheduled tribes to 100 percent among those households not belonging to a scheduled tribe, scheduled caste, or an other backward classes. Access to toilet facility is universal, across all the districts. In Tripura all the households (100%) in urban areas having access to a toilet facility in all 8 districts, whereas in rural areas five districts 99 percent of households have access to toilet facility and in remaining three districts namely Dhalai, Gomati and South Tripura 98 percent of households have access to toilet facility.

Selected household possessions

In Tripura, 48 percent of households own a house (43% of rural households and 61% of urban households). Almost all urban households (96%) and most rural households (89%) in Tripura have a mobile phone. Ninety-seven percent of households have a bank or post office account. Twenty-seven percent of households own either a motorcycle or a scooter. BPL cards are held by 43 percent of households. Irrigated land is owned by only 15 percent of rural households and 4 percent of urban households. Nearly, one-fifth (18%) of all households in Tripura own agricultural land, and more than half (54%) of households own farm animals.

Background characteristics of respondents

Twenty-eight percent of women and 23 percent of men are in the 15-24 age group, while 33 and 31 percent of women and men, respectively, are in the 25-34 age group. Seventy-one percent of both women and men age 15-49 are in rural areas.

In NFHS-5, literate persons are those who have either completed at least standard 9 or passed a simple literacy test conducted as part of the survey. According to this measure, 78 percent of women age 15-49 and 84 percent of men age 15-49 are literate.

Eleven percent of women and 6 percent of men age 15-49 have never been to school. Over one-tenth (12%) of women age 15-49 in Tripura have completed 12 or more years of schooling, compared with one-sixth (16%) of men.

Media exposure is quite widespread among women and men in Tripura. More than half (52%) of women and 48 percent of men watch television at least once a week. However, men (14%) are more likely than women (6%) to read a newspaper or magazine at least once a week. Forty-six percent of men and women are not regularly exposed to print media or other forms of media.

Women are more likely than men to be currently married (80% versus 70%) or widowed (3% versus 0.7%), while men are more likely than women to be never married (29% versus 15%). A majority of female respondents are Hindus (84%), while 9 percent are Muslims, and 5 percent are Christians.

Twenty-eight percent of female respondents belong to scheduled tribe, while 23 percent belong to a scheduled caste and 21 percent belong to an other backward class. Similarly one-quarter of the men belong to a scheduled tribe and an other backward classes, and over one-fifth of men belong to a scheduled caste from the surveyed population. Twenty-eight percent of women and men age 15-49 do not belong to a scheduled caste, a scheduled tribe, or an other backward class.

More than two-thirds (69%) of women and 20 percent of men age 15-49 were not employed in the 12 months preceding the survey. Three percent of women and 32 percent of men were engaged in an agricultural occupation, while 16 percent of women and 36 percent of men were employed in non-agricultural occupations.

EDUCATION

In NFHS-5, information related to preschool attendance has been collected for the first time, in addition to school attendance among children age 6-17 years and educational attainment of other members of the household, including reasons for drop-out in the case of those who discontinued education.

Preschool attendance

In India many children attend *anganwadi* centres that provide spaces for children to learn, play, eat nutritious food, and develop the skills needed for a lifetime of learning. Attending pre-primary education, such as at an *anganwadi* centre, improves children's school readiness by it providing quality learning through interactive, play methods with qualified instructors. Also, parents or guardians can go to work at ease if children are enrolled in pre-primary education.

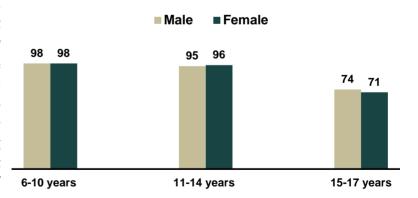

In Tripura, 52 percent of boys and 50 percent of girls age 2-4 years attend preschool. Preschool attendance is similar among children in nuclear households (52%) and non-nuclear households (50%). Preschool attendance is highest among households headed by Hindus (54%) than Muslims (47%) and Christians (35%). Preschool attendance is highest among other backward class households (59%) and lowest among scheduled tribe households (43%). Preschool attendance is lower in households with 6 or more members (45%), compared with households with 3-5 members (53%). Overall, there is no differential in preschool attendance among children of rural and urban households (51%, each). Preschool attendance is highest in Sepahijala district (64%) and lowest in Unakoti district (35%).

School attendance among children

Ninety-one percent of children age 6-17 years in Tripura attend school (95% in urban areas and 90% in rural areas). School attendance is almost universal (97%) at age 6-14 years among male and female, but drops sharply to 72 percent at age 15-17 years. There is no gender disparity in school attendance in the 6-14 year age group; however, in the age group 15-17 years, 71 percent of girls compared with 74 percent of boys are school. Overall, attending children of the age 6-17 years 85 percent from urban areas compared with 67 percent from rural area are attending school.

Are there gender differentials in children's school attendance?

Percentage of children attending school by age

FERTILITY

This section provides trends in the total fertility rate, age at marriage, pregnancy outcomes, teenage pregnancy, birth interval, the desire for more children, and son preference. NFHS-5 estimates on the median age at marriage, total fertility rate, and teenage motherhood illustrated in this section can help in setting benchmarks for the Sustainable Development Goals at the subnational level.

Age at first marriage

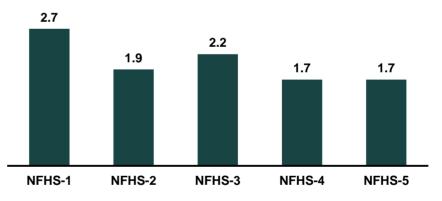

In Tripura, the median age at first marriage is 19.0 years among women age 25-29 years and 18.9 years among women age 20-49 years. Only 6 percent of women age 20-49 years have never married, compared with 19 percent of men age 20-49 years. Forty percent of women age 20-24 years got married before attaining the legal minimum age of 18 years, it was 33 percent in NFHS-4. Twenty-two percent of women age 20-24 years are never married, compared with 78 percent of men in the same age group, showing that the age at marriage is much lower for women than men in Tripura.

Fertility levels

The total fertility rate (TFR) in Tripura is 1.7 children per woman, which is well below the replacement level of fertility. Fertility has remain unchanged between NFHS-4 and NFHS-5.

The total fertility rate in urban areas, at 1.4 children per woman, and in rural areas, at 1.8 children per woman, are both below the replacement level. Among births in the three years preceding the survey, 4 percent were of birth order four or higher, compared with 5 percent in NFHS-4.

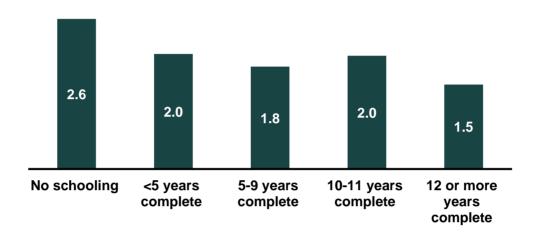

Fertility Trends Total fertility rate (children per woman)

The utmost differentials in fertility are by schooling. At current fertility rates, women with no schooling will have an average of 1.1 more children than women with 12 or more years of schooling. Muslim women will have an average of 0.5 children more than Christian women (a TFR of 2.1, compared with 1.6).

Total fertility rate (children per woman)

Pregnancy outcome

Eighty-seven percent of last pregnancies in the five years preceding the survey ended in a live birth, and the remaining 13 percent terminated in foetal wastage (abortion, miscarriage, or stillbirth). Abortion is the most commonly reported type of foetal wastage, accounting for 8 percent of all pregnancies, and miscarriage accounted for 4 percent. Surprisingly, majority (45%) of abortions were performed at home and (40%) in the public health sector. Only 14 percent abortion were performed in the private health sector. Thirteen percent of women reporting an abortion reported having complications from the abortion. Most induced abortions in Tripura (51%) are performed by a doctor.

The two main reasons for seeking abortion reported by women were unplanned pregnancy (68%) and last child too young (16%). The most common methods used for performing abortions were medicines (73%), other surgical methods (16%) and manual vacuum aspiration (MVA) (8%).

Teenage pregnancy

Among young women age 15-19 in Tripura, 22 percent have already begun childbearing, that is, they have already had a live birth or are pregnant with their first child, which was 19 percent in NFHS-4. The proportion of women who have started childbearing rises sharply from 18 percent at age 17 years to 28 percent among women age 18 years and to 49 percent among women age 19 years. The proportion who have started childbearing is higher among young women who had of 5-9 years of schooling (27%) than those with 12 or more years of schooling (10%).

Birth intervals

The median interval between births in the five years before the survey in Tripura is 57.2 months. Five percent of births take place within 18 months of the previous birth and 13 percent occur within 24 months. The proportion of births occurring within 24 months of a previous birth is slightly high for mothers in the 20-29 age group (14%) and for births occurring after a deceased sibling (47%). One-quarter of all births occur within three years of the previous birth. Research shows that waiting at least three years between children reduces the risk of infant mortality and has a positive impact on maternal health.

One-quarter of births in Tripura occur within three years of the previous birth.

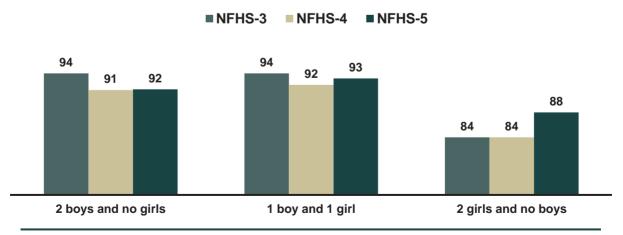

Fertility preferences

Seventy-one percent of currently married women and 69 percent of men age 15-49 years want no more children, are already sterilized, or have a spouse who is sterilized. Among those who want another child, 52 percent of women and 48 percent of men would like to wait at least two years before the next birth. Ninety-two percent of women and 89 percent of men consider the ideal family size to be two or fewer children.

In Tripura, there is a strong preference for sons. Twelve percent of women and 14 percent of men want more sons than daughters, but only 7 percent of women and 3 percent of men want more daughters than sons. However, about three-quarters of women (79%) and men (74%) would like to have at least one son and similarly 77 percent of women and 68 percent of men want at least one daughter.

How does son preference affect women's desire for children?

Percentage of currently married women with two children who want no more children

Current sex composition of families with two living children

Women's desire for more children is strongly affected by their current number of sons. For example, among women with two children, 93 and 92 percent with 1-2 sons respectively, want no more children, compared with 88 percent with two daughters who want no more children. Notably, the proportion of currently married women with two children who want no more children has almost remained unchanged (from 91 % to 92 %) in the 4 years, since NFHS-4.

In Tripura, unplanned pregnancies are fairly common. If all women were to have only the number of children they wanted, the total fertility rate would have been 1.5 children per woman, instead of the current level of 1.7 children per woman.

FAMILY PLANNING

The family planning section covers trends in contraceptive knowledge and current use, informed choice, and unmet need for family planning methods among women 15-49 years. It also includes information on men's attitude towards women using a contraceptive method. As in previous rounds of the survey, NFHS-5 provides estimates of the contraceptive prevalence rate and unmet need for family planning.

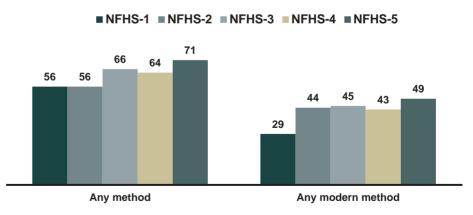

Contraceptive knowledge and use

Knowledge of contraception is almost universal in Tripura. However, some methods are still less well known. More than three-quarters (79%) of currently married women know about injectables and 73 percent of currently married women know the lactational amenorrhoea method (LAM). Whereas, only 21 percent women knows about female condoms. Among all women, only 46 percent women knows all three methods such as Pills, IUD/ PPIUD and Condom. Just, 6 and 5 percent currently married women have knowledge about diaphargm and foam or jelly as contraceptive method.

The contraceptive prevalence rate (CPR) among currently married women age 15-49 is 71 percent, increase from NFHS-4 (64%). The use of modern family planning methods (49%) has also increased by 6 percentage points from its level in NFHS-4 (43%). The use of female sterilization has declined slightly, from percent in NFHS-4 to 11 percent in NFHS-5; overall contraceptive use of any

How many women use family planning?

Percentage of currently married women

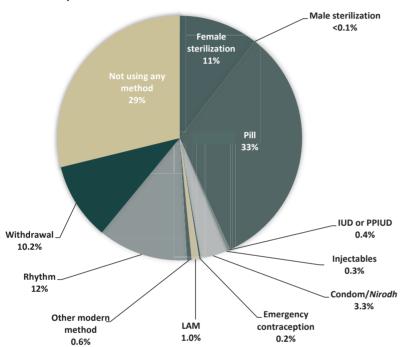

modern method has fluctuated between 29 and 49 percent in all five NFHS surveys. Contraceptive use in NFHS-5 increases sharply with age, from 42 percent for women age 15-19 to 62 percent for women age 40-49. Slightly more than one-quarter (27%) of women with 12 or more year of schooling use a traditional method compared with one fifth (22%) of women with no schooling.

In Tripura, contraceptive use is higher in urban areas (77%) than in rural areas (69%). Contraceptive prevalence increases with increasing schooling of women except for 12 or more years of schooling. Fifteen percent of currently married women with no schooling use female sterilization, compared with only 7 percent of women with 12 or more years of schooling. Muslim women (60%) are less likely to use contraception compared with Christian (73%) or Hindu (72%).

Women in Tripura are more likely to use contraception if they already have a son. For example, among women with two children, 79 percent compared with at least one son use a method of family planning compared with 78 percent of women with two daughters and no sons.

What contraceptive methods do women use? Currently married women

The common modern spacing methods used bv currently married women in Tripura are Pills (33%), followed condom (3%)bv the negligible proportion of currently married women use IUD or PPIUD (0.4%). In general, urban women are more likely to use spacing methods compared to rural women.

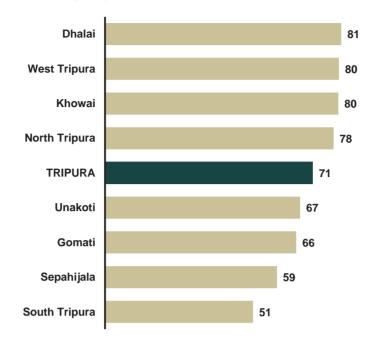

Ninety percent of sterilized women had their sterilization operation in the public sector, mainly in a government or municipal hospital, and 65 percent of pill users get their supply from the private health sector.

The majority of pill and condom/*Nirodh* users get their supply from the private health sector or other source, mainly from pharmacy/drugstore. Nonetheless, 24 percent of pill users and 18 percent of condom/*Nirodh* users get their supply from the public health sector.

The 12-month discontinuation rate for any reason is 44 percent for all contraceptive methods. Over two-fifths (44%) of users of modern spacing methods discontinued use within the first year after they adopted the method. The most common reason for discontinuation is wanted more effective method followed by the desire to become pregnant.

Contraceptive Prevalence Rate by District

Percentage of currently married women

Forty-four percent of users of modern spacing methods discontinued use within the first year after they adopted the method.

Informed choice

Women who know about all available contraceptive methods and their side effects can make better choices about what method to use. Only 54 percent of users of selected modern contraceptive methods were ever told by a health or family planning worker about other methods they could use. Only 44 percent were told about the possible side effects or problems with their method, and even fewer (37%) were told what to do if they experienced any side effects.

Men's attitudes

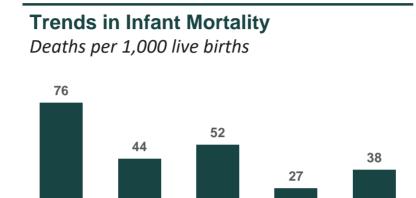

Almost three-fifths of men age 15-49 in Tripura (59%) agree that contraception is women's business and a man should not have to worry about it. However, only 18 percent of men think that women using contraception may become promiscuous. Sixty-seven percent of men know that a condom, if used correctly, protects against pregnancy most of the time.

Unmet need

Unmet need for family planning is defined as the percentage of currently married women who either want to space their next birth or stop childbearing entirely, but are not using contraception. According to this definition, 8 percent of currently married women have an unmet need for family planning, it was 11 percent in NFHS-4. Currently, 90 percent of the demand for family planning is being satisfied and 62 percent of the demand is being satisfied by modern methods.

INFANT AND CHILD MORTALITY

The mortality rates among children under age 5 years including neonatal, postneonatal and infant mortality rates is an important indicator that measures the overall well-being of a country. The infant mortality rate in Tripura in NFHS-5 is estimated at 38 deaths before the age of one year per 1,000 live births, more from the NFHS-4 estimate of 27, but down from the NFHS-3 estimate of 52, the NFHS-2 estimate of 44, and the NFHS-1 estimate of 76.

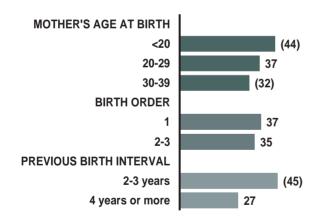

NFHS-3

NFHS-4

High-risk births have higher mortality rates
Deaths in the first year of life per 1,000 live births

NFHS-1

NFHS-2

Note: Category "Mother's age at birth 40-49" and "birth order 4 or more" are not shown since there are fewer than 250 unweighted person-years of exposure to the risk of death; figures in parentheses are based on 250-499 unweighted person-years of exposure to the risk of death.

As expected, boys have higher mortality rates than girls, especially during the neonatal period (in the first month of life) and postneonatal period (ages 1-11 months). In Tripura, child mortality is higher among girl (9%) child than the boy child (3%).

NFHS-5

Children born to mothers under age 20 are more likely to die during infancy than children born to mothers in the prime childbearing age (20-29 years).

Infant mortality rate is highest among scheduled tribes compared to other social groups. The infant mortality rate is higher in both, rural and urban areas from NFHS-4 to NFHS-5. The infant mortality rate is higher for children whose mothers have below 10 years of schooling.

Children born to the teenage mothers are more likely to die during infancy than to mothers age 20-29.

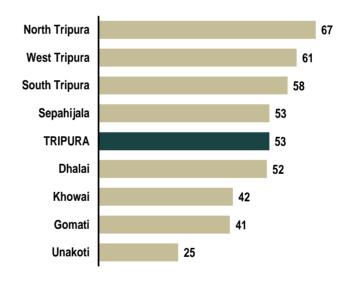

MATERNAL **H**EALTH

Maternal health are an important aspect for the development of any country in terms of increasing equity and reducing poverty. The survival and well-being of mothers are not only important in their own right, but are also central to solving broader economic, social, and developmental challenges. Maternal health care services are essential for the health and wellbeing of mothers, as well as their children, affecting the overall population and its health and nutritional status. This section describes the utilization of antenatal care, delivery care, and postnatal care by women who reported their last births in the five years preceding the survey. It also shows the extent of male invovement in maternal health care.

Antenatal care

Among mothers who gave birth in the five years preceding the survey, more than 8 in 10 women received antenatal care for their last birth. from а health professional (82% from a doctor and 2% from an auxiliary nurse midwife (ANM), lady health visitor (LHV), nurse, or midwife). Fourteen percent did not receive any antenatal care (ANC). Among mothers who gave birth in the five years preceding the survey, 9 out 10 womem (93%) have registered the pregnancy for the most recent live birth and received a Mother and Child Protection Card (MCP Card).

Four or More Antenatal Care Visits by District
Percentage of last births in the past five years

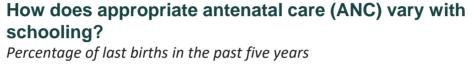

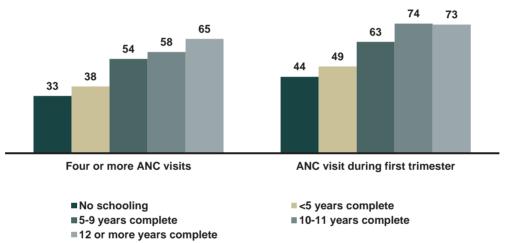

Just over three-fifths (63%) of women received antenatal care during the first trimester of pregnancy, as is recommended. Slightly more than half (53%) of mothers had four or more antenatal care visits. Urban women (64%) were more likely to have four or more antenatal care visits than rural women (49%). Since NFHS-4, there has been decline of 3 percentage points in the percentage of mothers who had an antenatal check in the first trimester (from 66% to 63%) and a 11 percentage points drop in the proportion of women who had four or more antenatal care visits (from 64% to 53%). Ninety-one percent of mothers received iron and folic acid (IFA) supplements for their last births, but only just over one-quarter (27%) mother consumed them for the recommended 100 days or more and only 9 percent consumed them for the newly recommended 180 days or more. Ninety-five percent of last births were protected against neonatal tetanus

through tetanus toxoid vaccinations given to the mother. Fourteen percent of mothers took an intestinal parasite drug during pregnancy for their most recent live birth.

Fifty-three percent of mothers in Tripura received at least four antenatal care visits for their last birth.

Among women with a live birth in the five years preceding the survey who met with a community health worker in the last three months of pregnancy for their most recent live birth, more than 7 out of 10 received advice on each of five different areas (85% received advice on breastfeeding, 78% on family planning, 77% on keeping the baby warm, 76% on the importance of institutional delivery and 73% on cord care).

Even when women receive antenatal care, sometimes they do not receive all the services needed to monitor their pregnancy. In Tripura, more than 9 in 10 women who received antenatal care for their last birth received each of the services needed to monitor their pregnancy: having their blood pressure measured, having a blood sample taken and their weight measured (98%, each), having a urine sample taken (95%), and having their abdomen examined (94%).

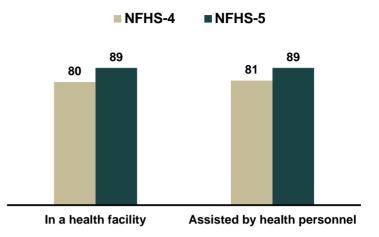

An ultrasound test was performed during 67 percent of pregnancies in the five years preceding the survey. Women with at least 12 years of schooling were much more likely to have an ultrasound test than women with no schooling. Eighty-four percent of women with at least 12 years of schooling had an ultrasound test compared with 38 percent of women with no schooling. Pregnant women with no sons are more likely to have an ultrasound test than those with at least having one son. For example, among women with two children, those with no sons (44%) were more likely to have an ultrasound test during their next pregnancy than those who had at least one son (37%).

Delivery care

Eighty-nine percent of births take place in a health facility (mostly a government facility) and 11 percent take place at home. The percentage of births in a health facility increased in the 4 years between NFHS-4 and NFHS-5, from 80 percent in NFHS-4 to 89 percent in NFHS-5. Institutional births are more common among women who have received an antenatal check, women with 10-11 years of schooling and 12 or more years of schooling, women who are having their first birth, and urban women.

For 78 percent of home births, a clean blade was used to cut the cord, as is recommended. A disposable delivery kit

Are babies being delivered safely? *Percentage of births in the past five years*

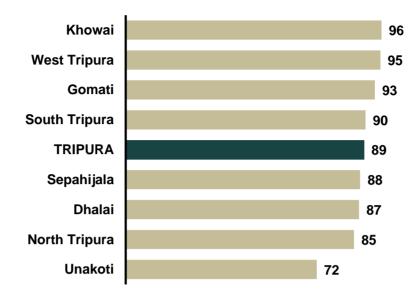

was used for 42 percent of deliveries. Eighty-five percent of home births followed the recommendation that the baby be immediately wiped dry and then wrapped without being bathed first.

Eighty-nine percent of births during the past five years took place with assistance from a skilled provider, and another 7 percent were delivered by a traditional birth attendant (TBA).

One-quarter of births during the past five years were delivered by caesarean section. Twenty-nine percent of caesarean sections (7 percent of all births) were emergency caesarean sections.

Among women who had a live birth in the five years preceding the survey that was delivered in a health facility, nearly one-fifth (18%) women received financial assistance under *Janani Suraksha Yojana* (JSY). Urban women (21%) were more likely than rural women (17%) to receive financial assistance under JSY. Scheduled tribe women were more likely to receive financial assistance under JSY than any other caste/tribe group of women.

Institutional Delivery by District *Percentage of births in the past five years*

Eighty-nine percent of children in Tripura who were born in the past five years were born in a health facility.

Postnatal care

Early postnatal care for a mother helps safeguard her health and can reduce maternal mortality. In Tripura, 75 percent of mothers had a postnatal check after their last birth and 73 percent of mothers had a postnatal check within two days of the birth, as is recommended. Postnatal care is most common following births in a health facility; 79 and 91 percent of births in public health facilities and private health facilities, respectively. Postnatal check for the mother within two days of birth received only 18 percent of home births.

Seventy-four percent of last births in the five years preceding the survey received a health check in the first two days after birth. Twelve percent of home births received a health check in the first two days after birth.

Male involvement in maternal care

Ninety-six percent of men with a child under three years of age said that the youngest child's mother received antenatal care. Seventy-nine percent of men with a child under three years said they were present during at least one antenatal check received by the child's mother (80 % in rural areas). Majority of men (91%) were told by a health provider or health worker what to do if the mother had a pregnancy complication. Regarding other signs of specific pregnancy complications such as vaginal bleeding, convulsions, high blood pressure, prolonged labour, and severe abdominal pain told by health provider ranges from 62 percent to 76 percent respectively.

Most fathers with a child less than three years of age were given information about various aspects of maternal care. Ninty-two percent of men were told about the importance of proper nutrition for the mother during pregnancy and 90 percent of men about the importance of delivering the baby in a health facility. Three-quarters (75%) of men were told by a health provider or a health worker about family planning or delaying the next child.

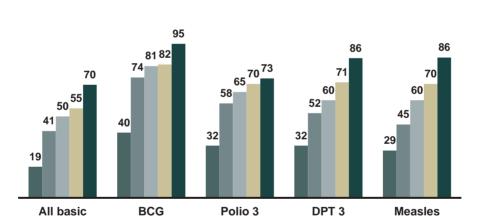

CHILD HEALTH

Vaccination of children

Vaccinations are considered as the most cost-effective intervention that can improve the overall health of children. Seventy percent of children age 12-23 months received all basic vaccinations against six major childhood illnesses (tuberculosis, diphtheria, pertussis, tetanus, polio, and measles) at any time before the survey. However, 98 percent of children are at least partially vaccinated; only 2 percent have not received any vaccinations at all. Vaccinations were recorded from a vaccination card for a large majority (87%) of children, which is a substantial increase since NFHS-4 (67%).

Trends in Vaccination Coverage

Percentage of children 12-23 months receiving vaccinations

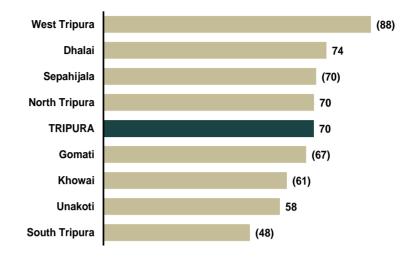

■NFHS-1 ■NFHS-2 ■NFHS-3 ■NFHS-4 ■NFHS-5

Ninety-five percent of children have received a BCG vaccination. However, nearly three-quarters (73%) of children have received the recommended three doses of polio vaccine, 86 percent have received the three recommended doses of DPT or Penta vaccine as well as have been vaccinated against measles. There is 9 percentage points dropout between the first and third doses of DPT vaccine (from 95% to 86%) and 15 percent difference in polio vaccine (from 88% to 73%).

Between NFHS-4 and NFHS-5, was an increase vaccination coverage for three doses of DPT (from 71% to 86%), measles (from 70% to 86%), and BCG (from 82% to 95%). The coverage for three doses of polio vaccine also marginaly increased, from 70% to 73%. Overall, there was a encouraging change in the coverage of all basic vaccinations (from 55% to 70%). In addition, 93 percent of children have received at least one dose of hepatitis B and 83 percent of vaccine, children have received all three recommended doses of hepatitis B vaccine.

Coverage of All Basic Vaccinations by District *Percentage of children 12-23 months*

There is no gender differiencial in coverage with all basic vaccinations and it is 70 percent each for boys and girls, and it is higher in urban areas than in rural areas (82% versus 66%). Coverage with all basic vaccinations is higher among children from other backward classes (82%) than children from other castes/tribes.

Childhood illnesses

In the two weeks before the survey, 1 percent of children under age five years had symptoms of an acute respiratory infection (cough accompanied by (1) short, rapid breathing that is chest related and/or (2) difficult breathing that is chest related).

Seventeen percent of children under age five were reported to have had fever in the two weeks preceding the survey; 66 percent of these children were taken to a health facility or provider for treatment.

Overall, 6 percent of children under age five years had diarrhoea in the two weeks preceding the survey. Sixty-three percent of these children were taken to a health facility or health provider. In Tripura, almost all mothers (98%) of young children have heard of oral rehydration salt (ORS) packets for the treatment of diarrhoea, but only 67 percent of children with diarrhoea were given ORS. Nearly one-quarter (24%) of children with diarrhoea were given gruel and slight more than three-quarters (77%) were given either ORS or gruel. One-sixth of the children (17%) were given zinc supplements during diarrhoea. Sixteen percent of children with diarrhoea did not receive any type of treatment at all.

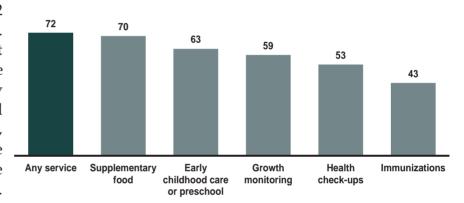

To reduce dehydration and minimise the effects of diarrhoea on nutritional status, it is recommended that normal feeding of children be continued when they have diarrhoea and that the amount of fluids given should be increased. However, in Tripura only 4 percent of children with diarrhoea received more to drink than normal. One-quarter of children received the same amount to drink as usual. Of greater concern, 71 percent of children with diarrhoea were given less to drink or nothing at all to drink. Over one-quarter (27%) of children with diarrhoea were given the same amount of food or more food, as recommended.

Integrated Child Development Services (ICDS)

The ICDS programme provides nutrition and health services for children under age six years and pregnant or breastfeeding women, as well as preschool activities for children age 3-5 years. These services are provided through community-based *anganwadi* centres.

Over two-thirds (72%) of children under 6 years received services of some kind from an anganwadi centre in the 12 months preceding the survey. The most common services that age-eligible children receive are supplementary food (70%), early childhood care or preschool (63%), growth monitoring (59%), health check-ups (53%), and the service that is least likely to be accessed is immunizations (43%).

How many children received *anganwadi* centre services? *Percentage of age-eligible children receiving services*

Less than two-thirds (64%) of mothers of children who were weighed at an *anganwadi* centre receive counselling from an *anganwadi* worker or an ANM. Among children under 6 years, 77 percent of their mothers received any service from an *anganwadi* centre during pregnancy, and 71 percent of mothers received any service while breastfeeding.

Breastfeeding, Nutrition, and Anaemia

Infant feeding

Although breastfeeding is universal in Tripura, only 62 percent of children under 6 months are exclusively breastfed, as the World Health Organization (WHO) recommends. Nine in 10 newborn babies (90%) are put to the breast within the first day of life, but only 34 percent started breastfeeding in the first hour of life (as recommended). While the initiation of exclusive breastfeeding indicators show 9 percentage points decline since NFHS-4 to NFHS-5 (71% versus 62%), many infants are still deprived of the highly nutritious first milk (colostrum) and the antibodies it contains.

It is recommended that nothing be given to children other than breastmilk even in the first three days when the milk has not begun to flow regularly because prelacteal feeds limit the frequency of suckling by the infant and expose the baby to the risk of infection. However, only 6 percent of children are given something other than breastmilk during the first three days. Overall, 89 percent of children continue breastfeeding at 1 year and more than 93 percent continue breastfeeding at 2 years. The median duration of breastfeeding among last born children in the past 3 years preciding the survey is 3.9 months and 5.1 months for exclusive and predominant breastfeeding, respectively.

After the first 6 months, breastmilk is no longer enough to meet the nutritional needs of infants. Therefore, complementary foods should be added to the diet of the child. However, at age 6-8 months, only 53 percent of children in Tripura receive breastmilk and complementary foods.

WHO has several recommendations for infant and young child feeding (IYCF) practices for children age 6-23 months. The key IYCF indicators measure the adequacy of dietary diversity and meal frequency for breastfed and non-breastfed children. Thirty-seven percent of children age 6-23 months are fed the recommended minimum number of times per day and even fewer (25%) are fed from the appropriate number of food groups. Only 13 percent are fed according to all three recommended practices.

Micronutrient deficiency is a major component of childhood undernutrition and a significant contributor to childhood morbidity and mortality. Vitamin A is an essential nutrient for growth, immunity, and vision. Severe vitamin A deficiency (VAD) can cause eye damage and a higher risk of dying from measles and diarrhoeal disease. The Government of India recommends that children under 5 years of age receive vitamin A supplements every six months, starting at age 9 months. In Tripura, more than two-thirds (70%) of children age 9-35 months were given a vitamin A supplement in the last six months, while more than half (51%) percent of children age 6-23 months living with their mother consumed vitamin A-rich foods during the day or night before the survey.

Iron deficiency is a primary cause of anaemia. Eating foods rich in iron and taking iron supplements can help prevent anaemia. Twienty-six percent of children age 6-23 months ate iron-rich foods during the day or night before the survey; however, only 15 percent of children age 6-23 months were given iron supplements in the week before the survey.

Children's nutritional status

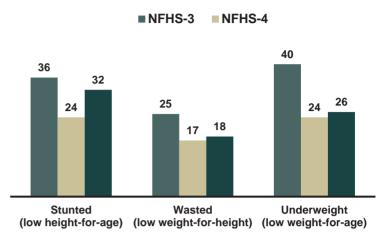

Childhood undernutrition contributes to childhood diseases and is a major cause of child mortality in India. Thirty-two percent of children under age five years are stunted, or too short for their age, which indicates that they have been undernourished for some time. Eighteen percent are wasted, or too thin for their height, which may result from inadequate recent food intake or a recent illness causing weight loss, and 7 percent are severely wasted. Twenty-six percent are underweight, which takes into account both chronic and acute undernutrition. Even during the first six months of life when almost all babies are breastfed, over one-third (31%) of children are stunted and 21 and 22 percent children are wasted and underweight, respectively.

Children's nutritional status in Tripura has changed since NFHS-4 by all measures. The percentage of children who are stunted increased marginally from 24 percent to 32 percent in the 4 years between NFHS-4 and NFHS-5. The percentage of children who are underweight (26%) or wasted (18%) has not much changed since NFHS-4. However, the continuing high levels of undernutrition are still a major problem in Tripura.

Differences in the levels of malnutrition are more pronounced for several background characteristics. Malnutrition generally decreases with increasing mother's schooling, better nutritional status of the mother, and larger child's size at birth. The level of undernutrition is relatively high for

Trends in Children's Nutritional Status

Percentage of children under five years

Note: Nutritional status estimates are based on the 2006 WHO International Reference Population

rural children and children of higher birth orders. It is generally higher among scheduled tribes than among children belongs to other categories. Stunting and underweight is somewhat higher for male children than female children, where as there is minimal increase of wasting among female children than male children.

Adults' nutritional status

Malnutrition refers to deficiencies, excesses, or imbalances in a person's intake of energy and/or nutrients, and includes undernutrition as well as overweight and obesity. The body mass index (BMI), which is defined as a person's weight in kilograms divided by the square of the person's height in metres, is a measure that indicates the nutritional status in adults.

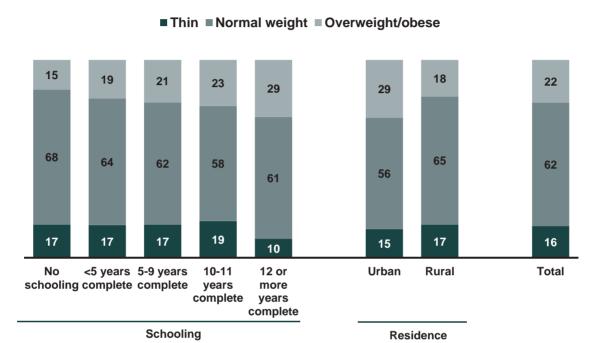

More than one-third (38%) of women and 36 percent of men are either too thin or overweight or obese. Among women age 15-49, the proportion overweight or obese is 22 percent, which was 16 percent in NFHS-4. More men are overweight or obese (23%) than thin (12%), which was 16 percent for overweight or obese and 15 percent for thin in NFHS-4. Sixteen percent of women in Tripura are too thin. More than 6 in 10 of women and men are at a healthy weight for their height.

Undernutrition is particularly common in the younger age groups (especially age 15-19), in rural areas, among less educated & Muslim women, and among women who don't know their caste/tribe followed by scheduled caste. Overweight and obesity are most prevalent in older adults, those in urban areas, and well-educated men. The population groups that are less likely to be too thin are the same age groups that are more likely to be overweight or obese, the percentage suffering from either of these two nutritional problems is fairly constant across the all groups, regardless of their educational attainment, caste, age, residence or marital status.

For the first time, the 2019-21 NFHS measured the waist circumference and hip circumference of women and men age 15-49 years. This information was used to calculate the waist-to-hip ratio (WHR). WHR helps to identify the distribution of body fat and predicts abdominal obesity. Abdominal obesity is associated with an increased risk of type 2 diabetes mellitus, myocardial infarction, stroke, and premature death.

How many women are at a healthy weight for their height?

Percent distribution of women

Sixty-three percent of women and 42 percent of men have a waist-to-hip ratio (WHR) that puts them at a substantially increased risk of metabolic complications. The proportion of adults with such an increased risk WHR increases with age, from 51 percent for women age 15-19 to 68 percent for women age 40-49, and from 27 percent for men age 15-19 to 49 percent for men age 40-49. The proportion of women and men, both having a substantially increased risk of WHR is much higher in urban areas (68% for women and 46% for men) than in rural areas (60% for women and 40% for men).

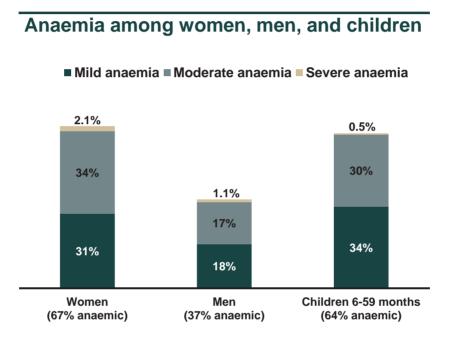

The use of iodized salt prevents iodine deficiency, which can lead to miscarriage, goitre, and mental retardation. More than 99 percent of Tripura's households were using iodized salt at the time of the survey.

Anaemia

Anaemia is a condition that is marked by low levels of haemoglobin in the blood. Iron deficiency is estimated to be responsible for about half of all anaemia globally, but anaemia can also be caused by malaria, hookworms and other helminths, other nutritional deficiencies, chronic infections, and genetic conditions. Anaemia can result in maternal mortality, weakness, diminished physical and mental capacity, increased morbidity from infectious diseases, perinatal mortality, premature

delivery, low birth weight, and (in children) impaired cognitive performance, motor development, and scholastic achievement. Anaemia is a major health problem in Tripura, especially among women and children.

Nearly two-thirds (64%) of children age 6-59 months are anaemic. This includes 34 percent who are mildly anaemic, 30 percent who are moderately anaemic, and less than 1 percent who have severe anaemia. The overall prevalence of anaemia in children increased from 48 percent in NFHS-4 to 64 percent in NFHS-5. There is 4 percentage points difference in the prevalence of anaemia among girls (66%) and boys (62%) in NFHS-5. Children of mothers who have anaemia are much more likely to be anaemic. Although anaemia levels vary somewhat according to background characteristics, anaemia among children is widespread in every group. Sixty percent of children in Tripura are anaemic even if their mother has 12 or more years of schooling.

Over two-thirds (67%) of women in Tripura have anaemia, including 31 percent with mild anaemia, 34 percent with moderate anaemia, and 2 percent with severe anaemia. Anaemia is slightly high among rural women, women age 40-49, women belonging to other backward classes and scheduled caste, but anaemia exceeds 50 percent for every group of women. Anaemia among women has increased by 13 percentage points since NFHS-4. Over one-third (37%) of men in Tripura are anaemic. Men in the age groups 20-29 and 40-49 and men in urban areas are particularly more likely to be anaemic.

ADULT HEALTH AND HEALTH CARE

Tuberculosis

Tuberculosis is an infectious disease caused by a type of bacterium called Mycobacterium tuberculosis, which primarily affects the lungs. Tuberculosis is transmitted from person to person through the air, and people with lowered immunity, HIV, malnutrition, diabetes, and those who use tobacco or alcoholhave higher chances of falling ill. Tuberculosis is both preventable and curable, however mortality is high if not treated properly. In Tripura, 346 persons per 100,000 are estimated to have medically treated tuberculosis, based on reports from household respondents. The prevalence of medically treated tuberculosis is lower among men (312 per 100,000) than among women (379 per 100,000) and is higher in urban areas (414 per 100,000) than in rural areas (319 per 100,000).

A large majority of respondents have heard of tuberculosis (98% of women and 96% of men), but even among those who have heard of tuberculosis, only 61 percent of women and 56 percent of men know that it is spread through the air by coughing or sneezing. Seventy percent of women and 59 percent of men have misconceptions about how tuberculosis is spread. Overall, 85 percent of women and 93 percent of men know that tuberculosis can be cured, and only 14 percent of women and 10 percent of men say that if a family member had tuberculosis, they would want to keep it a secret.

Diabetes, asthma, goitre, heart disease, and cancer

According to self-reports, 2,250 women age 15-49 and 2,391 men age 15-49 per 100,000 have diabetes. Overall, 2,704 women and 1,611 men per 100,000 have asthma. The prevalence of asthma among women in older age groups is higher but surprisingly among men it is higher in younger age group 15-19. In case of urban areas the prevalence of asthma is high among both women and men. Goitre is more common than asthma or diabetes among women, but less common than asthma or diabetes among men (3,643 per 100,000 women and 409 per 100,000 men). The prevalence of any heart disease is higher among women (1,807 per 100,000) than among men (1,350 per 100,000). Among the five diseases, cancer is the least common, with 109 women per 100,000, however not even single men reported having cancer.

Blood pressure (hypertension)

Blood pressure is the force exerted by circulating blood against the arterial walls. Hypertension or high blood pressure is a condition in which the blood vessels have persistently raised pressure. Hypertension is a major risk factor for cardiovascular diseases, chronic kidney diseases, and brain diseases, and it is a major cause of premature deaths worldwide. Some of the risk factors for developing hypertension are unhealthy diets, physical inactivity, alcohol and tobacco consumption, and excess body weight.

Thirteen percent of women age 15-49 in Tripura have hypertension, including eight percent with Stage 1 hypertension and two and one percent with Stage 2 and Stage 3 hypertension, respectively. Hypertension also includes women with normal blood pressure who are taking medicine to lower their blood pressure. Fifty-five percent of women have normal blood pressure.

The prevalence of hypertension among men age 15-49 is somewhat higher than women. Seventeen percent of men in Tripura have hypertension, including 12 percent with Stage 1 hypertension, two percent with Stage 2 hypertension, and one percent with Stage 3 hypertension. Hypertension also includes men with normal blood pressure who are taking medicine to lower their blood pressure. Thirty-eight percent of men have normal blood pressure. For both women and men, prevalence hypertension increases with age.

Blood glucose

Diabetes mellitus is a chronic metabolic disease characterized by elevated levels of blood glucose. Diabetes over a period of time can cause severe damage to the heart, blood vessels, retina, kidneys, and nerves, and it puts sufferers at increased risk of various infectious and non-infectious diseases. Early diagnosis, determined by blood glucose testing, and adequate treatment are the key steps for managing diabetes and its complication. NFHS-5 has included random blood glucose measurement using capillary blood among women and men age 15 and above.

Men are more likely than women to have normal blood glucose levels and are taking medicine to lower their blood glucose level (3% of men versus 1% of women). Thirteen percent of women and 20 percent of men have blood glucose levels ≥140 mg/dl and are taking medicine to lower their blood glucose level.

In Tripura, seven and 6 percent of women age 15-49 have high and very high blood glucose levels respectively. In comparison, it is 9 percent of men age 15-49 having high as well as very high blood glucose levels, respectively. Women and men in older age groups have relatively high blood glucose levels.

Screening tests for cancer

Cancer is a group of diseases with high mortality, and it is the second leading cause of death globally. The chances of successful treatment of cancer increase if diagnosed early. One way of early detection is screening, which is identification of unrecognized disease by using simple tests or examinations among those individuals who have the disease but do not yet have symptoms. NFHS-5 collected information about whether respondents had ever undergone screening test for cancer of the oral cavity, breast, and cervix.

In Tripura, less than one percent of women age 15-49 have ever undergone a screening test for cancer of the cervix (0.5%), breast cancer (0.3%), and oral cavity (0.5%), wheras only 0.2 percent of men ever undergone a sceening test for oral cavity.

Health insurance

Universal access to health care is the absence of any barriers in health care, including economic barriers. Adequate coverage by health insurance protects a person from financial hardships because of the costs of health care. Despite the emergence of a number of health insurance programmes and health schemes in India, only one-third (33%) of households in Tripura have any kind of health insurance that covers at least one member of the household. There is 12 percentage points difference in Health insurance coverage in rural and urban areas (25% in urban and 37% in rural areas). There is a substantial decline in the coverage of health insurance or health scheme in Tripura because of bifurcation of 4 districts to 8 districts with smaller sample. In Tripura, two types

of programmes dominate: the *Rashtriya Swasthya Bima Yojana* (RSBY) and other types of health insurances/financing schemes.

More than one-quarter of women (28%) and men (29%) age 15-49 in Tripura are covered by any health insurance/financing scheme. Older women and men are more likely to be covered than younger women and men. Health insurance/financing scheme coverage is higher (37%) among women age 15-49 with less than 5 years of schooling where as in men it is higher (36%) among men age 15-49 who have completed 5-7 years of schooling.

Tobacco and alcohol use

Fifty-six percent of men and 39 percent of women, age 15-49 use some form of tobacco. Tobacco products mainly used by men are cigarettes (24%), paan with tobacco (19%), and khaini (17%) respectively. Among women and men, the use of any form of tobacco is higher in rural areas (40% for women and 59% for men) than in urban areas (37% for women and 50% for men). Most men who smoke cigarettes smoked fewer than five cigarettes in the past 24 hours.

In Tripura, among adults age 15-49, four percent of women and 36 percent of men drink alcohol, and the consumption is slightly higher in the rural areas. The percentage of women consuming alcohol is higher in rural areas (6%) than urban areas (1%). Among men, consumption is higher in rural areas (39%) than urban areas (28%). Most men who drink alcohol drink it about once a week (53%) or less than once a week (40%), and seven percent men drink almost every day. In case of women, preference is mostly less than once a week (61%).

HIV/AIDS

This section presents the findings from NFHS-5 on HIV/AIDS knowledge and attitudes, prior HIV testing, and the prevalence of sexually transmitted infections (STIs), as well as sexual behaviour of the adult and youth population. Questions on HIV/AIDS were included only in the subsample of households selected for the state module.

Awareness of HIV or AIDS

Ninety-two percent of women in Tripura have heard of HIV or AIDS. In urban areas, almost all women (99%) know about HIV or AIDS, compared with 89 percent in rural areas. Women age 25-29 are more likely (93%) than older women age 40-49 (92%) to have heard of HIV or AIDS. Women with no schooling (83%), women with no regular exposure to media (87%), and women from scheduled tribes (87%) are less likely than other women to have heard of HIV or AIDS. Men are more likely than women to know about HIV or AIDS. Ninety-six percent of men in Tripura have heard of HIV or AIDS, including 99.9 percent in urban areas.

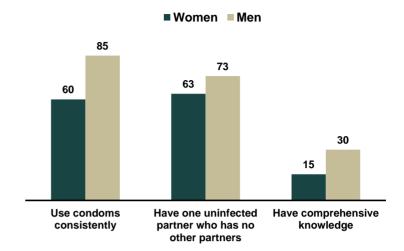

Knowledge of prevention and transmission

Men are much more likely than women to know how HIV/AIDS is transmitted and how to keep from getting it. For example, only 60 percent of women know that consistent condom use can help to prevent HIV/AIDS, compared with 85 percent of men, and 63 percent of women know that having just one uninfected partner who has no other partners can reduce the chance of getting HIV/AIDS, compared with 73 percent of men.

Only 15 percent of women and 30 percent of men in Tripura have a 'comprehensive knowledge' about HIV/AIDS. This means they know that consistent use of condoms every time they have sex and having just one uninfected sex partner who has no other partners can reduce the chance of getting HIV/AIDS, they know that a healthy-looking person can have HIV/AIDS, and they reject two common misconceptions about the transmission or prevention of HIV/AIDS.

Do people know how to prevent HIV/AIDS?

Percentage of women and men age 15-49

HIV-related stigma

Nearly half of women (48%) and men (50%) in Tripura would be willing to take care of a relative with HIV/AIDS in their home. A similar proportion of women (58%) and men (68%) say that a female teacher who has HIV/AIDS but is not sick should be allowed to continue teaching. Over half (53%) of women and 59 percent of men say that they would buy fresh vegetables from a shopkeeper with HIV/AIDS. Fifty-nine percent of women and 68 percent of men say that if a family member got infected with HIV/AIDS, they would not want to keep it a secret.

Fifty-five percent of women and 66 percent of men say that an HIV positive student should be allowed to attend school with students who are HIV negative. About half of women (49%) and 61 percent of men think that people living with HIV/AIDS should be treated in the same public hospital as persons who are HIV negative. Above three-fifths (62%) women and men (63%) think that people living with HIV should be allowed to work in the same office with people who are HIV negative.

HIV testing prior to NFHS-5, blood transfusions, and safe injections

Only 16 percent of women and 5 percent of men age 15-49 had ever been tested for HIV prior to NFHS-5. Women and men in urban areas are somewhat more likely to have ever been tested for HIV prior to NFHS-5 than rural women and men. Twenty-two percent of women who had a live birth in the past five years and received ANC during pregnancy were tested for HIV during ANC. Rural women who have been tested for HIV during ANC is about one-quarter (22%).

Twenty-two percent of women who had a live birth in the past five years and received ANC during pregnancy were tested for HIV during ANC.

In Tripura, 5 percent of women and 3 percent of men have ever had a blood transfusion. Men are more likely than women to have received an injection in the past 12 months (32% of women, compared with 25% of men). A disposable syringe was used for injections for 88 percent of adults who received an injection in the past 12 months.

SEXUAL BEHAVIOUR

NFHS-5 included questions on respondents' sexual behaviour. Respondents were asked about their age at first sex, their current and previous sexual partners, higher-risk intercourse, and condom use. In addition, men were asked whether they had paid for sex in the past year. These questions are sensitive and subject to reporting bias, so the results should be interpreted with caution.

Higher-risk behaviour

Higher-risk sex is sexual intercourse with someone who is neither a spouse nor a cohabiting partner. Among those who had sex in the past 12 months, only 0.1 percent of women and one percent of men reported having had higher-risk sex during the past 12 months. The percentage of men who had higher-risk sexual intercourse in the past 12 months is lower (0.2%) in urban areas than in rural areas (0.5%). Even fewer male respondents said that they had multiple sex partners in the past 12 months (1%) and none of the women reported about having multiple sex partner in the past 12 months.

Mean number of sexual partner in lifetime who had higher-risk sex in the past 12 months is 2 percent and it is 1 percent among women, it is slightly higher in rural (2%) than the urban (1%) areas. Less than one percent (0.6%) of men said they had paid for sex in the past year.

WOMEN'S EMPOWERMENT

Empowering women and promoting gender equality in every sphere of life are essential to improving their lives and achieving the Sustainable Development Goals. NFHS-5 has collected information related to women's empowerment and autonomy, including menstrual hygiene, employment and earnings, decision-making, ownership of assets, gender role attitudes, and domestic violence.

Women's hygiene

Using a hygienic method of menstrual protection is important for women's health and personal hygiene. In NFHS-5, young women age 15-24 were asked what method or methods they use for menstrual protection, if anything. In Tripura, 56 percent uses cloth, 53 percent use sanitary napkins, 13 percent use locally prepared napkins, and 4 percent use tampons. Overall, 69 percent of women age 15-24 use a hygienic method of menstrual protection, up from 44 percent in NFHS-4. Notably, only 64 percent of rural women use a hygienic method of menstrual protection, compared with 83 percent of urban women.

Employment and earnings

Only 31 percent of all women age 15-49, compared with 81 percent of men, were employed in the 12 months preceding the survey. Among employed women, 75 percent earned cash, including 9 percent who earned both cash and in-kind. Nearly one-quarter (24%) were not paid at all. More men who were employed earned cash (98%), including 4 percent who earned both cash and in-kind. Two percent of employed men were not paid at all. A large majority (92%) of employed women work in non-agricultural occupations, compared with 60 percent of employed men.

Only 31 percent of all women age 15-49 were employed in the 12 months preceding the survey.

Among currently married women who work and are paid in cash, 92 percent decide how their earnings will be used, either alone or jointly with their husbands. Over two-fifths (44 %) of women who work for cash and whose husbands earn in cash say that they earn more than or about the same as their husbands. Eighty-six percent of currently married men who have wives who have cash earnings report that they alone or jointly with their wives decide how her earnings are used, and half of men who have cash earnings and whose wives have cash earnings say that their wife earns more than or about the same as them.

Decision making

Currently married women were asked who makes decisions about their own health care, major household purchases, and visits to their own family or relatives. Women are somewhat more likely to participate in decisions about visits to their own family and relatives (87%) than decisions about their own health care and about major household purchases (85% each). Overall, 80 percent of currently married women participate in making all three of these decisions, and 9 percent do not participate in making any of the three decisions. Participation in all three decisions varies most by age, increasing sharply from 72 percent among women age 20-24 to 87 percent among women age 40-49.

In the case of currently married men, they are much more likely than women to report that they alone or jointly with their wives participated in making decisions about major household purchases (96%) than about their own health care (94%). Two percent of men participated in making neither of these decisions.

Among currently married women who work and are paid in cash, 92 percent decide how their earnings will be used, either alone or jointly with their husbands. Over two-fifths (44%) of women who work for cash and whose husbands earn in cash say that they earn more than or about the same as their husbands. Eighty-six percent of currently married men who have wives who have cash earnings report that they alone or jointly with their wives decide how her earnings are used, and half of men who have cash earnings and whose wives have cash earnings say that their wife earns more than or about the same as them.

Other indicators of women's empowerment

In Tripura, 55 percent of women have money that they can decide how to use. The proportion of women who have money that they can decide how to use is higher among rural (57%) than urban (50%) women, increases sharply with age, is much higher among women with 12 or more years of schooling (63%), and is highest among women who are employed for cash (78%) than any other group of women.

More than three-quarters (77%) of women have a bank or savings account that they themselves use.

Seventy-seven percent of women have a bank or savings account that they themselves use. This percentage is high among women who have 12 or more years of schooling (82%) and Hindu women (77%). Women's knowledge and use of microcredit programmes is very limited. Fifty-nine

percent of women know of a microcredit programme in their area, and only one-fifth (21%) of women have ever taken a loan from a microcredit programme.

Only 7 percent of women who have a mobile phone use it for financial transactions. Urban women are more (9%) likely to use a mobile phone for financial transactions, than rural women (6%). This percentage increases with education with one-fifth of women with 12 or more years of education using a mobile phone for financial transactions, compared with less than one-tenth of women having 5-7 years of schooling (5%) or having 10-11 years of schooling (11%). Only five percent of employed women who earn in cash and have a mobile phone use a mobile phone for financial transactions, compared with 16 percent of employed women who don't earn in cash and have a mobile phone. Muslim women are more likely (9%) to use a mobile phone for financial transactions, compared with Hindu (6%) women. Women not belonging to a scheduled caste and a scheduled tribe (6% each), or an other backward class (7%), and 9 percent of the women belonging to any other caste are using a mobile phone for financial transactions.

Ownership of assets

Sixteen percent of women and 53 percent of men age 15-49 in Tripura own a house alone or jointly with someone else, and 11 percent of women and 35 percent of men own land alone or jointly with someone else. Among women and men, ownership of a house and land is more common in rural than urban areas.

Sixteen percent of women own a house alone or jointly with someone else, and 11 percent of women own land alone or jointly with someone else.

In Tripura, 53 percent of women have a mobile phone that they themselves use, and among women who have a mobile phone that they themselves use, 69 percent can read SMS messages. Sixty-six percent of urban women have a mobile phone they themselves use, compared with 48 percent of rural women. Mobile phone access increases substantially with education, from 25

percent among women with no schooling to 84 percent among women with 12 or more years of schooling. Only 46 percent of women belonging to a scheduled tribe have a mobile phone they themselves use, compared with 48-59 percent of women in other castes/tribes. Scheduled tribe women who have a mobile phone that they themselves use are also less likely to be able to read SMS messages (65%) than women in other groups (67-74%).

Fifty-three percent of women in Tripura have a mobile phone that they themselves use.

Gender-role attitudes

Thirty percent of women agree that a husband is justified in hitting or beating his wife under some circumstances. Women are most likely to agree that wife beating is justified if a she argues with him (19%), shows disrespect for her in-laws (18%), he suspects her of being unfaithful and if she neglects the house or children (17% each). Men are less likely to agree: 21 percent say that wife beating is justified in some circumstances, especially he suspects her of being unfaithful (10%), if the wife shows disrespect for in-laws (8%) or if she neglects the house or children, if she argues with him and refuse to have sexual intercourse (7% each). Even among women and men who have completed at least 12 years of schooling, 25 percent of women and 12 percent of men say that a husband is justified in hitting or beating his wife for one or more of the specified reasons.

Seventy-six percent of women and 73 percent of men believe that a woman is justified in refusing to have sex with her husband if she knows he has a sexually transmitted disease, if she knows he has intercourse with other women, and if she is tired or not in the mood. Over four-fifths (83%) of men agree that if a wife refuses to have sex with her husband he does not have a right to get angry and reprimand her, refuse to give her financial support, use force to have sex even if she doesn't want to, or have sex with another woman.

DOMESTIC VIOLENCE

The World Health Organization recognizes that violence against women, particularly domestic or spousal violence, is a major public and clinical health problem and a violation of women's human rights, which also reflects the scale of gender inequality and discrimination against women. The consequences of violence on physical, mental, sexual, and reproductive health often last a lifetime. NFHS-5 collected information on domestic violence from women age 18-49, related to behaviours of her husband that cause physical, sexual or emotional harm, including physical violence, sexual coercion, emotional abuse, and controlling behaviours. Information was also collected on violence during pregnancy and help seeking behaviour for any violence experienced.

In Tripura, 27 percent of women age 18-49 have ever experienced physical violence, and 7 percent have ever experienced sexual violence. In all, 21 percent of women experienced physical or sexual violence and 6 percent experienced both physical and sexual violence. For ever-married women who experienced physical violence since age 18, the most common perpetrator was the current husband.

Twenty-nine percent of ever-married women age 18-49 in Tripura have experienced physical or sexual violence.

Violence during pregnancy

Two percent of women age 18-49 who have ever been pregnant have ever experienced physical violence during one or more of their pregnancies. Women with less than 5 years of schooling (4%), women with 3-4 children (2%), and women in rural areas (3%) are more likely to experience violence during pregnancy than women in any other group.

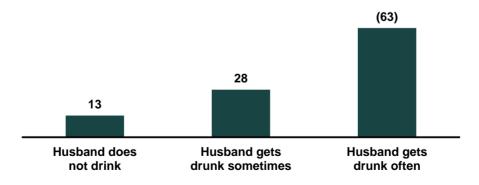

Spousal violence

In Tripura, 19 percent of ever-married women age 18-49 have experienced any form of physical violence committed by their husband, 11 percent have experienced any form of emotional violence committed by their husband, and 7 percent have experienced any form of sexual violence committed by their husband. Seventeen percent of ever-married women report having been slapped by their husband. Ten percent report being pushed, shaken, or having something thrown at them. Six percent experienced having their arm twisted or hair pulled, punched with a fist or something that could hurt her and as well as being kicked, dragged, or beaten up, and 1 percent that her husband tried to choke or burn her on purpose.

Four percent of ever-married women age 18-49 report that their husband have physically forced them to have sex even when they did not want to, and 3 percent report that their husband forced them with threats or in any other way to perform sexual acts they did not want to perform. Overall, 19 percent of ever-married women have experienced spousal physical and (7%) sexual violence from their current husband or, if not currently married, from their most recent husband. Few ever-married women (2%) reported that they have initiated violence against their husband when he was not already beating or physically hurting them.

Is alcohol use related to spousal physical or sexual violence?

Percentage of ever-married women experiencing violence

Note: Category "Husband drinks, but never gets drunk" not shown since there are fewer than 25 unweighted cases; figures in parentheses are based on 25-49 unweighted cases.

Spousal violence prevails across all groups. Although spousal violence is much lower among more educated women, 3 percent of women who have at least 12 years of schooling have experienced sexual or physical, spousal violence. The experience of spousal violence is higher among women in rural areas (27%) than in urban areas (15%); and among women who are employed for cash (40%) than women who are not employed (18%). Husband's characteristics are also related to overall spousal violence (emotional, physical, or sexual). For instance, women are more likely to experience spousal violence if their husband displays 3-4 marital control behaviours (48%), gets drunk sometimes (30%), and if the husband never attended school (34%). Over three-fifths of women (64%) say that they are afraid of their husband most of the time have experienced spousal violence. The contextual and intergenerational aspects of spousal violence are clear from the fact that women whose mothers were beaten by their fathers are more than twice as likely to be in abusive marriages themselves as compared with women whose mothers were not beaten by their fathers.

One-fifth of ever-married women age 18-49 who have ever experienced physical or sexual violence reported suffering from injuries from what their husband did to them. The most common types of injuries among women who have experienced physical or sexual violence are cuts, bruises, or aches (19%); eye injuries, sprains, dislocations, or minor burns and deep wounds, broken bones, broken teeth, or any other serious injury (2%) and severe burns (1%).

Help seeking

Only 16 percent of women age 18-49 who have ever experienced physical or sexual violence sought help, while 8 percent never sought help but told someone. More than three-quarters (76%) of women never sought help and never told anyne. Among women who sought help, the main sources of help were their own family. None of them have received help from the police.

Total Number	100.0 2,150	100.0 5,059	100.0 7,209	100.0 26,370

na = Not applicable.

¹ Nuclear households are households comprised of a married couple or a man or a woman living alone or with unmarried children (biological, adopted, or fostered) with or without unrelated individuals. The remaining households are non-nuclear households.

² Protected dug well, protected spring, rainwater, community RO plant, tanker truck, cart with small tank, bottled water.

³ Defined as drinking water from an improved source, provided either water is on the premises or round-trip collection time is 30 minutes or less. Includes safely managed drinking water, which is not shown separately.

⁴ Drinking water from an improved source, provided round-trip collection time is more than 30 minutes or is unknown.

⁵ Total may add to more than 100.0 because households may use more than one method of treatment.

⁶ Appropriate water treatment methods are boiling, adding bleach/chlorine tablets, filtering, electronic purifying, and solar disinfection

⁷ Includes ventilated improved pit (VIP) latrine/biogas latrine, and twin pit/composting toilet.

⁸ Facilities that would be considered improved if they were not shared by two or more households.

⁹ Defined as use of improved facilities that are not shared with other households.

¹⁰ Defined as use of improved facilities shared by two or more households.

¹¹ Houses made from mud, thatch, or other low-quality materials are called *kachha* houses, houses that use partly low-quality and partly high-quality materials are called semi-*pucca* houses, and houses made with high quality materials throughout, including the floor, roof, and exterior walls, are called *pucca* houses.

 $^{^{\}rm 12}$ Electricity, LPG/natural gas, biogas .

¹³ Includes coal/lignite, charcoal, wood, straw/shrubs/grass, agricultural crop waste, and dung cakes.

¹⁴ Frequency of smoking by anyone inside the house

Table 5 Access to a toilet facility

Percentage of households having access to a toilet facility by selected background characteristics, according to residence, Tripura, 2019-21

Background characteristic	Urban	Rural	Total
Religion of household head			
Hindu	99.8	98.7	99.1
Muslim	99.3	99.8	99.7
Christian	*	97.8	97.9

45-49	0.000	0.000	0.000	0.000	0.003	0.002	*	0.000	0.000
TFR(15-49)	1.39	1.81	1.70	1.40	1.80	1.69	1.66	2.34	2.22
CBR	11.0	15.8	14.5	12.7	16.4	15.3	17.8	22.8	21.9

Note: Rates are for the period 1-36 months preceding the survey (approximately 2003-05 for NFHS-3, 2013-2015 for NFHS-4, and 2017-2019 for NFHS-5). Age-specific fertility rates are expressed per woman. Figures in parentheses are based on 125-249 unweighted woman-years of exposure. An asterisk indicates that a figure is based on fewer than 125 unweighted woman-years of exposure and has been suppressed.

TFR = Total fertility rate, expressed per woman

CBR = Crude birth rate, expressed per 1,000 population

Table 19 Fertility by background characteristics

Total fertility rate for the 3 years preceding the survey, percentage of women age 15-49 currently pregnant, mean number of children ever born to women age 40-49, and total wanted fertility by background characteristics, Tripura, 2019-21

Background characteristic	Total fertility rate	Percentage of women age 15-49 currently pregnant	Mean number of children ever born to women age 40-49	Total wanted fertility rate
Residence	4.20	2.2	1.0	4.20

Number of users	645	1,921	25	200	2,854

Note: All information in this table is based on women's reports. Table includes all users of modern contraceptive methods regardless of their marital status. All modern methods include male sterilization, injectables, and emergency contraception, which are not shown separately.

IUD = Intrauterine device; PPIUD = Postpartum intrauterine device; AYUSH = Ayurveda, yoga and naturopathy, unani, siddha and homeopathy; UHC = Urban health centre; UHP = Urban health post; UFWC = Urban family welfare centre; CHC = Community health centre; PHC = Primary health centre; ANM = Auxiliary nurse midwife; ICDS = Integrated Child Development Services; ASHA = Accredited Social Health Activist; NGO = Nongovernmental organization; TBA = Traditional birth attendant

¹ Excludes standard days method, lactational amenorrhoea method (LAM), and "other" modern methods

Table 32 Informed choice

Among women who are current users of selected modern contraceptive methods who started the last episode of use within the 5 years preceding the survey, percentage who were informed about possible side effects or problems of that method, percentage who were informed about what to do if they experienced side effects, percentage who were ever told by a health or family planning worker about other methods of family planning they could use, and percentage who were informed of all three (Method Information Index) by method, according to residence, Tripura, 2019-21

Method	Percentage who were informed about side effects or problems of method used	Percentage who were informed about what to do if experienced side effects	Percentage who were informed by a health or family planning worker of other methods that could be used	Percentage who were informed about all three (Method Information Index)	Number of women

All methods	2.5	7.1	4.3	7.1	8.4	3.8	11.0	44.2	16.9	3,882

Note: Figures are based on life table calculations using information on episodes of contraceptive use that occurred 3-62 months preceding the survey. All methods include female and male sterilization, IUD or PPIUD, and injectables, which are not shown separately.

IUD = Intrauterine device; PPIUD = Postpartum intrauterine device

¹ Includes infrequent sex/husband away, difficult to get pregnant/menopausal, and marital dissolution/separation

² Includes lack of access/too far, costs too much, and inconvenient to use

³ Reasons for discontinuation are mutually exclusive and add to the total given in this column

⁴ The episodes of use included in this column are a subset of the discontinued episodes included in the discontinuation rate. A woman is considered to have switched to another method if she used a different method in the month following discontinuation or if she gave "wanted a more effective method" as the reason for discontinuation and started another method within 2 months of discontinuation.

⁵ All episodes of use that occurred within the 5 years preceding the survey are included. Number of episodes of use includes both episodes of use that were discontinued during the period of observation and episodes of use that were not discontinued during the period of observation.

⁶ Includes female condom, diaphragm, foam/jelly, standard days method, lactational amenorrhoea method (LAM), and other modern and traditional methods that are not shown separately

⁷ Includes pill, IUD/PPIUD, injectables, male condom, female condom, lactational amenorrhoea method (LAM), diaphragm, foam/jelly, and other modern spacing methods that are not shown separately

⁸ Includes pill, IUD/PPIUD, injectables, male condom, female condom, lactational amenorrhoea method (LAM), diaphragm, foam/jelly, rhythm, withdrawal, and other modern spacing and traditional methods that are not shown separately

Table 34 Men's contraception-related perceptions and knowledge

Note: Numbers in this table correspond to the revised definition of unmet need described in Bradley et al., 2012, Revising Unmet Need for Family Planning, DHS Analytical Studies No. 25, ICF International, Calverton, Maryland, USA.

¹ Total demand is the sum of unmet need and met need

² Percentage of demand satisfied is met need divided by total demand
³ Modern methods include female sterilization, male sterilization, pill, IUD/PPIUD, injectables, male condom, female condom, standard days method, diaphragm, foam/jelly, lactational amenorrhoea method (LAM), and other modern methods

Table 36 Unmet need for family planning by district

Percentage of currently married women age 15-49 with unmet need for family planning by district, Tripura, 2019-21 and total for NFHS-4

District	Total unmet need	Unmet need for spacing	Unmet need for limiting	Number of women
Dhalai	4.0	1.8	2.1	603

Note: If more than one source of ANC was mentioned, only the provider with the highest qualification is considered in this table. Figures in parentheses are based on 25-49 unweighted cases.

ANM = Auxiliary nurse midwife; LHV = Lady health visitor; TBA = Traditional birth attendant; ICDS = Integrated Child Development Services; ASHA = Accredited Social Health Activist

¹ Skilled provider includes doctor, auxiliary nurse midwife, nurse, midwife, and lady health visitor.

Table 45 Antenatal care services and information received

Percent of women who had a live birth in the 5 years preceding the survey who received antenatal care (ANC) for the most recent live birth by services and information received, according to residence and source of antenatal care, Tripura, 2019-21

Note: Children are considered to have received the vaccine if it was either written on the child's vaccination card or reported by the mother. For children whose vaccination information is based on the mother's report, the date of vaccination is not collected. The proportions of vaccinations given during the first year of life are assumed to be the same as for children with a written record of vaccination. Figures in parentheses are based on 25-49 unweighted cases. Total includes children of birth order 4 or more, children belonging to Christian or other religions, and children whose caste/tribe is not known, who are not shown separately.

¹ Hepatitis B 0 is the hepatitis vaccination given at birth. There is no Penta 0 vaccine.

² Polio 0 is the polio vaccination given at birth

BCG, MCV/Measles/MMR/MR, and three doses each of DPT/Penta and polio vaccine (excluding polio vaccine given at birth)

BGG, MCV/Measles/MMR/MR, four doses of hepatitis B/Penta, and three doses each of DPT/Penta and polio vaccine (excluding polio vaccine given at birth)

⁵ Child has not received any vaccinations listed in the table

Table 60 Vaccinations by district

on fewer than 25 unweighted cases and has been supressed. Total includes children of birth order 6 or more, children who have no caste/tribe or whose caste/tribe is missing, and children whose mother's nutritional Note: Table is based on children who stayed in the household the night before the interview. Each of the indices is expressed in standard deviation (5D) units from the median of the WHO Child Growth Standards. Table is based on children with valid dates of birth (month and year) and valid measurement of both height and weight. Figures in parentheses are based on 25-49 unweighted cases. An asterisk indicates that a figure is based status is missing, who are not shown separately.

BMI = Body mass index

Recumbent length is measured for children under age 2; standing height is measured for all other children

² Includes children who are below -3 standard deviations (SD) from the WHO Child Growth Standards population median

³ Excludes children whose mothers were not interviewed

First-born twins (triplets, etc.) are counted as first births because they do not have a previous birth interval

For women who are not interviewed, information is taken from the Household Questionnaire. Excludes children whose mothers are not listed in the household schedule.

Excludes children whose mothers were not weighed and measured, children whose mothers were not interviewed, and children whose mothers are pregnant or gave birth within the preceding 2 months. Mother's nutritional status in terms of BMI (Body Mass Index) is presented in Table 78.

Table 68 Initial breastfeeding

Among last-born children who were born in the age 2 years preceding the survey, percentage who were ever breastfed, and percentages who started breastfeeding within 1 hour and 1 day of birth, and among last-born children born in the 2 years preceding the survey who were ever breastfed, percentage who received a prelacteal feed in the first 3 days after birth, by background characteristics, Tripura, 2019-21

20-23	7.5	4.7	1.9	1.9	1.6	82.3	100.0	92.5	118	28.8	119

Note: Breastfeeding status refers to a "24-hour" period (yesterday during the day or at night). Children who are classified as breastfeeding and consuming plain water only consumed no liquid or solid supplements. The categories of not breastfeeding, exclusively breastfed, breastfeeding and consuming plain water, non-milk liquids, other milk, and complementary foods (solids and semi-solids) are hierarchical and mutually exclusive, and their percentages add to 100 percent. Thus, children who receive breast milk and non-milk liquids and who do not receive other milk and who do not receive complementary foods are classified in the non-milk liquid category even though they may also get plain water. Any children who get complementary food are classified in that category as long as they are breastfeeding as well.

1 Non-milk liquids include juice, juice drinks, clear broth, and other liquids.

<u>Table 70 Median duration of breastfeeding and infant and young child feeding (IYCF)</u> practices

Median duration of any breastfeeding, exclusive breastfeeding, and predominant breastfeeding among last-born children born in the 3 years preceding the survey, by background characteristics, Tripura, 2019-21

Other	a	(4.0)	(4.4)	287
Total	а	3.9	5.1	1,101

Note: Median and mean durations are based on breastfeeding status of the child at the time of the survey (current status). Includes living and deceased children. Figures in parentheses are based on 25-49 unweighted cases. An asterisk indicates that a figure is based on fewer than 25 unweighted cases and has been supressed. Total includes children of mothers with no schooling or with less than 5 years of schooling or with 12 or more years of schooling, children belonging to Christian or other religions, and children whose caste/tribe is not known, who are not shown separately.

a = Omitted because the smoothed percentage is below 50 percent in the first age cell (<2 months) and therefore the median cannot be calculated

¹ For last-born children under age 24 months who live with the mother and are breastfeeding, information to determine exclusive and predominant breastfeeding comes from a 24-hour dietary recall. Tabulations assume that last-born children age 24 months or older who live with the mother and are breastfeeding are neither exclusively nor predominantly breastfed. It is assumed that last-born children not currently living with the mother and all non-last-born children are not currently breastfeeding.

² Either exclusively breastfed or received breast milk and plain water, and/or non-milk liquids only

Table 71 Minimum acceptable diet

breast milk, cheese or yogurt or other milk products; c. foods made from grains or roots, including porridge or gruel, fortified baby food made from grains; d. vitamin A-rich fruits and vegetables; e. other fruits and Minimum dietary diversity is receiving foods from 5 or more of the following 8 food groups: Children received foods from four or more of the following food groups: a. breast milk b. infant formula, milk other than vegetables; f. eggs; g. meat, poultry, fish, shellfish, or organ meats; h. beans, peas, lentils, or nuts

For breastfed children, minimum meal frequency is receiving solid or semi-solid food at least twice a day for infants 6-8 months and at least three times a day for children 9-23 months

Breastfed children age 6-23 months are considered to be fed a minimum acceptable diet if they are fed the minimum dietary diversity as described in footnote 1 and the minimum meal frequency as described in

lincludes two or more feedings of commercial infant formula; fresh, tinned and powdered animal milk; and yogurt

⁵ For non-breastfed children age 6-23 months, minimum meal frequency is receiving solid or semi-solid food or milk feeds at least four times a day. At least one of the feeds must be a solid or semi-solid food

6 Non-breastfed children age 6-23 months are considered to be fed a minimum acceptable diet if they receive other milk or milk products at least twice a day, receive the minimum meal frequency as described in footnote 5, and receive solid or semi-solid foods from at least four food groups not including the milk or milk products food group

Breastfeeding, or not breastfeeding and receiving two or more feedings of commercial infant formula, fresh, tinned, and powdered animal milk, and yogurt

children are fed the minimum recommended number of times per day according to their age and breastfeeding status as described in footnotes 2 and

Children age 6-23 months are considered to be fed a minimum acceptable diet if they receive breast milk, other milk or milk products as described in footnote 7, are fed the minimum dietary diversity as described in footnote 1, and are fed the minimum meal frequency as described in footnotes 2 and 5

Table 72 Child feeding practices and nutritional status of children by district

Among last-born children who were born in the 2 years preceding the survey, percentage who started breastfeeding within 1 hour of birth, percentage of youngest children under age 6 months living with the mother who are exclusively breastfed, and percentage of children under age 5 years classified as malnourished according to three anthropometric indices of nutritional status: height-for-age, weight-for-height, and weight-for-age, by district, Tripura, 2019-21

	Among last born children in the past 2 years		Percentage of children under age 6		Height-fo	or-age²	Weight-fo	r-height	Weight-f	or-age

NFHS-4 (2015-16)	30.5	17.6	0.2	48.3	1,029

Note: Table is based on children who stayed in the household the night before the interview and who were tested for anaemia. Prevalence of anaemia, based on haemoglobin levels, is adjusted for altitude using the CDC formula (Centers for Disease Control (CDC). 1998. Recommendations to prevent and control iron deficiency in the United Tripuras. *Morbidity and Mortality Weekly Report* 47 (RR-3): 1-29). Haemoglobin levels shown in grams per decilitre (g/dl). Total includes children of birth order 6 or more and children whose caste/tribe is not known, who are not shown separately.

¹ Excludes children whose mothers were not interviewed

² For mothers who are not interviewed, information is taken from the Household Questionnaire. Excludes children whose mothers are not listed in the household schedule.

³ Mildly anaemic is 11.0-11.9 g/dl for non-pregnant women and 10.0-10.9 g/dl for pregnant women. Moderately/severely anaemic is <11.0 g/dl for non-pregnant women and <10.0 g/dl for pregnant women. Adjusted for altitude and for smoking status. Excludes children whose mother's anaemia status is not known.

Table 74 Micronutrient intake among children

Table 81 Nutritional status and anaemia among children and women by district

Percentage of children age 6-59 months classified as having anaemia and percentage of women age 15-49 years with anaemia and specific body mass index (BMI) levels by district, Tripura, 2019-21

District	Percentage of children having any anaemia (<11.0 g/dl)	Number of children	Percentage of women having any anaemia (<12.0 g/dl) ¹	Number of women	Percentage of women with BMI <18.5 (total thin)	Percentage of women with BMI ≥25.0 (overweight or obese)	Number of women ²
Dhalai	81.2	209	70.0	762	15.9	19.1	719
Gomati	70.7	166	62.2	749	14.1	19.6	719
Khowai	73.4	134	63.7	644	18.7	15.4	620
North Tripura	52.5	221	69.2	830	18.6	16.8	818
Sepahijala	72.1	187	69.4	881	13.9	24.2	844
South Tripura	59.6	188	66.5	845	16.8	22.8	816
Unakoti	62.8	131	67.9	494	26.0	16.6	467
West Tripura	54.5	376	67.3	1,919	13.7	26.8	1,873
Tripura	64.2	1,611	67.2	7,124	16.2	21.5	6,876

Note: Table is based on children who stayed in the household the night before the interview. Prevalence of anaemia, based on haemoglobin levels, is adjusted for altitude using the CDC formula (Centers for Disease Control (CDC). 1998. Recommendations to prevent and control iron deficiency in the United Tripuras. *Morbidity and Mortality Weekly Report* 47 (RR-3): 1-29). Haemoglobin levels shown in grams per decilitre (g/dl). The body mass index (BMI) is expressed as the ratio of weight in kilograms to the square of height in metres (kg/m²).

¹ For pregnant women, the value is <11.0 g/dl

² Excludes pregnant women and women with a birth in the preceding 2 months

Table 82 Knowledge and prevention of HIV/AIDS

Percentage of women and men age 15-49 who have heard of HIV or AIDS and who, in response to prompted questions, say that people can reduce the risk of getting HIV/AIDS by using condoms every time they have sexual intercourse, who know that the risk of getting HIV/AIDS can be reduced by limiting sex to one uninfected partner, who have a comprehensive knowledge about HIV/AIDS, and who know that HIV/AIDS can be transmitted from a mother to her baby, by background characteristics, Tripura, 2019-21

¹ Partner who has no other partners

Comprehensive knowledge means knowing that consistent use of a condom every time they have sex and having just one uninfected faithful sex partner can reduce the chance of getting HIV/AIDS, knowing that a healthy-looking person can have HIV/AIDS, and rejecting two common misconceptions about transmission or prevention of HIV/AIDS.

³ Exposure to radio, television, or newspapers/magazines at least once a week or cinema at least once a month

⁴ For women, visits to parental/in-laws' home excluded

SBP = Systolic blood pressure; DBP = Diastolic blood pressure

¹ A woman is classified as having hypertension if she has SBP≥140 mmHg or DBP≥90 mmHg at the time of the survey, or she is currently taking antihypertensive medication to control blood pressure. The term hypertension as used in this table is not meant to be a clinical diagnosis of the disease, but rather to provide an indication of the disease burden in the population at the time of the survey.

living children and women/men who don't know their caste/tribe, who are not shown separately.

1 Nuclear households are households comprised of a married couple or a man or a woman living alone or with unmarried children (biological, adopted, or fostered) with or without unrelated individuals. The remaining Note: Figures in parentheses are based on 25-49 unweighted cases. An asterisk indicates that a figure is based on fewer than 25 unweighted cases and has been supressed. Total includes women/men with 5 or more

households are non-nuclear households.

Table 100 Women's access to money and credit

Table 108 Spousal violence by husband's characteristics and empowerment indicators—Continued

Percentage of ever-married women age 18-49 who have ever suffered emotional, physical, or sexual violence committed by their husband, according to his characteristics, marital characteristics, and selected empowerment indicators, Tripura, 2019-21

Background characteristic	Emotional violence	Physical violence	Sexual violence	Physical or sexual violence	Emotional, physical, or sexual violence	Number of women
Number of reasons given for refusing to have sexual intercourse with husband ⁵						
0	13.8	26.4	2.0	26.9	34.6	45
1-2	14.0	26.8	7.4	28.0	32.8	135
3	10.6	17.3	6.7	18.6	20.3	618
Afraid of husband						
Most of the time	37.5	58.4	27.9	60.6	64.0	69
Sometimes	10.4	18.5	3.9	19.1	21.5	524
Never	4.7	8.6	6.3	11.2	13.8	205
Total	11.3	19.4	6.6	20.6	23.2	798

Note: Husband refers to the current husband for currently married women and the most recent husband for widowed, divorced, separated, or deserted women. Figures in parentheses are based on 25-49 unweighted cases. Total includes women whose husband drinks alcohol but never gets drunk, women who are older than their husband, and women whose husband displayed 5-6 marital control behaviours, who are not shown separately.

¹ Currently married women only

² Behaviours include: Is jealous or angry if she talks to other men, frequently accuses her of being unfaithful, does not permit her to meet her female friends, tries to limit her contact with her family, insists on knowing where she is at all times, and does not trust her with any money

³ Currently married women only. Decisions included are decisions about own health care, major household purchases, and visits to her family or relatives

⁴ Reasons given for which wife beating is justified include: she goes out without telling him, she neglects the house or children, she argues with him, she refuses to have sexual intercourse with him, she doesn't cook properly, he suspects she is unfaithful, and she shows disrespect for in-laws

⁵ Reasons given for refusing to have sexual intercourse with husband include: she knows her husband has a sexually transmitted disease, she knows her husband has sex with other women, and she is tired or not in the mood

Table 109 Injuries to women due to spousal violence

Percentage of ever-married women age 18-49 who have experienced spousal violence by types of injuries resulting from what their husband did to them, the type of violence, and whether they have experienced the violence ever and in the 12 months preceding the survey, Tripura, 2019-21

		Percenta	ge of women wh	no have had:		=

Number of women who experienced violence and			
sought help	20	18	39

Note: Figures in parentheses are based on 25-49 unweighted cases. An asterisk indicates that a figure based on fewer than 25 unweighted cases and has been suppressed.

¹ Women can report more than one source from which they sought help.

APPENDIX

ESTIMATES OF SAMPLING ERRORS

The estimates from a sample survey are affected by two types of errors: (1) non-sampling errors, and (2) sampling errors. Non-sampling errors are the results of mistakes made in implementing data collection and data processing, such as failure to locate and interview the correct household, misunderstanding of the questions on the part of either the interviewer or the respondent, and data entry errors. Although numerous efforts were made during the implementation of the fifth National Family Health Survey (NFHS-5) to minimize this type of error, non-sampling errors are impossible to avoid and difficult to evaluate statistically.

Sampling errors, on the other hand, can be evaluated statistically. The sample of respondents selected in NFHS-5 is only one of many samples that could have been selected from the same population, using the same design and expected sample size. Each of these samples would yield results that differ somewhat from the results of the actual sample selected. Sampling errors are a measure of the variability among all possible samples. Although the degree of variability is not known exactly, it can be estimated from the survey results.

A sampling error is usually measured in terms of the standard error for a particular statistic (mean, percentage, etc.), which is the square root of the variance. The standard error can be used to calculate confidence intervals within which the true value for the population can reasonably be assumed to fall. For example, for any given statistic calculated from a sample survey, the value of that statistic will fall within a range of plus or minus two times the standard error of that statistic in 95 percent of all possible samples of identical size and design.

If the sample of respondents had been selected as a simple random sample, it would have been possible to use straightforward formulas for calculating sampling errors. However, the NFHS-5 sample is the result of a multi-stage stratified design, and, consequently, it was necessary to use more complex formulae. The computer software used to calculate sampling errors for NFHS-5 is programmed in SAS. This procedure uses the Taylor linearization method for variance estimation for survey estimates that are means or proportions. The Jackknife repeated replication method is used for variance estimation of more complex statistics such as total fertility rates and child mortality rates.

The Taylor linearization method treats any proportion or mean as a ratio estimate, r = y/x, where y represents the total sample value for variable y, and x represents the total number of cases in the group or subgroup under consideration. The variance of r is computed using the formula given below, with the standard error being the square root of the variance:

$$SE^{2}(r) = var(r) = \frac{1 - f}{x^{2}} \sum_{h=1}^{H} \left[\frac{m_{h}}{m_{h} - 1} \left(\sum_{i=1}^{m_{h}} z_{hi}^{2} - \frac{z_{h}^{2}}{m_{h}} \right) \right]$$

in which

$$z_{hi} = y_{hi} - rx_{hi}$$
, and $z_h = y_h - rx_h$

where h represents the stratum, which varies from 1 to H,

 m_h is the total number of clusters selected in the h^{th} stratum,

 y_{hi} is the sum of the weighted values of variable y in the ith cluster in the hth stratum,

 x_{hi} is the sum of the weighted number of cases in the i^{th} cluster in the h^{th} stratum, and

f is the overall sampling fraction, which is so small that it is ignored.

The Jackknife repeated replication method derives estimates of complex rates from each of several replications of the parent sample, and calculates standard errors for these estimates using simple formulae. Each replication considers all but one cluster in the calculation of the estimates. Pseudo-independent replications are thus created. In the NFHS-5 sample for Tripura, there were 336 clusters. Hence, 336 replications were created. The variance of a rate r is calculated as follows:

$$SE^{2}(r) = var(r) = \frac{1}{k(k-1)} \sum_{i=1}^{k} (r_{i} - r)^{2}$$

in which

$$r_i = kr - (k-1)r_{(i)}$$

where r is the estimate computed from the full sample of 336 clusters,

 $r_{(i)}$ is the estimate computed from the reduced sample of 335 clusters (ith cluster excluded), and

k is the total number of clusters.

In addition to the standard error, the design effect (DEFT) for each estimate is computed, which is defined as the ratio between the standard error using the given sample design and the standard error that would result if a simple random sample had been used. A DEFT value of 1.0 indicates that the sample design is as efficient as a simple random sample, while a value greater than 1.0 indicates the increase in the sampling error due to the use of a more complex and less statistically efficient design. The relative standard error (SE/R) and confidence limits (R±2SE) for each estimate are also computed.

Sampling errors for NFHS-5 are calculated for selected variables considered to be of primary interest. The results are presented in this appendix for Tripura as a whole and for the urban and rural areas of the state. For each variable, the type of statistic (mean, proportion, rate, or ratio) and the base population are given in Table A.1. Tables A.2-A.4 present the total, urban, and rural values of the statistic (R), their standard errors (SE), the number of unweighted (N) and weighted (WN) cases, the design effect (DEFT), the relative standard error (SE/R), and the 95 percent confidence limits (R±2SE) for each variable. The DEFT is considered undefined when the standard error for a simple random sample is zero (when the estimate is close to 0 or 1).

Variable	Estimate	Base population
	HOUSEHO	DLDS
Using an improved source of drinking water	Proportion	Households
Jsing an improved sanitation facility	Proportion	Households
Jsing iodized salt	Proportion	Households
Sex ratio (females per 1,000 males)	Ratio	De facto household population, all ages
	WOME	N
No schooling (Females age 6 years and above)	Proportion	De facto household population of females age 6 and above
Jrban residence	Proportion	Women age 15-49
No schooling (Women age 15-49)	Proportion	Women age 15-49
Completed 10 or more years of schooling	Proportion	Women age 15-49
Never married, including married gauna not performed	Proportion	Women age 15-49
Currently married	Proportion	Women age 15-49
Married before age 18	Proportion	Women age 20-49
Currently using any contraceptive method	Proportion	Currently married women age 15-49
Currently using a modern contraceptive method	Proportion	Currently married women age 15-49
Currently using a traditional contraceptive method	Proportion	Currently married women age 15-49
Currently using pill	Proportion	Currently married women age 15-49
Currently using IUD/PPIUD	Proportion	Currently married women age 15-49
Currently using condom/ <i>Nirodh</i>	Proportion	Currently married women age 15-49
Currently using female sterilization	Proportion	Currently married women age 15-49
Jsing public health sector source of contraception	Proportion	Women age 15-49 currently using modern methods of contraception
Jnmet need for family planning	Proportion	Currently married women age 15-49
Vant no more children	Proportion	Currently married women age 15-49
Vant to delay next birth at least 2 years	Proportion	Currently married women age 15-49
Mother received four or more antenatal care (ANC) visits	Proportion	Women with at least one birth in last five years (last birth)
Fook iron and folic acid (IFA) for 100 days or more	Proportion	Women with at least one birth in last five years (last birth)
Birth registration	Proportion	De jure children under age 5 years
Births delivered by a skilled provider	Proportion	Births in last 5 years
nstitutional delivery	Proportion	Births in last 5 years
Postnatal check for mother within 2 days of birth	Proportion	Women with at least one birth in last five years (last birth)
Postnatal check for newborn within 2 days of birth	Proportion	Women with at least one birth in last five years (last birth)
Exclusive breastfeeding	Proportion	Children under age 6 months
Children with diarrhoea in the last two weeks	Proportion	Children under age 5 years
reated with oral rehydration salt (ORS) packets	Proportion	Children under age 5 years with diarrhoea in last 2 weeks
Children with diarrhoea taken to a health provider	Proportion	Children under age 5 years with diarrhoea in last 2 weeks
Child received BCG vaccination	Proportion	Children age 12-23 months
Child received penta or DPT vaccination (3 doses)	Proportion	Children age 12-23 months
Child received polio vaccination (3 doses)	Proportion	Children age 12-23 months
Child received first dose of measles vaccine	Proportion	Children age 12-23 months
Child received penta or hepatitis B vaccination (3 doses)	Proportion	Children age 12-23 months
Child with all basic vaccinations	Proportion	Children age 12-23 months
leight-for-age, stunting (below -2SD)	Proportion	Children under age 5 years who were measured
Veight-for-height, wasting (below -2SD)	Proportion	Children under age 5 years who were measured
Veight-for-age, underweight (below -2SD)	Proportion	Children under age 5 years who were measured
Children with any anaemia	Proportion	Children age 6-59 months with an anaemia test
Nomen with any anaemia	Proportion	Women age 15-49 with an anaemia test
Body mass index (BMI) <18.5 kg/m ²	Proportion	Women age 15-49 who were measured
Body mass index (BMI) ≥25.0 kg/m²	Proportion	Women age 15-49 who were measured
Vaist-to-hip ratio ≥0.85	Proportion	Women age 15-49 who were measured
lave heard of HIV or AIDS	Proportion	Women age 15-49
lave comprehensive knowledge about HIV/AIDS	Proportion	Women age 15-49
Ever experienced physical or sexual violence	Proportion	Women age 15-49
Total fertility rate (last 3 years)	Rate	Women
